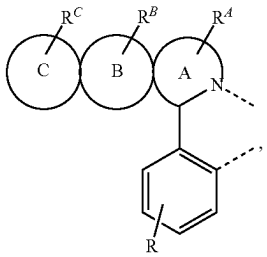
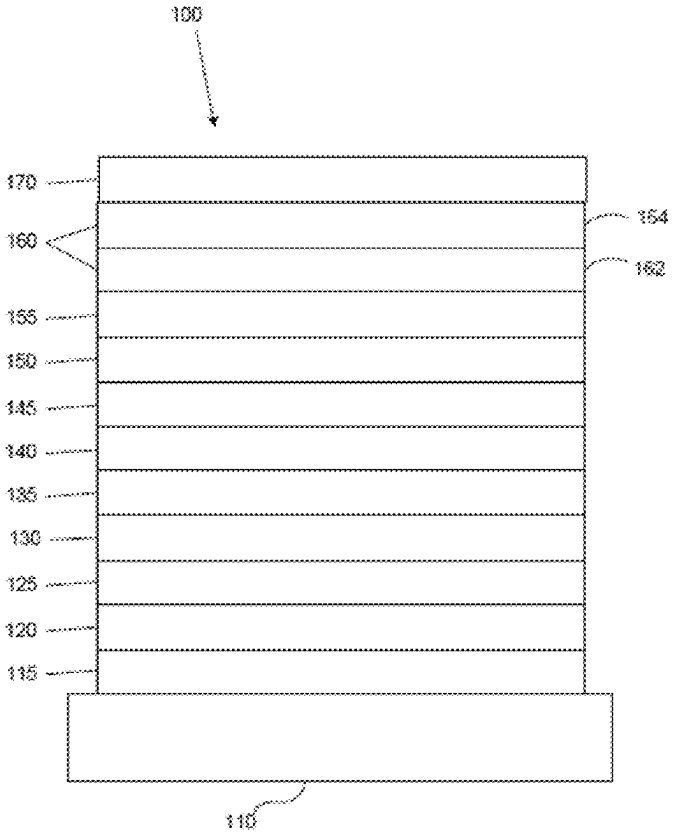
(57) **ABSTRACT**

Provided are organometallic compounds that includes a ligand $L_A$ of

Formula I



Also provided are formulations comprising these organometallic compounds. Further provided are OLEDs and related consumer products that utilize these organometallic compounds.



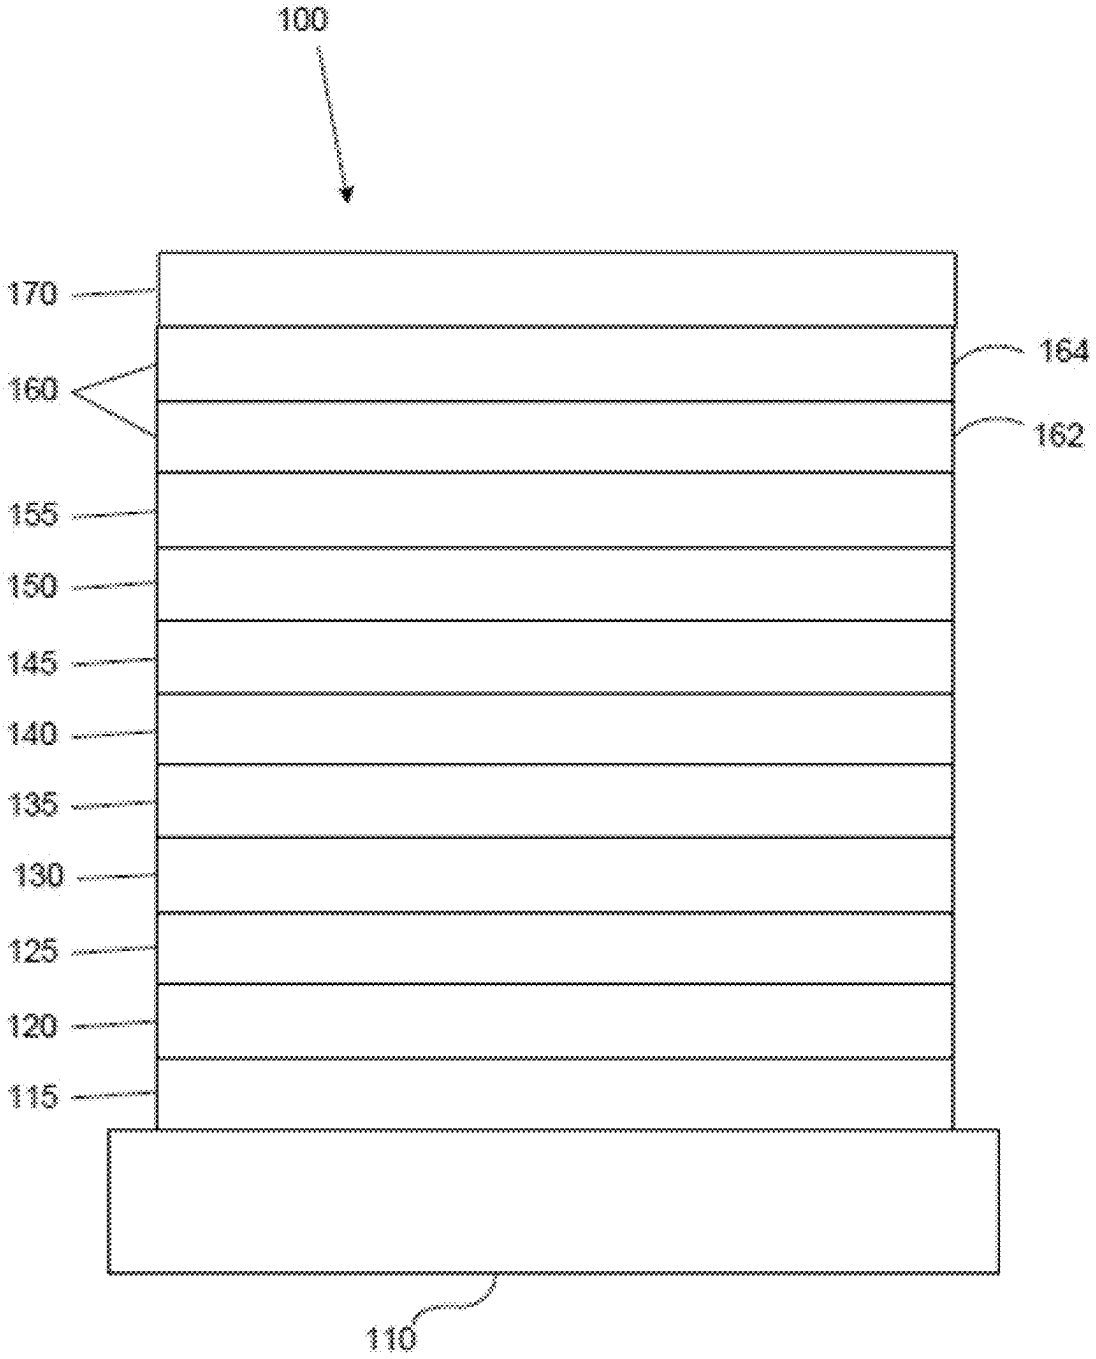


FIG. 1

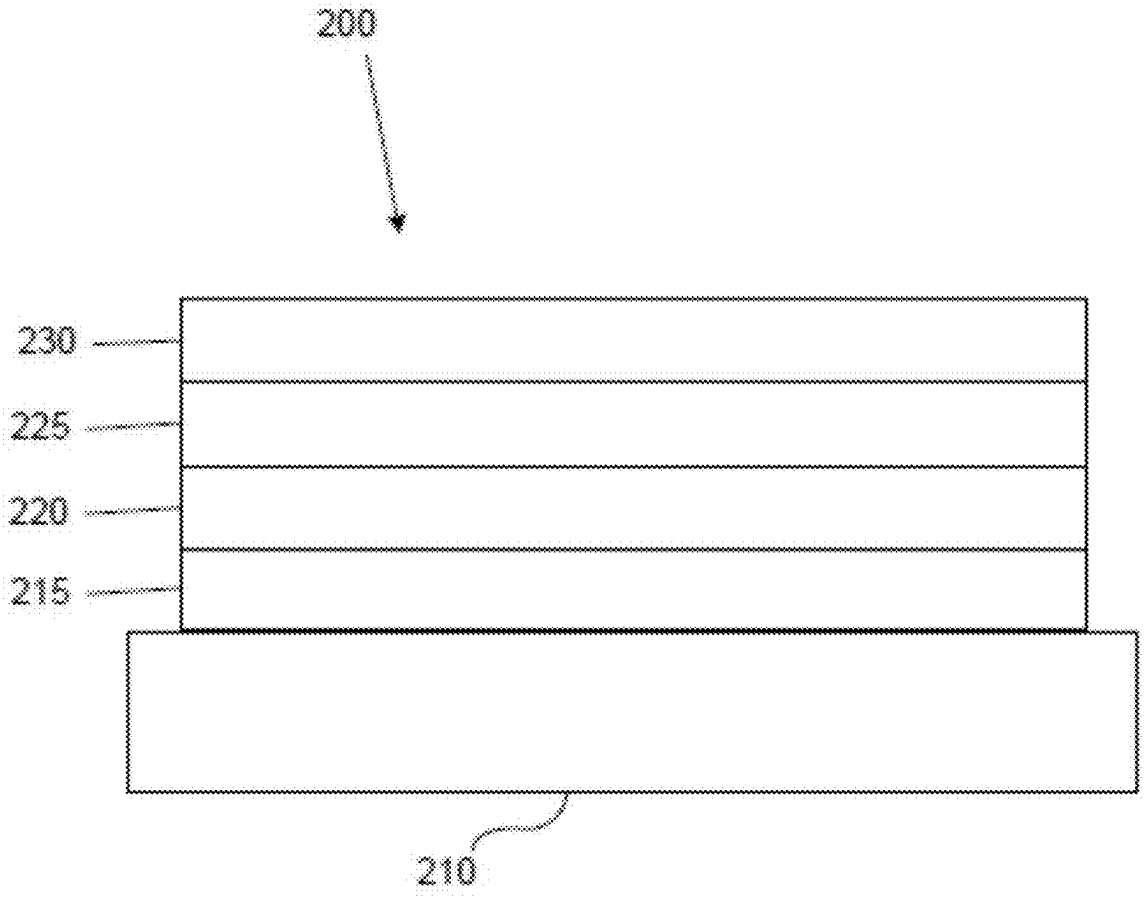

FIG. 2

# ORGANIC ELECTROLUMINESCENT MATERIALS AND DEVICES

## CROSS-REFERENCE TO RELATED APPLICATIONS

**[0001]** This application is a continuation of U.S. patent application Ser. No. 17/173,218, filed Feb. 11, 2021, which claims priority under 35 U.S.C. § 119(e) to U.S. Provisional Application No. 62/982,826, filed on Feb. 28, 2020, and U.S. Provisional Application No. 62/986,945, filed on Mar. 9, 2020, the entire contents of which are incorporated herein by reference.

## FIELD

**[0002]** The present disclosure generally relates to organometallic compounds and formulations and their various uses including as emitters in devices such as organic light emitting diodes and related electronic devices.

## BACKGROUND

**[0003]** Opto-electronic devices that make use of organic materials are becoming increasingly desirable for various reasons. Many of the materials used to make such devices are relatively inexpensive, so organic opto-electronic devices have the potential for cost advantages over inorganic devices. In addition, the inherent properties of organic materials, such as their flexibility, may make them well suited for particular applications such as fabrication on a flexible substrate. Examples of organic opto-electronic devices include organic light emitting diodes/devices (OLEDs), organic phototransistors, organic photovoltaic cells, and organic photodetectors. For OLEDs, the organic materials may have performance advantages over conventional materials.

**[0004]** OLEDs make use of thin organic films that emit light when voltage is applied across the device. OLEDs are becoming an increasingly interesting technology for use in applications such as flat panel displays, illumination, and backlighting.

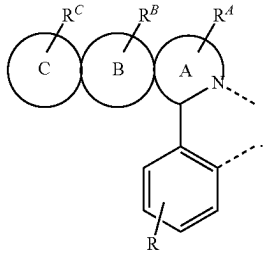
**[0005]** One application for phosphorescent emissive molecules is a full color display. Industry standards for such a display call for pixels adapted to emit particular colors, referred to as "saturated" colors. In particular, these standards call for saturated red, green, and blue pixels. Alternatively, the OLED can be designed to emit white light. In conventional liquid crystal displays emission from a white backlight is filtered using absorption filters to produce red, green and blue emission. The same technique can also be used with OLEDs. The white OLED can be either a single emissive layer (EML) device or a stack structure. Color may be measured using CIE coordinates, which are well known to the art.

## SUMMARY

**[0006]** Disclosed are ligands comprising multiple fused aromatic ring systems that can form organometallic complex capable of exhibiting electroluminescence and thereby improve performance of OLED devices. These aromatic systems contain either a cycloalkyl, fluorinated, alkoxy, or silane side chain on its core.

**[0007]** In one aspect, the present disclosure provides a compound comprising a ligand $L_A$ of

Formula I



wherein ring A is a 5- or 6-membered heterocyclic ring; ring B and ring C are each independently a 5- or 6-membered carbocyclic or heterocyclic ring; ring A is fused to ring B which is in turn fused to ring C; R, $R^A$, $R^B$ and $R^C$ each independently represent zero, mono, or up to the maximum allowed number of substitutions to its associated ring; each of R, $R^A$ $R^B$, and $R^C$ is independently a hydrogen or a substituent selected from the group consisting of the general substituents defined herein, with at least one of R, $R^A$, $R^B$, and $R^C$ being selected from the group consisting of fluorine, a partially fluorinated alkyl, a fully fluorinated alkyl, a partially or fully fluorinated alkyl derivative, an alkoxy, a silyl, a cycloalkyl, a cycloalkyl derivative, a heterocycloalkyl, a heterocycloalkyl derivative, and combinations thereof; and any two adjacent R, $R^A$, $R^B$, and $R^C$ can be joined or fused together to form a ring, wherein the ligand $L_A$ is coordinated through the indicated dashed lines to a metal M selected from the group consisting of Os, Ir, Pd, Pt, Cu, Ag, and Au; and wherein the ligand $L_A$ can be joined with other ligands to form a tridentate, tetradentate, pentadentate, or hexadentate ligand.

**[0008]** In another aspect, the present disclosure provides a formulation of a compound comprising a ligand $L_A$ of Formula 1 as described herein.

**[0009]** In yet another aspect, the present disclosure provides an OLED having an organic layer comprising a compound comprising a ligand $L_A$ of Formula 1 as described herein.

**[0010]** In yet another aspect, the present disclosure provides a consumer product comprising an OLED with an organic layer comprising a compound comprising a ligand $L_A$ of Formula 1 as described herein.

## BRIEF DESCRIPTION OF THE DRAWINGS

**[0011]** FIG. **1** shows an organic light emitting device.

**[0012]** FIG. **2** shows an inverted organic light emitting device that does not have a separate electron transport layer.

## DETAILED DESCRIPTION

### A. Terminology

**[0013]** Unless otherwise specified, the below terms used herein are defined as follows:

**[0014]** As used herein, the term "organic" includes polymeric materials as well as small molecule organic materials that may be used to fabricate organic opto-electronic devices. "Small molecule" refers to any organic material that is not a polymer, and "small molecules" may actually be quite large. Small molecules may include repeat units in some circumstances. For example, using a long chain alkyl group as a substituent does not remove a molecule from the

"small molecule" class. Small molecules may also be incorporated into polymers, for example as a pendent group on a polymer backbone or as a part of the backbone. Small molecules may also serve as the core moiety of a dendrimer, which consists of a series of chemical shells built on the core moiety. The core moiety of a dendrimer may be a fluorescent or phosphorescent small molecule emitter. A dendrimer may be a "small molecule," and it is believed that all dendrimers currently used in the field of OLEDs are small molecules.

**[0015]** As used herein, "top" means furthest away from the substrate, while "bottom" means closest to the substrate. Where a first layer is described as "disposed over" a second layer, the first layer is disposed further away from substrate. There may be other layers between the first and second layer, unless it is specified that the first layer is "in contact with" the second layer. For example, a cathode may be described as "disposed over" an anode, even though there are various organic layers in between.

**[0016]** As used herein, "solution processable" means capable of being dissolved, dispersed, or transported in and/or deposited from a liquid medium, either in solution or suspension form.

**[0017]** A ligand may be referred to as "photoactive" when it is believed that the ligand directly contributes to the photoactive properties of an emissive material. A ligand may be referred to as "ancillary" when it is believed that the ligand does not contribute to the photoactive properties of an emissive material, although an ancillary ligand may alter the properties of a photoactive ligand.

**[0018]** As used herein, and as would be generally understood by one skilled in the art, a first "Highest Occupied Molecular Orbital" (HOMO) or "Lowest Unoccupied Molecular Orbital" (LUMO) energy level is "greater than" or "higher than" a second HOMO or LUMO energy level if the first energy level is closer to the vacuum energy level. Since ionization potentials (IP) are measured as a negative energy relative to a vacuum level, a higher HOMO energy level corresponds to an IP having a smaller absolute value (an IP that is less negative). Similarly, a higher LUMO energy level corresponds to an electron affinity (EA) having a smaller absolute value (an EA that is less negative). On a conventional energy level diagram, with the vacuum level at the top, the LUMO energy level of a material is higher than the HOMO energy level of the same material. A "higher" HOMO or LUMO energy level appears closer to the top of such a diagram than a "lower" HOMO or LUMO energy level.

**[0019]** As used herein, and as would be generally understood by one skilled in the art, a first work function is "greater than" or "higher than" a second work function if the first work function has a higher absolute value. Because work functions are generally measured as negative numbers relative to vacuum level, this means that a "higher" work function is more negative. On a conventional energy level diagram, with the vacuum level at the top, a "higher" work function is illustrated as further away from the vacuum level in the downward direction. Thus, the definitions of HOMO and LUMO energy levels follow a different convention than work functions.

**[0020]** The terms "halo," "halogen," and "halide" are used interchangeably and refer to fluorine, chlorine, bromine, and iodine.

**[0021]** The term "acyl" refers to a substituted carbonyl radical (C(O)—$R_s$).

**[0022]** The term "ester" refers to a substituted oxycarbonyl (—O—C(O)—$R_s$ or —C(O)—O—$R_s$) radical.

**[0023]** The term "ether" refers to an —$OR_s$ radical.

**[0024]** The terms "sulfanyl" or "thio-ether" are used interchangeably and refer to a —$SR_s$ radical.

**[0025]** The term "sulfinyl" refers to a —S(O)—$R_s$ radical.

**[0026]** The term "sulfonyl" refers to a —$SO_2$—$R_s$ radical.

**[0027]** The term "phosphino" refers to a —$P(R_s)_3$ radical, wherein each $R_s$ can be same or different.

**[0028]** The term "silyl" refers to a —$Si(R_s)_3$ radical, wherein each $R_s$ can be same or different.

**[0029]** The term "boryl" refers to a —$B(R_s)_2$ radical or its Lewis adduct —$B(R_s)_3$ radical, wherein $R_s$ can be same or different.

**[0030]** In each of the above, $R_s$ can be hydrogen or a substituent selected from the group consisting of deuterium, halogen, alkyl, cycloalkyl, heteroalkyl, heterocycloalkyl, arylalkyl, alkoxy, aryloxy, amino, silyl, alkenyl, cycloalkenyl, heteroalkenyl, alkynyl, aryl, heteroaryl, and combination thereof. Preferred $R_s$ is selected from the group consisting of alkyl, cycloalkyl, aryl, heteroaryl, and combination thereof.

**[0031]** The term "alkyl" refers to and includes both straight and branched chain alkyl radicals. Preferred alkyl groups are those containing from one to fifteen carbon atoms and includes methyl, ethyl, propyl, 1-methylethyl, butyl, 1-methylpropyl, 2-methylpropyl, pentyl, 1-methylbutyl, 2-methylbutyl, 3-methylbutyl, 1,1-dimethylpropyl, 1,2-dimethylpropyl, 2,2-dimethylpropyl, and the like. Additionally, the alkyl group may be optionally substituted.

**[0032]** The term "cycloalkyl" refers to and includes monocyclic, polycyclic, and spiro alkyl radicals. Preferred cycloalkyl groups are those containing 3 to 12 ring carbon atoms and includes cyclopropyl, cyclopentyl, cyclohexyl, bicyclo[3.1.1]heptyl, spiro[4.5]decyl, spiro[**5.5**]undecyl, adamantyl, and the like. Additionally, the cycloalkyl group may be optionally substituted.

**[0033]** The terms "heteroalkyl" or "heterocycloalkyl" refer to an alkyl or a cycloalkyl radical, respectively, having at least one carbon atom replaced by a heteroatom. Optionally the at least one heteroatom is selected from O, S, N, P, B, Si and Se, preferably, O, S or N. Additionally, the heteroalkyl or heterocycloalkyl group may be optionally substituted.

**[0034]** The term "alkenyl" refers to and includes both straight and branched chain alkene radicals. Alkenyl groups are essentially alkyl groups that include at least one carbon-carbon double bond in the alkyl chain. Cycloalkenyl groups are essentially cycloalkyl groups that include at least one carbon-carbon double bond in the cycloalkyl ring. The term "heteroalkenyl" as used herein refers to an alkenyl radical having at least one carbon atom replaced by a heteroatom. Optionally the at least one heteroatom is selected from O, S, N, P, B, Si, and Se, preferably, O, S, or N. Preferred alkenyl, cycloalkenyl, or heteroalkenyl groups are those containing two to fifteen carbon atoms. Additionally, the alkenyl, cycloalkenyl, or heteroalkenyl group may be optionally substituted.

**[0035]** The term "alkynyl" refers to and includes both straight and branched chain alkyne radicals. Alkynyl groups are essentially alkyl groups that include at least one carbon-carbon triple bond in the alkyl chain. Preferred alkynyl

groups are those containing two to fifteen carbon atoms. Additionally, the alkynyl group may be optionally substituted.

**[0036]** The terms "aralkyl" or "arylalkyl" are used interchangeably and refer to an alkyl group that is substituted with an aryl group. Additionally, the aralkyl group may be optionally substituted.

**[0037]** The term "heterocyclic group" refers to and includes aromatic and non-aromatic cyclic radicals containing at least one heteroatom. Optionally the at least one heteroatom is selected from O, S, N, P, B, Si, and Se, preferably, O, S, or N. Hetero-aromatic cyclic radicals may be used interchangeably with heteroaryl. Preferred hetero-non-aromatic cyclic groups are those containing 3 to 7 ring atoms which includes at least one hetero atom, and includes cyclic amines such as morpholino, piperidino, pyrrolidino, and the like, and cyclic ethers/thio-ethers, such as tetrahydrofuran, tetrahydropyran, tetrahydrothiophene, and the like. Additionally, the heterocyclic group may be optionally substituted.

**[0038]** The term "aryl" refers to and includes both single-ring aromatic hydrocarbyl groups and polycyclic aromatic ring systems. The polycyclic rings may have two or more rings in which two carbons are common to two adjoining rings (the rings are "fused") wherein at least one of the rings is an aromatic hydrocarbyl group, e.g., the other rings can be cycloalkyls, cycloalkenyls, aryl, heterocycles, and/or heteroaryls. Preferred aryl groups are those containing six to thirty carbon atoms, preferably six to twenty carbon atoms, more preferably six to twelve carbon atoms. Especially preferred is an aryl group having six carbons, ten carbons or twelve carbons. Suitable aryl groups include phenyl, biphenyl, triphenyl, triphenylene, tetraphenylene, naphthalene, anthracene, phenalene, phenanthrene, fluorene, pyrene, chrysene, perylene, and azulene, preferably phenyl, biphenyl, triphenyl, triphenylene, fluorene, and naphthalene. Additionally, the aryl group may be optionally substituted.

