United States Patent	12391452
Kind Code	B2
Date of Patent	August 19, 2025
Inventor(s)	Hermanson; Terry et al.

Packing material and method of manufacturing the packing material

Abstract

Cellulosic packing materials, layers for the cellulosic packing materials, and panels therefor. The panels can be cushioning panels and, more specifically, cellulosic cushioning panels, such as cushioning panels formed from molded pulp or corrugated fiberboard sheets. The panels can be rigid panels and, more specifically, cellulosic rigid panels. The cellulosic cushioning panels can form cushioning layers, and the rigid panels can form rigid layers. Cushioning bocks and packing materials can be formed from the cushioning layers and rigid layers.

Inventors: **Hermanson; Terry (Jackson, WY), Meng-Suen; Huang (Hong Kong, CN)**

Applicant: **Hermanson; Terry** (Memphis, TN)

Family ID: **1000008766331**

Assignee: **Hermanson; Terry (Memphis, TN)**

Appl. No.: **18/884705**

Filed: **September 13, 2024**

Background/Summary

CROSS-REFERENCE TO RELATED APPLICATIONS (1) This application claims the benefit under 35 U.S.C. § 119(e) of U.S. Provisional Patent Application No. 63/673,406, filed Jul. 19, 2024, and titled "PACKING MATERIAL AND METHOD OF MANUFACTURING THE PACKING MATERIAL." This application claims the benefit under 35 U.S.C. § 119(e) of U.S. Provisional Patent Application No. 63/624,460, filed Jan. 24, 2024, and titled "PACKING MATERIAL AND METHOD OF MANUFACTURING THE PACKING MATERIAL." This application claims the benefit under 35 U.S.C. § 119(e) of U.S. Provisional Patent Application No. 63/538,629, filed Sep. 15, 2023, and titled "PACKING MATERIAL AND METHOD OF MANUFACTURING THE PACKING MATERIAL." The foregoing applications are incorporated herein by reference in their entireties.

FIELD OF THE INVENTION
(1) The invention relates to packing material and to methods of manufacturing the same.
BACKGROUND OF THE INVENTION
(2) Various packing materials are used to secure and protect items in shipping containers, including cardboard boxes, to thereby prevent damage to these items if they move within the shipping container during shipment or other impacts during shipping, air, and land transport, such as being dropped or impacted. Such packing materials include bubble wrap, expanded polystyrene foam (EPS foam), and other plastic foam packing, which may be molded into blocks or into other shapes, peanuts, and inflated plastic bags (also known as air pillows). These plastic products may be discarded as waste after they have been used during shipping. Plastic waste takes a significant time to decompose and produces carbon dioxide in the decomposition process. In addition, EPS foam does not readily biodegrade and may take many, many years to effectively break down.
SUMMARY OF THE INVENTION
(3) In one aspect, the invention relates to cushioning panels and, more specifically, cellulosic cushioning panels, such as cushioning panels formed from molded pulp or corrugated fiberboard sheets.
(4) In another aspect, the invention relates to rigid panels and, more specifically, cellulosic rigid panels.
(5) In a further aspect, the invention relates to packing materials including a plurality of layers, such as cushioning layers formed from the cushioning panels, the rigid panels, or both.
(6) In still another aspect, the invention relates to a packing material including one or more cushioning layers. Each cushioning layer includes a first cushioning panel and a second cushioning panel. The first cushioning panel has a first base layer with a plurality of first projections extending therefrom. Each of the first projections has a distal end that is distal from the first base layer. The first cushioning panel is a molded pulp panel. The second cushioning panel has a second base layer with a plurality of second projections extending therefrom. Each of the second projections has a distal end that is distal from the second base layer. The second cushioning panel is a molded pulp

panel. The first cushioning panel is positioned with the plurality of first projections projecting toward the second cushioning panel. The second cushioning panel is positioned with the plurality of second projections projecting toward the first cushioning panel, and at least a portion of the second projections of the plurality of second projections being second contacting projections. The distal ends of the second contacting projections contact the first cushioning panel.

(7) In still a further aspect, the invention relates to composite packing material including one or more cushioning layers arranged to have a product side and an outer side and a cellulosic sheet positioned on the outer side of the one or more cushioning layers. Each cushioning layer includes a first cushioning panel and a second cushioning panel. The first cushioning panel has a first base layer with a plurality of first projections extending therefrom. The first cushioning panel is a molded pulp panel. The second cushioning panel has a second base layer with a plurality of second projections extending therefrom. The second cushioning panel is a molded pulp panel. The first cushioning panel and the second cushioning panel are positioned to contact each other with the plurality of first projections projecting toward the second cushioning panel and the plurality of second projections projecting toward the first cushioning panel.

(8) In yet another aspect, the invention relates to composite packing material including a cushioning layer and a rigid panel. The cushioning layer includes a cushioning panel having a base layer with a plurality of projections extending therefrom. Each of the projections has a distal end that is distal from the base layer. The cushioning panel is a molded pulp panel. The rigid panel contacts the cushioning layer. The rigid panel is formed of a cellulosic material. The rigid panel has a rigidity greater than that of the cushioning panel when a load is applied in a thickness direction of the rigid panel or the cushioning panel.

(9) In yet a further aspect, the invention relates to a packing material including one or more cushioning blocks capable of being positioned around an object-to-be-shipped on a product side of each cushioning block. Each cushioning block includes one or more cushioning layers. Each cushioning layer includes a first cushioning panel and a second cushioning panel. The first cushioning panel has a first base layer with a plurality of first projections extending therefrom. Each of the first projections has a distal end that is distal from the first base layer. The first cushioning panel is a molded pulp panel. The second cushioning panel has a second base layer with a plurality of second projections extending therefrom. Each of the second projections has a distal end that is distal from the second base layer. The second cushioning panel is a molded pulp panel. The first cushioning panel is positioned with the plurality of first projections projecting toward the second cushioning panel, and the second cushioning panel is positioned with the plurality of second projections projecting toward the first cushioning panel.

(10) These and other aspects of the invention will become apparent from the following disclosure.

Description

BRIEF DESCRIPTION OF THE DRAWINGS

(1) FIG. **1** shows packing materials formed according to the present disclosure to protect an item-to-be-shipped.

(2) FIG. **2** is a schematic view of a cushioning block that can be used to form the packing materials.

(3) FIG. **3**A is a top view of a cushioning panel that may be to form cushioning layers of the packing materials.

(4) FIG. **3**B is a cross-sectional view of the cushioning panel taken shown in FIG. **3**A along line **3**B-**3**B in FIG. **3**A.

(5) FIG. **3**C is a cross-sectional view of a cushioning panel taken from a perspective similar to FIG. **3**B.

(6) FIG. **3**D is a cross-sectional view of a cushioning panel taken from a perspective similar to FIG.

3B.
(7) FIG. **3**E is a cross-sectional view of a cushioning panel taken from a perspective similar to FIG. **3**B.
(8) FIG. **3**F is a cross-sectional view of a cushioning panel taken from a perspective similar to FIG. **3**B.
(9) FIG. **3**G is a schematic view of another cushioning panel that may be to form cushioning layers of the packing materials.
(10) FIG. **3**H is a schematic view illustrating the cushioning panel shown in FIG. **3**G in a compressed state.
(11) FIG. **4**A is a top view of the cushioning layer formed by positioning a first cushioning panel relative to a second cushioning panel.
(12) FIG. **4**B is a cross-sectional view of the cushioning layer shown in FIG. **4**A taken along line **4**B-**4**B in FIG. **4**A.
(13) FIG. **4**C is a cross-sectional view of a plurality of the cushioning layers shown in FIGS. **4**A and **4**B, taken from a perspective similar to FIG. **4**B.
(14) FIG. **4**D is a schematic view of a cushioning layer formed by positioning a first cushioning panel relative to a second cushioning panel.
(15) FIG. **5**A is a top view of the cushioning layer formed by positioning a first cushioning panel relative to a second cushioning panel.
(16) FIG. **5**B is a cross-sectional view of the cushioning layer shown in FIG. **5**A taken along line **5**B-**5**B in FIG. **5**A.
(17) FIG. **5**C is a cross-sectional view of a plurality of the cushioning layers shown in FIGS. **5**A and **5**B, taken from a perspective similar to FIG. **5**B.
(18) FIG. **6**A is a top view of the cushioning layer formed by positioning a first cushioning panel relative to a second cushioning panel.
(19) FIG. **6**B is a cross-sectional view of the cushioning layer shown in FIG. **6**A taken along line **6**B-**6**B in FIG. **6**A.
(20) FIG. **6**C is a cross-sectional view of a plurality of the cushioning layers shown in FIGS. **6**A and **6**B, taken from a perspective similar to FIG. **6**B.
(21) FIG. **7**A is a top view of the cushioning layer formed by positioning a first cushioning panel relative to a second cushioning panel.
(22) FIG. **7**B is a cross-sectional view of the cushioning layer shown in FIG. **7**A taken along line **7**B-**7**B in FIG. **7**A.
(23) FIG. **8**A is a cross-sectional view of a cushioning layer, taken from a perspective similar to FIG. **4**B.
(24) FIG. **8**B is a cross-sectional view of a cushioning layer, taken from a perspective similar to FIG. **4**B.
(25) FIG. **8**C is a cross-sectional view of a cushioning layer, taken from a perspective similar to FIG. **4**B.
(26) FIG. **9**A is a top view of the cushioning layer formed by positioning a first cushioning panel relative to a second cushioning panel.
(27) FIG. **9**B is a cross-sectional view of the cushioning layer shown in FIG. **9**A taken along line **9**B-**9**B in FIG. **9**A.
(28) FIG. **9**C is a cross-sectional view of a plurality of the cushioning layers shown in FIGS. **9**A and **9**B, taken from a perspective similar to FIG. **9**B.
(29) FIG. **9**D is a cross-sectional view of cushioning panels of different types in another arrangement, taken from a perspective similar to FIG. **9**B.
(30) FIGS. **10**A and **10**B illustrate a method of forming a cushioning layer. FIG. **10**A is a first step, and FIG. **10**B is a second step.
(31) FIGS. **11**A to **11**E illustrate another method of forming a cushioning. FIG. **11**A is a first step,

and FIG. **11**B is a second step. FIG. **11**C shows an optional additional step.
(32) FIG. **11**D shows another optional additional step. **11**E shows an alternative optional additional step.
(33) FIG. **12** is an exploded view of a cushioning block that can be used to form the packing materials.
(34) FIG. **13** is an exploded view of a cushioning block that can be used to form the packing materials
(35) FIG. **14**A is a schematic view of a rigid sheet panel and, more specifically, a honeycomb panel that can be used to form the cushioning blocks.
(36) FIG. **14**B is a schematic view showing the core of the honeycomb panel.
(37) FIG. **15**A is a cross-sectional view of a cushioning block using with a rigid layer using the honeycomb panel, taken from a perspective similar to FIG. **4**B.
(38) FIG. **15**B is a cross-sectional view of a cushioning block using with a rigid layer using the honeycomb panel, taken from a perspective similar to FIG. **4**B.
(39) FIG. **15**C is a cross-sectional view of a cushioning block using with a rigid layer using the honeycomb panel, taken from a perspective similar to FIG. **4**B.
(40) FIG. **15**D is a cross-sectional view of a cushioning block using with a rigid layer using the honeycomb panel, taken from a perspective similar to FIG. **4**B.
(41) FIG. **16**A is a schematic view of a corner-shaped packing material.
(42) FIG. **16**B is an exploded view of the corner-shaped packing material shown in FIG. **16**A.
(43) FIG. **17** is a schematic view of a U-shaped packing material.
(44) FIG. **18** is a schematic view of two corner-shaped packing materials and a U-shaped packing material arranged next to each other.
(45) FIG. **19**A is a schematic view of a corner-shaped packing material.
(46) FIG. **19**B is an exploded view of the corner-shaped packing material shown in FIG. **19**A.
(47) FIG. **20**A is a schematic view of a corner-shaped packing material in a flat configuration.
(48) FIG. **20**B is a schematic view of the corner-shaped packing material of FIG. **20**A in a folded configuration.
(49) FIG. **21**A is a schematic view of a corner-shaped packing material in a flat configuration.
(50) FIG. **21**B is a schematic view of the corner-shaped packing material of FIG. **21**A in a folded configuration.
(51) FIG. **22**A is a top view of a corner-shaped packing material.
(52) FIG. **22**B is a schematic view of the corner-shaped packing material shown in FIG. **22**A.
(53) FIG. **23** is a schematic view of a corner-shaped packing material.
(54) FIG. **24**A is a schematic view of a U-shaped packing material.
(55) FIG. **24**B is a schematic view of a U-shaped packing material.
(56) FIG. **25**A is a cross-sectional view of an irregular cushioning layer, taken from a perspective similar to FIG. **4**B.
(57) FIG. **25**B is a cross-sectional view of an irregular cushioning layer, taken from a perspective similar to FIG. **4**B.
(58) FIG. **25**C is a cross-sectional view of an irregular cushioning layer, taken from a perspective similar to FIG. **4**B.
(59) FIG. **26**A is a schematic view of a shipping container with cushioning blocks in a flat configuration.
(60) FIG. **26**B is a schematic view of the shipping container of FIG. **26**A in a folded configuration.
(61) FIG. **27**A is a schematic view of a shipping container with cushioning blocks in a flat configuration.
(62) FIG. **27**B is a schematic view of the shipping container of FIG. **27**A in a folded configuration.
(63) FIG. **28**A is a schematic view of a shipping container with cushioning blocks in a flat configuration.

(64) FIG. **28**B is a schematic view of the shipping container of FIG. **28**A in a folded configuration.
(65) FIG. **29**A is a schematic view of a shipping container with cushioning blocks in a flat configuration.
(66) FIG. **29**B is a schematic view of the shipping container of FIG. **29**A in a folded configuration.
(67) FIG. **30**A is a cross-sectional view of a first foldable molded cushioning panel, taken from a perspective similar to FIG. **3**B.
(68) FIG. **30**B is a schematic view of a second foldable molded cushioning panel, taken from a perspective similar to FIG. **3**B.
(69) FIG. **30**C is a schematic end view of a shipping container formed using the first foldable molded cushioning panel of FIG. **30**A and the second foldable molded cushioning panel of FIG. **30**B.
(70) FIG. **31** is a schematic view of cushioning panel.
(71) FIG. **32** is a schematic view of cushioning block using the cushioning panel of FIG. **31**.
(72) FIG. **33** is a schematic view of rigid sheet panel and, more specifically, a shaped corrugated fiberboard rigid sheet panel.
(73) FIG. **34** is a schematic view of cushioning block using the shaped corrugated fiberboard rigid sheet panel of FIG. **33**.
(74) FIG. **35** is a schematic view of cushioning panel.
(75) FIG. **36** is a schematic view of cushioning block using the cushioning panel of FIG. **35**.
(76) FIG. **37**A is a schematic view of cushioning panel.
(77) FIG. **37**B is a detail view of a portion of the cushioning panel of FIG. **37**A, showing detail **37**B in FIG. **37**A.
(78) FIG. **38** is a schematic cross-sectional view of cushioning block using the cushioning panel of FIG. **37**A.
(79) FIG. **39**A is an exploded view of cushioning block having a rigid layer and, more specifically, a lattice-structured rigid sheet panel.
(80) FIG. **39**B is schematic view of the cushioning block shown in FIG. **35**A.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

(81) With an increased awareness of the negative effects of plastics and EPS foam on the environment, as discussed above, companies and consumers are increasingly seeking to use environmentally friendly, recyclable, and biodegradable products as a packing material. The packing materials discussed herein provide environmentally friendly, recyclable, and biodegradable products while also providing sufficient protection and cushioning effects at an affordable cost. In particular, embodiments discussed herein may be environmentally friendly, recyclable, and biodegradable replacements for EPS and other plastic foams (e.g., expanded polyethylene, or EPE, foam).
(82) FIG. **1** shows packing materials **100** formed according to the present disclosure used to protect an item-to-be-shipped, such as a flat-panel television, during shipping. The item-to-be-shipped is referred to herein as a product **10**. The packing materials **100** can be arranged around the product **10** in various different arrangements to protect the product during shipping. As will be discussed further below, however, the packing materials **100** can be arranged with certain features thereof closer to the product **10** than others. The packing materials **100** can include a product side and include a product-side surface. The product-side surface can be in contact with the product **10** in some arrangements.
(83) The packing materials **100** are positioned around the product **10**, and the product **10**, with the packing materials **100** positioned therearound, can be placed in a shipping container, such as a shipping box **20**, for example. The shipping box **20** depicted in FIG. **1** is a corrugated cardboard shipping box, but the packing materials **100** discussed herein can be used with other shipping containers. The shipping box **20** includes a plurality of walls **22** defining an internal cavity **24**; more specifically, each wall **22** can include an interior-facing surface **26** delineating the internal

cavity **24**. As will be discussed further below, the packing materials **100** can be arranged with certain features thereof closer to the shipping box **20** than others. The packing materials **100** can include a container side and include a container-side surface. The container-side surface can be in contact with the interior-facing surfaces **26** of the shipping container (e.g., the shipping box **20**). The shipping box **20** can also include a plurality of flaps **28** that can be used to open and close the shipping box **20** to allow access to the internal cavity **24** through an opening.

(84) In FIG. **1**, the plurality of packing materials **100** are depicted around the product **10**. The packing materials **100**, or a portion of the packing materials **100**, can be positioned around the product **10** prior to placing the product **10** into the shipping box **20**. Other packing methods can be used, such as placing packing materials **100** into the internal cavity **24** of the shipping box **20** before the product **10**, after the product **10**, together with the product **10**, or a combination thereof.