**[0039]** The term "heteroaryl" refers to and includes both single-ring aromatic groups and polycyclic aromatic ring systems that include at least one heteroatom. The heteroatoms include, but are not limited to O, S, N, P, B, Si, and Se. In many instances, O, S, or N are the preferred heteroatoms. Hetero-single ring aromatic systems are preferably single rings with 5 or 6 ring atoms, and the ring can have from one to six heteroatoms. The hetero-polycyclic ring systems can have two or more rings in which two atoms are common to two adjoining rings (the rings are "fused") wherein at least one of the rings is a heteroaryl, e.g., the other rings can be cycloalkyls, cycloalkenyls, aryl, heterocycles, and/or heteroaryls. The hetero-polycyclic aromatic ring systems can have from one to six heteroatoms per ring of the polycyclic aromatic ring system. Preferred heteroaryl groups are those containing three to thirty carbon atoms, preferably three to twenty carbon atoms, more preferably three to twelve carbon atoms. Suitable heteroaryl groups include dibenzothiophene, dibenzofuran, dibenzoselenophene, furan, thiophene, benzofuran, benzothiophene, benzoselenophene, carbazole, indolocarbazole, pyridylindole, pyrrolodipyridine, pyrazole, imidazole, triazole, oxazole, thiazole, oxadiazole, oxatriazole, dioxazole, thiadiazole, pyridine, pyridazine, pyrimidine, pyrazine, triazine, oxazine, oxathiazine, oxadiazine, indole, benzimidazole, indazole, indoxazine, benzoxazole, benzisoxazole, benzothiazole, quinoline, isoquinoline, cinnoline, quinazoline, quinoxaline, naphthyridine, phthalazine, pteridine, xanthene, acridine, phenazine, phenothiazine, phenoxazine, benzofuropyridine, furodipyridine, benzothienopyridine, thienodipyridine, benzoselenophenopyridine, and selenophenodipyridine, preferably dibenzothiophene, dibenzofuran, dibenzoselenophene, carbazole, indolocarbazole, imidazole, pyridine, triazine, benzimidazole, 1,2-azaborine, 1,3-azaborine, 1,4-azaborine, borazine, and aza-analogs thereof. Additionally, the heteroaryl group may be optionally substituted.

**[0040]** Of the aryl and heteroaryl groups listed above, the groups of triphenylene, naphthalene, anthracene, dibenzothiophene, dibenzofuran, dibenzoselenophene, carbazole, indolocarbazole, imidazole, pyridine, pyrazine, pyrimidine, triazine, and benzimidazole, and the respective aza-analogs of each thereof are of particular interest.

**[0041]** The terms alkyl, cycloalkyl, heteroalkyl, heterocycloalkyl, alkenyl, cycloalkenyl, heteroalkenyl, alkynyl, aralkyl, heterocyclic group, aryl, and heteroaryl, as used herein, are independently unsubstituted, or independently substituted, with one or more general substituents.

**[0042]** In many instances, the general substituents are selected from the group consisting of deuterium, halogen, alkyl, cycloalkyl, heteroalkyl, heterocycloalkyl, arylalkyl, alkoxy, aryloxy, amino, silyl, boryl, alkenyl, cycloalkenyl, heteroalkenyl, alkynyl, aryl, heteroaryl, acyl, carboxylic acid, ether, ester, nitrile, isonitrile, sulfanyl, sulfinyl, sulfonyl, phosphino, and combinations thereof.

**[0043]** In some instances, the preferred general substituents are selected from the group consisting of deuterium, fluorine, alkyl, cycloalkyl, heteroalkyl, alkoxy, aryloxy, amino, silyl, boryl, alkenyl, cycloalkenyl, heteroalkenyl, aryl, heteroaryl, nitrile, isonitrile, sulfanyl, and combinations thereof.

**[0044]** In some instances, the preferred general substituents are selected from the group consisting of deuterium, fluorine, alkyl, cycloalkyl, alkoxy, aryloxy, amino, silyl, boryl, aryl, heteroaryl, sulfanyl, and combinations thereof.

**[0045]** In yet other instances, the more preferred general substituents are selected from the group consisting of deuterium, fluorine, alkyl, cycloalkyl, aryl, heteroaryl, and combinations thereof.

**[0046]** The terms "substituted" and "substitution" refer to a substituent other than H that is bonded to the relevant position, e.g., a carbon or nitrogen. For example, when $R^1$ represents mono-substitution, then one $R^1$ must be other than H (i.e., a substitution). Similarly, when $R^1$ represents di-substitution, then two of $R^1$ must be other than H. Similarly, when $R^1$ represents zero or no substitution, $R^1$, for example, can be a hydrogen for available valencies of ring atoms, as in carbon atoms for benzene and the nitrogen atom in pyrrole, or simply represents nothing for ring atoms with fully filled valencies, e.g., the nitrogen atom in pyridine. The maximum number of substitutions possible in a ring structure will depend on the total number of available valencies in the ring atoms.

**[0047]** As used herein, "combinations thereof" indicates that one or more members of the applicable list are combined to form a known or chemically stable arrangement that one of ordinary skill in the art can envision from the applicable list. For example, an alkyl and deuterium can be combined to form a partial or fully deuterated alkyl group; a halogen and alkyl can be combined to form a halogenated alkyl substituent; and a halogen, alkyl, and aryl can be combined to form a halogenated arylalkyl. In one instance,

the term substitution includes a combination of two to four of the listed groups. In another instance, the term substitution includes a combination of two to three groups. In yet another instance, the term substitution includes a combination of two groups. Preferred combinations of substituent groups are those that contain up to fifty atoms that are not hydrogen or deuterium, or those which include up to forty atoms that are not hydrogen or deuterium, or those that include up to thirty atoms that are not hydrogen or deuterium. In many instances, a preferred combination of substituent groups will include up to twenty atoms that are not hydrogen or deuterium.

**[0048]** The "aza" designation in the fragments described herein, i.e. aza-dibenzofuran, aza-dibenzothiophene, etc. means that one or more of the C—H groups in the respective aromatic ring can be replaced by a nitrogen atom, for example, and without any limitation, azatriphenylene encompasses both dibenzo[fh]quinoxaline and dibenzo[fh]quinoline. One of ordinary skill in the art can readily envision other nitrogen analogs of the aza-derivatives described above, and all such analogs are intended to be encompassed by the terms as set forth herein.

**[0049]** As used herein, "deuterium" refers to an isotope of hydrogen. Deuterated compounds can be readily prepared using methods known in the art. For example, U.S. Pat. No. 8,557,400, Patent Pub. No. WO 2006/095951, and U.S. Pat. Application Pub. No. US 2011/0037057, which are hereby incorporated by reference in their entireties, describe the making of deuterium-substituted organometallic complexes. Further reference is made to Ming Yan, et al., *Tetrahedron* 2015, 71, 1425-30 and Atzrodt et al., *Angew. Chem. Int. Ed.* (Reviews) 2007, 46, 7744-65, which are incorporated by reference in their entireties, describe the deuteration of the methylene hydrogens in benzyl amines and efficient pathways to replace aromatic ring hydrogens with deuterium, respectively.

**[0050]** It is to be understood that when a molecular fragment is described as being a substituent or otherwise attached to another moiety, its name may be written as if it were a fragment (e.g. phenyl, phenylene, naphthyl, dibenzofuryl) or as if it were the whole molecule (e.g. benzene, naphthalene, dibenzofuran). As used herein, these different ways of designating a substituent or attached fragment are considered to be equivalent.

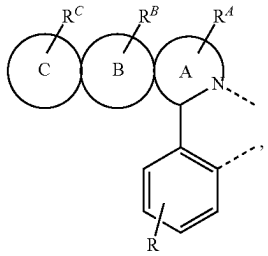
**[0051]** In some instance, a pair of adjacent substituents can be optionally joined or fused into a ring. The preferred ring is a five, six, or seven-membered carbocyclic or heterocyclic ring, includes both instances where the portion of the ring formed by the pair of substituents is saturated and where the portion of the ring formed by the pair of substituents is unsaturated. As used herein, "adjacent" means that the two substituents involved can be on the same ring next to each other, or on two neighboring rings having the two closest available substitutable positions, such as 2, 2' positions in a biphenyl, or 1, 8 position in a naphthalene, as long as they can form a stable fused ring system.

B. The Compounds of the Present Disclosure

**[0052]** Disclosed are transition metal compounds having fused heteroaromatic ligands shown in Formula 1. Because of their unique configuration of the fused rings, the compounds show phosphorescent emission in red region and are useful as emitter materials in organic electroluminescence device. As shown in Formula 1, the fused rings systems linked covalently to the metal complex contain 3 or more fused rings. These ring systems contain at least one of the following: a cycloalkyl side chain, a partially fluorinated or perfluorinated side chain, an alkoxy or silane side chain on its core. These side chains are allowing the final complexes to be suitable for such applications but also enable good color tunability and higher EQE.

**[0053]** In one aspect, the present disclosure provides a compound comprising a ligand $L_A$ of

Formula I



**[0054]** wherein:

**[0055]** ring A is a 5- or 6-membered heterocyclic ring;

**[0056]** ring B and ring C are each independently a 5- or 6-membered carbocyclic or heterocyclic ring;

**[0057]** ring A is fused to ring B which is in turn fused to ring C;

**[0058]** R, $R^A$, $R^B$ and $R^C$ each independently represents zero, mono, or up to the maximum allowed number of substitutions to its associated ring;

**[0059]** each of R, $R^A$ $R^B$, and $R^C$ is independently a hydrogen or a substituent selected from the group consisting of the general substituents defined herein, with at least one of R, $R^A$, $R^B$, and $R^C$ being selected from the group consisting of fluorine, a partially fluorinated alkyl, a fully fluorinated alkyl, a partially or fully fluorinated alkyl derivative, an alkoxy, a silyl, a cycloalkyl, a partially fluorinated cycloalkyl, a fully fluorinated cycloalkyl, a cycloalkyl derivative, a heterocycloalkyl, a partially fluorinated heterocycloalkyl, a fully fluorinated heterocycloalkyl, a heterocycloalkyl derivative, and combinations thereof; and

**[0060]** any two adjacent R, $R^A$ $R^B$, and $R^C$ can be joined or fused together to form a ring, wherein the ligand $L_A$ is coordinated through the indicated dashed lines to a metal M selected from the group consisting of Os, Ir, Pd, Pt, Cu, Ag, and Au; and wherein the ligand $L_A$ can be joined with other ligands to form a tridentate, tetradentate, pentadentate, or hexadentate ligand.

**[0061]** In some embodiments, each of R, $R^A$, $R^B$, and $R^C$ can be independently a hydrogen or a substituent selected from the group consisting of deuterium, fluorine, alkyl, cycloalkyl, heteroalkyl, heterocycloalkyl, alkoxy, aryloxy, amino, silyl, boryl, alkenyl, cycloalkenyl, heteroalkenyl, aryl, heteroaryl, nitrile, isonitrile, sulfanyl, and combinations thereof.

**[0062]** In some embodiments, ring A, ring B, and ring C can each be independently a 6-membered ring. In some embodiments, ring A can be a 6-membered aromatic ring. In some embodiments, ring A can be a pyridine ring. In some embodiments, ring B can be a 6-membered aromatic ring. In some embodiments, ring B can be a benzene ring. In some

embodiments, ring B can have at least one N atom. In some embodiments, ring C can be a 6-membered aromatic ring. In some embodiments, ring C can be a benzene ring. In some embodiments, ring C can have at least one N atom. In some embodiments, ring A, ring B, and ring C can each be independently a 6-membered aromatic ring. In some embodiments, ring A, ring B, and ring C can form a benzoisoquinoline ring structure. In some embodiments, ring A, ring B, and ring C can form a benzoquinoline ring structure. In some embodiments, ring B can be a 5-memebered aromatic ring and ring C can be a 6-mebered aromatic ring. In some embodiments, ring B can be a 6-membred aromatic ring and ring C can be a 5-memebered aromatic ring.

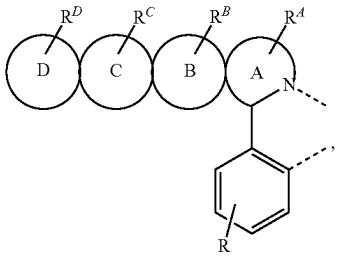
**[0063]** In the above embodiments, ring B can be fused to ring A in any chemically feasible manner including fused each time to a different side of ring A. Likewise, ring C can be fused to ring B in any chemically feasible manner such as rings A, B and C are fused linearly or non-linearly.

**[0064]** In some embodiments, at least one of $R^C$ can comprise a cyclohexyl, a partially or fully fluorinated cyclohexyl, a cyclopentyl, a partially or fully fluorinated cyclopentyl, a partially or fully fluorinated alkyl group, or a partially or fully fluorinated cycloalkyl group. In some embodiments, at least one of $R^B$ can comprise a cyclohexyl, a partially or fully fluorinated cyclohexyl, a cyclopentyl, a partially or fully fluorinated cyclopentyl, a partially or fully fluorinated alkyl group, or a partially or fully fluorinated cycloalkyl group. In some embodiments, at least one of $R^A$ can comprise a cyclohexyl, a partially or fully fluorinated cyclohexyl, a cyclopentyl, a partially or fully fluorinated cyclopentyl, a partially or fully fluorinated alkyl group, or a partially or fully fluorinated cycloalkyl group. In some embodiments, at least one of R can comprise a cyclohexyl, a partially or fully fluorinated cyclohexyl, a cyclopentyl, a partially or fully fluorinated cyclopentyl, a partially or fully fluorinated alkyl group, or a partially or fully fluorinated cycloalkyl group.

**[0065]** In some embodiments, one of $R^A$, $R^B$, or $R^C$ can be fluorine. In some embodiments, one of $R^A$ can be fluorine. In some embodiments, one of $R^B$ can be fluorine. In some embodiments, one of $R^C$ can be fluorine. In some embodiments, at least one of R, $R^A$, $R^B$, or $R^C$ can comprise a cyclopentyl group. In some embodiments, at least one of R, $R^A$, $R^B$, or $R^C$ can comprise two cyclohexyl groups. In some embodiments, at least one of R, $R^A$, $R^B$, or $R^C$ can comprise a CF, $CF_2$, or $CF_3$ group. In some embodiments, at least one of $R^A$, $R^B$, and $R^C$ can be independently selected from the group consisting of fluorine, a partially fluorinated alkyl, a fully fluorinated alkyl, a partially or fully fluorinated alkyl derivative, a cycloalkyl, a partially fluorinated cycloalkyl, a fully fluorinated cycloalkyl, a cycloalkyl derivative, a heterocycloalkyl, a partially fluorinated heterocycloalkyl, a fully fluorinated heterocycloalkyl, a heterocycloalkyl derivative and their combinations.

**[0066]** In some embodiments, the compound can comprise a ligand $L_A$ of

Formula II



**[0067]** wherein:

**[0068]** ring D is 5- or 6-membered carbocyclic or heterocyclic ring and fused to ring C;

**[0069]** $R^D$ represents zero, mono, or up to the maximum allowed number of substitutions to its associated ring;

**[0070]** $R^D$ for each occurrence is independently a hydrogen or a substituent selected from the group consisting of the general substituents defined herein;

**[0071]** the remaining variables are the same as defined with respect to Formula I; and

**[0072]** any two adjacent R, $R^A$, $R^B$, $R^C$, and $R^D$ can be joined to fused to form a ring.

**[0073]** In some of the above embodiments, $R^D$ for each occurrence can be independently a hydrogen or a substituent selected from the group consisting of deuterium, fluorine, alkyl, cycloalkyl, heteroalkyl, heterocycloalkyl, alkoxy, aryloxy, amino, silyl, boryl, alkenyl, cycloalkenyl, heteroalkenyl, aryl, heteroaryl, nitrile, isonitrile, sulfanyl, and combinations thereof.

**[0074]** In some of the above embodiments, ring D can be a 6-memerbed ring. In some of the above embodiments, ring D can be a 6-membered aromatic ring. In some of the above embodiments, ring D can be a benzene ring. In some of the above embodiments, ring D can be a 5-membered aromatic ring. In some of the above embodiments, ring D can comprise at least one N atom. In some of the above embodiments, ring A, ring B, ring C, and ring D can form a naphthoquinoline ring structure. In some of the above embodiments, ring A, ring B, ring C, and ring D can form a naphthoisoquinoline ring structure.

**[0075]** In the above embodiments, ring B can be fused to ring A in any chemically feasible manner including fused each time to a different side of ring A. Likewise, ring C can be fused to ring B in any chemically feasible such as rings A, B and C are fused linearly or non-linearly. Similarly, ring D can be fused to ring C in any chemically feasible manner such as rings A, B, C, and D can be fused linearly or non-linearly.

**[0076]** In some of the above embodiments, at least one $R^D$ can be selected from the group consisting of fluorine, a partially fluorinated alkyl, a fully fluorinated alkyl, a partially or fully fluorinated alkyl derivative, a cycloalkyl, a partially fluorinated cycloalkyl, a fully fluorinated cycloalkyl, a cycloalkyl derivative, a heterocycloalkyl, a partially fluorinated heterocycloalkyl, a fully fluorinated heterocycloalkyl, a heterocycloalkyl derivative, an alkoxy, a silyl, and combinations thereof. In some embodiments, $R^D$ can be fluorine.

**[0077]** In some of the above embodiments, one R substituent can be alkyl or cycloalkyl, and the remaining R substituents may be H. In some of the above embodiments,

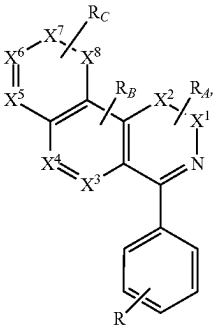
one R substituent can be a partially or fully fluorinated alkyl or cycloalkyl and the remaining R may be H. In some of the above embodiments, two or more R substituents can each be independently alkyl or cycloalkyl. In some of the above embodiments, two or more R substituents can ach be independently partially or fully fluorinated alkyl or cycloalkyl. In some of the above embodiments, one or more of R, $R^A$, $R^B$, $R^C$, or $R^D$ can comprise a $C_1$ to $C_{20}$ alkyl group. In some of the above embodiments, one or more of R, $R^A$, $R^B$, $R^C$, or $R^D$ can comprise a $C_1$ to $C_{20}$ partially or fully fluorinated alkyl group. In some of the above embodiments, one or more of R, $R^A$, $R^B$, $R^C$, or $R^D$ can comprise a spiroalkyl group. In some of the above embodiments, one or more of R, $R^A$, $R^B$, $R^C$, or $R^D$ can comprise a spiro[5.5]undecane, spiro[4.5]decane, or spiro[4.4]nonane group. In some of the above embodiments, two R substituents can be joined together to form a fused 6-membered ring, and the remaining R substituents are H.

**[0078]** In some of the above embodiments, the compound can comprise a ligand $L_A$ with five fused ring structure. In some of the above embodiments, the compound can comprise a ligand $L_A$ with six or more fused ring structure. In some of the above embodiments, the metal M can be Ir. In some of the above embodiments, the metal M can be Pt or Pd.

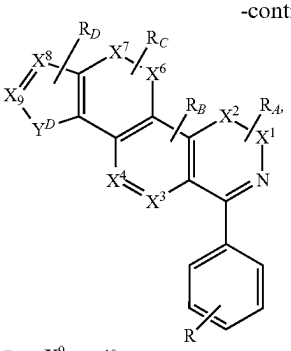
**[0079]** In the above embodiments, a derivative of a parent compound can include any compound so long as the derivative contains the parent portion or moiety. For example, a partially or fully fluorinated alkyl derivative includes any molecule if the molecule has a partially or fully fluorinated alkyl moiety no matter where the moiety is embedded within the molecule. Similarly, a cycloalkyl derivative includes any molecule if the molecule has a cycloalkyl moiety embedded within the molecule regardless of where it is embedded. Likewise, a heterocycloalkyl derivative can include any molecule if the molecule has an embedded heterocycloalkyl moiety regardless of where it is embedded.

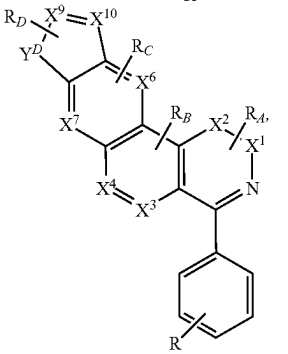
**[0080]** In some of the above embodiments, the compound can further comprise a substituted or unsubstituted phenylpyridine ligand. In some of the above embodiments, the compound can further comprise a substituted or unsubstituted acetylacetonate ligand.

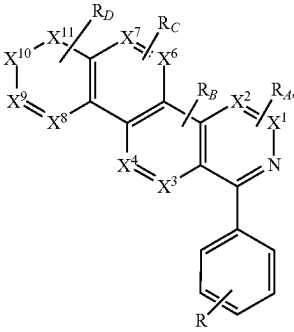
**[0081]** In some of the above embodiments, the Ligand $L_A$ can be selected from the group consisting of:



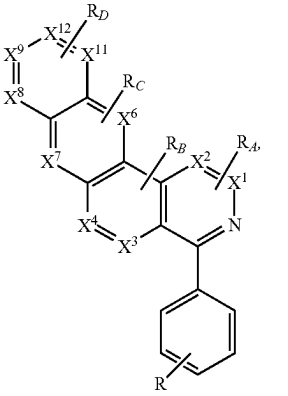
-continued







and



**[0082]** wherein:

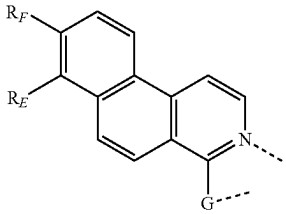
**[0083]** $X^1$-$X^{12}$ are each independently C or N;

**[0084]** $Y^D$ for each occurrence is independently selected from the group consisting of $BR_e$, $NR_e$, PR, O, S, Se, C═O, S═O, $SO_2$, $CR_eR_f$, $SiR_eR_f$, and $GeR_eR_f$; wherein $R_e$ and $R_f$ can be fused or joined to form a ring; each of $R_e$ and $R_f$ is independently hydrogen or a substituent selected from the group consisting of the general substituents defined herein; and

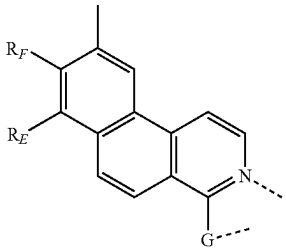
**[0085]** all the remaining variables are the same as previously defined.

**[0086]** In some embodiments, the ligand $L_A$ can be selected from the group consisting of $L_{Ai-m}$, wherein i is an integer from 1 to 1152, and m an integer from 1 to 29, and the structure of each $L_{Ai-m}$ is defined in LIST 1 below:

$L_{Ai-1}$ based on Structure 1



$L_{Ai-2}$ based on Structure 2



$L_{Ai-3}$ based on Structure 3

and

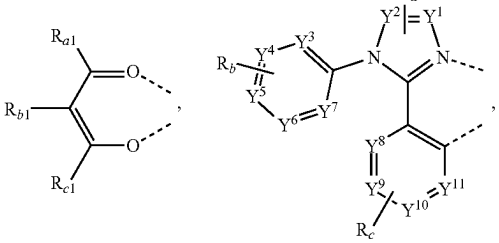
**[0092]** In some embodiments, the compound may have a formula of $M(L_A)_x(L_B)_y(L_C)_z$ wherein $L_B$ and $L_C$ are each a

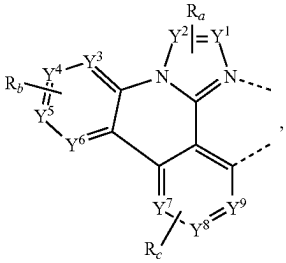
bidentate ligand; and wherein x is 1, 2, or 3; y is 0, 1, or 2; z is 0, 1, or 2; and x+y+z is the oxidation state of the metal M.

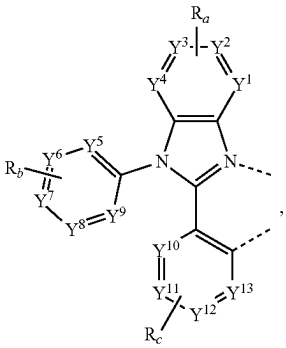
**[0093]** In some embodiments, the compound can have a formula selected from the group consisting of $Ir(L_A)_3$, $Ir(L_A)(L_B)_2$, $Ir(L_A)_2(L_B)$, $Ir(L_A)_2(L_C)$, and $Ir(L_A)(L_B)(L_C)$, wherein $L_A$, $L_B$, and $L_C$ are different from each other.