(85) As will be discussed further below, the packing materials **100** can be comprised of a plurality of cushioning blocks in different arrangements to form the packing materials **100**. The packing materials **100**, depicted in FIG. **1**, include, for example, corner-shaped packing materials **102** and U-shaped packing materials **104**. In some embodiments, such as those depicted for use in protecting the TV (the product **10**) in FIG. **1**, the U-shaped packing materials **104** can be elongated, and the packing materials **100** can also be arranged to form elongated packing materials.

(86) FIG. **2** shows a cushioning block **200** and, more specifically, a cushioning block **201** that can be used to form the packing materials **100** (FIG. **1**) discussed herein. As noted above, the packing materials **100** discussed herein can be formed from one or more cushioning blocks **200**. The cushioning blocks **200** discussed herein can have several different constructions, but reference numeral **200** is used to refer generally to any one of the cushioning blocks **200** discussed herein. The cushioning blocks **200** discussed herein can include a plurality of layers. In some of the cushioning blocks **200**, at least some of the layers may be different from each other in terms of materials, their construction, or both, and these different layers have various different structures, resulting in different strengths, rigidity, and cushioning properties. The cushioning blocks **200**, with these different layers and the packing materials **100**, may be referred to herein as composite cushioning blocks and composite packing materials. The composite cushioning blocks and composite packing materials can be, for example, a cushioning layer **210**, discussed further below, in combination with at least one other, different layer.

(87) The materials of construction also directly affect such properties. As discussed in more detail below, the cushioning blocks **200** can be formed of cellulosic materials. Some layers, or portions thereof, are formed from molded pulp (also referred to as molded fiber), fiberboard, including corrugated fiberboard sheets (also referred to as corrugated cardboard), and paper sheets in different arrangements. The inventors have found that particular arrangements and constructions of these different layers can be successful in protecting the product **10** during shipping, where other arrangements, including the use of certain layers alone, do not provide the same protective capacity.

(88) The cushioning blocks **200** can include one or more cushioning layers. The cushioning block **201** shown in FIG. **2** includes two cushioning layers **210**, a first cushioning layer **210***a* and a second first cushioning layer **210***b*. Each cushioning layer **210** can be formed from one or more cushioning panels **300**. Various different cushioning panels **300** that can be used to form the cushioning layer **210** are discussed further below, and reference numeral **300** is used herein to refer generally to the various different cushioning panels. More specifically, in FIG. **2**, the cushioning layer **210** is formed from a first cushioning panel **220**, such as a top cushioning panel, and a second cushioning panel **230**, such as a bottom cushioning panel. As will be discussed further below, the cushioning layer **210** can be used in various different arrangements to form the cushioning blocks **200**, but the cushioning layer **210** can be used on its own as the cushioning block **201**.

(89) FIG. **3**A is a top view of a cushioning panel **301** that may be used as the cushioning panel **300** to form the cushioning layers **210** (FIG. **2**) discussed herein. FIG. **3**B is a cross-sectional view of

the cushioning panel **301** taken along line **3**B-**3**B in FIG. **3**A. The cushioning panel **301**, shown in FIGS. **3**A and **3**B, can be used to form the cushioning layer **210** shown in FIG. **2**, and more specifically, the cushioning panel **301** can be used to form either one or both of the first cushioning panel **220** or the second cushioning panel **230**.

(90) The cushioning panels **300** discussed herein, such as cushioning panel **301**, are formed from cellulosic materials, like natural cellulosic materials; as such, cellulosic materials are recyclable and biodegradable. The cushioning panel **301** may be formed by using a molded pulp process (also known as a molded fiber process). The pulp or fibers used in this process are preferably cellulosic pulp and fibers and, even more preferably, pulp produced from post-consumer recycled paper, including newsprint, recycled paperboard/fiberboard, recycled cardboard, recycled corrugated cardboard (OCC), and the like. Wastepaper, including paperboard/fiberboard, recycled cardboard, and OCC, may be dissolved in water to defibrillate paper fibers, forming an aqueous slurry of paper (cellulosic) fibers. Other suitable cellulosic (paper) fiber sources may be used and, in some embodiments, recycled paper fibers may be blended with other cellulosic (paper) fibers. Other suitable defibrillating methods and pulping methods (such as Kraft methods) may be used depending upon the source of cellulosic fibers. Accordingly, the cushioning panels **300** formed using this process can also be referred to as molded cushioning panels.

(91) One such molded pulp process is a vacuum-forming process or wet fiber molding process. A forming tool having a surface shaped to correspond to the cushioning panels **300** discussed herein, such as a surface with a plurality of cylindrical projections, may be placed in the aqueous slurry of paper (cellulosic) fibers. The shaped surface may be referred to as a mold or molding surface. A vacuum is drawn, such as through the molding surface, to remove water and to cause the paper fibers to accumulate on the molding surface and take the shape of the molding surface. Once a desired thickness of paper fibers has been accumulated, the molding surface is removed from the aqueous slurry, and the now-molded paper fibers are allowed to dry. The molded paper fibers may be removed from the molding surface to complete drying, such as in a drying oven.

(92) Other suitable fiber molding processes may be used, including, for example, dry fiber molding processes. In such dry fiber molding processes, the paper pulp/fibers are defibrillated, such as by milling, and then molded in a dry form (e.g., without the aqueous slurry). The dry, defibrillated paper fibers may be molded in a press mold under pressure and temperature to form the desired shape, such as the shapes discussed herein. In some processes, the dry, defibrillated paper fibers may be loosely formed into a sheet (referred to as a fiber sheet) by a vacuum, rolled (or otherwise shaped) to a desired thickness, and then fed to the press mold. Prior to being fed into the press mold, the fiber sheet may optionally include a tissue sheet applied to at least one of the top or bottom of the fiber sheet.

(93) The cushioning panel **301** shown in FIGS. **3**A and **3**B is formed with a base layer **310**, having a plurality of projections **320** extending therefrom. The base layer **310** can be a generally planar layer. The base layer **310** can include a projection side with a projection-side surface **312**. Each of the projections **320** can extend from the projection-side surface **312**. The other side of the base layer **310** is referred to herein as a back side, and the base layer **310** can thus include a back-side surface **314**. In FIGS. **3**A and **3**B, the projections **320** all extend from the projection-side surface **312**, and the back-side surface **314** of the cushioning panel **301** is a generally flat surface.

(94) Each of the projections **320** have a distal end **322** that is distal from the base layer **310**. Each projection **320** has a geometric shape. As shown in FIGS. **3**A and **3**B, the projections **320** are cylindrical and, more specifically, circular-cylindrical. As will be discussed further below, the projections **320** can be other geometric shapes such as a cylinder, a rectangular prism, a pyramid, or a cone. The projections **320** of the cushioning panel **301**, shown in FIGS. **3**A and **3**B, all have the same geometric shape, but the cushioning panel **301** can have projections **320** with a plurality of different geometric shapes. That is, one projection of the plurality of projections **320** has a first geometric shape, and another projection of the plurality of projections **320** has a second geometric

shape that is different from the first geometric shape.
(95) Each of the projections **320** can be a hollow projection with a cavity **324** formed therein. Each of the projections **320** thus can include one or more sidewalls extending from the base layer **310** and defining the cavity **324**. Each of the projections **320** can be closed on one end. In FIGS. **3**A and **3**B, for example, the distal end **322** is closed and includes an end wall, defining, in part, the cavity **324**. The distal end **322** and, more specifically, the end wall can have various suitable shapes. As depicted in FIG. **3**B, the distal end **322** is rounded. The distal end **322** can have, for example, a spherical dome shape, such as a hemispherical shape. Alternatively, the distal end **322** can be flat, for example, and the projections **320** can have a U-shaped cross-sectional.
(96) The cavity **324** of the projections **320** in the depicted embodiments is an open cavity, having an opening **326** formed in the base layer **310** and, more specifically, in the back-side surface **314** of the base layer **310**. The opening **326** is an opening into the cavity **324**. Depending upon how the cushioning panel **301** is arranged, with respect to other features of the cushioning block **200**, the cavity **324** can become a closed cavity **324**, such as when a plurality of cushioning panels **301** are arranged back-to-back with the back-side surface **314** of one cushioning panel **301** abutting another cushioning panel **301**. The openings **326** can also be seen in FIG. **2**, for example.
(97) The base layer **310** has a thickness. The thickness of the base layer **310** can be less than the length of the projections **320**. The length of each projection **320** can be taken as the distance from the projection-side surface **312** to a tip **328** of the distal end **322**. In FIG. **3**B, all of the projections **320** have the same length, but, as will be discussed further below, the projections **320** can have a plurality of different lengths.
(98) The plurality of projections **320** can be arranged in a two-dimensional (2D) array, having a plurality of rows and columns. The cushioning panel **301** has a length and a width with a corresponding length direction and a width direction. The plurality of projections **320** can be arrayed in both the length direction and the width direction. In FIG. **3**A (see also FIG. **2**), the projections **320** in each row are evenly spaced apart from each other, and the projections **320** in each column are also evenly spaced apart from each other. Other arrangements, however, may be used.
(99) As noted above, the projections **320** can have other shapes, such as other geometric shapes. FIGS. **3**C to **3**F depict cushioning panels with projections **320** of different geometric shapes. Other than the shape of the projections **320**, these cushioning panels have the same or similar features as the cushioning panel **301** discussed above with reference to FIGS. **3**A and **3**B, and that discussion applies here. For clarity, with other cushioning panels discussed herein, the projections shown in FIGS. **3**A and **3**B are referred to as cylindrical projections **331**.
(100) FIG. **3**C is a cross-sectional view of a cushioning panel **303** taken from a perspective similar to FIG. **3**B. The projections **320** of the cushioning panel **303** shown in FIG. **3**C have a dome shape. The dome shape can be, for example, a spherical dome shape, such as a hemispherical shape. For clarity, with other cushioning panels discussed herein, the projections shown in FIG. **3**C are referred to as dome-shaped projections **333**.
(101) FIG. **3**D is a cross-sectional view of a cushioning panel **305** taken from a perspective similar to FIG. **3**B. The projections **320** of the cushioning panel **305** shown in FIG. **3**D have a pyramidal or cone shape. The base can have various suitable shapes, including a circular base and a corresponding curved side wall or a rectangular base, such as a square base, with corresponding triangular or trapezoidal side walls. For clarity, with other cushioning panels discussed herein, the projections shown in FIG. **3**D are referred to as pyramidal projections **335**. Instead of coming to a point, the pyramidal projections **335** shown in FIG. **3**D have a distal end **322** that is flat.
(102) FIG. **3**E is a cross-sectional view of a cushioning panel **307** taken from a perspective similar to FIG. **3**B. The projections **320** of the cushioning panel **307** shown in FIG. **3**E have arcuate sidewalls. As with the pyramidal projections **335**, the base can have various suitable shapes, including a circular base and a square base. For clarity, with other cushioning panels discussed

herein, the projections shown in FIG. **3**E are referred to as arcuate projections **337**. The arcuate projections **337** shown in FIG. **3**E have a distal end **322** that is flat.

(103) FIG. **3**F is a cross-sectional view of a cushioning panel **309** taken from a perspective similar to FIG. **3**B. The projections **320** of the cushioning panel **309** shown in FIG. **3**F have a geometric shape that is a rectangular prism. The base can be various rectangular shapes, including square. For clarity, with other cushioning panels discussed herein, the projections shown in FIG. **3**F are referred to as rectangular projections **339**. The rectangular projections **339** shown in FIG. **3**F have a distal end **322** that is flat.

(104) FIG. **3**G shows another cushioning panel **302** that may be used as one of the cushioning panels **300** discussed herein. The cushioning panel **302** is similar to the cushioning panels **300** discussed above, but instead of having projections **320** arranged in a plurality of rows or columns, the projections **320** are ridges **332**. The ridges **332** are elongated and extend parallel to each other. The ridges **332** can have various shapes, including the domed or arcuate distal end **322** shown in FIG. **3**G.

(105) FIG. **3**H illustrates the cushioning panel **302** shown in FIG. **3**G in a compressed state. When a force is applied in a direction normal to the cushioning panel **302**, the ridges **332** can deform such as by spreading out on the distal end **322** and having portions of the base layer **310** move closer together, reducing the size of the opening **326**.

(106) As noted above, the cushioning layer **210** (FIG. **2**) can be formed by arranging two or more cushioning panels **300**. The following discussion will refer to certain cushioning panels **300** discussed above (e.g., the cushioning panels **302** having the dome-shaped projections **333**), but the discussion is also applicable to other cushioning panels **300**, with projections **320** having other shapes. In general, reference numeral **210** is used to apply to any of the cushioning layers **210**, regardless of the specific configurations below. Likewise, the first cushioning panel **220** and the second cushioning panel **230** are used generally to refer to the cushioning panels of the cushioning layer **210**, regardless of the specific shape of the projections.

(107) FIGS. **4**A and **4**B show a cushioning layer **211** formed by positioning a first cushioning panel **220** relative to a second cushioning panel **230**. FIG. **4**A is a top view of the cushioning layer **211**, and FIG. **4**B is a cross-sectional view of the cushioning layer **211** taken along line **4**B-**4**B in FIG. **4**A. Each of the first cushioning panel **220** and the second cushioning panel **230** are shown as the cushioning panels **303**, having the dome-shaped projections **333**, but as noted above, the first cushioning panel **220** and the second cushioning panel **230** can be other cushioning panels **300** (FIGS. **3**A to **3**F), having projections **320** with alternative shapes. The first cushioning panel **220** thus has a first base layer **222** and a plurality of first projections **224** extending therefrom. Similarly, the second cushioning panel **230** has a second base layer **232** and a plurality of second projections **234** extending therefrom. Each first projection **224** of the plurality of first projections **224** has a first geometric shape, and each second projection **234** of the plurality of second projections **234** has a second geometric shape. In FIGS. **4**A and **4**B, the second geometric shape is the same geometric shape as the first geometric shape and is depicted as the dome-shaped projections **333**. The second geometric shape, however, can be a different geometric shape than the first geometric shape.

(108) The first cushioning panel **220** is positioned with the plurality of first projections **224** projecting toward the second cushioning panel **230**, and the second cushioning panel **230** is positioned with the plurality of the second projections **234** projecting toward the first cushioning panel **220**. The first base layer **222** has an inner side **226** and an outer side **228**. The inner side **226** of the first base layer **222** is positioned to oppose the second cushioning panel **230**, and the plurality of first projections **224** extend from the inner side **226** of the first base layer **222**. The second base layer **232** also has an inner side **236** and an outer side **238**. The inner side **236** of the second base layer **232** is positioned to oppose the first cushioning panel **220**, and the plurality of second projections **234** extend from the inner side **236** of the second base layer **232**.

(109) In FIGS. **4**A and **4**B, the first projections **224** and the second projections **234** oppose each other and, more specifically, directly oppose each other. When the first projections **224** and the second projections **234** directly oppose each other, the distal end **322** of the first projections **224** can contact the distal end **322** of the second projections **234**. The projections that contact another surface, such as the other cushioning panel (more specifically projections with the distal end **322** contacting another surface), are referred to herein as contacting projections, and accordingly, at least a portion of the first projections **224** and at least a portion of the second projections **234** are contacting projections. At least a portion of the first projections **224** are first contacting projections with the distal ends **322** of the first contacting projections contacting the second cushioning panel **230**, and at least a portion of the second projections **234** are second contacting projections with the distal ends **322** of the second contacting projections contacting the first cushioning panel **220**. More specifically, in FIGS. **4**A and **4**B, the first contacting projections and the second contacting projections are positioned to directly oppose each other, with the distal end **322** of each first contacting projection contacting a distal end **322** of a corresponding second contacting projection. In this case, both the first projections **224** and the second projections **234** are contacting projections, but in other cases, as will be discussed further below, only one of the first projections **224** or the second projections **234** are contacting projections.

(110) FIG. **4**C is a cross-sectional view of a plurality of the cushioning layers **211** taken from a perspective similar to FIG. **4**B. As noted above, the packing materials **100** (FIG. **1**) can include cushioning blocks **200** (FIG. **2**) with a single cushioning layer **210**, such as the cushioning layer **211** shown in FIG. **5**B. Other packing materials **100** can include cushioning blocks **200** with a plurality of cushioning layers **210**. FIG. **5**C shows, for example, four cushioning panels **300** arranged to form two cushioning layers **210** and, more specifically, a first cushioning layer **211***a* and a second cushioning layer **211***b*. Each of the first cushioning layer **211***a* and the second cushioning layer **211***b*, shown in FIG. **4**C, are the cushioning layers **211** discussed above with reference to FIG. **4**B, and that discussion applies here. Although shown as having the same arrangement, the first cushioning layer **211***a* and the second cushioning layer **211***b* can be arranged differently from each other.

(111) FIG. **4**D is a perspective view of a cushioning layer **211***c* formed by positioning a first cushioning panel **220** relative to a second cushioning panel **230**. In FIG. **4**D, each of the first cushioning panel **220** and a second cushioning panel **230** is the cushioning panel **302** with the ridges **332** arranged to directly oppose each other in a manner similar to the cushioning layers **211** discussed above with reference to FIGS. **4**A and **4**B.

(112) As depicted in FIG. **5**C, the packing materials **100** (FIG. **1**), such as cushioning block **200**, can have two or more cushioning layers, including the first cushioning layer **211***a* and the second cushioning layer **211***b*. The outer side **238** of one of the first base layer **222** or the second base layer **232** of the first cushioning layer **211***a* abuts the outer side **238** of one of the first base layer **222** or the second base layer **232** of the second cushioning layer **211***b*. In FIG. **4**C, the outer side **238** of the second base layer **232** in the first cushioning layer **211***a* abuts the outer side **238** of the first base layer **222** in the second cushioning layer **211***b*.