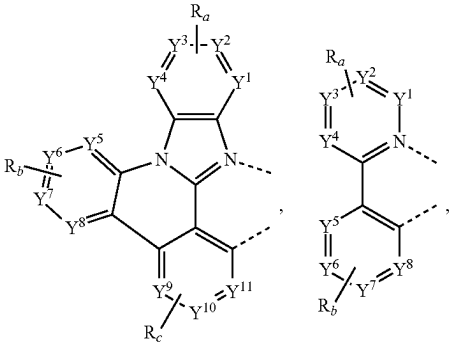
**[0094]** In some embodiments, compound can have a formula of $Pt(L_A)(L_B)$, wherein $L_A$ and $L_B$ can be the same or different. In some embodiments, $L_A$ and $L_B$ can be connected to form a tetradentate ligand.

**[0095]** In some embodiments, $L_B$ and $L_C$ can each be independently selected from the group consisting of:

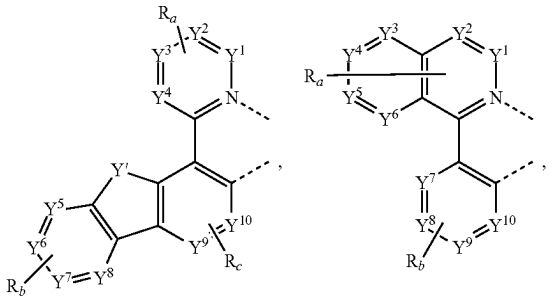


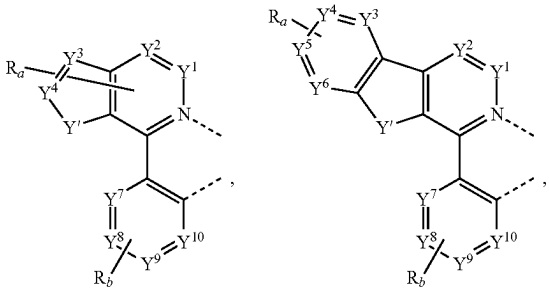


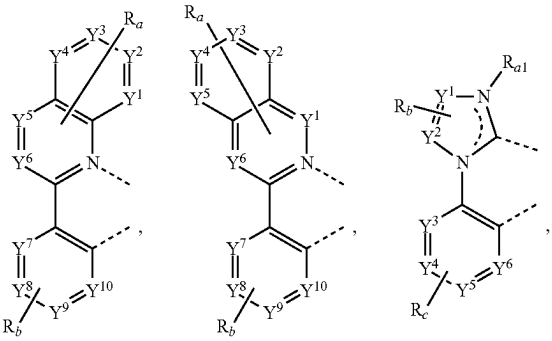


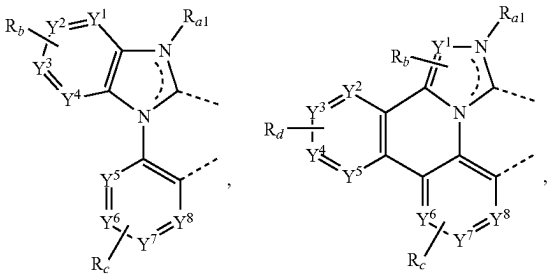


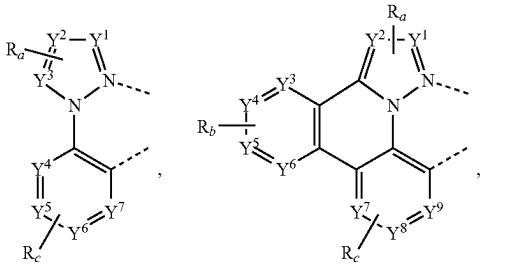
-continued



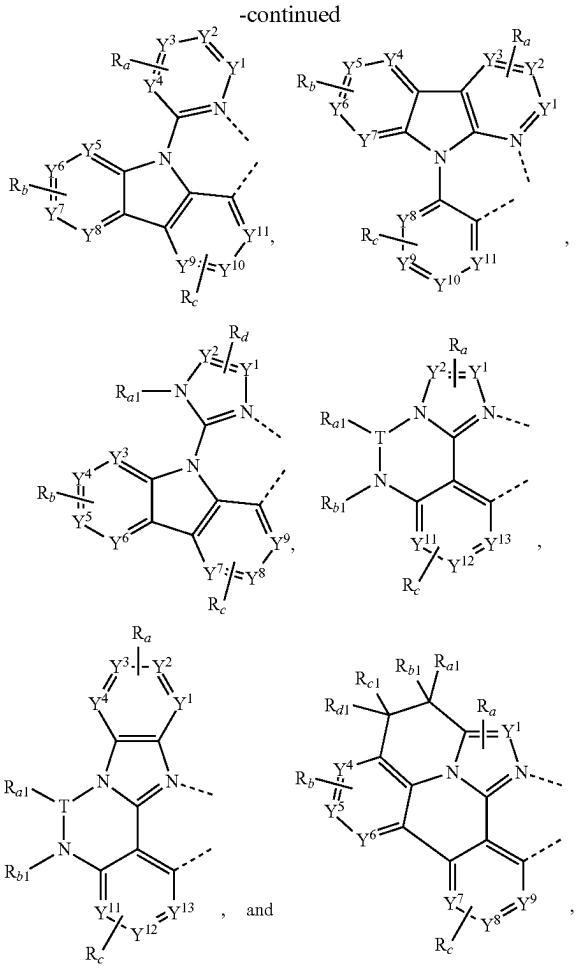








-continued



**[0096]** wherein:

**[0097]** T is B, Al, Ga, In;

**[0098]** each of $Y^1$ to $Y^{13}$ is independently selected from the group consisting of carbon and nitrogen;

**[0099]** Y' is selected from the group consisting of $BR_e$, $NR_e$, $PR_e$, O, S, Se, C═O, S═O, $SO_2$, $CR_eR_f$, $SiR_eR_f$, and $GeR_eR_f$;

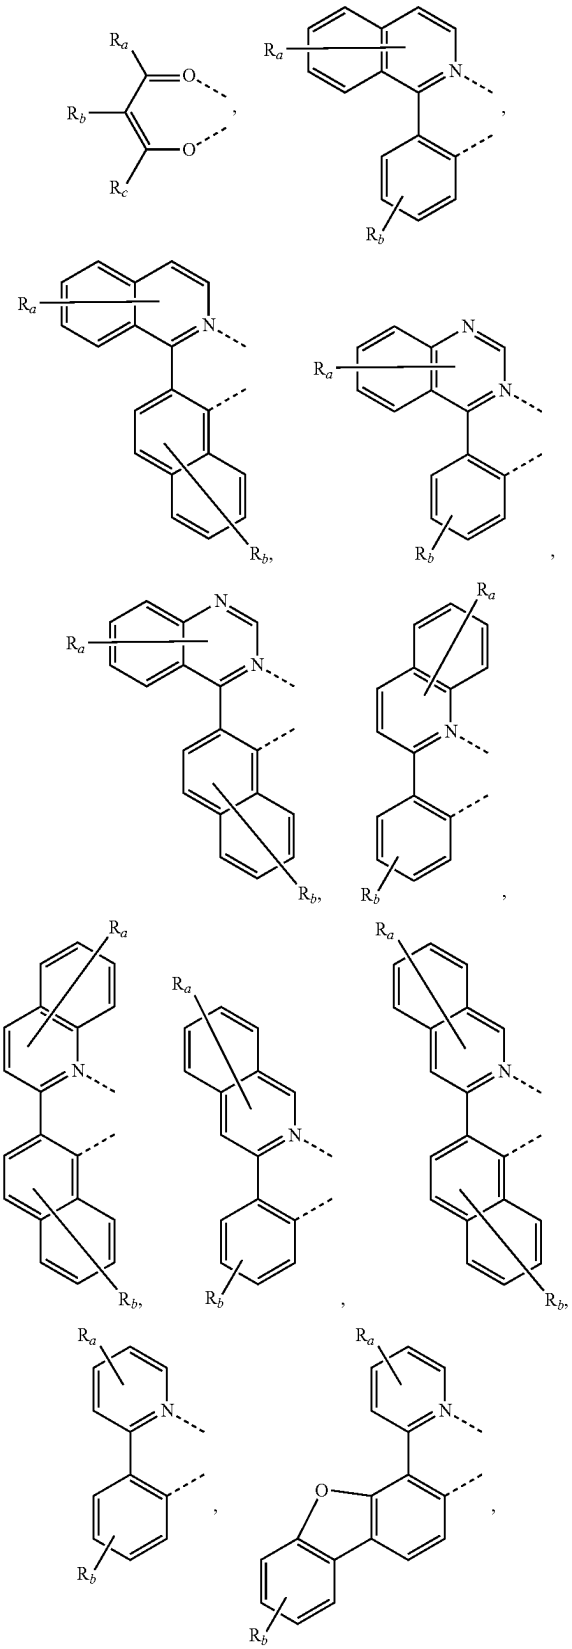
**[0100]** $R_e$ and $R_f$ can be fused or joined to form a ring;

**[0101]** each $R_a$, $R_b$, $R_c$, and $R_d$ independently represent zero, mono, or up to the maximum allowed number of substitutions to its associated ring;

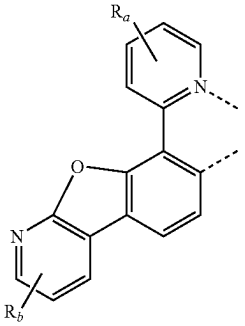
**[0102]** each of $R_{a1}$, $R_{b1}$, $R_{c1}$, $R_{d1}$, $R_a$, $R_b$, $R_c$, $R_d$, $R_e$ and $R_f$ is independently a hydrogen or a substituent selected from the group consisting of the general substituents defined herein; and

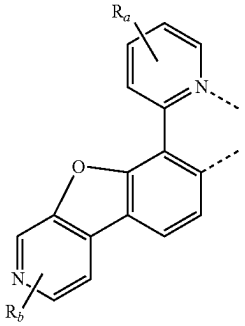
**[0103]** any two adjacent $R_{a1}$, $R_{b1}$, $R_{e1}$, $R_{d1}$, $R_a$, $R_b$, $R_c$, $R_d$, $R_e$ and $R_f$ can be fused or joined to form a ring or form a multidentate ligand.

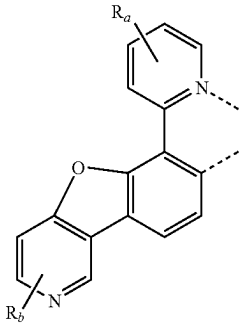
**[0104]** In some embodiments, $L_B$ and $L_C$ can each be independently selected from the group consisting of the structures in LIST 3:

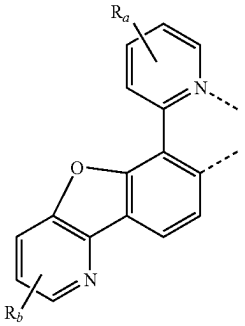


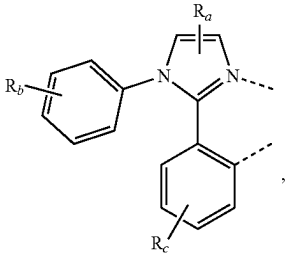
-continued

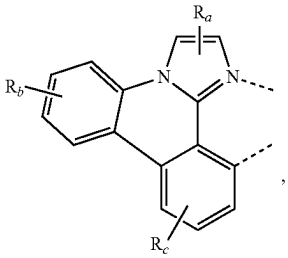


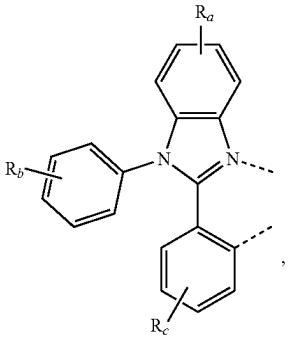




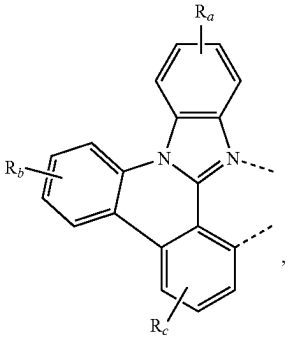


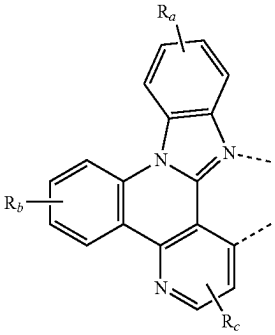


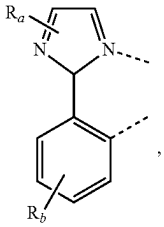


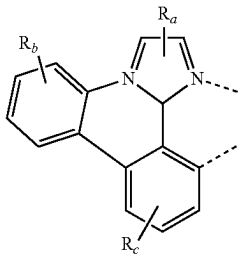


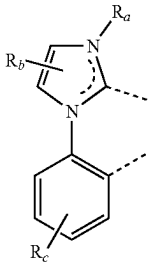
-continued

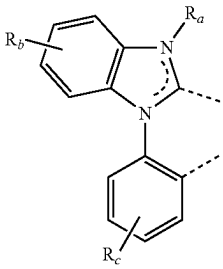


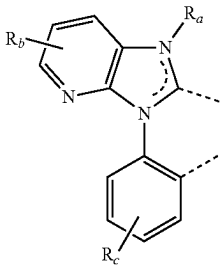


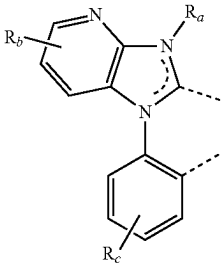


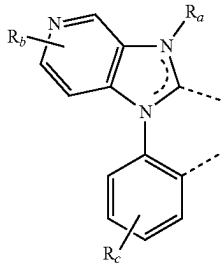




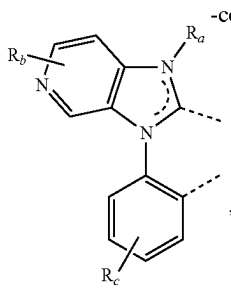


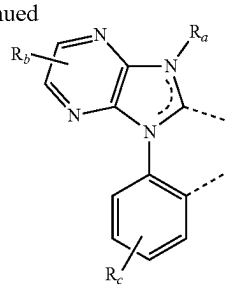


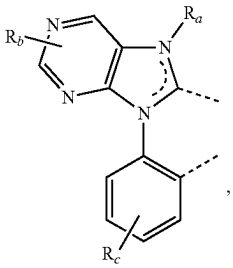


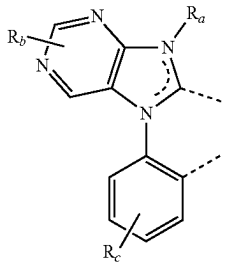


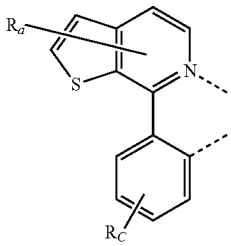
-continued

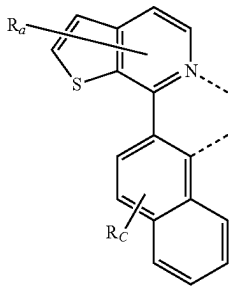


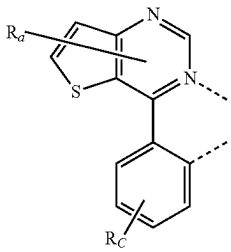


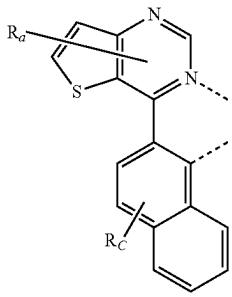


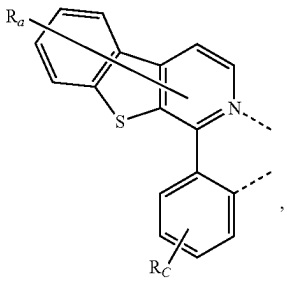




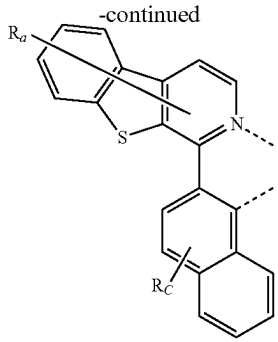


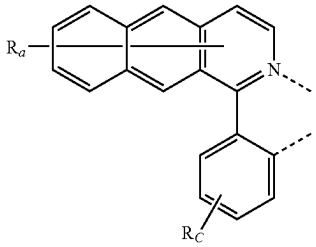


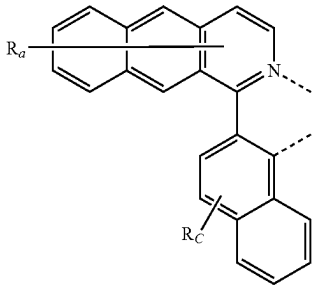


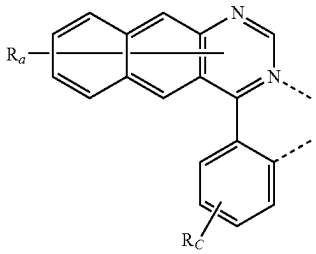


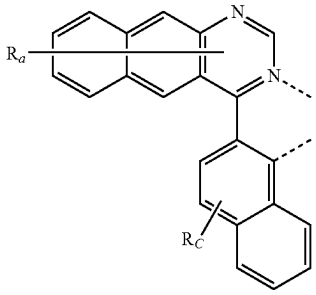
-continued

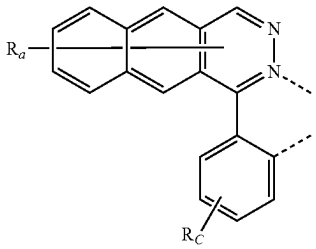




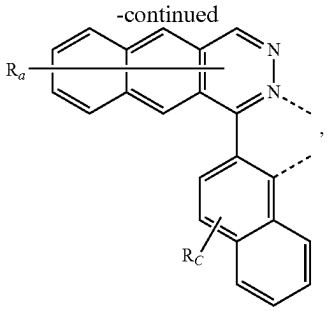


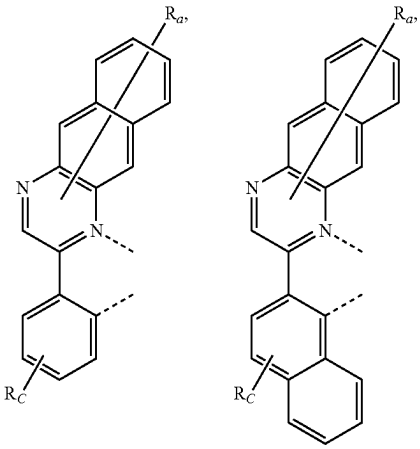


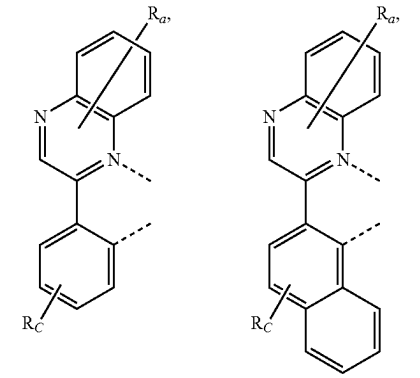


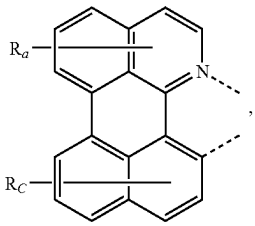


-continued

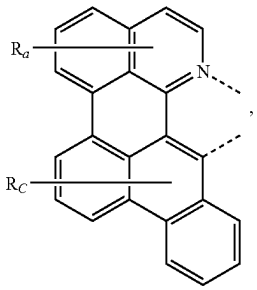








and



**[0105]** wherein $R_a$, $R_b$, and $R_c$ are all defined the same as above, and each of which can form a ring with the other where chemically feasible.

**[0106]** In some embodiments, the compound may have the formula $Ir(L_A)_3$, the formula $Ir(L_A)(L_{Bk})_2$, the formula $Ir(L_A)_2(L_{Bk})$, the formula $Ir(L_A)_2(L_{Cj-1})$, the formula $Ir(L_A)_2(L_{Cj-11})$, the formula $Ir(L_A)(L_{Bk})(L_{Cj-1})$, or the formula $Ir(L_A)(L_{Bk})(L_{Cj-11})$, wherein $L_A$ is a compound as described herein; $L_{Bk}$ is selected from the group as described below, and $L_{Cj-1}$ and $L_{Cj-II}$ are each independently selected from the groups as described below.

**[0107]** In some embodiments, wherein when the compound has formula $Ir(L_{Ai-m})_3$, i is an integer from 1 to 1152; m is an integer from 1 to 29; and the compound is selected from the group consisting of $Ir(L_{AI-1})_3$ to $Ir(L_{A1152-29})_3$; when the compound has formula $Ir(L_{Ai-m})(L_{Bk})_2$, i is an integer from 1 to 1152; m is an integer from 1 to 29; k is an integer from 1 to 270; and the compound is selected from the group consisting of $Ir(L_{AI-1}—)(L_{BI})_2$ to $Ir(L_{A1152-29})_2(L_{B270})_2$;

**[0108]** when the compound has formula $Ir(L_{Ai-m})_2(L_{Bk})$, i is an integer from 1 to 1152; m is an integer from 1 to 29; k is an integer from 1 to 270; and the compound is selected from the group consisting of $Ir(L_{AI-1})_2(L_{BI})$ to $Ir(L_{A1152-29})_2(L_{B270})$;

**[0109]** when the compound has formula $Ir(L_{Ai-m})_2(L_{Cj-1})$, i is an integer from 1 to 1152; m is an integer from 1 to 29;j is an integer from 1 to 1416; and the compound is selected from the group consisting of $Ir(L_{A1-I})_2(L_{C1-I})$ to $Ir(L_{A1152-29})$ $(L_{C1416-I})$; and

**[0110]** when the compound has formula $Ir(L_{Ai-m})_2(L_{Cj-II})$, i is an integer from 1 to 1152; m is an integer from 1 to 29;j is an integer from 1 to 1416; and the compound is selected from the group consisting of $Ir(L_{A1-1})_2(L_{C1-II})$ to $Ir(L_{A152-29})$ $(L_{C1416-II})$,

**[0111]** wherein each $L_{Ai-m}$ is defined in LIST 1; wherein each $L_{Bk}$ is selected from the group consisting of $L_{B1}$ to $L_{B270}$ as shown below (LIST 4):

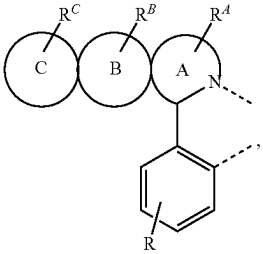
C. The OLEDs and the Devices of the Present Disclosure

**[0122]** In another aspect, the present disclosure also provides an OLED device comprising an organic layer that contains a compound as disclosed in the above compounds section of the present disclosure.