(113) FIGS. **5**A and **5**B show a cushioning layer **212** formed by positioning a first cushioning panel **220** relative to a second cushioning panel **230**. FIG. **5**A is a top view of the cushioning layer **212**, and FIG. **5**B is a cross-sectional view of the cushioning layer **212** taken along line **6**B-**6**B in FIG. **6**A. FIGS. **5**A and **5**B depict a direct opposition of the first projections **224** and the second projections **234**, but as noted above, other arrangements of the first cushioning panel **220** and the second cushioning panel **230** may be used to form the cushioning layers **210** discussed herein, such as, for example, offset arrangements. FIGS. **5**A and **5**B depict the cushioning layer **212** with one such offset arrangement.

(114) The first projections **224** and the second projections **234** are offset from each other. More specifically, the first projections **224** and the second projections **234** are offset from each other in

one of a length direction or a width direction of the cushioning panel **303** but aligned in the other one of a length direction or a width direction of the cushioning panel **303**. In FIG. **5**A, the first projections **224** are shown with solid lines and the second projections **234** are shown with broken lines. As can be seen in FIG. **5**A, the rows of projections of the first cushioning panel **220** and the second cushioning panel **230** are still aligned with each other, but the columns of the first cushioning panel **220** and the second cushioning panel **230** are offset from each other.

(115) More specifically, at least some second projections **234** are each positioned between two adjacent first projections **224**, and at least some first projections **224** are each positioned between two adjacent second projections **234**. In the depicted embodiment, some of the first projections **224** are on the edges of the first cushioning panel **220** and are referred to herein as edge projections. The edge projections are not positioned between two adjacent second projections **234**, but rather next to only one second projection **234**. Each of the first projections **224** and the second projections **234** may include edge projections. More specifically, at least a portion of the first projections **224** can be edge projections, and/or at least a portion of the second projections **234** can be edge projections. Other projections of the first projections **224** and the second projections **234** can be internal projections. More specifically, at least a portion of the first projections **224** can be internal projections, and/or at least a portion of the second projections **234** can be internal projections. Each of the internal projections of the first projections **224** are positioned between two adjacent second projections **234**, and each of the internal projections of the second projections **234** are positioned between two first projections **224**. In FIGS. **5**A and **5**B, the internal projections of the first projections **224** contact two adjacent second projections **234**, and the internal projections of the second projections **234** contact two adjacent first projections **224**.

(116) FIG. **5**C is a cross-sectional view of a plurality of the cushioning layers **212** taken from a perspective similar to FIG. **5**B. Two or more of the cushioning layers **212** shown in FIGS. **5**A and **5**B can be arranged adjacent to each other in a manner similar to the first cushioning layer **211***a* and the second cushioning layer **211***b*, discussed above with reference to FIG. **4**C. More specifically, the plurality of cushioning layers **213** shown in FIG. **5**C includes a first cushioning layer **212***a* and the second cushioning layer **212***b*. In FIG. **6**C, the outer side **238** of the second base layer **232** in the first cushioning layer **212***a* abuts the outer side **238** of the first base layer **222** in the second cushioning layer **212***b*. While these can be arranged in different ways, the openings **326** of the second projections **234** in the first cushioning layer **212***a* are aligned with the openings **326** of the first projections **224** in the second cushioning layer **212***b* to form a closed cavity between the cavity **324** of the second projections **234** in the first cushioning layer **212***a* and the cavity **324** of the first projections **224** in the second cushioning layer **212***b*.

(117) FIGS. **6**A and **6**B show a cushioning layer **213** formed by positioning a first cushioning panel **220** relative to a second cushioning panel **230**. FIG. **6**A is a top view of the cushioning layer **213** and FIG. **6**B is a cross-sectional view of the cushioning layer **213** taken along line **6**B-**6**B in FIG. **6**A. FIGS. **6**A and **6**B depict the cushioning layer **213** with another offset arrangement.

(118) The first projections **224** and the second projections **234** are offset from each other. More specifically, the first projections **224** and the second projections **234** are offset from each other in both the length direction and the width direction of the cushioning panel **303**. In FIG. **6**A, the first projections **224** are shown in solid lines and the second projections **234** are shown in broken lines. As can be seen in FIG. **6**A, at least a portion of the second projections **234**, such as the internal projections, are located in interstitial locations between the first projections **224**. In FIG. **6**A, this interstitial position is between four adjacent first projections **224**. With this arrangement, at least a portion of the first projections **224**, such as the internal projections, are also located in interstitial locations between the second projections **234**. In FIG. **6**A, this interstitial position is between four adjacent second projections **234**. In FIGS. **6**A and **6**B, the internal projections of the first projections **224** contact four adjacent second projections **234**, and the internal projections of the second projections **234** contact four adjacent first projections **224**.

(119) FIG. **6**C is a cross-sectional view of a plurality of the cushioning layers **213** taken from a perspective similar to FIG. **6**B. Two or more of the cushioning layers **213** shown in FIGS. **6**A and **6**B can be arranged adjacent to each other in a manner similar to the first cushioning layer **212***a* and the second cushioning layer **212***b*, discussed above with reference to FIG. **5**C. The discussion of the features in FIG. **5**C applies to a first cushioning layer **213***a* and a second cushioning layer **213***b* shown in FIG. **7**C, but with the offset arrangement discussed above, with respect to FIGS. **6**A and **6**B.

(120) FIGS. **7**A and **7**B show a cushioning layer **214** formed by positioning a first cushioning panel **220** relative to a second cushioning panel **230**. FIG. **7**A is a top view of the cushioning layer **213** and FIG. **7**B is a cross-sectional view of the cushioning layer **214**, taken along line **7**B-**7**B in FIG. **7**A. FIGS. **7**A and **7**B depict the cushioning layer **213** with another offset arrangement. In FIGS. **6**A and **6**B, the contacting projections of the first projections **224** and the second projections **234** contacted other projections, but other arrangements can be used. In FIGS. **7**A and **7**B, the contacting projections of the first projections **224** and the second projections **234** do not contact each other, but rather, are in contact with other portions of the second cushioning panel **230** and the first cushioning panel **220**, respectively. More specifically, the distal ends **322** of the first projections **224** contact the projection-side surface **312** of the second base layer **232**, and the distal ends **322** of the second projections **234** contact the projection-side surface **312** of the second projections **234**.

(121) The cushioning layers **210** discussed herein can provide a level of cushioning for the product **10**. The cushioning layer **210** has some elastic deformability to provide a first level of cushioning but also provide energy absorption by crumpling or deforming. These different arrangements of the cushioning layers **210** provide different levels of energy absorption that can be adjusted depending upon the need. Additionally, as noted above, the first projections **224** and the second projections **234** can have a variety of shapes, such as different geometric shapes. These different geometric shapes can have different configurations to provide different cushioning or resilience. For example, FIG. **8**A shows a cushioning layer **215** formed by positioning a first cushioning panel **220** relative to a second cushioning panel **230**. FIG. **8**A is a cross-sectional view of the cushioning layer **214** taken from a perspective similar to FIG. **4**B above, but each of the first cushioning panel **220** and the second cushioning panel **230** in the cushioning layer **215** is the cushioning panel **305** having the pyramidal projections **335** shown in FIG. **3**D. Similarly, FIG. **8**B shows a cushioning layer **216** formed by positioning a first cushioning panel **220** relative to a second cushioning panel **230**. FIG. **8**B is a cross-sectional view of the cushioning layer **216** taken from a perspective similar to FIG. **4**B above, but each of the first cushioning panel **220** and the second cushioning panel **230** in the cushioning layer **216** is the cushioning panel **307** having the arcuate projections **337** shown in FIG. **3**E. While FIGS. **8**A and **8**B are depicted with the first projections **224** and the second projections **234** directly opposing each other, other arrangements can be used, including the offset arrangements discussed above.

(122) FIG. **8**C also shows a cushioning layer **217** formed by positioning a first cushioning panel **220** relative to a second cushioning panel **230**. FIG. **8**C is a cross-sectional view of the cushioning layer **216** taken from a perspective similar to FIG. **4**B above. In the cushioning layers **210** discussed above, the first cushioning panel **220** and the second cushioning panel **230** are arranged such that the first projections **224** project toward the second cushioning panel **230** and the second projections **234** project toward the first cushioning panel **220**, but as depicted in FIG. **8**C, the first cushioning panel **220** and the second cushioning panel **230** are arranged such that the first projections **224** project away from the second cushioning panel **230** and the second projections **234** project the first cushioning panel **220**. As with the discussion of a plurality of layers, the discussion of which applies here, the first cushioning panel **220** and the second cushioning panel **230** are positioned with the back-side surface **314** of the first cushioning panel **220** abutting the back-side surface **314** of the second cushioning panel **230**.

(123) FIGS. **9**A and **9**B show a cushioning layer **218** formed by positioning a first cushioning panel **220** relative to a second cushioning panel **230**. FIG. **9**A is a top view of the cushioning layer **213** and FIG. **9**B is a cross-sectional view of the cushioning layer **218** taken along line **9**B-**9**B in FIG. **9**A. As noted above, the second projections **234** can have a geometric shape that is different than the geometric shape of the first projections **224**. In FIGS. **9**A and **9**B, the first cushioning panel **220** is formed using the cushioning panel **305**, shown in FIG. **4**D, with pyramidal projections **335**, and the second cushioning panel **230** is formed using the cushioning panel **309**, shown in FIG. **4**F, with rectangular projections **339**. Although other arrangements may be used, FIGS. **9**A and **9**B depict the cushioning layer **218** with the offset arrangement discussed above with reference to FIGS. **5**A and **5**B. In the previous cushioning layers **210**, both the first projections **224** and the second projections **234** included contacting projections, but depending upon the arrangement and geometric shape, only one of the first projections **224** or the second projections **234** can include contacting projections. As depicted in FIGS. **9**A and **9**B, for example, the second projections **234** include contacting projections where the distal end **322** of the second projections **234** contact the first cushioning panel **220**, but the distal end **322** of the first projections **224** is not in contact with the second cushioning panel **230**.

(124) FIG. **9**C is a cross-sectional view of a plurality of the cushioning layers **218** taken from a perspective similar to FIG. **9**B. Two or more of the cushioning layers **218** shown in FIGS. **9**A and **9**B can be arranged adjacent to each other in a manner similar to the first cushioning layer **212***a* and the second cushioning layer **212***b*, discussed above with reference to FIG. **5**C. The discussion of the features in FIG. **5**C applies to a first cushioning layer **218***a* and a second cushioning layer **218***b* shown in FIG. **9**C.

(125) FIG. **9**D shows a plurality of cushioning panels of different types in another arrangement. The shapes of the projections, in addition to their arrangement relative to each other, result in different levels of rigidity for each sheet. As will be discussed in more detail below, using a first cushioning layer **219***a* in combination with a second layer **219***b* that has a greater rigidity that the first cushioning layer **219***a* can be advantageous, particularly when the first cushioning layer **219***a* is positioned closer to the product **10** than the more rigid layer, the second layer **219***b* in FIG. **9**D. In FIG. **9**D, the first cushioning layer **219***a* is depicted as using the cushioning layer **211** shown and described above with reference to FIGS. **4**A and **4**B, the second layer **219***b* is depicted as the cushioning panel **309** having rectangular projections **339** shown in FIG. **3**F. Other cushioning panels, however, can be used to form these layers provided the rigidity is as discussed above.

(126) FIGS. **10**A and **10**B illustrate a method of forming a cushioning layer **210**, such as the cushioning layer **211** discussed above. FIG. **10**A is a first step and FIG. **10**B is a second step. After each of the first cushioning panel **220** and the second cushioning panel **230** are formed using the molded pulp methods discussed above, an adhesive **241** can be applied to the first cushioning panel **220**, the second cushioning panel **230**, or both. In FIG. **10**A, the adhesive **241** is shown being applied to the second cushioning panel **230**. More specifically, the adhesive **241** is shown as being applied to the projection side of the second cushioning panel **230**, including the distal end **322** of the second projections **234**. Then the first cushioning panel **220** is positioned relative to the second cushioning panel **230**, which, as depicted, can include positioning the first projections **224** to directly oppose the second projections **234**, with the distal ends **322** of the first projections **224** contacting the distal ends **322** of the second projections **234**. The adhesive **241** then is allowed to dry, binding the distal ends **322** of the first projections **224** to the distal ends **322** of the second projections **234**.

(127) FIGS. **11**A and **11**B illustrate another method of forming a cushioning layer **210**, such as the cushioning layer **211** discussed above. FIG. **11**A illustrates a first step and FIG. **11**B illustrates a second step. In this method, the first cushioning panel **220** and the second cushioning panel **230** are formed as a single cushioning panel **240**, with the first cushioning panel **220** being a first portion **243** of the cushioning panel **240** and the second cushioning panel **230** being a second portion **245**

of the cushioning panel **240**. The first portion **243** and the second portion **245** are separated by a connecting portion **247**. The connecting portion **247** can be a portion of the cushioning panel **240** without the projections **320** formed thereon. The connecting portion **247** can be a flat sheet portion of the cushioning panel **240**. After the adhesive **241** is applied in the manner discussed above, the first portion **243** can be rotated relative to the second portion **245** as indicated by the arrow to be positioned, as shown in FIG. **11**B, in the manner discussed above relative to FIG. **10**B.

(128) FIG. **11**C shows an optional additional step. As will be discussed further below, the cushioning layers **210** and cushioning bocks **200** can be positioned relative to each other to form various packing materials. As will be discussed with reference to FIGS. **16**A and **16**B, a third cushioning block **116** and a fourth cushioning block **118** can be arranged transversely to each other, such as to form an L-shape, with a product cavity **122** therebetween. One way of arranging transversely is to further fold the cushioning panel **240** after the step shown in FIG. **11**B. For example, one end of the cushioning panel **240** can be rotated relative to the other end of the cushioning panel **240** to form two cushioning blocks (e.g., third cushioning block **116** and the fourth cushioning block **118**) positioned transversely to each other. The cushioning panel **240** can include a corner portion **249** and, before rotating one of the first base portion **222** and the second base portion **232** can be scored or otherwise cut to facilitate rotation. Additionally, instead of stopping the fold to form the L-shape, the one end of the cushioning panel **240** can be further rotated to form a plurality of cushioning layers (e.g., the first cushioning layer **211***a* and second cushioning layer **211***b* discussed above with reference to FIG. **4**C).

(129) FIG. **11**D shows another optional additional step. The cushioning panel **240** can be further rotated in the manner discussed above with reference to FIG. **11**C to form a U-shape having for example, a first cushioning block **112**, a second cushioning block **114**, and a third cushioning block **116**, discussed in more detail below. One end of the L-shape shown in FIG. **11**C can be further rotated to be arranged transversely to another section of the cushioning panel **240**.

(130) FIG. **11**E shows another optional additional step to form a plurality of layers. In FIG. **11**B the cushioning panel **240** was folded back on itself once to form the cushioning layer and then one end of the cushioning layer was folded the other end of the cushioning layer. Here, in FIG. **11**E, the cushioning panel **240** is folded back on itself multiple times to form a plurality of cushioning layers. The base layer of the cushioning panel **240** can thus have a serpentine structure after being folded.

(131) FIG. **12** shows a cushioning block **202** that can be used as a cushioning block **200** of the packing materials **100** (FIG. **1**) discussed herein. As noted above, the cushioning block **202** can be a composite cushioning block having one or more cushioning layers **210** in combination with at least one other layer that is a different construction, such as having a different material or a different structure. The other layer, shown in this embodiment, is a cellulosic sheet **250**. The cellulosic sheet **250** can be a paper sheet having various basis weights. Thicker and stiffer cellulosic sheets **250** can be used, including, for example, fiberboard sheets. The cellulosic sheet **250** can abut and be attached to the cushioning layer **210**. More specifically, the cellulosic sheet **250** can abut and be directly attached to one of the outer side **228** of the first cushioning panel **220** or the outer side **238** of the second cushioning panel **230**. The cellulosic sheet **250** can include a first surface **252** and a second surface **254**. The first surface **252** can abut and be directly attached to one of the outer side **228** of the first cushioning panel **220** or the outer side **238** of the second cushioning panel **230**. An adhesive may be applied to the first surface **252** of the cellulosic sheet **250**, to one of the outer side **228** of the first cushioning panel **220** or the outer side **238** of the second cushioning panel **230**, or both to directly attach the cellulosic sheet **250** to the cushioning layer **210**.