**[0123]** In some embodiments, the organic layer may comprise a compound comprising a ligand $L_A$ of

Formula I



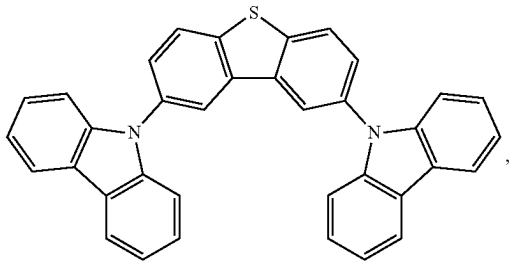
**[0124]** wherein ring A is a 5- or 6-membered heterocyclic ring; ring B and ring C are each independently a 5- or 6-membered carbocyclic or heterocyclic ring; ring A is fused to ring B which is in turn fused to ring C; R, $R^A$, $R^B$ and $R^C$ each independently represent zero, mono, or up to the maximum allowed number of substitutions to its associated ring; each of R, $R^A$ $R^B$, and $R^C$ is independently a hydrogen or a substituent selected from the group consisting of the general substituents defined herein, with at least one of R, $R^A$, $R^B$, and $R^C$ being selected from the group consisting of fluorine, a partially fluorinated alkyl, a fully fluorinated alkyl, a partially or fully fluorinated alkyl derivative, an alkoxy, a silyl, a cycloalkyl, a partially fluorinated cycloalkyl, a fully fluorinated cycloalkyl, a cycloalkyl derivative, a heterocycloalkyl, a partially fluorinated heterocycloalkyl, a fully fluorinated heterocycloalkyl, a heterocycloalkyl derivative, and combinations thereof; and any two adjacent R, $R^A$, $R^B$, and $R^C$ can be joined or fused together to form a ring, wherein the ligand $L_A$ is coordinated through the indicated dashed lines to a metal M selected from the group consisting of Os, Ir, Pd, Pt, Cu, Ag, and Au; and wherein the ligand $L_A$ can be joined with other ligands to form a tridentate, tetradentate, pentadentate, or hexadentate ligand.

**[0125]** In some embodiments, the organic layer may be an emissive layer and the compound as described herein may be an emissive dopant or a non-emissive dopant.

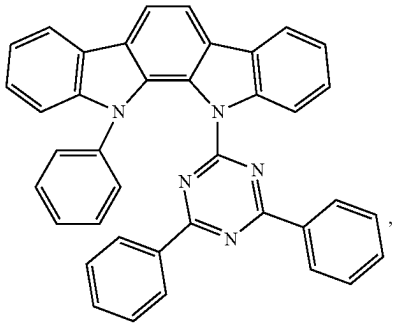
**[0126]** In some embodiments, the organic layer may further comprise a host, wherein the host comprises a triphenylene containing benzo-fused thiophene or benzo-fused furan, wherein any substituent in the host is an unfused substituent independently selected from the group consisting of $C_nH_{2n+1}$, $OC_nH_{2n+1}$, $OAr_1$, $N(C_nH_{2n+1})_2$, $N(Ar_1)(Ar_2)$, $CH{=}CH{-}C_nH_{2n+1}$, $C{=}CC_nH_{2n+1}$, $Ar_1$, $Ar_1$-$Ar_2$, $C_nH_{2n}{-}Ar_1$, or no substitution, wherein n is from 1 to 10; and wherein $Ar_1$ and $Ar_2$ are independently selected from the group consisting of benzene, biphenyl, naphthalene, triphenylene, carbazole, and heteroaromatic analogs thereof.

**[0127]** In some embodiments, the organic layer may further comprise a host, wherein host comprises at least one chemical moiety selected from the group consisting of naphthalene, fluorene, triphenylene, carbazole, indolocarbazole, dibenzothiphene, dibenzofuran, dibenzoselenophene, 5,9-dioxa-13b-boranaphtho[3,2,1-de]anthracene, aza-naphthalene, aza-fluorene, aza-triphenylene, aza-carbazole, aza-indolocarbazole, aza-dibenzothiophene, aza-dibenzofuran, aza-dibenzoselenophene, and aza-(5,9-dioxa-13b-boranaphtho[3,2,1-de]anthracene).

**[0128]** In some embodiments, the host may be selected from the host group consisting of:



,



,

and combinations thereof.

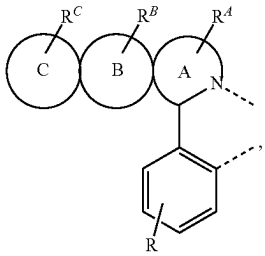
**[0129]** In some embodiments, the organic layer may further comprise a host, wherein the host comprises a metal complex.

**[0130]** In some embodiments, the compound as described herein may be a sensitizer; wherein the device may further comprise an acceptor; and wherein the acceptor may be selected from the group consisting of fluorescent emitter, delayed fluorescence emitter, and combination thereof.

**[0131]** In yet another aspect, the OLED of the present disclosure may also comprise an emissive region containing a compound as disclosed in the above compounds section of the present disclosure.

**[0132]** In some embodiments, the emissive region may comprise a compound comprising a ligand $L_A$ of

Formula I



**[0133]** wherein ring A is a 5- or 6-membered heterocyclic ring; ring B and ring C are each independently a 5- or 6-membered carbocyclic or heterocyclic ring; ring A is fused to ring B which is in turn fused to ring C; R, $R^A$, $R^B$ and $R^C$ each independently represent zero, mono, or up to the maximum allowed number of substitutions to its associated ring; each of R, $R^A$ $R^B$, and $R^C$ is independently a hydrogen or a substituent selected from the group consisting of the general substituents defined herein, with at least one of R, $R^A$, $R^B$, and $R^C$ being selected from the group consisting of fluorine, a partially fluorinated alkyl, a fully fluorinated alkyl, a partially or fully fluorinated alkyl derivative, an alkoxy, a silyl, a cycloalkyl, a partially fluorinated cycloalkyl, a fully fluorinated cycloalkyl, a cycloalkyl derivative, a heterocycloalkyl, a partially fluorinated heterocycloalkyl, a fully fluorinated heterocycloalkyl, a heterocycloalkyl derivative, and combinations thereof; and any two adjacent R, $R^A$, $R^B$, and $R^C$ can be joined or fused together to form a ring, wherein the ligand $L_A$ is coordinated through the indicated dashed lines to a metal M selected from the group consisting of Os, Ir, Pd, Pt, Cu, Ag, and Au; and wherein the ligand $L_A$ can be joined with other ligands to form a tridentate, tetradentate, pentadentate, or hexadentate ligand.

**[0134]** In some embodiments, at least one of the anode, the cathode, or a new layer disposed over the organic emissive layer functions as an enhancement layer. The enhancement layer comprises a plasmonic material exhibiting surface plasmon resonance that non-radiatively couples to the emitter material and transfers excited state energy from the emitter material to non-radiative mode of surface plasmon polariton. The enhancement layer is provided no more than a threshold distance away from the organic emissive layer, wherein the emitter material has a total non-radiative decay rate constant and a total radiative decay rate constant due to the presence of the enhancement layer and the threshold distance is where the total non-radiative decay rate constant is equal to the total radiative decay rate constant. In some embodiments, the OLED further comprises an outcoupling layer. In some embodiments, the outcoupling layer is disposed over the enhancement layer on the opposite side of the organic emissive layer. In some embodiments, the outcoupling layer is disposed on opposite side of the emissive layer from the enhancement layer but still outcouples energy from the surface plasmon mode of the enhancement layer. The outcoupling layer scatters the energy from the surface plasmon polaritons. In some embodiments this energy is scattered as photons to free space. In other embodiments, the energy is scattered from the surface plasmon mode into other modes of the device such as but not limited to the organic waveguide mode, the substrate mode, or another waveguiding mode. If energy is scattered to the non-free space mode of the OLED other outcoupling schemes could be incorporated to extract that energy to free space. In some embodiments, one or more intervening layer can be disposed between the enhancement layer and the outcoupling layer. The examples for interventing layer(s) can be dielectric materials, including organic, inorganic, perovskites, oxides, and may include stacks and/or mixtures of these materials.

**[0135]** The enhancement layer modifies the effective properties of the medium in which the emitter material resides resulting in any or all of the following: a decreased rate of emission, a modification of emission line-shape, a change in

emission intensity with angle, a change in the stability of the emitter material, a change in the efficiency of the OLED, and reduced efficiency roll-off of the OLED device. Placement of the enhancement layer on the cathode side, anode side, or on both sides results in OLED devices which take advantage of any of the above-mentioned effects. In addition to the specific functional layers mentioned herein and illustrated in the various OLED examples shown in the figures, the OLEDs according to the present disclosure may include any of the other functional layers often found in OLEDs.

**[0136]** The enhancement layer can be comprised of plasmonic materials, optically active metamaterials, or hyperbolic metamaterials. As used herein, a plasmonic material is a material in which the real part of the dielectric constant crosses zero in the visible or ultraviolet region of the electromagnetic spectrum. In some embodiments, the plasmonic material includes at least one metal. In such embodiments the metal may include at least one of Ag, Al, Au, Ir, Pt, Ni, Cu, W, Ta, Fe, Cr, Mg, Ga, Rh, Ti, Ru, Pd, In, Bi, Ca alloys or mixtures of these materials, and stacks of these materials. In general, a metamaterial is a medium composed of different materials where the medium as a whole acts differently than the sum of its material parts. In particular, we define optically active metamaterials as materials which have both negative permittivity and negative permeability. Hyperbolic metamaterials, on the other hand, are anisotropic media in which the permittivity or permeability are of different sign for different spatial directions. Optically active metamaterials and hyperbolic metamaterials are strictly distinguished from many other photonic structures such as Distributed Bragg Reflectors ("DBRs") in that the medium should appear uniform in the direction of propagation on the length scale of the wavelength of light. Using terminology that one skilled in the art can understand: the dielectric constant of the metamaterials in the direction of propagation can be described with the effective medium approximation. Plasmonic materials and metamaterials provide methods for controlling the propagation of light that can enhance OLED performance in a number of ways.

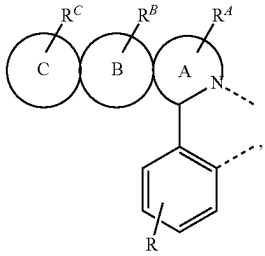
**[0137]** In some embodiments, the enhancement layer is provided as a planar layer. In other embodiments, the enhancement layer has wavelength-sized features that are arranged periodically, quasi-periodically, or randomly, or sub-wavelength-sized features that are arranged periodically, quasi-periodically, or randomly. In some embodiments, the wavelength-sized features and the sub-wavelength-sized features have sharp edges.

**[0138]** In some embodiments, the outcoupling layer has wavelength-sized features that are arranged periodically, quasi-periodically, or randomly, or sub-wavelength-sized features that are arranged periodically, quasi-periodically, or randomly. In some embodiments, the outcoupling layer may be composed of a plurality of nanoparticles and in other embodiments the outcoupling layer is composed of a plurality of nanoparticles disposed over a material. In these embodiments the outcoupling may be tunable by at least one of varying a size of the plurality of nanoparticles, varying a shape of the plurality of nanoparticles, changing a material of the plurality of nanoparticles, adjusting a thickness of the material, changing the refractive index of the material or an additional layer disposed on the plurality of nanoparticles, varying a thickness of the enhancement layer, and/or varying the material of the enhancement layer. The plurality of nanoparticles of the device may be formed from at least one of metal, dielectric material, semiconductor materials, an alloy of metal, a mixture of dielectric materials, a stack or layering of one or more materials, and/or a core of one type of material and that is coated with a shell of a different type of material. In some embodiments, the outcoupling layer is composed of at least metal nanoparticles wherein the metal is selected from the group consisting of Ag, Al, Au, Ir, Pt, Ni, Cu, W, Ta, Fe, Cr, Mg, Ga, Rh, Ti, Ru, Pd, In, Bi, Ca, alloys or mixtures of these materials, and stacks of these materials. The plurality of nanoparticles may have additional layer disposed over them. In some embodiments, the polarization of the emission can be tuned using the outcoupling layer. Varying the dimensionality and periodicity of the outcoupling layer can select a type of polarization that is preferentially outcoupled to air. In some embodiments the outcoupling layer also acts as an electrode of the device.

**[0139]** In yet another aspect, the present disclosure also provides a consumer product comprising an organic light-emitting device (OLED) having an anode; a cathode; and an organic layer disposed between the anode and the cathode, wherein the organic layer may comprise a compound as disclosed in the above compounds section of the present disclosure.

**[0140]** In some embodiments, the consumer product comprises an organic light-emitting device (OLED) having an anode; a cathode; and an organic layer disposed between the anode and the cathode, wherein the organic layer may comprise a compound comprising a ligand $L_A$ of

Formula I



**[0141]** wherein ring A is a 5- or 6-membered heterocyclic ring; ring B and ring C are each independently a 5- or 6-membered carbocyclic or heterocyclic ring; ring A is fused to ring B which is in turn fused to ring C; R, $R^A$, $R^B$ and $R^C$ each independently represent zero, mono, or up to the maximum allowed number of substitutions to its associated ring; each of R, $R^A$ $R^B$, and $R^C$ is independently a hydrogen or a substituent selected from the group consisting of the general substituents defined herein, with at least one of R, $R^A$, $R^B$, and $R^C$ being selected from the group consisting of fluorine, a partially fluorinated alkyl, a fully fluorinated alkyl, a partially or fully fluorinated alkyl derivative, an alkoxy, a silyl, a cycloalkyl, a partially fluorinated cycloalkyl, a fully fluorinated cycloalkyl, a cycloalkyl derivative, a heterocycloalkyl, a partially fluorinated heterocycloalkyl, a fully fluorinated heterocycloalkyl, a heterocycloalkyl derivative, and combinations thereof; and any two adjacent R, $R^A$, $R^B$, and $R^C$ can be joined or fused together to form a ring, wherein the ligand $L_A$ is coordinated through the indicated dashed lines to a metal M selected from the group consisting of Os, Ir,

Pd, Pt, Cu, Ag, and Au; and wherein the ligand $L_A$ can be joined with other ligands to form a tridentate, tetradentate, pentadentate, or hexadentate ligand.

**[0142]** In some embodiments, the consumer product can be one of a flat panel display, a computer monitor, a medical monitor, a television, a billboard, a light for interior or exterior illumination and/or signaling, a heads-up display, a fully or partially transparent display, a flexible display, a laser printer, a telephone, a cell phone, tablet, a phablet, a personal digital assistant (PDA), a wearable device, a laptop computer, a digital camera, a camcorder, a viewfinder, a micro-display that is less than 2 inches diagonal, a 3-D display, a virtual reality or augmented reality display, a vehicle, a video wall comprising multiple displays tiled together, a theater or stadium screen, a light therapy device, and a sign.

**[0143]** Generally, an OLED comprises at least one organic layer disposed between and electrically connected to an anode and a cathode. When a current is applied, the anode injects holes and the cathode injects electrons into the organic layer(s). The injected holes and electrons each migrate toward the oppositely charged electrode. When an electron and hole localize on the same molecule, an "exciton," which is a localized electron-hole pair having an excited energy state, is formed. Light is emitted when the exciton relaxes via a photoemissive mechanism. In some cases, the exciton may be localized on an excimer or an exciplex. Non-radiative mechanisms, such as thermal relaxation, may also occur, but are generally considered undesirable.

**[0144]** Several OLED materials and configurations are described in U.S. Pat. Nos. 5,844,363, 6,303,238, and 5,707,745, which are incorporated herein by reference in their entirety.

**[0145]** The initial OLEDs used emissive molecules that emitted light from their singlet states ("fluorescence") as disclosed, for example, in U.S. Pat. No. 4,769,292, which is incorporated by reference in its entirety. Fluorescent emission generally occurs in a time frame of less than 10 nanoseconds.

**[0146]** More recently, OLEDs having emissive materials that emit light from triplet states ("phosphorescence") have been demonstrated. Baldo et al., "Highly Efficient Phosphorescent Emission from Organic Electroluminescent Devices," Nature, vol. 395, 151-154, 1998; ("Baldo-I") and Baldo et al., "Very high-efficiency green organic light-emitting devices based on electrophosphorescence," Appl. Phys. Lett., vol. 75, No. 3, 4-6 (1999) ("Baldo-II"), are incorporated by reference in their entireties. Phosphorescence is described in more detail in U.S. Pat. No. 7,279,704 at cols. 5-6, which are incorporated by reference.

**[0147]** FIG. **1** shows an organic light emitting device **100**. The figures are not necessarily drawn to scale. Device **100** may include a substrate **110**, an anode **115**, a hole injection layer **120**, a hole transport layer **125**, an electron blocking layer **130**, an emissive layer **135**, a hole blocking layer **140**, an electron transport layer **145**, an electron injection layer **150**, a protective layer **155**, a cathode **160**, and a barrier layer **170**. Cathode **160** is a compound cathode having a first conductive layer **162** and a second conductive layer **164**. Device **100** may be fabricated by depositing the layers described, in order. The properties and functions of these various layers, as well as example materials, are described in more detail in U.S. Pat. No. 7,279,704 at cols. 6-10, which are incorporated by reference.

**[0148]** More examples for each of these layers are available. For example, a flexible and transparent substrate-anode combination is disclosed in U.S. Pat. No. 5,844,363, which is incorporated by reference in its entirety. An example of a p-doped hole transport layer is m-MTDATA doped with $F_4$-TCNQ at a molar ratio of 50:1, as disclosed in U.S. Patent Application Publication No. 2003/0230980, which is incorporated by reference in its entirety. Examples of emissive and host materials are disclosed in U.S. Pat. No. 6,303,238 to Thompson et al., which is incorporated by reference in its entirety. An example of an n-doped electron transport layer is BPhen doped with Li at a molar ratio of 1:1, as disclosed in U.S. Patent Application Publication No. 2003/0230980, which is incorporated by reference in its entirety. U.S. Pat. Nos. 5,703,436 and 5,707,745, which are incorporated by reference in their entireties, disclose examples of cathodes including compound cathodes having a thin layer of metal such as Mg:Ag with an overlying transparent, electrically-conductive, sputter-deposited ITO layer. The theory and use of blocking layers is described in more detail in U.S. Pat. No. 6,097,147 and U.S. Patent Application Publication No. 2003/0230980, which are incorporated by reference in their entireties. Examples of injection layers are provided in U.S. Patent Application Publication No. 2004/0174116, which is incorporated by reference in its entirety. A description of protective layers may be found in U.S. Patent Application Publication No. 2004/0174116, which is incorporated by reference in its entirety.

**[0149]** FIG. **2** shows an inverted OLED **200**. The device includes a substrate **210**, a cathode **215**, an emissive layer **220**, a hole transport layer **225**, and an anode **230**. Device **200** may be fabricated by depositing the layers described, in order. Because the most common OLED configuration has a cathode disposed over the anode, and device **200** has cathode **215** disposed under anode **230**, device **200** may be referred to as an "inverted" OLED. Materials similar to those described with respect to device **100** may be used in the corresponding layers of device **200**. FIG. **2** provides one example of how some layers may be omitted from the structure of device **100**.

**[0150]** The simple layered structure illustrated in FIGS. **1** and **2** is provided by way of non-limiting example, and it is understood that embodiments of the present disclosure may be used in connection with a wide variety of other structures. The specific materials and structures described are exemplary in nature, and other materials and structures may be used. Functional OLEDs may be achieved by combining the various layers described in different ways, or layers may be omitted entirely, based on design, performance, and cost factors. Other layers not specifically described may also be included. Materials other than those specifically described may be used. Although many of the examples provided herein describe various layers as comprising a single material, it is understood that combinations of materials, such as a mixture of host and dopant, or more generally a mixture, may be used. Also, the layers may have various sublayers. The names given to the various layers herein are not intended to be strictly limiting. For example, in device **200**, hole transport layer **225** transports holes and injects holes into emissive layer **220**, and may be described as a hole transport layer or a hole injection layer. In one embodiment, an OLED may be described as having an "organic layer"

disposed between a cathode and an anode. This organic layer may comprise a single layer, or may further comprise multiple layers of different organic materials as described, for example, with respect to FIGS. **1** and **2**.

**[0151]** Structures and materials not specifically described may also be used, such as OLEDs comprised of polymeric materials (PLEDs) such as disclosed in U.S. Pat. No. 5,247,190 to Friend et al., which is incorporated by reference in its entirety. By way of further example, OLEDs having a single organic layer may be used. OLEDs may be stacked, for example as described in U.S. Pat. No. 5,707,745 to Forrest et al, which is incorporated by reference in its entirety. The OLED structure may deviate from the simple layered structure illustrated in FIGS. **1** and **2**. For example, the substrate may include an angled reflective surface to improve outcoupling, such as a mesa structure as described in U.S. Pat. No. 6,091,195 to Forrest et al., and/or a pit structure as described in U.S. Pat. No. 5,834,893 to Bulovic et al., which are incorporated by reference in their entireties.

**[0152]** Unless otherwise specified, any of the layers of the various embodiments may be deposited by any suitable method. For the organic layers, preferred methods include thermal evaporation, ink-jet, such as described in U.S. Pat. Nos. 6,013,982 and 6,087,196, which are incorporated by reference in their entireties, organic vapor phase deposition (OVPD), such as described in U.S. Pat. No. 6,337,102 to Forrest et al., which is incorporated by reference in its entirety, and deposition by organic vapor jet printing (OVJP), such as described in U.S. Pat. No. 7,431,968, which is incorporated by reference in its entirety. Other suitable deposition methods include spin coating and other solution based processes. Solution based processes are preferably carried out in nitrogen or an inert atmosphere. For the other layers, preferred methods include thermal evaporation. Preferred patterning methods include deposition through a mask, cold welding such as described in U.S. Pat. Nos. 6,294,398 and 6,468,819, which are incorporated by reference in their entireties, and patterning associated with some of the deposition methods such as ink-jet and organic vapor jet printing (OVJP). Other methods may also be used. The materials to be deposited may be modified to make them compatible with a particular deposition method. For example, substituents such as alkyl and aryl groups, branched or unbranched, and preferably containing at least 3 carbons, may be used in small molecules to enhance their ability to undergo solution processing. Substituents having 20 carbons or more may be used, and 3-20 carbons are a preferred range. Materials with asymmetric structures may have better solution processability than those having symmetric structures, because asymmetric materials may have a lower tendency to recrystallize. Dendrimer substituents may be used to enhance the ability of small molecules to undergo solution processing.

**[0153]** Devices fabricated in accordance with embodiments of the present disclosure may further optionally comprise a barrier layer. One purpose of the barrier layer is to protect the electrodes and organic layers from damaging exposure to harmful species in the environment including moisture, vapor and/or gases, etc. The barrier layer may be deposited over, under or next to a substrate, an electrode, or over any other parts of a device including an edge. The barrier layer may comprise a single layer, or multiple layers. The barrier layer may be formed by various known chemical vapor deposition techniques and may include compositions having a single phase as well as compositions having multiple phases. Any suitable material or combination of materials may be used for the barrier layer. The barrier layer may incorporate an inorganic or an organic compound or both. The preferred barrier layer comprises a mixture of a polymeric material and a non-polymeric material as described in U.S. Pat. No. 7,968,146, PCT Pat. Application Nos. PCT/US2007/023098 and PCT/US2009/042829, which are herein incorporated by reference in their entireties. To be considered a "mixture", the aforesaid polymeric and non-polymeric materials comprising the barrier layer should be deposited under the same reaction conditions and/or at the same time. The weight ratio of polymeric to non-polymeric material may be in the range of 95:5 to 5:95. The polymeric material and the non-polymeric material may be created from the same precursor material. In one example, the mixture of a polymeric material and a non-polymeric material consists essentially of polymeric silicon and inorganic silicon.

**[0154]** Devices fabricated in accordance with embodiments of the present disclosure can be incorporated into a wide variety of electronic component modules (or units) that can be incorporated into a variety of electronic products or intermediate components. Examples of such electronic products or intermediate components include display screens, lighting devices such as discrete light source devices or lighting panels, etc. that can be utilized by the end-user product manufacturers. Such electronic component modules can optionally include the driving electronics and/or power source(s). Devices fabricated in accordance with embodiments of the present disclosure can be incorporated into a wide variety of consumer products that have one or more of the electronic component modules (or units) incorporated therein. A consumer product comprising an OLED that includes the compound of the present disclosure in the organic layer in the OLED is disclosed. Such consumer products would include any kind of products that include one or more light source(s) and/or one or more of some type of visual displays. Some examples of such consumer products include flat panel displays, curved displays, computer monitors, medical monitors, televisions, billboards, lights for interior or exterior illumination and/or signaling, heads-up displays, fully or partially transparent displays, flexible displays, rollable displays, foldable displays, stretchable displays, laser printers, telephones, mobile phones, tablets, phablets, personal digital assistants (PDAs), wearable devices, laptop computers, digital cameras, camcorders, viewfinders, micro-displays (displays that are less than 2 inches diagonal), 3-D displays, virtual reality or augmented reality displays, vehicles, video walls comprising multiple displays tiled together, theater or stadium screen, a light therapy device, and a sign. Various control mechanisms may be used to control devices fabricated in accordance with the present disclosure, including passive matrix and active matrix. Many of the devices are intended for use in a temperature range comfortable to humans, such as 18 degrees C. to 30 degrees C., and more preferably at room temperature (20-25° C.), but could be used outside this temperature range, for example, from −40 degree c. to +80° C.