(132) A plurality of cellulosic sheets **250** can be used in different arrangements. In some arrangements, a first cellulosic sheet and a second cellulosic sheet can abut and be directly attached to the outer side **228** of the first cushioning panel **220** and the outer side **238** of the second

cushioning panel **230**, respectively. In some embodiments, the cellulosic sheet **250** is formed on an outer side of the cushioning block **202** and can be referred to as a cover layer.
(133) FIG. **13** shows a cushioning block **203** that can be used as a cushioning block **200** of the packing materials **100** (FIG. **1**) discussed herein. The cushioning block **203** shown in FIG. **13** is also a composite cushioning block, but instead of using the cellulosic sheet **250**, the cushioning block **203** can be a corrugated fiberboard sheet **260**, also referred to as corrugated cardboard. The corrugated fiberboard sheet **260**, shown in FIG. **13**, is a single-walled corrugated fiberboard sheet, but other corrugated fiberboard sheets **260** can be used, including, for example, double-walled corrugated fiberboard sheets and triple-walled corrugated fiberboard sheets. The corrugated fiberboard sheet **260** includes a top sheet **261**, a bottom sheet **263**, and a corrugated sheet **265** sandwiched between the top sheet **261** and the bottom sheet **263**. When the corrugated fiberboard sheet **260** is a double-walled corrugated fiberboard sheet or a triple-walled corrugated fiberboard sheet, the corrugated fiberboard sheet **260** can include a plurality of corrugated sheets **265** sandwiched between the top sheet **261** and the bottom sheet **263** with intermediate or middle sheets separating the corrugated sheet **265**.
(134) Each of the liners (e.g., the top sheet **261**, the bottom sheet **263**, and the middle or intermediate sheets) and the corrugated sheets **265** can be suitable sheets made from cellulosic fibers that are typically used in the construction of cardboard shipping boxes. The corrugated sheets **265** each include a plurality of flutes. Any suitable standard flute shape typically used in the construction of cardboard shipping boxes may be used. These flutes are referred to herein as interior flutes to distinguish them from other flutes formed in the packing materials discussed below.
(135) The corrugated fiberboard sheet **260** can be positioned and arranged in a manner similar to the cellulosic sheet **250** discussed above. More specifically, the corrugated fiberboard sheet **260** can include a first surface **267**, which is an outward-facing surface of the top sheet **261**, and a second surface **269**, which is an outward-facing surface of the bottom sheet **263**. The first surface **267** and the second surface **269** of the corrugated fiberboard sheet **260** can be positioned and arranged similarly to the first surface **252** and the second surface **254** of the cellulosic sheet **250** discussed above. In some embodiments, the corrugated fiberboard sheet **260** is formed on an outer side of the cushioning block **202** and, like the cellulosic sheet **250**, can be referred to as a cover layer. The corrugated fiberboard sheet **260** can also be a structural layer of the cushioning block **203**.
(136) For some applications, including the TV application discussed above, a combination of both strong and rigid protection with cushioning may be desired. Accordingly, in some embodiments, one or more cushioning panels **300** (FIGS. **3**A to **3**G), arranged and constructed in the manner discussed above, can be used in conjunction with additional layers of a stronger, more rigid construction. For example, a composite cushioning block can be formed using a cushioning layer **210** (FIG. **2**) having one or more cushioning panels **300**, with another panel or sheet panel, having a stronger, more rigid construction than the cushioning panels **300** and cushioning layer **210**. These sheet panels are referred to herein as rigid sheet panels **400** (FIG. **14**A) to distinguish them from the cushioning panels **300**, and the rigid sheet panels **400** have a rigidity greater than that of the cushioning panels **300**, the cushioning layer **210**, or both, when a load is applied in the thickness direction of the rigid sheet panels **400**, the cushioning panels **300**, or cushioning layer **210**. The composite cushioning blocks can include one or more rigid layer **270** (FIGS. **15**A to **15**D) formed from one or more rigid sheet panels **400**. Various different rigid sheet panels **400** that can be used to form the rigid layer **270** are discussed further below, and reference numeral **400** is used herein to refer generally to the various different rigid panels.
(137) FIG. **14**A shows a rigid sheet panel **400** that can be used to form the cushioning blocks **200** and the packing materials **100** (FIG. **1**). The rigid sheet panel **400** shown in FIG. **14**A is a honeycomb panel **410**. The honeycomb panel **410** includes a top sheet **412** and a bottom sheet **414**. The honeycomb panel **410** can include a first surface **416**, which is an outward-facing surface of

the top sheet **412**, and a second surface **418**, which is an outward-facing surface of the bottom sheet **414**. Each of the top sheet **412** and the bottom sheet **414** are cellulosic sheets, and the discussion of the cellulosic sheet **250** above applies to these sheets. The honeycomb panel **410** also includes a core **420** sandwiched between the top sheet **412** and bottom sheet **414**.

(138) FIG. **14**B shows the core **420** of the honeycomb panel **410**. The core **420** includes a plurality of bands **422**. The bands **422** are cellulosic bands of cellulosic sheet materials, and the discussion of the cellulosic sheet **250** above applies to these cellulosic bands. The core **420** is formed by attaching, such as by using an adhesive, the bands **422** together to form a plurality of cells **424** defined by the bands **422**. In FIG. **14**B, the cells **424** have a hexagonal shape, but other shapes can be used. The bands **422** can be oriented in a direction transverse to the top sheet **412** and the bottom sheet **414**, such as in a direction normal to the top sheet **412** and bottom sheet **414**. The cells **424** are also oriented in a direction transverse to the top sheet **412** and the bottom sheet **414**, such as in a direction normal to the top sheet **412** and bottom sheet **414**. The top sheet **412** and the bottom sheet **414** can have a thickness greater than the bands **422**.

(139) FIGS. **15**A to **15**D show cushioning blocks **200** and, more specifically, composite cushioning blocks formed with one or more cushioning layers **210** in combination with one or more rigid layers **270**. FIG. **15**A shows a cushioning block **204** having the cushioning layer **212** discussed above and a rigid layer **270** formed using one honeycomb panel **410**. The rigid layer **270** and, more specifically, the honeycomb panel **410** is shown in FIG. **15**A as contacting the cushioning layer **210**. As noted above, the honeycomb panel **410** includes a top sheet **412** with a first surface **416**. The top sheet **412** can be positioned to abut the second cushioning panel **230** of the cushioning layer **210**. The first surface **416** of the top sheet **412** can abut and be directly attached to one of the outer sides **228** of the first cushioning panel **220** or the outer side **238** of the second cushioning panel **230**. An adhesive may be applied to the first surface **416** of the honeycomb panel **410** to one of the outer side **228** of the first cushioning panel **220** or the outer side **238** of the second cushioning panel **230**, or both to directly attach the honeycomb panel **410** to the cushioning layer **210**. In FIG. **15**A, the top sheet **412** abuts the second base layer **232** of the cushioning layer **210**.

(140) The projections **320**, such as the first projections **224**, the second projections **234**, or both, can be oriented in the same direction as the cells **424** (FIG. **14**B) of the honeycomb panel **410**. The first projections **224**, the second projections **234**, the cells **424**, or combinations thereof can be oriented in a thickness direction of the cushioning block **204**.

(141) FIG. **15**B shows a cushioning block **205** with the rigid layer **270** formed using one honeycomb panel **410**. The cushioning block **205** is similar to the cushioning block **204** discussed above with reference to FIG. **15**A, but as shown in FIG. **15**B, the cushioning layer **210** is formed with one cushioning panel **300**, such as the cushioning panel **303** discussed above. The cushioning panel **303** can be positioned in different orientations, such as with the projections **320** extending towards the honeycomb panel **410**, such as with the distal ends **322** of the projections **320** contacting the first surface **416** of the top sheet **412**.

(142) FIG. **15**C shows another cushioning block **206** with the rigid layer **270** being the honeycomb panel **410**. The cushioning block **206** shown in FIG. **15**C is similar to the cushioning block **205** discussed above with reference to FIG. **15**B, but here, the projections **320** project away from the honeycomb panel **410**. The base layer **310** can abut the honeycomb panel **410**, such as the top sheet **412**. More specifically, the back-side surface **314** can be positioned to abut and directly contact the first surface **416**.

(143) FIG. **15**D shows another cushioning block **207**. The cushioning block **207** is similar to the cushioning block **204** discussed above with reference to FIG. **15**A. The cushioning block **207** includes a corrugated fiberboard sheet **260** in addition to the cushioning layer **210** and the rigid layer **270**. The corrugated fiberboard sheet **260** can be integrated in various locations within the cushioning block **207**. The corrugated fiberboard sheet **260** can be positioned adjacent to, such as to abut, the cushioning layer **210**, the rigid layer **270**, or both. The corrugated fiberboard sheet **260**

can be positioned on an outer surface of the cushioning block **207**, such as on an outer side of the cushioning layer **210** or the rigid layer **270**, but the corrugated fiberboard sheet **260** can be positioned between the cushioning layer **210** and the rigid layer **270**. As shown in FIG. **15**D, for example, the corrugated fiberboard sheet **260** is positioned adjacent to the rigid layer **270** and, more specifically, to abut the honeycomb panel **410** of the rigid layer **270**.

(144) As noted above, the packing materials **100** (FIG. **1**) discussed herein can be formed from one or more cushioning blocks **200**. The cushioning blocks **200** can be arranged in various ways and in various combinations around the product **10** (FIG. **1**). In the following discussion, the packing materials **100** will be described as being formed into unitary structures with the cushioning blocks **200** connected to each other, such as by a corrugated fiberboard sheet **260**. The cushioning blocks **200** can be arranged around the product **10** in the manner discussed below without being connected to each other.