**[0155]** More details on OLEDs, and the definitions described above, can be found in U.S. Pat. No. 7,279,704, which is incorporated herein by reference in its entirety.

**[0156]** The materials and structures described herein may have applications in devices other than OLEDs. For example, other optoelectronic devices such as organic solar cells and organic photodetectors may employ the materials and structures. More generally, organic devices, such as organic transistors, may employ the materials and structures.

**[0157]** In some embodiments, the OLED has one or more characteristics selected from the group consisting of being flexible, being rollable, being foldable, being stretchable, and being curved. In some embodiments, the OLED is transparent or semi-transparent. In some embodiments, the OLED further comprises a layer comprising carbon nanotubes.

**[0158]** In some embodiments, the OLED further comprises a layer comprising a delayed fluorescent emitter. In some embodiments, the OLED comprises a RGB pixel arrangement or white plus color filter pixel arrangement. In some embodiments, the OLED is a mobile device, a hand held device, or a wearable device. In some embodiments, the OLED is a display panel having less than 10 inch diagonal or 50 square inch area. In some embodiments, the OLED is a display panel having at least 10 inch diagonal or 50 square inch area. In some embodiments, the OLED is a lighting panel.

**[0159]** In some embodiments, the compound can be an emissive dopant. In some embodiments, the compound can produce emissions via phosphorescence, fluorescence, thermally activated delayed fluorescence, i.e., TADF (also referred to as E-type delayed fluorescence; see, e.g., U.S. application Ser. No. 15/700,352, which is hereby incorporated by reference in its entirety), triplet-triplet annihilation, or combinations of these processes. In some embodiments, the emissive dopant can be a racemic mixture, or can be enriched in one enantiomer. In some embodiments, the compound can be homoleptic (each ligand is the same). In some embodiments, the compound can be heteroleptic (at least one ligand is different from others). When there are more than one ligand coordinated to a metal, the ligands can all be the same in some embodiments. In some other embodiments, at least one ligand is different from the other ligands. In some embodiments, every ligand can be different from each other. This is also true in embodiments where a ligand being coordinated to a metal can be linked with other ligands being coordinated to that metal to form a tridentate, tetradentate, pentadentate, or hexadentate ligands. Thus, where the coordinating ligands are being linked together, all of the ligands can be the same in some embodiments, and at least one of the ligands being linked can be different from the other ligand(s) in some other embodiments.

**[0160]** In some embodiments, the compound can be used as a phosphorescent sensitizer in an OLED where one or multiple layers in the OLED contains an acceptor in the form of one or more fluorescent and/or delayed fluorescence emitters. In some embodiments, the compound can be used as one component of an exciplex to be used as a sensitizer. As a phosphorescent sensitizer, the compound must be capable of energy transfer to the acceptor and the acceptor will emit the energy or further transfer energy to a final emitter. The acceptor concentrations can range from 0.001% to 100%. The acceptor could be in either the same layer as the phosphorescent sensitizer or in one or more different layers. In some embodiments, the acceptor is a TADF emitter. In some embodiments, the acceptor is a fluorescent emitter. In some embodiments, the emission can arise from any or all of the sensitizer, acceptor, and final emitter.

**[0161]** According to another aspect, a formulation comprising the compound described herein is also disclosed.

**[0162]** The OLED disclosed herein can be incorporated into one or more of a consumer product, an electronic component module, and a lighting panel. The organic layer can be an emissive layer and the compound can be an emissive dopant in some embodiments, while the compound can be a non-emissive dopant in other embodiments.

**[0163]** In yet another aspect of the present disclosure, a formulation that comprises the novel compound disclosed herein is described. The formulation can include one or more components selected from the group consisting of a solvent, a host, a hole injection material, hole transport material, electron blocking material, hole blocking material, and an electron transport material, disclosed herein.

**[0164]** The present disclosure encompasses any chemical structure comprising the novel compound of the present disclosure, or a monovalent or polyvalent variant thereof. In other words, the inventive compound, or a monovalent or polyvalent variant thereof, can be a part of a larger chemical structure. Such chemical structure can be selected from the group consisting of a monomer, a polymer, a macromolecule, and a supramolecule (also known as supermolecule). As used herein, a "monovalent variant of a compound" refers to a moiety that is identical to the compound except that one hydrogen has been removed and replaced with a bond to the rest of the chemical structure. As used herein, a "polyvalent variant of a compound" refers to a moiety that is identical to the compound except that more than one hydrogen has been removed and replaced with a bond or bonds to the rest of the chemical structure. In the instance of a supramolecule, the inventive compound can also be incorporated into the supramolecule complex without covalent bonds.

D. Combination of the Compounds of the Present Disclosure with Other Materials

**[0165]** The materials described herein as useful for a particular layer in an organic light emitting device may be used in combination with a wide variety of other materials present in the device. For example, emissive dopants disclosed herein may be used in conjunction with a wide variety of hosts, transport layers, blocking layers, injection layers, electrodes and other layers that may be present. The materials described or referred to below are non-limiting examples of materials that may be useful in combination with the compounds disclosed herein, and one of skill in the art can readily consult the literature to identify other materials that may be useful in combination.

a) Conductivity Dopants:

**[0166]** A charge transport layer can be doped with conductivity dopants to substantially alter its density of charge carriers, which will in turn alter its conductivity. The conductivity is increased by generating charge carriers in the matrix material, and depending on the type of dopant, a change in the Fermi level of the semiconductor may also be achieved. Hole-transporting layer can be doped by p-type conductivity dopants and n-type conductivity dopants are used in the electron-transporting layer.

**[0167]** Non-limiting examples of the conductivity dopants that may be used in an OLED in combination with materials disclosed herein are exemplified below together with refer-

ences that disclose those materials: EP01617493, EP01968131, EP2020694, EP2684932, US20050139810, US20070160905, US20090167167, US2010288362, WO06081780, WO2009003455, WO2009008277, WO2009011327, WO2014009310, US2007252140, US2015060804, US20150123047, and US2012146012.

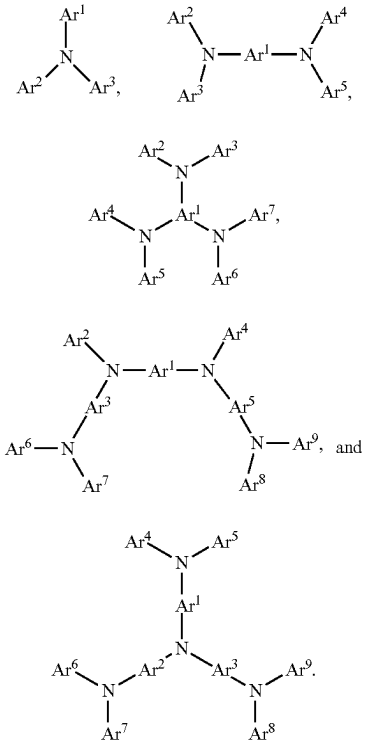
b) HIL/HTL:

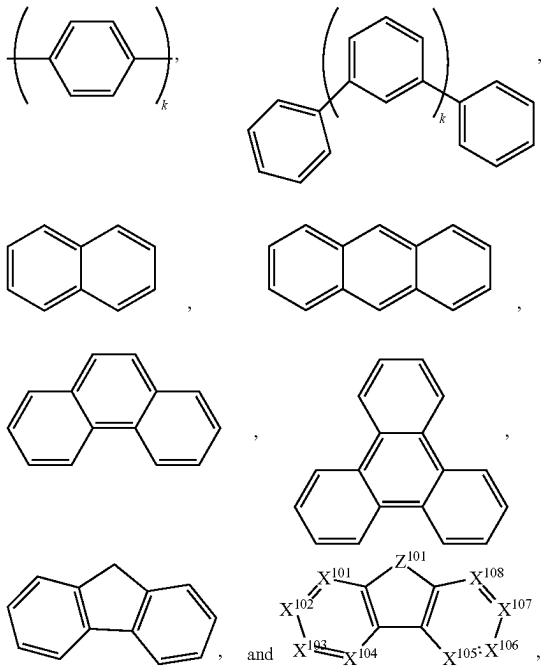
**[0168]** A hole injecting/transporting material to be used in the present disclosure is not particularly limited, and any compound may be used as long as the compound is typically used as a hole injecting/transporting material. Examples of the material include, but are not limited to: a phthalocyanine or porphyrin derivative; an aromatic amine derivative; an indolocarbazole derivative; a polymer containing fluorohydrocarbon; a polymer with conductivity dopants; a conducting polymer, such as PEDOT/PSS; a self-assembly monomer derived from compounds such as phosphonic acid and silane derivatives; a metal oxide derivative, such as MoOx; a p-type semiconducting organic compound, such as 1,4,5,8,9,12-Hexaazatriphenylenehexacarbonitrile; a metal complex, and a cross-linkable compounds.

**[0169]** Examples of aromatic amine derivatives used in HIL or HTL include, but not limit to the following general structures:



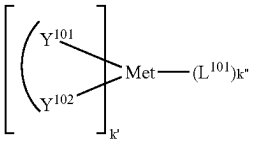
**[0170]** Each of $Ar^1$ to $Ar^9$ is selected from the group consisting of aromatic hydrocarbon cyclic compounds such as benzene, biphenyl, triphenyl, triphenylene, naphthalene, anthracene, phenalene, phenanthrene, fluorene, pyrene, chrysene, perylene, and azulene; the group consisting of aromatic heterocyclic compounds such as dibenzothiophene, dibenzofuran, dibenzoselenophene, furan, thiophene, benzofuran, benzothiophene, benzoselenophene, carbazole, indolocarbazole, pyridylindole, pyrrolodipyridine, pyrazole, imidazole, triazole, oxazole, thiazole, oxadiazole, oxatriazole, dioxazole, thiadiazole, pyridine, pyridazine, pyrimidine, pyrazine, triazine, oxazine, oxathiazine, oxadiazine, indole, benzimidazole, indazole, indoxazine, benzoxazole, benzisoxazole, benzothiazole, quinoline, isoquinoline, cinnoline, quinazoline, quinoxaline, naphthyridine, phthalazine, pteridine, xanthene, acridine, phenazine, phenothiazine, phenoxazine, benzofuropyridine, furodipyridine, benzothienopyridine, thienodipyridine, benzoselenophenopyridine, and selenophenodipyridine; and the group consisting of 2 to 10 cyclic structural units which are groups of the same type or different types selected from the aromatic hydrocarbon cyclic group and the aromatic heterocyclic group and are bonded to each other directly or via at least one of oxygen atom, nitrogen atom, sulfur atom, silicon atom, phosphorus atom, boron atom, chain structural unit and the aliphatic cyclic group. Each Ar may be unsubstituted or may be substituted by a substituent selected from the group consisting of deuterium, halogen, alkyl, cycloalkyl, heteroalkyl, heterocycloalkyl, arylalkyl, alkoxy, aryloxy, amino, silyl, alkenyl, cycloalkenyl, heteroalkenyl, alkynyl, aryl, heteroaryl, acyl, carboxylic acids, ether, ester, nitrile, isonitrile, sulfanyl, sulfinyl, sulfonyl, phosphino, and combinations thereof.

**[0171]** In one aspect, $Ar^1$ to $Ar^9$ is independently selected from the group consisting of:



**[0172]** wherein k is an integer from 1 to 20; $X^{101}$ to $X^{108}$ is C (including CH) or N; $Z^{101}$ is $NAr^1$, O, or S; $Ar^1$ has the same group defined above.

**[0173]** Examples of metal complexes used in HIL or HTL include, but are not limited to the following general formula:



**[0174]** wherein Met is a metal, which can have an atomic weight greater than 40; ($Y^{101}$-$Y^{102}$) is a bidentate ligand, $Y^{101}$ and $Y^{102}$ are independently selected from C, N, O, P, and S; $L^{101}$ is an ancillary ligand; k' is an integer value from 1 to the maximum number of ligands that may be attached to the metal; and k'+k" is the maximum number of ligands that may be attached to the metal.

**[0175]** In one aspect, ($Y^{101}$-$Y^{102}$) is a 2-phenylpyridine derivative. In another aspect, ($Y^{101}$-$Y^{102}$) is a carbene ligand. In another aspect, Met is selected from Ir, Pt, Os, and Zn. In a further aspect, the metal complex has a smallest oxidation potential in solution vs. $Fc^{+}/Fc$ couple less than about 0.6 V.

**[0176]** Non-limiting examples of the HIL and HTL materials that may be used in an OLED in combination with materials disclosed herein are exemplified below together with references that disclose those materials: CN102702075, DE102012005215, EP01624500, EP01698613, EP01806334, EP01930964, EP01972613, EP01997799, EP02011790, EP02055700, EP02055701, EP1725079, EP2085382, EP2660300, EP650955, JP07-073529, JP2005112765, JP2007091719, JP2008021687, JP2014-009196, KR20110088898, KR20130077473, TW201139402, U.S. Ser. No. 06/517,957, US20020158242, US20030162053, US20050123751, US20060182993, US20060240279, US20070145888, US20070181874, US20070278938, US20080014464, US20080091025, US20080106190, US20080124572, US20080145707, US20080220265, US20080233434, US20080303417, US2008107919, US20090115320, US20090167161, US2009066235, US2011007385, US20110163302, US2011240968, US2011278551, US2012205642, US2013241401, US20140117329, US2014183517, U.S. Pat. c) EBL:

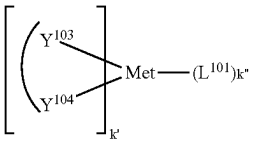
**[0177]** An electron blocking layer (EBL) may be used to reduce the number of electrons and/or excitons that leave the emissive layer. The presence of such a blocking layer in a device may result in substantially higher efficiencies, and/or longer lifetime, as compared to a similar device lacking a blocking layer. Also, a blocking layer may be used to confine emission to a desired region of an OLED. In some embodiments, the EBL material has a higher LUMO (closer to the vacuum level) and/or higher triplet energy than the emitter closest to the EBL interface. In some embodiments, the EBL material has a higher LUMO (closer to the vacuum level) and/or higher triplet energy than one or more of the hosts closest to the EBL interface. In one aspect, the compound used in EBL contains the same molecule or the same functional groups used as one of the hosts described below.

d) Hosts:

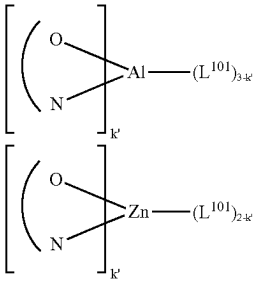
**[0178]** The light emitting layer of the organic EL device of the present disclosure preferably contains at least a metal complex as light emitting material, and may contain a host material using the metal complex as a dopant material. Examples of the host material are not particularly limited, and any metal complexes or organic compounds may be used as long as the triplet energy of the host is larger than that of the dopant. Any host material may be used with any dopant so long as the triplet criteria is satisfied.

**[0179]** Examples of metal complexes used as host are preferred to have the following general formula:



**[0180]** wherein Met is a metal; ($Y^{103}$-$Y^{104}$) is a bidentate ligand, $Y^{103}$ and $Y^{104}$ are independently selected from C, N, O, P, and S; $L^{101}$ is an another ligand; k' is an integer value from 1 to the maximum number of ligands that may be attached to the metal; and k'+k" is the maximum number of ligands that may be attached to the metal.

**[0181]** In one aspect, the metal complexes are:

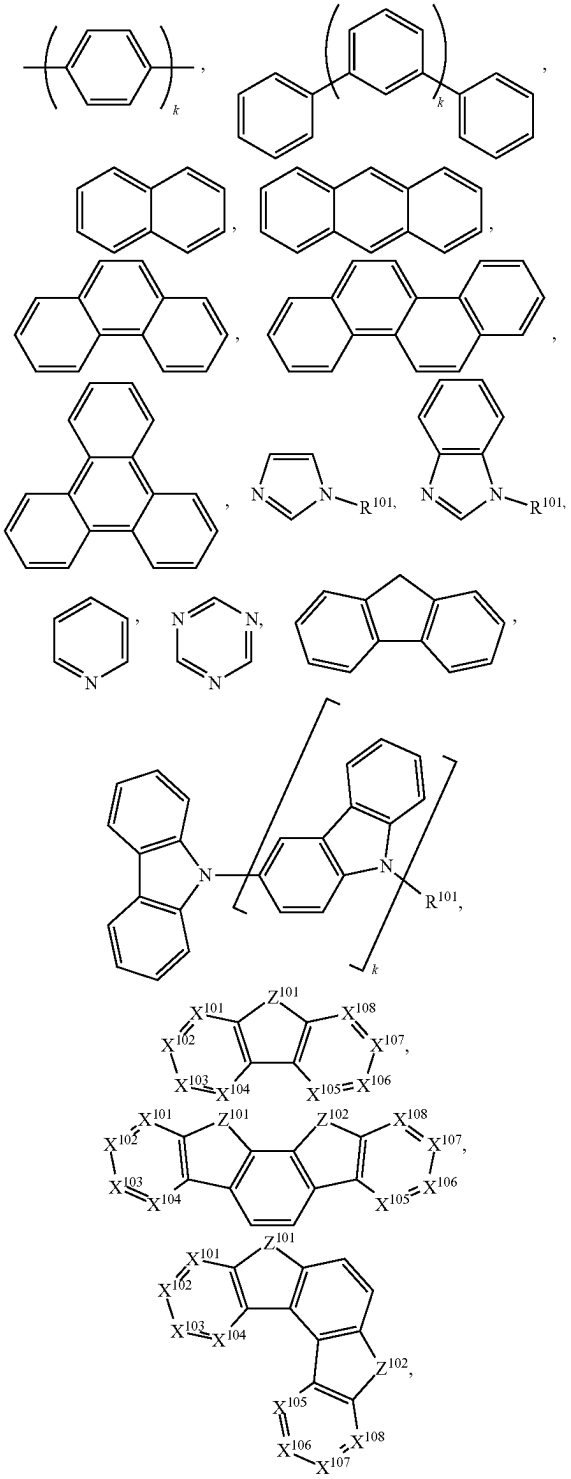


**[0182]** wherein (O—N) is a bidentate ligand, having metal coordinated to atoms O and N.

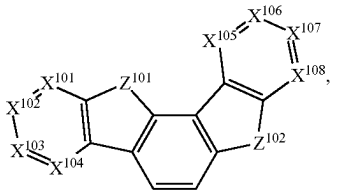
**[0183]** In another aspect, Met is selected from Ir and Pt. In a further aspect, ($Y^{103}$-$Y^{104}$) is a carbene ligand.

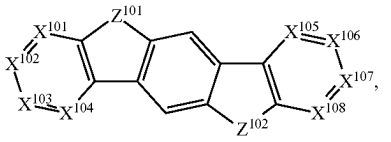
**[0184]** In one aspect, the host compound contains at least one of the following groups selected from the group consisting of aromatic hydrocarbon cyclic compounds such as benzene, biphenyl, triphenyl, triphenylene, tetraphenylene, naphthalene, anthracene, phenalene, phenanthrene, fluorene, pyrene, chrysene, perylene, and azulene; the group consisting of aromatic heterocyclic compounds such as dibenzothiophene, dibenzofuran, dibenzoselenophene, furan, thiophene, benzofuran, benzothiophene, benzoselenophene, carbazole, indolocarbazole, pyridylindole, pyrrolodipyridine, pyrazole, imidazole, triazole, oxazole, thiazole, oxadiazole, oxatriazole, dioxazole, thiadiazole, pyridine, pyridazine, pyrimidine, pyrazine, triazine, oxazine, oxathiazine, oxadiazine, indole, benzimidazole, indazole, indoxazine, benzoxazole, benzisoxazole, benzothiazole, quinoline, isoquinoline, cinnoline, quinazoline, quinoxaline, naphthyridine, phthalazine, pteridine, xanthene, acridine, phenazine, phenothiazine, phenoxazine, benzofuropyridine, furodipyridine, benzothienopyridine, thienodipyridine, benzoselenophenopyridine, and selenophenodipyridine; and the group consisting of 2 to 10 cyclic structural units which are groups of the same type or different types selected from the aromatic hydrocarbon cyclic group and the aromatic heterocyclic group and are bonded to each other directly or via at least one of oxygen atom, nitrogen atom, sulfur atom, silicon atom, phosphorus atom, boron atom, chain structural unit and the aliphatic cyclic group. Each option within each group may be unsubstituted or may be substituted by a substituent selected from the group consisting of deuterium, halogen, alkyl, cycloalkyl, heteroalkyl, heterocycloalkyl, arylalkyl, alkoxy, aryloxy, amino, silyl, alkenyl, cycloalkenyl, heteroalkenyl, alkynyl, aryl, heteroaryl, acyl, carboxylic acids, ether, ester, nitrile, isonitrile, sulfanyl, sulfinyl, sulfonyl, phosphino, and combinations thereof.

**[0185]** In one aspect, the host compound contains at least one of the following groups in the molecule:

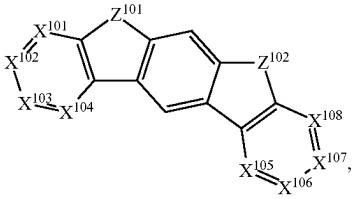


-continued





and



**[0186]** wherein $R^{101}$ is selected from the group consisting of hydrogen, deuterium, halogen, alkyl, cycloalkyl, heteroalkyl, heterocycloalkyl, arylalkyl, alkoxy, aryloxy, amino, silyl, alkenyl, cycloalkenyl, heteroalkenyl, alkynyl, aryl, heteroaryl, acyl, carboxylic acids, ether, ester, nitrile, isonitrile, sulfanyl, sulfonyl, sulfonyl, phosphino, and combinations thereof, and when it is aryl or heteroaryl, it has the similar definition as Ar's mentioned above. k is an integer from 0 to 20. $X^{101}$ to $X^{108}$ are independently selected from C (including CH) or N. $Z^{101}$ and $Z^{102}$ ae independently selected from $NR^{101}$, O, or S.

**[0187]** Non-limiting examples of the host materials that may be used in an OLED in combination with materials disclosed herein are exemplified below together with references that disclose those materials: EP2034538, EP2034538A, EP2757608, JP2007254297, KR20100079458, KR20120088644, KR20120129733, KR20130115564, TW201329200, US20030175553, US20050238919, US20060280965, US20090017330, US20090030202, US20090167162, US20090302743, US20090309488, US20100012931, US20100084966, US20100187984, US2010187984, US2012075273, US2012126221, US2013009543, US2013105787, US2013175519, US2014001446, US20140183503, US20140225088, US2014034914, U.S. Pat. e) Additional Emitters:

**[0188]** One or more additional emitter dopants may be used in conjunction with the compound of the present disclosure. Examples of the additional emitter dopants are not particularly limited, and any compounds may be used as long as the compounds are typically used as emitter materials. Examples of suitable emitter materials include, but are not limited to, compounds which can produce emissions via phosphorescence, fluorescence, thermally activated delayed fluorescence, i.e., TADF (also referred to as E-type delayed fluorescence), triplet-triplet annihilation, or combinations of these processes.

**[0189]** Non-limiting examples of the emitter materials that may be used in an OLED in combination with materials disclosed herein are exemplified below together with references that disclose those materials: CN103694277, CN1696137, EB01238981, EP01239526, EP01961743, EP1239526, EP1244155, EP1642951, EP1647554, EP1841834, EP1841834B, EP2062907, EP2730583, JP2012074444, JP2013110263, JP4478555,

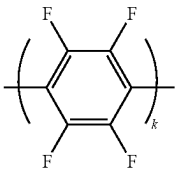
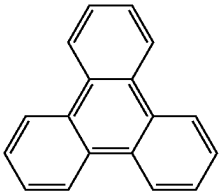
f) HBL:

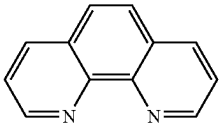
**[0190]** A hole blocking layer (HBL) may be used to reduce the number of holes and/or excitons that leave the emissive layer. The presence of such a blocking layer in a device may result in substantially higher efficiencies and/or longer lifetime as compared to a similar device lacking a blocking layer. Also, a blocking layer may be used to confine emission to a desired region of an OLED. In some embodiments, the HBL material has a lower HOMO (further from the vacuum level) and/or higher triplet energy than the emitter closest to the HBL interface. In some embodiments, the HBL material has a lower HOMO (further from the vacuum level) and/or higher triplet energy than one or more of the hosts closest to the HBL interface.

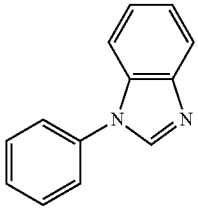
**[0191]** In one aspect, compound used in HBL contains the same molecule or the same functional groups used as host described above.

**[0192]** In another aspect, compound used in HBL contains at least one of the following groups in the molecule:

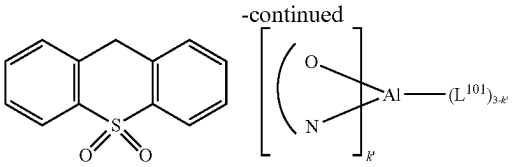








-continued

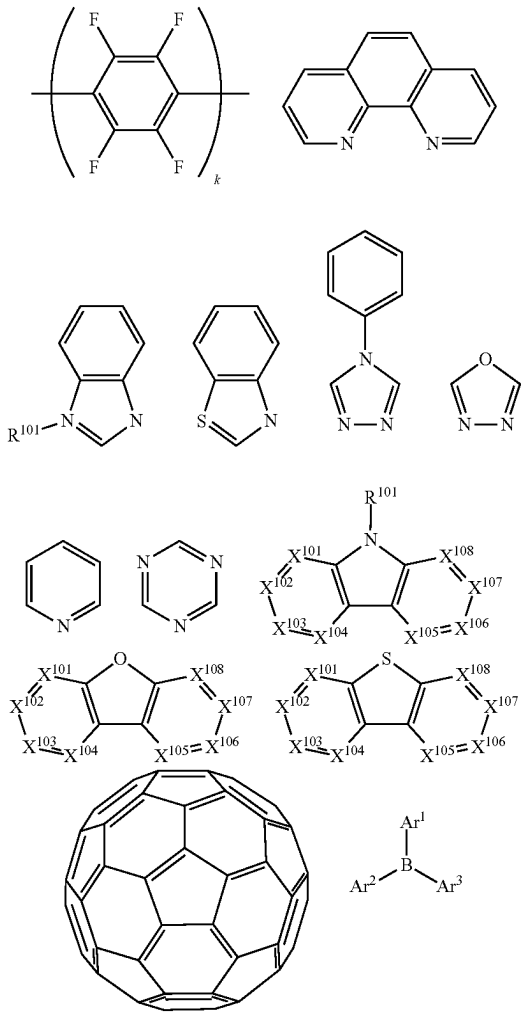


**[0193]** wherein k is an integer from 1 to 20; $L^{101}$ is another ligand, k' is an integer from 1 to 3.

g) ETL:

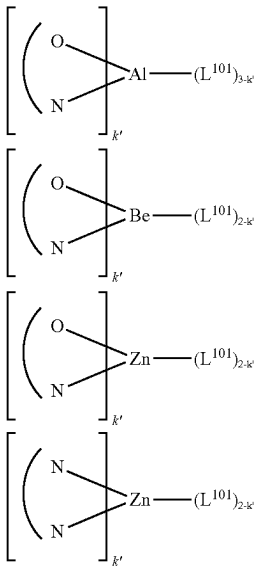
**[0194]** Electron transport layer (ETL) may include a material capable of transporting electrons. Electron transport layer may be intrinsic (undoped), or doped. Doping may be used to enhance conductivity. Examples of the ETL material are not particularly limited, and any metal complexes or organic compounds may be used as long as they are typically used to transport electrons.

**[0195]** In one aspect, compound used in ETL contains at least one of the following groups in the molecule:



**[0196]** wherein $R^{101}$ is selected from the group consisting of hydrogen, deuterium, halogen, alkyl, cycloalkyl, heteroalkyl, heterocycloalkyl, arylalkyl, alkoxy, aryloxy, amino, silyl, alkenyl, cycloalkenyl, heteroalkenyl, alkynyl, aryl, heteroaryl, acyl, carboxylic acids, ether, ester, nitrile, isonitrile, sulfanyl, sulfinyl, sulfonyl, phosphino, and combinations thereof, when it is aryl or heteroaryl, it has the similar definition as Ar's mentioned above. $Ar^1$ to $Ar^3$ has the similar definition as Ar's mentioned above. k is an integer from 1 to 20. $X^{101}$ to $X^{108}$ is selected from C (including CH) or N.

**[0197]** In another aspect, the metal complexes used in ETL contains, but not limit to the following general formula:



**[0198]** wherein (O—N) or (N—N) is a bidentate ligand, having metal coordinated to atoms O, N or N, N; $L^{101}$ is another ligand; k' is an integer value from 1 to the maximum number of ligands that may be attached to the metal.

**[0199]** Non-limiting examples of the ETL materials that may be used in an OLED in combination with materials disclosed herein are exemplified below together with references that disclose those materials: CN103508940, EP01602648, EP01734038, EP01956007, JP2004-022334, JP2005149918, JP2005-268199, KR0117693, KR20130108183, US20040036077, US20070104977, US2007018155, US20090101870, US20090115316, US20090140637, US20090179554, US2009218940, US2010108990, US2011156017, US2011210320, US2012193612, US2012214993, US2014014925, US2014014927, US20140284580, U.S. Pat. h) Charge Generation Layer (CGL)

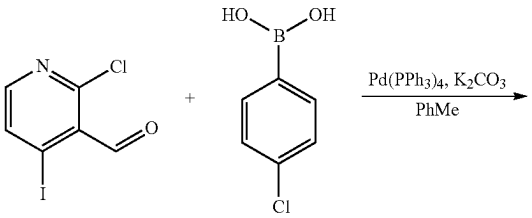
**[0200]** In tandem or stacked OLEDs, the CGL plays an essential role in the performance, which is composed of an n-doped layer and a p-doped layer for injection of electrons and holes, respectively. Electrons and holes are supplied from the CGL and electrodes. The consumed electrons and holes in the CGL are refilled by the electrons and holes injected from the cathode and anode, respectively; then, the bipolar currents reach a steady state gradually. Typical CGL materials include n and p conductivity dopants used in the transport layers.

**[0201]** In any above-mentioned compounds used in each layer of the OLED device, the hydrogen atoms can be partially or fully deuterated. Thus, any specifically listed substituent, such as, without limitation, methyl, phenyl, pyridyl, etc. may be undeuterated, partially deuterated, and fully deuterated versions thereof. Similarly, classes of substituents such as, without limitation, alkyl, aryl, cycloalkyl, heteroaryl, etc. also may be undeuterated, partially deuterated, and fully deuterated versions thereof.

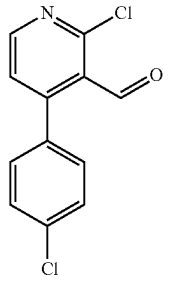
**[0202]** It is understood that the various embodiments described herein are by way of example only and are not intended to limit the scope of the invention. For example, many of the materials and structures described herein may be substituted with other materials and structures without deviating from the spirit of the invention. The present invention as claimed may therefore include variations from the particular examples and preferred embodiments described herein, as will be apparent to one of skill in the art. It is understood that various theories as to why the invention works are not intended to be limiting.

E. Experimental Section

Synthesis of
2-chloro-4-(4-chlorophenyl)nicotinaldehyde

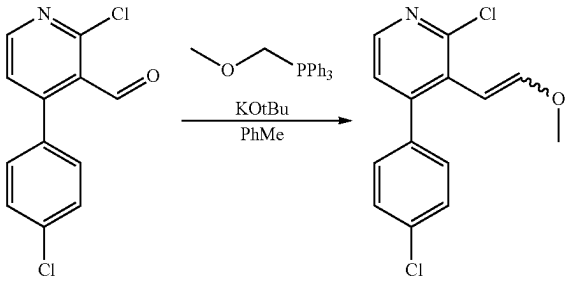


-continued



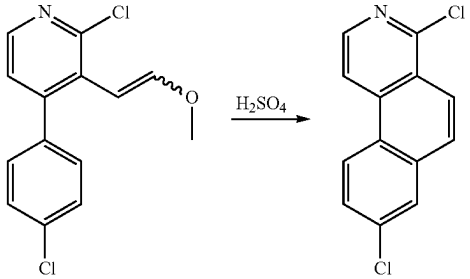
**[0203]** 2-Chloro-4-iodonicotinaldehyde (12.8 g, 47.9 mmol), (4-chlorophenyl)boronic acid (7.0 g, 45 mmol) and tetrakis(triphenylphosphine)palladium(0) (2.0 g, 1.7 mmol) were placed in a sealed vessel and evacuated/backfilled with nitrogen 3 times. Toluene (100 mL) and 1.5 M $K_2CO_3$(aq) (80 mL, 120 mmol) were added, the mixture was evacuated/backfilled with nitrogen three times and the mixture was stirred at 65° C. under nitrogen for 16 hours. The reaction mixture was cooled to room temperature (RT) and allowed the product to precipitate. The water layer was separated and the organic layer with suspended solid was cooled in an ice bath and filtered. The solid was dried to produce a pale yellow solid (6.5 g). The aqueous was extracted with EtOAc (20 mL). The organic extract was combined with the mother liquor to form the crystallisation, dried ($MgSO_4$), filtered and concentrated. This material was recrystallised from MeCN (100 mL) with a hot filtration to remove insoluble solids. The resultant solid was collected by filtration and dried to result in the solid in the form of pale yellow needles (5.5 g). The solids from the two crystallizations were combined to give 2-chloro-4-(4-chlorophenyl)nicotinaldehyde (12.0 g, 40.5 mmol, 85% yield, 95% LCMS purity).

Synthesis of 2-chloro-4-(4-chlorophenyl)-3-(2-methoxyvinyl)pyridine



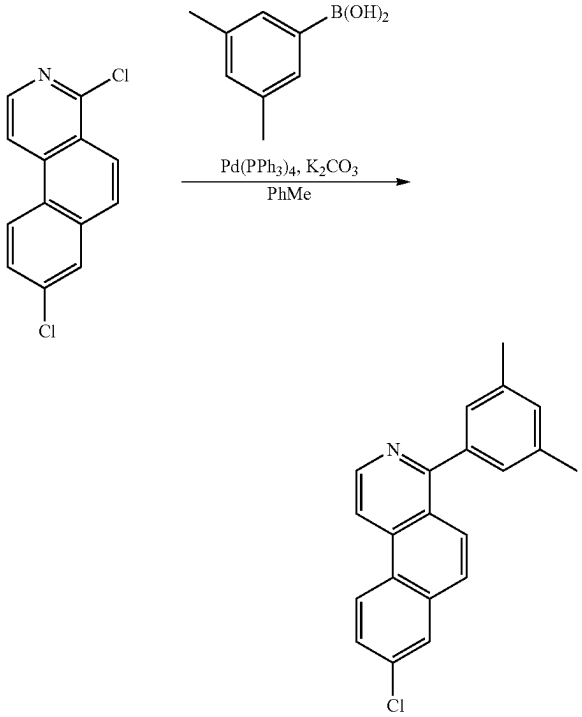
**[0204]** Potassium tert-butoxide solution (1.6 M in THF, 35 mL, 58 mmol) was added dropwise to a stirred solution of (methoxymethyl)triphenylphosphonium chloride (20 g, 58 mmol) in dry THF (100 mL) at 5° C. The resulting dark red suspension was stirred for 20 min before dropwise addition of a solution of 2-chloro-4-(4-chlorophenyl)nicotinaldehyde (10 g, 34 mmol) in THF (150 mL). The mixture was warmed to RT and stirred for 1 hour. The reaction mixture was partitioned with water (100 mL) and EtOAc (100 mL). The organic layer was separated, preabsorbed on silica gel (40 g) and purified by chromatography (silica gel, solid load, 330 g cart., 0-30% EtOAc/isohexane) to give 2-chloro-4-(4-chlorophenyl)-3-(2-methoxyvinyl)pyridine (5.5 g, 18 mmol, 54% yield) as a mixture of geometric isomers.

Synthesis of 4,8-dichlorobenzo[f]isoquinoline



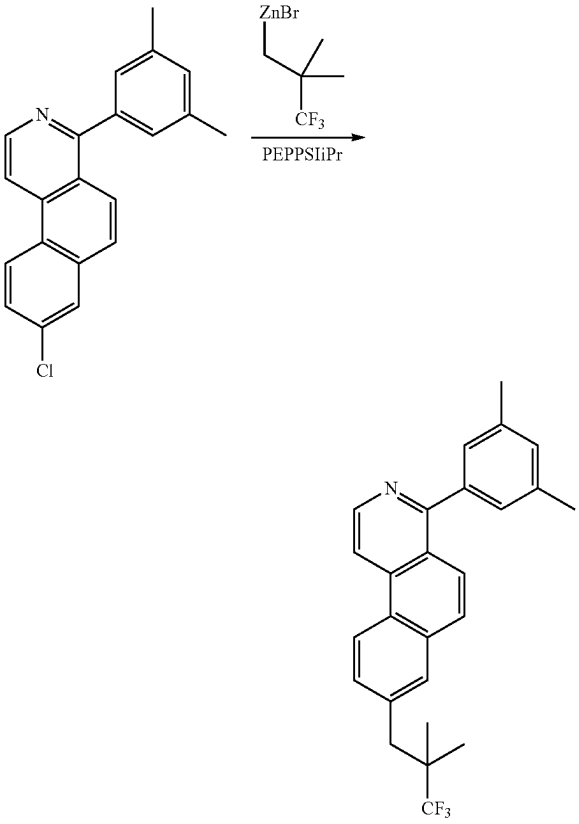
**[0205]** 2-Chloro-4-(4-chlorophenyl)-3-(2-methoxyvinyl) pyridine (5.0 g, 18 mmol) was added portion-wise over 30 min to rapidly stirring 95% sulfuric acid (5.0 mL, 89 mmol). Additional 95% sulfuric acid (2×1.0 mL, 18 mmol) was added at intervals during this process to keep the mixture mobile. The reaction was stirred vigorously for 1 hour and poured onto ice (50 g) in a large (500 mL) beaker. Water (50 mL) was added and the mixture basified by cautious, portion-wise addition of solid sodium bicarbonate (15 g, 180 mmol). The resulting solid was collected by filtration, the filter cake was rinsed with isohexane and dried in vacuo to give 4,8-dichlorobenzo[isoquinoline (4.2 g, 16 mmol, 90% yield) as a tan solid.

Synthesis of 8-chloro-4-(3,5-dimethylphenyl)benzo[f]isoquinoline



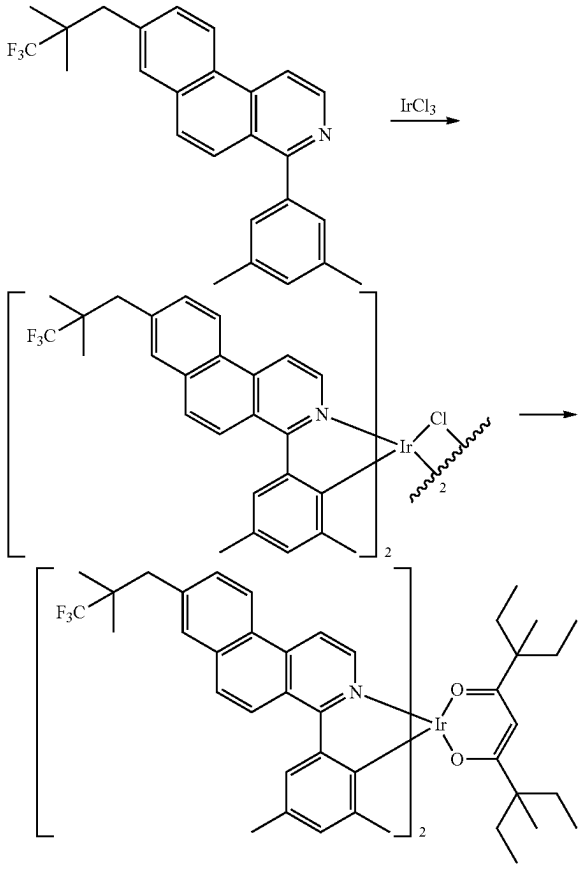
**[0206]** (3,5-Dimethylphenyl)boronic acid (2.1 g, 14 mmol), 4,8-dichlorobenzo [isoquinoline (4.1 g, 16 mmol) and tetrakis(triphenylphosphine)palladium(0) (0.75 g, 0.65 mmol) were placed in a 250 mL 3 neck flask and evacuated/backfilled with nitrogen three times. THF (50 mL) and 1.5 M $K_2CO_3$(aq) (30 mL, 45 mmol) were added and vessel was evacuated/backfilled with nitrogen three times. The reaction was stirred vigorously under nitrogen at 65° C. (internal temperature) for 8 hours. The mixture was cooled to RT, the phases were separated and the organic layer was concentrated. Purification by flash column chromatography (silica gel, DCM load, 220 g cart., 0-30% EtOAc/isohexane) gave a pale yellow solid. This material was slurried in MeCN (50 mL) for 30 min and the solid was collected by filtration and dried to give 8-chloro-4-(3,5-dimethylphenyl)benzo[f]isoquinoline (4.2 g, 13 mmol, 83% yield) as a white crystalline solid.

Synthesis of 4-(3,5-dimethylphenyl)-8-(3,3,3-trifluoro-2,2-dimethylpropyl)benzo[f]isoquinoline



**[0207]** (3,3,3-Trifluoro-2,2-dimethylpropyl)zinc(II) bromide (0.2 M in THF, 50 mL, 10 mmol) was added dropwise to a degassed solution of 8-chloro-4-(3,5-dimethylphenyl) benzo[f]isoquinoline (5.0 g, 16 mmol), PEPPSI-lPr[CAS: 905459-27-0](500 mg, 0.735 mmol) in a mixture of THF (20 mL), lithium chloride (0.5 M in THF, 40 mL, 20 mmol) and N-methyl-2-pyrrolidinone (50 mL) under nitrogen at RT. The reaction mixture was stirred under nitrogen at 30° C. for 6 hours. LCMS showed complete conversion. The reaction mixture was filtered and partitioned with sat. $NH_4Cl$(aq) (200 mL) and EtOAc (200 mL). The organic layer was separated and washed with 20% w/w NaCl(aq) (200 mL), dried ($MgSO_4$), filtered and concentrated onto silica (20 g). Purification by chromatography (silica gel, 220 g, 0-20% EtOAc/cyclohexane) gave 4-(3,5-dimethylphenyl)-8-(3,3,3-trifluoro-2,2-dimethylpropyl)benzo[fj isoquinoline (5.2 g, 13 mmol, 81% yield) as a colourless glass.

Synthesis of bis[4-(3,5-dimethylphenyl-κ$C^2$)-8-(3,3,3-trifluoro-2,2-dimethylpropyl)benzo[f]isoquinoline-κ$N^3$]-(3,7-diethyl-3,7-dimethylnonane-4,6-dione-$\kappa_2$O,O') iridium(III)

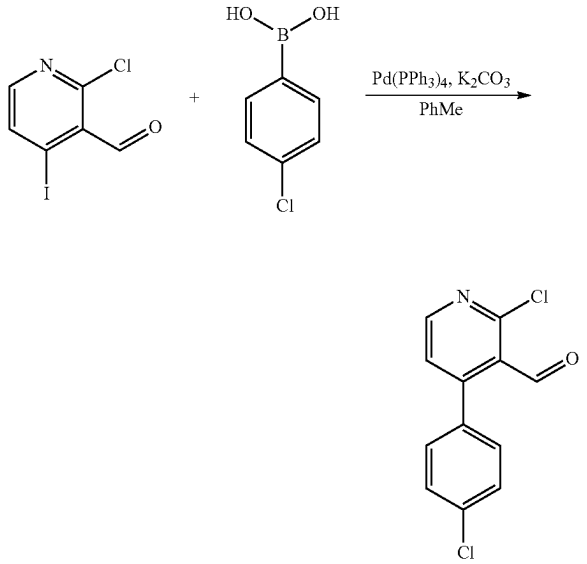


Inventive Example

**[0208]** To a 100 mL two-neck round bottom flask with a stir bar was added 4-(3,5-dimethylphenyl)-8-(3,3,3-trifluoro-2,2-dimethylpropyl)benzo[f]isoquinoline (1.271 g, 3.12 mmol), iridium(Ill) chloride hydrate (0.500 g, 1.42 mmol), 2-ethoxyethanol (24 mL) and DIUF water (6 mL). The mixture was sparged with nitrogen for 10 minutes. The reaction mixture was stirred at 100° C. for 18 hours to give complete consumption of the starting ligand. The resulting solid was filtered and washed with MeOH to give 0.75 g of an orange solid. The orange solid was dissolved in THF (40 mL), and the solution was sparged with nitrogen for 5 minutes. 3,7-Diethyl-3,7-dimethylnonane-4,6-dione (0.447 g, 1.86 mmol) and powdered potassium carbonate (0.257 g, 1.86 mmol) was added, and the reaction mixture was stirred at 50° C. for 24 hours. After cooling to room temperature,

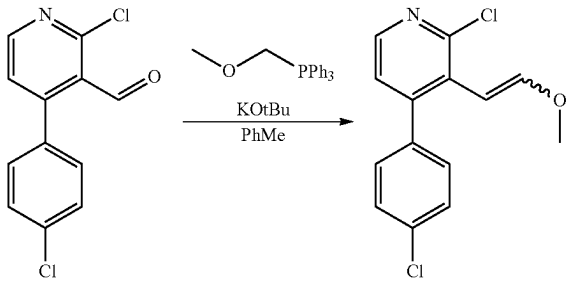
the mixture was concentrated under reduced pressure and the solids were dissolved in dichloromethane (400 mL) and dry-loaded onto Celite (40 g). The crude material was purified over silica gel, eluting with a gradient of 5 to 20% dichloromethane in hexanes. The recovered product was dissolved/suspended in dichloromethane (5 mL), methanol (20 mL) was added and the mixture triturated at room temperature to afford bis[4-(3,5-dimethylphenyl-κC$^2$)-8-(3,3,3-trifluoro-2,2-dimethylpropyl)benzo[f]isoquinoline-N$^3$]-(3,7-diethyl-3,7-dimethylnonane-4,6-dione-κ$_2$O,O') iridium (III) (0.27 g, 16% yield two steps) as a red solid.

Synthesis of
2-chloro-4-(4-chlorophenyl)nicotinaldehyde



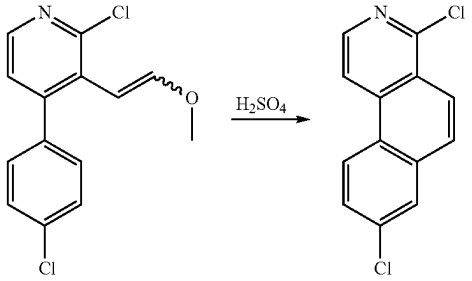
**[0209]** 2-Chloro-4-iodonicotinaldehyde (12.8 g, 47.9 mmol), (4-chlorophenyl)boronic acid (7.0 g, 45 mmol) and tetrakis(triphenylphosphine)palladium(0) (2.0 g, 1.7 mmol) were placed in a sealed vessel and evacuated/backfilled with nitrogen 3 times. Toluene (100 mL) and 1.5 M $K_2CO_3$(aq) (80 mL, 120 mmol) were added, the mixture was evacuated/backfilled with nitrogen three times and the mixture was stirred at 65° C. under nitrogen for 16 hours. The reaction mixture was cooled to RT until the product precipitated. The water layer was separated and the organic layer with suspended solid was cooled in an ice bath and filtered. The solid was dried to give a pale yellow solid (6.5 g). The aqueous was extracted with EtOAc (20 mL). The organic extract was combined with mother liquor form the crystallisation, dried ($MgSO_4$), filtered and concentrated. This material was recrystallised from MeCN (100 mL) with a hot filtration to remove insoluble solids. The resultant solid was collected by filtration and dried to give pale yellow needles (5.5 g). The solids from the two crystallizations were combined to give 2-chloro-4-(4-chlorophenyl)nicotinaldehyde (12.0 g, 40.5 mmol, 85% yield).

Synthesis of 2-Chloro-4-(4-chlorophenyl)-3-(2-methoxyvinyl)pyridine



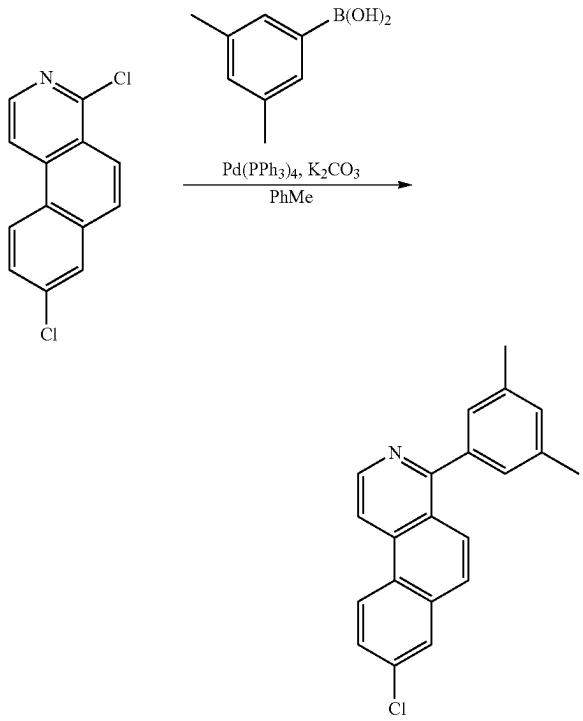
**[0210]** Potassium tert-butoxide solution (1.6 M in THF, 35 mL, 58 mmol) was added dropwise to a stirred solution of (methoxymethyl)triphenylphosphonium chloride (20 g, 58 mmol) in dry THF (100 mL) at 5° C. The resulting dark red suspension was stirred for 20 min before dropwise addition of a solution of 2-chloro-4-(4-chlorophenyl)nicotinaldehyde (10 g, 34 mmol) in THF (150 mL). The mixture was warmed to RT and stirred for 1 hour. The reaction mixture was partitioned with water (100 mL) and EtOAc (100 mL). The organic layer was separated, preabsorbed on silica gel (40 g) and purified by chromatography (silica gel, solid load, 330 g cart., 0-30% EtOAc/isohexane) to give 2-chloro-4-(4-chlorophenyl)-3-(2-methoxyvinyl)pyridine (5.5 g, 18 mmol, 54% yield) as a mixture of geometric isomers.

Synthesis of 4,8-dichlorobenzo[f]isoquinoline



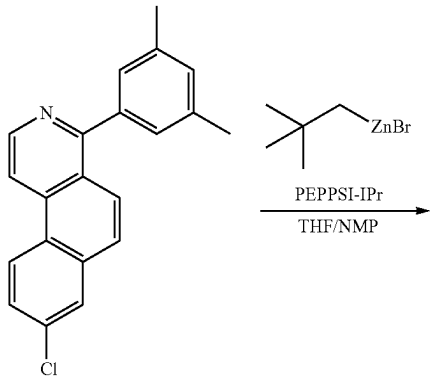
**[0211]** 2-Chloro-4-(4-chlorophenyl)-3-(2-methoxyvinyl) pyridine (5.0 g, 18 mmol) was added portion-wise over 30 min to rapidly stirring 95% sulfuric acid (5.0 mL, 89 mmol). Additional 95% sulfuric acid (2×1.0 mL, 18 mmol) was added at intervals during this process to keep the mixture mobile. The reaction was stirred vigorously for 1 hour and poured onto ice (50 g) in a large (500 mL) beaker. Water (50 mL) was added and the mixture basified by cautious, portion-wise addition of solid sodium bicarbonate (15 g, 180 mmol). The resulting solid was collected by filtration, the filter cake was rinsed with isohexane and dried in vacuo to give 4,8-dichlorobenzo[isoquinoline (4.2 g, 16 mmol, 90% yield) as a tan solid.

Synthesis of 8-Chloro-4-(3,5-dimethylphenyl)benzo [f]isoquinoline

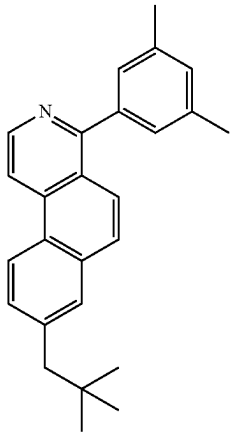


**[0212]** (3,5-Dimethylphenyl)boronic acid (2.1 g, 14 mmol), 4,8-dichlorobenzo [isoquinoline (4.1 g, 16 mmol) and tetrakis(triphenylphosphine)palladium(0) (0.75 g, 0.65 mmol) were placed in a 250 mL 3 neck flask and evacuated/backfilled with nitrogen three times. THF (50 mL) and 1.5 M $K_2CO_3$(aq) (30 mL, 45 mmol) were added and vessel was evacuated/backfilled with nitrogen three times. The reaction was stirred vigorously under nitrogen at 65° C. (internal temperature) for 8 hours. The mixture was cooled to RT, the phases were separated and the organic layer was concentrated. Purification by flash column chromatography (silica gel, DCM load, 220 g cart., 0-30% EtOAc/isohexane) gave a pale yellow solid. This material was slurried in MeCN (50 mL) for 30 min and the solid was collected by filtration and dried to give 8-chloro-4-(3,5-dimethylphenyl)benzo[f]isoquinoline (4.2 g, 13 mmol, 83% yield) as a white crystalline solid.

Synthesis of 4-(3,5-Dimethylphenyl)-8-neopentyl-benzo[f]isoquinoline

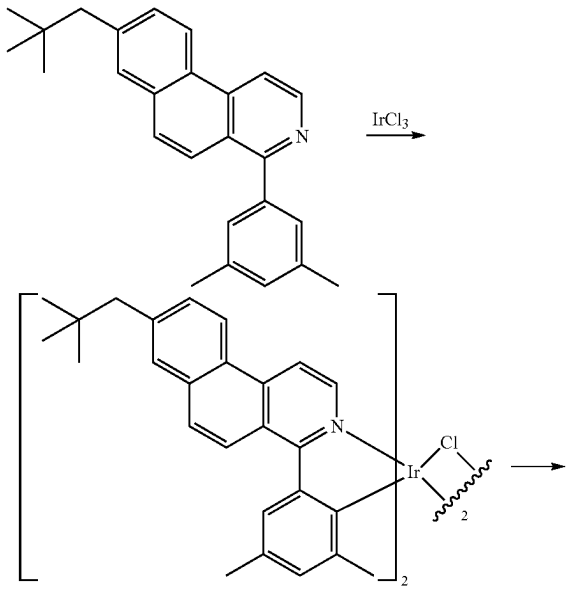


-continued

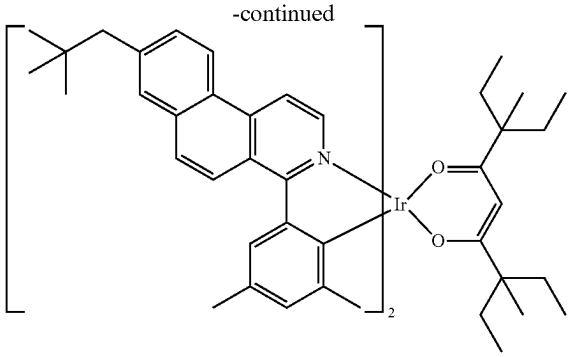


**[0213]** Neopentylzinc(II) bromide (0.31 M in THF, 50 mL, 16 mmol) was added dropwise to a nitrogen-sparged solution of 8-chloro-4-(3,5-dimethylphenyl)benzo [A]isoquinoline (3.9 g, 12 mmol), lithium chloride (0.5 M in THF, 30 mL, 15 mmol) and PEPPSI-lPr [CAS: 905459-27-0](200 mg, 0.294 mmol) in a mixture of THF (20 mL) and N-methyl-2-pyrrolidinone (40 mL) under nitrogen at RT. The reaction was stirred under nitrogen for 3 hours, filtered and partitioned with sat. $NH_4Cl$(aq) (100 mL) and EtOAc (200 mL). The organic layer was separated and washed with 20% w/w NaCl solution (100 mL), dried ($MgSO_4$), filtered and concentrated to a thick brown oil. This material was preabsorbed on silica gel (20 g) and purified by chromatography (silica gel, solid load, 220 g cart., 0-20% EtOAc/isohexane) to give 4-(3,5-dimethylphenyl)-8-neopentyl-benzo[ ]isoquinoline (4.1 g, 11 mmol, 91% yield as a colourless glass.

Synthesis of bis[(4-(3,5-dimethylphenyl)-2'-yl)-8-neopentylbenzo[f]isoquinolin-3-yl)]-(3,7-diethyl-3,7-dimethyl-4,6-nonanedionato-$\kappa_2$O,O')iridium(III)



-continued



Comparative Example

**[0214]** A mixture of 4-(3,5-dimethylphenyl)-8-neopentylbenzo[f]isoquinoline (0.50 g, 1.41 mmol, 1.75 equiv) and iridium(III) chloride hydrate (0.30 g, 0.81 mmol, 1.0 equiv) in 2-ethoxyethanol (20 mL) and DIUF water (5 mL) was heated at 100° C. for 24 hours. The reaction mixture was filtered. The solid was washed with methanol (5×10 mL) and air-dried to give di-p-chloro-tetrakis[(4-(3,5-dimethylphenyl)-2'-yl)-**8**-neopentyl-benzo[ ]isoquinolin-3-yl]diiridium (II) (1.5 g, 66% yield) as an orange solid. 3,7-Diethyl-3,7-dimethylheptane-3,5-dione (342 mg, 1.4 mmol, 2.7 equiv) was added to a suspension of di-p-chloro-tetrakis[(4-(3,5-dimethylphenyl)-2-yl)-8-neopentylbenzo[f]isoquinolin-3-yl]-diiridium(III) (0.5 g, 0.71 mmol, 1.0 equiv) in tetrahydrofuran (25 mL) and the reaction mixture sparged with nitrogen for 5 minutes. Powdered potassium carbonate (196 mg, 0.71 mmol, 2.6 equiv) was added and the reaction mixture stirred at 45° C. for 25 hours in a flask wrapped in foil to exclude light. $^1$H-NMR analysis indicated the reaction was complete. The reaction mixture was dry-loaded onto Celite (20 g). The adsorbed material was purified on an Interchim automated chromatography system (**2** stacked 120 g basic alumina cartridges), eluting with a gradient of 0 to 100% dichloromethane in hexanes. Cleanest product fractions were concentrated under reduced pressure to give bis[(4-(3,5-dimethylphenyl)-2'-yl)-8-neopentylbenzo[f]isoquinolin-3-yl]-(3,7-diethyl-3,7-dimethyl-4,6-nonanedionato-$\kappa_2$O,O')iridium(Ill) (350 mg, 19% yield) as a red solid.

## Device Examples

**[0215]** All example devices were fabricated by high vacuum (<10-7 Torr) thermal evaporation. The anode electrode was 1,200 Å of indium tin oxide (ITO). The cathode consisted of 10 Å of Liq (8-hydroxyquinoline lithium) followed by 1,000 Å of Al. All devices were encapsulated with a glass lid sealed with an epoxy resin in a nitrogen glove box (<1 ppm of $H_2O$ and $O_2$) immediately after fabrication, and a moisture getter was incorporated inside the package. The organic stack of the device examples consisted of sequentially, from the ITO surface, 100 Å of LG101 (purchased from LG Chem) as the hole injection layer (HIL); 400 Å of HTM as a hole transporting layer (HTL); 50 Å of EBM as a electron blocking layer (EBL); 400 Å of an emissive layer (EML) containing RH as a red host, 18% of SD as a stability dopant, and 3% of emitter, and 350 Å of Liq (8-hydroxyquinolinelithium) doped with 35% of ETM as the electron transporting layer (ETL). Table 1 shows the thickness of the device layers and materials.

TABLE 1

Device layer materials and thicknesses

| Layer | Material | Thickness [Å] |
|---|---|---|
| Anode | ITO | 1,200 |
| HIL | LG101 | 100 |
| HTL | HTM | 400 |
| EBL | EBM | 50 |
| EML | RH: SD 18%: Emitter 3% | 400 |
| ETL | Liq: ETM 35% | 350 |
| EIL | Liq | 10 |
| Cathode | Al | 1,000 |

**[0216]** The chemical structures of the materials used in the devices are shown below:

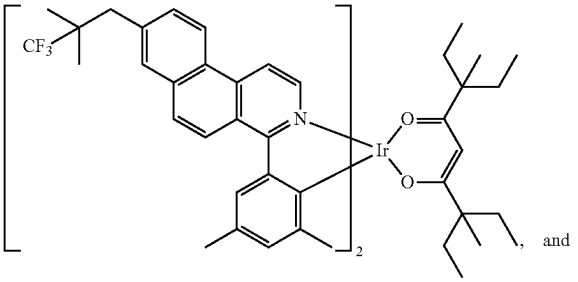
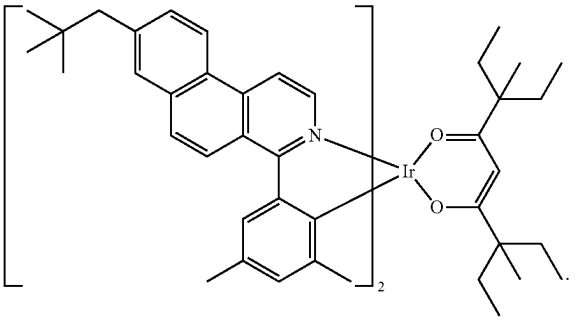
Inventive Example



and

Comparative Example



**[0217]** Upon fabrication, the devices were tested for electroluminescence (EL) and current density-voltage-luminance (JVL) characteristics. For this purpose, the sample was energized by the 2 channel Keysight B2902A SMU at a current density of 10 mA/cm$^2$ and measured by the Photo Research PR735 Spectroradiometer. Radiance (W/str/cm$^2$) from 380 nm to 1080 nm, and total integrated photon count were collected. The device was then placed under a large area silicon photodiode for the JVL sweep. The integrated photon count of the device at 10 mA/cm$^2$ is used to convert the photodiode current to photon count. The voltage was swept from 0 to a voltage equating to 200 mA/cm$^2$. The external quantum efficiency (EQE) of the device was calculated using the total integrated photon count. All results are summarized in Table 2. Voltage and EQE of inventive example (Device 1) are reported as relative numbers normalized to the results of the comparative example (Device 2).

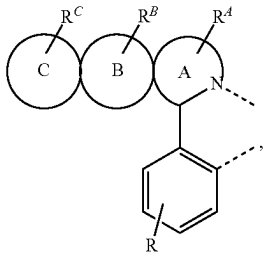
TABLE 2

| | | 1931 CIE | | λ max | FWHM | At 10 mA/cm$^2$ | |
|---|---|---|---|---|---|---|---|
| Device | Red emitter | x | y | [nm] | [nm] | Voltage [V] | EQE [%] |
| Device 1 | Inventive Example | 0.658 | 0.341 | 615 | 45 | 1.00 | 0.99 |
| Device 2 | Comparative Example | 0.651 | 0.348 | 611 | 45 | 1.00 | 1.00 |

**[0218]** Tables 2 provides a summary of performance of electroluminescence device of the materials. The inventive device (Device 1) shows similar voltage, EQE, and FWHM compared to the comparative example (Device 2), but the inventive device shows 4 nm red shift in $\lambda_{max}$. As a result, the inventive device emits more saturated red light which is desired.

What is claimed is:

**1**. A compound comprising a ligand $L_A$ of Formula I



wherein:

ring A is a 5- or 6-membered heterocyclic ring;

ring B and ring C are each independently a 5- or 6-membered carbocyclic or heterocyclic ring;

ring A is fused to ring B which is in turn fused to ring C;

R, $R^A$, $R^B$ and $R^C$ each independently represents zero, mono, or up to the maximum allowed number of substitutions to its associated ring;

each of R, $R^A$, $R^B$, and $R^C$ is independently a hydrogen or a substituent selected from the group consisting of deuterium, halogen, alkyl, cycloalkyl, heteroalkyl, heterocycloalkyl, arylalkyl, alkoxy, aryloxy, amino, silyl, boryl, alkenyl, cycloalkenyl, heteroalkenyl, alkynyl, aryl, heteroaryl, acyl, carboxylic acid, ether, ester, nitrile, isonitrile, sulfanyl, sulfinyl, sulfonyl, phosphino, and combinations thereof, with at least one of R, $R^A$, $R^B$, and $R^C$ being selected from the group consisting of a partially fluorinated alkyl, a fully fluorinated alkyl, an alkoxy, a silyl, a cycloalkyl, a partially fluorinated cycloalkyl, a fully fluorinated cycloalkyl, a heterocycloalkyl, a partially fluorinated heterocycloalkyl, a fully fluorinated heterocycloalkyl, and combinations thereof; and

any two adjacent R, $R^A$, $R^B$, and $R^C$ can be joined or fused together to form a ring,

two adjacent R, $R^A$, $R^B$, or $R^C$ are joined or fused together to form a ring,

wherein the ligand $L_A$ is coordinated through the indicated dashed lines to a metal M selected from the group consisting of Os, Ir, Pd, Pt, Cu, A g, and A u; and

wherein the ligand $L_A$ can be joined with other ligands to form a tridentate, tetradentate, pentadentate, or hexadentate ligand.

**2**. The compound of claim **1**, wherein each of R, $R^A$, $R^B$, and $R^C$ is independently a hydrogen or a substituent selected from the group consisting of deuterium, fluorine, alkyl, cycloalkyl, heteroalkyl, heterocycloalkyl, alkoxy, aryloxy, amino, silyl, boryl, alkenyl, cycloalkenyl, heteroalkenyl, aryl, heteroaryl, nitrile, isonitrile, sulfanyl, and combinations thereof.

**3**. The compound of claim **1**, wherein ring A, ring B, and ring C are each independently a 6-membered aromatic ring.

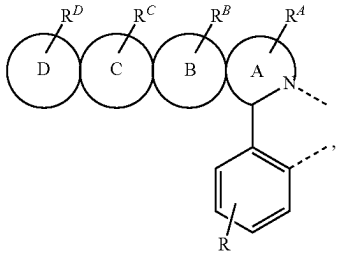
**4**. The compound of claim **1**, wherein two adjacent R are joined or fused together to form a ring.

**5**. The compound of claim **1**, wherein two adjacent $R^C$ are joined or fused together to form a ring.

**6**. The compound of claim **5**, wherein ring A, ring B, ring C, and the ring formed by two adjacent $R^C$ are all 6-membered rings.

**7**. The compound of claim **1**, wherein ring B is a 5-membered aromatic ring and ring C is a 6-membered aromatic ring, or ring B is a 6-membered aromatic ring and ring C is a 5-membered aromatic ring.

**8**. The compound of claim **1**, wherein the compound comprises a ligand $L_A$ of Formula II



wherein:

ring D is 5- or 6-membered carbocyclic or heterocyclic ring and fused to ring C;

$R^D$ represents zero, mono, or up to the maximum allowed number of substitutions to its associated ring;

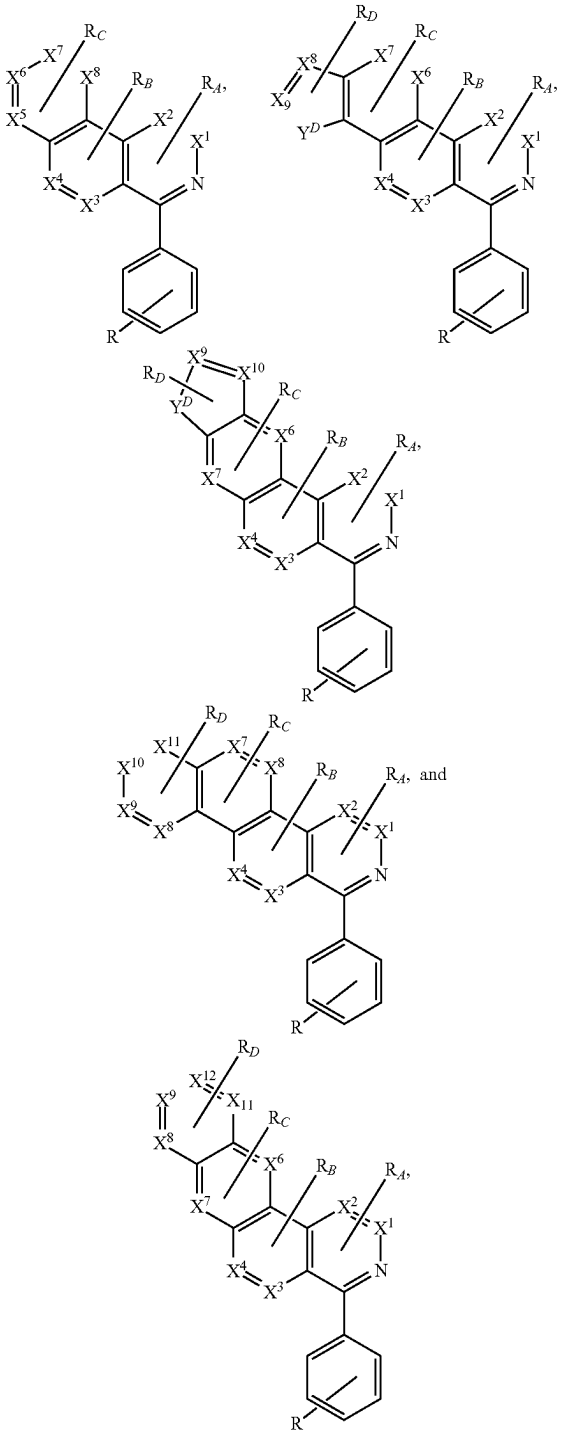
$R^D$ for each occurrence is independently a hydrogen or a substituent selected from the group consisting of deuterium, halogen, alkyl, cycloalkyl, heteroalkyl, heterocycloalkyl, arylalkyl, alkoxy, aryloxy, amino, silyl, boryl, alkenyl, cycloalkenyl, heteroalkenyl, alkynyl, aryl, heteroaryl, acyl, carboxylic acid, ether, ester, nitrile, isonitrile, sulfanyl, sulfinyl, sulfonyl, phosphino, and combinations thereof;

at least one of R, $R^A$, $R^B$, $R^C$, and $R^D$ being selected from the group consisting of a partially fluorinated alkyl, a fully fluorinated alkyl, an alkoxy, a silyl, a cycloalkyl, a partially fluorinated cycloalkyl, a fully fluorinated cycloalkyl, a heterocycloalkyl, a partially fluorinated heterocycloalkyl, a fully fluorinated heterocycloalkyl, and combinations thereof; and

any two adjacent R, $R^A$, $R^B$, $R^C$, and $R^D$ can be joined or fused to form a ring.

**9**. The compound of claim **8**, wherein at least one $R^D$ is selected from the group consisting of a partially fluorinated alkyl, a fully fluorinated alkyl, a cycloalkyl, a partially fluorinated cycloalkyl, a fully fluorinated cycloalkyl, a heterocycloalkyl, a partially fluorinated heterocycloalkyl, a fully fluorinated heterocycloalkyl, and combinations thereof.

**10**. The compound of claim **1**, wherein the ligand $L_A$ is selected from the group consisting of:



wherein:

$X^1$-$X^{12}$ are each independently C or N;

$Y^D$ for each occurrence is independently selected from the group consisting of $BR_e$, $NR_e$, $PR_e$, O, S, Se, C═O, S═O, $SO_2$, $CR_eR_f$, $SiR_eR_f$, and $GeR_eR_f$; wherein $R_e$ and $R_f$ can be fused or joined to form a ring;

each of $R_e$ and $R_f$ is independently hydrogen or a substituent selected from the group consisting of deuterium, halide, alkyl, cycloalkyl, heteroalkyl, arylalkyl, alkoxy, aryloxy, amino, silyl, boryl, alkenyl, cycloalkenyl, heteroalkenyl, alkynyl, aryl, heteroaryl, acyl, carbonyl, carboxylic acid, ester, nitrile, isonitrile, sulfanyl, sulfinyl, sulfonyl, phosphino, and combinations thereof;

at least one of R, $R^A$, $R^B$, $R^C$, and $R^D$ being selected from the group consisting of a partially fluorinated alkyl, a fully fluorinated alkyl, an alkoxy, a silyl, a cycloalkyl, a partially fluorinated cycloalkyl, a fully fluorinated cycloalkyl, a heterocycloalkyl, a partially fluorinated heterocycloalkyl, a fully fluorinated heterocycloalkyl, and combinations thereof; and

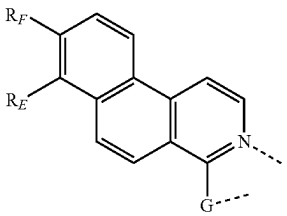
all the remaining variables are the same as previously defined.

**11**. The compound of claim **1**, wherein the ligand $L_A$ can be selected from the group consisting of $L_{Ai-m}$, wherein:

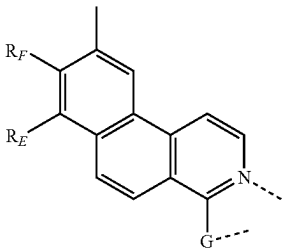
when m is an integer from 1 to 7 or 25 to 27, m is an integer from 385 to 1152;

when m is an integer from 8 to 24, i is an integer from 1 to 1152; and

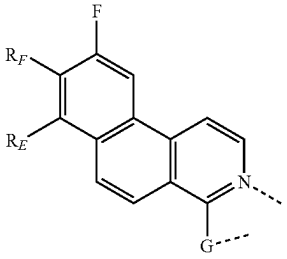
wherein the structure of each $L_{Ai-m}$ is defined as follows:



$L_{Ai-1}$ based on Structure 1



$L_{Ai-2}$ based on Structure 2



$L_{Ai-3}$ based on Structure 3

-continued

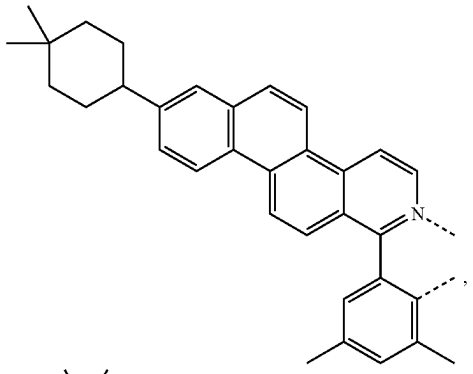
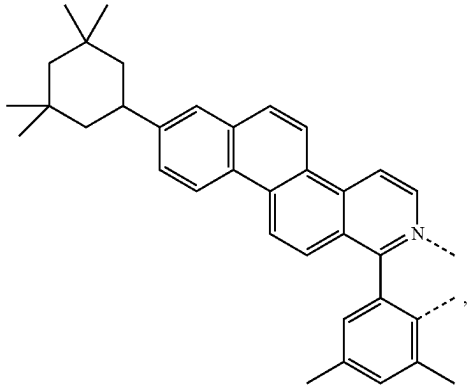
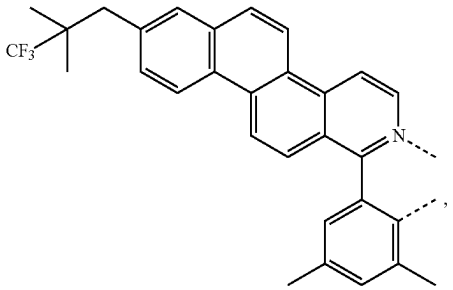
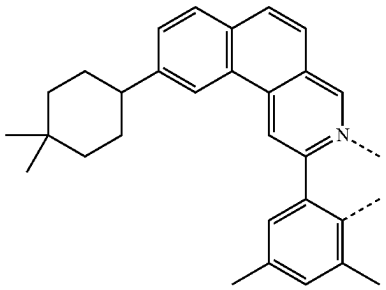
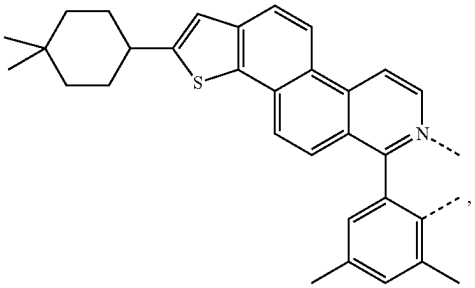
**12**. The compound of claim **1**, wherein the ligand $L_A$ is selected from the group consisting of:



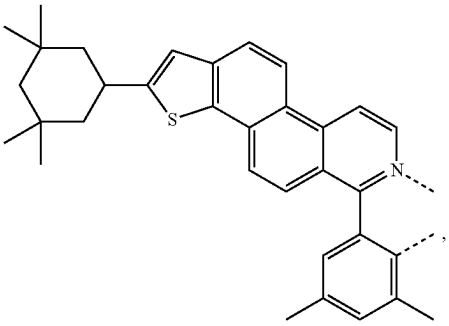


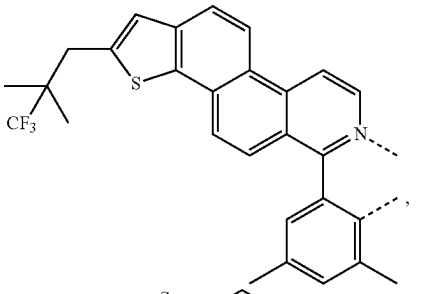


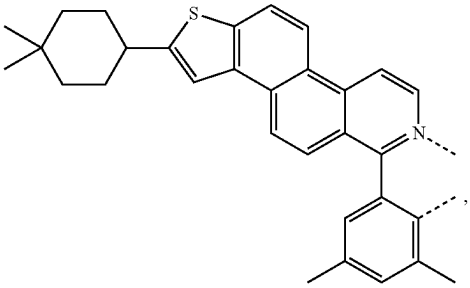


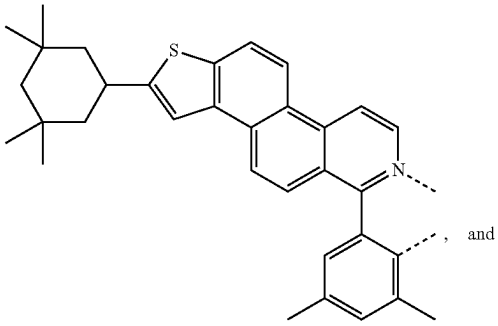


-continued

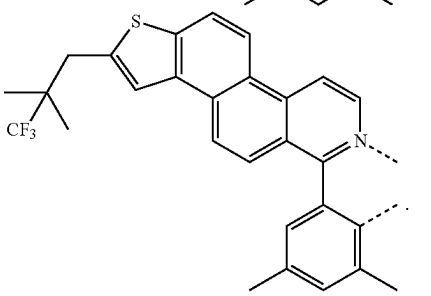








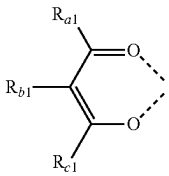
and

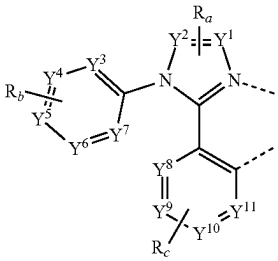


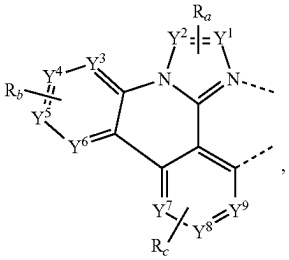
**13**. The compound of claim **1**, wherein the compound has a formula of $M(L_A)_x(L_B)_y(L_C)_z$ wherein $L_B$ and $L_C$ are each a bidentate ligand; and wherein x is 1, 2, or 3; y is 0, 1, or 2; z is 0, 1, or 2; and x+y+z is the oxidation state of the metal M.

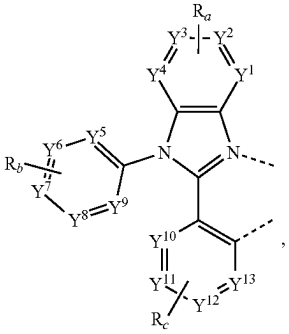
**14**. The compound of claim **13**, wherein the compound has a formula selected from the group consisting of $Ir(L_A)_3$, $Ir(L_A)(L_B)_2$, $Ir(L_A)_2(L_B)$, $Ir(L_A)_2(L_C)$, and $Ir(L_A)(L_B)(L_C)$, wherein $L_A$, $L_B$, and $L_C$ are different from each other, or a formula of $Pt(L_A)(L_B)$, wherein $L_A$ and $L_B$ can be the same or different.

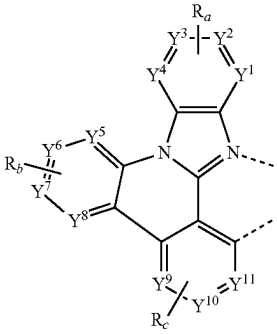
**15**. The compound of claim **14**, wherein $L_B$ and $L_C$ are each independently selected from the group consisting of:

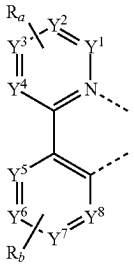




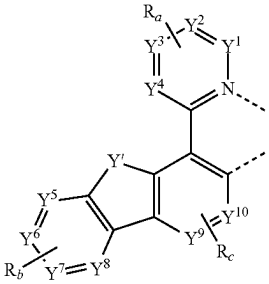


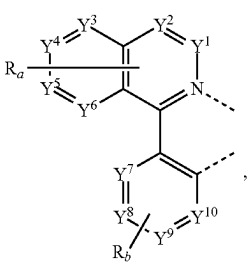


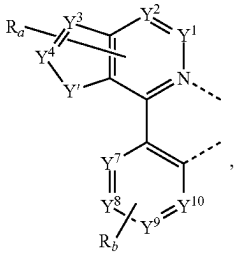


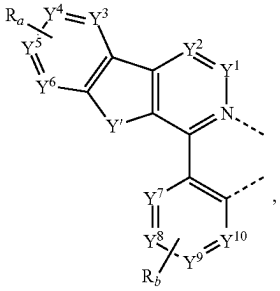


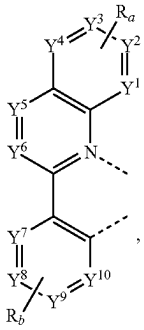
-continued

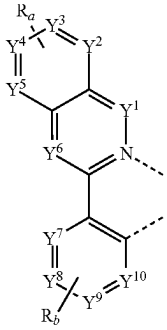


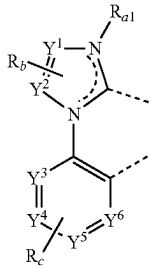


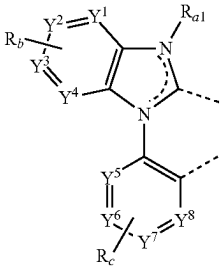


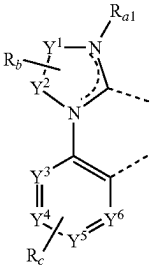


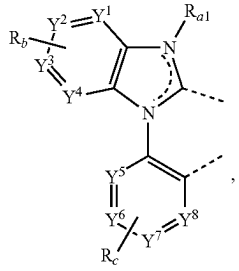




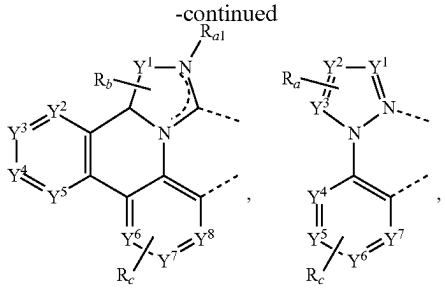


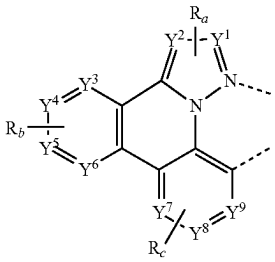


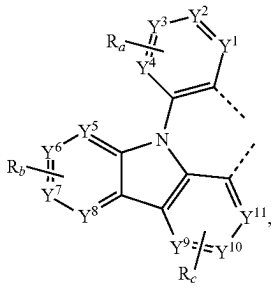


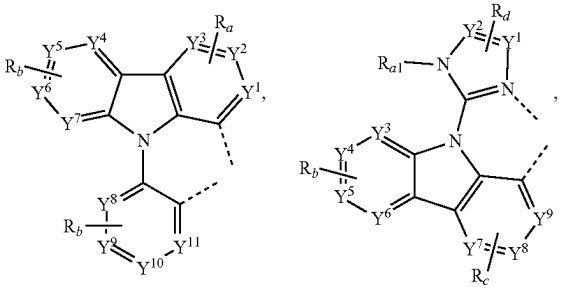


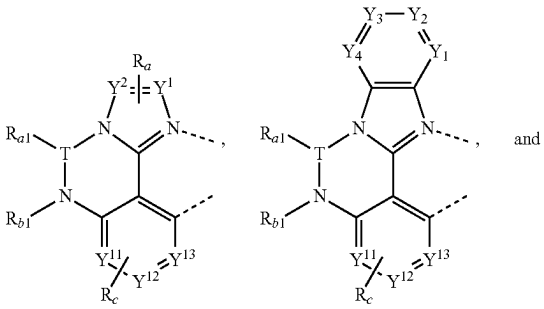
-continued



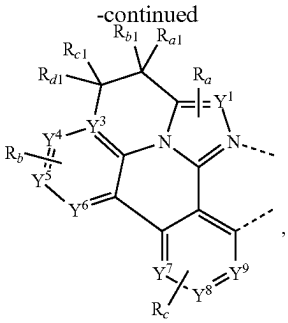








-continued



wherein:

T is B, Al, Ga, In;

each of $Y^1$ to $Y^{13}$ is independently selected from the group consisting of carbon and nitrogen;

Y' is selected from the group consisting of $BR_e$, $NR_e$, $PR_e$, O, S, Se, C═O, S═O, $SO_2$, $CR_eR_f$, $SiR_eR_f$, and $GeR_eR_f$;

$R_e$ and $R_f$ can be fused or joined to form a ring;

each $R_a$, $R_b$, $R_c$, and $R_d$ independently represent zero, mono, or up to a maximum allowed number of substitutions to its associated ring;

each of $R_{a1}$, $R_{b1}$, $R_{c1}$, $R_{d1}$, $R_a$, $R_b$, $R_c$, $R_d$, $R_e$ and $R_f$ is independently a hydrogen or a substituent selected from the group consisting of deuterium, halide, alkyl, cycloalkyl, heteroalkyl, arylalkyl, alkoxy, aryloxy, amino, silyl, boryl, alkenyl, cycloalkenyl, heteroalkenyl, alkynyl, aryl, heteroaryl, acyl, carbonyl, carboxylic acid, ester, nitrile, isonitrile, sulfanyl, sulfinyl, sulfonyl, phosphino, and combinations thereof; the general substituents defined herein; and

any two adjacent $R_{a1}$, $R_{b1}$, $R_{c1}$, $R_{d1}$, $R_a$, $R_b$, $R_c$, $R_d$, $R_e$ and $R_f$ can be fused or joined to form a ring of form a multidentate ligand.

**16**. The compound of claim **14**, wherein:

for $L_{Ai\text{-}m}$, when m is an integer from 1 to 7 or 25 to 27, m is an integer from 385 to 1152; and when m is an integer from 8 to 24, i is an integer from 1 to 1152;

when the compound has formula $Ir(L_{Ai\text{-}m})_3$, the compound is selected from the group consisting of $Ir(L_{A1\text{-}1})_3$ to $Ir(L_{A1152\text{-}29})_3$;

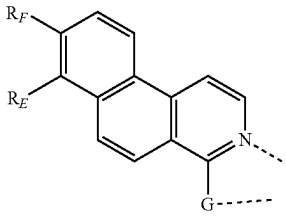
when the compound has formula $Sr(L_{Ai\text{-}m})(L_{Bk})_2$, k is an integer from 1 to 270; and the compound is selected from the group consisting of $Ir(L_{A1\text{-}1})(L_{B1})_2$ to $Ir(L_{A1152\text{-}27})(L_{B270})_2$;

when the compound has formula $Ir(L_{Ai\text{-}m})_2(L_{Bk})$, k is an integer from 1 to 270; and the compound is selected from the group consisting of $Ir(L_{Ai\text{-}1})_2(L_{B1})$ to $Ir(L_{A1152\text{-}27})_2(L_{B270})$;

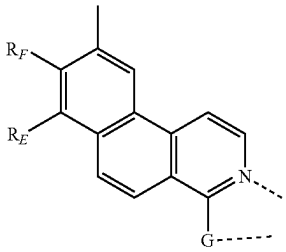
when the compound has formula $Ir(L_{Ai\text{-}m})_2(L_{cj\text{-}I})$, j is an integer from 1 to 1416; and the compound is selected from the group consisting of $Ir(L_{A1\text{-}1})_2(L_{CI\text{-}I})$ to $Ir(L_{A1152\text{-}27})$ $(L_{C1416\text{-}1})$; and

when the compound has formula $Ir(L_{Ai\text{-}m})_2(L_{Cj\text{-}II})$, j is an integer from 1 to 1416; and the compound is selected from the group consisting of $Ir(L_{A1\text{-}I})_2(L_{CI\text{-}II})$ to $Ir(L_{A152\text{-}27})$ $(L_{C1416\text{-}II})$,

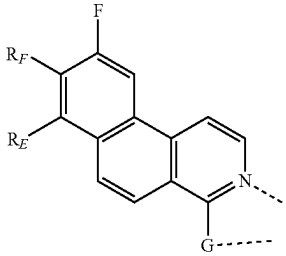
wherein the structure of each $L_{Ai-m}$ is defined as follow:



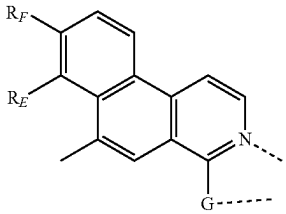
$L_{Ai-1}$ based on Structure 1



$L_{Ai-2}$ based on Structure 2



$L_{Ai-3}$ based on Structure 3



$L_{Ai-4}$ based on Structure 4

**18**. An organic light emitting device (OLED) comprising:

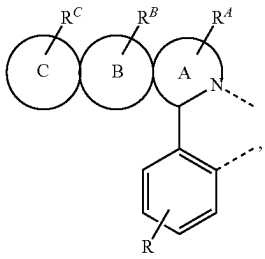
an anode;

a cathode; and

an organic layer disposed between the anode and the cathode,

wherein the organic layer comprises a compound comprising a ligand $L_A$ of

Formula I



wherein:

ring A is a 5- or 6-membered heterocyclic ring;

ring B and ring C are each independently a 5- or 6-membered carbocyclic or heterocyclic ring;

ring A is fused to ring B which is in turn fused to ring C;

R, $R^A$, $R^B$ and $R^C$ each independently represents zero, mono, or up to the maximum allowed number of substitutions to its associated ring;

each of R, $R^A$, $R^B$, and $R^C$ is independently a hydrogen or a substituent selected from the group consisting of deuterium, halogen, alkyl, cycloalkyl, heteroalkyl, heterocycloalkyl, arylalkyl, alkoxy, aryloxy, amino, silyl, boryl, alkenyl, cycloalkenyl, heteroalkenyl, alkynyl, aryl, heteroaryl, acyl, carboxylic acid, ether, ester, nitrile, isonitrile, sulfanyl, sulfinyl, sulfonyl, phosphino, and combinations thereof, with at least one of R, $R^A$, $R^B$, and $R^C$ being selected from the group consisting of a partially fluorinated alkyl, a fully fluorinated alkyl, an alkoxy, a silyl, a cycloalkyl, a partially fluorinated cycloalkyl, a fully fluorinated cycloalkyl, a heterocycloalkyl, a partially fluorinated heterocycloalkyl, a fully fluorinated heterocycloalkyl, and combinations thereof; and

any two adjacent R, $R^A$, $R^B$, and $R^C$ can be joined or fused together to form a ring,

two adjacent R, $R^A$, $R^B$, or $R^C$ are joined or fused together to form a ring,

wherein the ligand $L_A$ is coordinated through the indicated dashed lines to a metal M selected from the group consisting of Os, Ir, Pd, Pt, Cu, A g, and A u; and

wherein the ligand $L_A$ can be joined with other ligands to form a tridentate, tetradentate, pentadentate, or hexadentate ligand.

**19**. The OLED of claim **18**, wherein the organic layer further comprises a host, wherein host comprises at least one chemical moiety selected from the group consisting of naphthalene, fluorene, triphenylene, carbazole, indolocarbazole, dibenzothiphene, dibenzofuran, dibenzoselenophene, 5,9-dioxa-13b-boranaphtho[3,2,1-de]anthracene, aza-naphthalene, aza-fluorene, aza-triphenylene, aza-carbazole, aza-indolocarbazole, aza-dibenzothiophene, aza-dibenzofuran, aza-dibenzoselenophene, and aza-(5,9-dioxa-13b-boranaphtho[3,2,1-de]anthracene).

**20**. A consumer product comprising an organic light-emitting device (OLED) comprising:

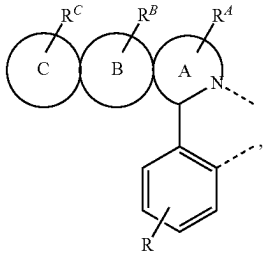
an anode;

a cathode; and

an organic layer disposed between the anode and the cathode,

wherein the organic layer comprises a compound comprising a ligand $L_A$ of

Formula I



wherein:

ring A is a 5- or 6-membered heterocyclic ring;

ring B and ring C are each independently a 5- or 6-membered carbocyclic or heterocyclic ring;

ring A is fused to ring B which is in turn fused to ring C;

R, $R^A$, $R^B$ and $R^C$ each independently represents zero, mono, or up to the maximum allowed number of substitutions to its associated ring;

each of R, $R^A$, $R^B$, and $R^C$ is independently a hydrogen or a substituent selected from the group consisting of deuterium, halogen, alkyl, cycloalkyl, heteroalkyl, heterocycloalkyl, arylalkyl, alkoxy, aryloxy, amino, silyl, boryl, alkenyl, cycloalkenyl, heteroalkenyl, alkynyl, aryl, heteroaryl, acyl, carboxylic acid, ether, ester, nitrile, isonitrile, sulfanyl, sulfinyl, sulfonyl, phosphino, and combinations thereof, with at least one of R, $R^A$, $R^B$, and $R^C$ being selected from the group consisting of a partially fluorinated alkyl, a fully fluorinated alkyl, an alkoxy, a silyl, a cycloalkyl, a partially fluorinated cycloalkyl, a fully fluorinated cycloalkyl, a heterocycloalkyl, a partially fluorinated heterocycloalkyl, a fully fluorinated heterocycloalkyl, and combinations thereof; and

any two adjacent R, $R^A$, $R^B$, and $R^C$ can be joined or fused together to form a ring,

two adjacent R, $R^A$, $R^B$, or $R^C$ are joined or fused together to form a ring,

wherein the ligand $L_A$ is coordinated through the indicated dashed lines to a metal M selected from the group consisting of Os, Ir, Pd, Pt, Cu, A g, and A u; and

wherein the ligand $L_A$ can be joined with other ligands to form a tridentate, tetradentate, pentadentate, or hexadentate ligand.