(145) FIGS. **16**A and **16**B show a corner-shaped packing material **110** that can be used as, for example, one of the corner-shaped packing materials **102** discussed above with reference to FIG. **1**. FIG. **16**B is an exploded view of the corner-shaped packing material **110**. The corner-shaped packing material **110** includes one or more cushioning blocks capable of being positioned around the product **10**. More specifically, the corner-shaped packing material **110** includes a plurality of cushioning blocks including a first cushioning block **112**, a second cushioning block **114**, a third cushioning block **116**, and a fourth cushioning block **118**. Each of these cushioning blocks **112**, **114**, **116**, and **118** includes one or more cushioning layers **210** and, more specifically, as depicted in FIGS. **16**A and **16**B, two cushioning layers **210**. The cushioning layers depicted in FIGS. **16**A and **16**B are the cushioning layers **211** shown and described above with reference to FIGS. **4**A to **4**C, but other cushioning layers **210** may be used, and each of these cushioning blocks **112**, **114**, **116**, and **118** includes the first cushioning layer **211***a* and the second cushioning layer **211***b*.

(146) The first cushioning block **112** and the second cushioning block **114** are positioned to oppose each other with a product cavity **122** therebetween. The first cushioning block **112** and the second cushioning block **114** can be oriented parallel to each other, with a thickness direction of each of the first cushioning block **112** and the second cushioning block **114** being oriented in the same direction. The first cushioning block **112** can be a front cushioning block and the second cushioning block **114** can be a back cushioning block. The first cushioning block **112** and the second cushioning block **114** can have different shapes, and, as depicted in FIGS. **16**A and **16**B, the first cushioning block **162** and the second cushioning block **114** each have the same shape, which is an L-shape.

(147) The third cushioning block **116** is positioned along one edge of each of the first cushioning block **112** and the second cushioning block **114** to form a bottom cushioning block. The third cushioning block **116** can be positioned on a long side of the first cushioning block **112** and the second cushioning block **114**. The third cushioning block **116** is positioned transverse and, more specifically, orthogonal to the first cushioning block **112** and the second cushioning block **114**.

(148) The fourth cushioning block **118** is positioned along one edge of each of the first cushioning block **112** and the second cushioning block **114** to form a side cushioning block. The fourth cushioning block **118** can be positioned on a short side of the first cushioning block **112** and the second cushioning block **114**. The fourth cushioning block **118** is positioned transverse and, more specifically, orthogonal to the first cushioning block **112** and the second cushioning block **114**. The third cushioning block **116** and the fourth cushioning block **118** also are positioned transverse and, more specifically, orthogonal to each other.

(149) The third cushioning block **116** and the fourth cushioning block **118** also define boundaries of the product cavity **122**. The product cavity **122** shown in FIG. **16**A is a slot, but other shapes may be formed with the arrangement of the product cavity **122**. In the depicted arrangement, each of the cushioning blocks **112**, **114**, **116**, and **118** define the product cavity **122** in which the product **10** can be placed. The cushioning blocks **112**, **114**, **116**, and **118** include a product side and a product-side

surface **124**, which is a surface of each of the cushioning blocks **112**, **114**, **116**, and **118** facing the product cavity **122**.

(150) The cushioning blocks **112**, **114**, **116**, and **118** also include a container side and a container-side surface **126**, which is a surface outward from the corner-shaped packing material **110** and away from the product cavity **122**. Each of the cushioning blocks **112**, **114**, **116**, and **118** include a backing sheet, such as a corrugated fiberboard sheet **260**, positioned on the container side of the cushioning blocks **112**, **114**, **116**, and **118**. More specifically, the corner-shaped packing material **110** includes a first corrugated fiberboard sheet portion **132**, a second corrugated fiberboard sheet portion **134**, a third corrugated fiberboard sheet **1** portion **36**, and a fourth corrugated fiberboard sheet portion **138** corresponding to the first cushioning block **112**, the second cushioning block **114**, the third cushioning block **116**, and the fourth cushioning block **118**, respectively, and arranged in the manner discussed above. Although the corrugated fiberboard sheet portions **132**, **134**, **136**, and **138** can be independently formed on the cushioning blocks **112**, **114**, **116**, and **118** as individual sheets, the corrugated fiberboard sheet portions **132**, **134**, **136**, and **138** are illustrated in FIGS. **16**A and **16**B as portions of a corrugated fiberboard sheet **130** that are connected to each other and folded in a manner to form an open box shaped structure.

(151) FIG. **17** shows a U-shaped packing material **142** that can be used as, for example, one of the U-shaped packing materials **104** discussed above with reference to FIG. **1**. The U-shaped packing material **142** is formed similarly to the corner-shaped packing material **110** discussed above with reference to FIGS. **16**A and **16**B. The U-shaped packing material **142** includes the first cushioning block **112**, the second cushioning block **114**, and the third cushioning block **116** arranged in a U-shape similar to the arrangement discussed above. The shape of each of the first cushioning block **112** and the second cushioning block **114** are depicted as elongated rectangular blocks to form an elongated product cavity **122**.

(152) FIG. **18** shows two corner-shaped packing materials **110** and a U-shaped packing material **142** arranged next to each other. The product cavities **122** of the corner-shaped packing materials **110** and the U-shaped packing material **142** can be aligned with each other to form a continuous cavity for the product **10** (FIG. **1**). While shown adjacent to each other in FIG. **18** (and also in FIG. **1**), the packing materials **100**, such as the corner-shaped packing materials **110** and the U-shaped packing material **142**, can be spaced apart from each other with gaps therebetween.

(153) FIGS. **19**A and **19**B show another corner-shaped packing material **144** that can be used as, for example, one of the corner-shaped packing materials **102** discussed above with reference to FIG. **1**. FIG. **19**B is an exploded view of the corner-shaped packing material **144**. The corner-shaped packing material **144** shown in FIGS. **19**A and **19**B is similar to the corner-shaped packing material **110** discussed above with reference to FIGS. **16**A and **16**B, and that discussion applies here. In this corner-shaped packing material **144**, the first corrugated fiberboard sheet portion **132**, the second corrugated fiberboard sheet portion **134**, the third corrugated fiberboard sheet portion **136**, and the fourth corrugated fiberboard sheet portion **138** are formed on the product-side surface **124** of each cushioning block **112**, **114**, **116**, and **118**, instead of the container-side surface **126**. In this embodiment, the corrugated fiberboard sheet **130** and, more specifically, the corrugated fiberboard sheet portions **132**, **134**, **136**, and **138** define the cavity instead of a surface of the cushioning layers **210**. In still other embodiments, the corrugated fiberboard sheet portions **132**, **134**, **136**, and **138** can be formed on either side of the cushioning layers **210** (e.g., combining the features of FIGS. **16**A and **16**B with FIGS. **19**A and **19**B).

(154) FIGS. **20**A and **20**B show another corner-shaped packing material **150** that can be used as, for example, one of the corner-shaped packing materials **102** discussed above with reference to FIG. **1**. The corner-shaped packing material **150** shown in FIGS. **20**A and **20**B is similar to the corner-shaped packing material **110** discussed above with reference to FIGS. **16**A and **16**B. As noted above, the first corrugated fiberboard sheet portion **132**, the second corrugated fiberboard sheet portion **134**, the third corrugated fiberboard sheet portion **136**, and the fourth corrugated

fiberboard sheet portion **138** can be portions of a corrugated fiberboard sheet **130**. An advantage of using the corrugated fiberboard sheet **130** is that the cushioning blocks **112**, **114**, **116**, and **118** can be attached to a surface, such as an internal surface, of the corrugated fiberboard sheet **130**, and then the corrugated fiberboard sheet **130** can be folded from a flat configuration to a folded configuration to form the corner-shaped packing material **150**. Suitable means of attachment include, for example, an adhesive to attach the cushioning blocks **112**, **114**, **116**, and **118** (or portions thereof such as the cushioning layers) to the surface of the corrugated fiberboard sheet **130**. The corner-shaped packing material **150** shown in FIGS. **20**A and **20**B is configurable in a flat configuration and a folded configuration. The flat configuration is shown in FIG. **20**A, and the folded configuration is shown in FIG. **20**B. In the folded configuration, the corner-shaped packing material **150** is shaped as discussed above with reference to FIGS. **16**A and **16**B.

(155) In the flat configuration shown in FIG. **20**A, the first cushioning block **112** can be spaced apart from the third cushioning block **116** with a gap therebetween. The corrugated fiberboard sheet **130** includes a first connection portion **152** that spans between the first cushioning block **112** and the third cushioning block **116**. A connection portion of the corrugated fiberboard sheet **130**, such as the first connection portion **152**, is a portion of the corrugated fiberboard sheet **130** without a cushioning block attached thereto and allows the first cushioning block **112** to be folded relative to the third cushioning block **116**. The first connection portion **152** connects the first corrugated fiberboard sheet portion **132** with the third corrugated fiberboard sheet portion **136**. In a similar manner, the second cushioning block **114** is spaced apart from the third cushioning block **116**, with a second connection portion **154** connecting the second corrugated fiberboard sheet portion **134** with the third corrugated fiberboard sheet portion **136** to allow the second cushioning block **114** to be folded relative to the third cushioning block **116**. Similarly, the fourth cushioning block **118** is spaced apart from the third cushioning block **116**, with a third connection portion **156** connecting the fourth corrugated fiberboard sheet portion **138** with the third corrugated fiberboard sheet portion **136** to allow the fourth cushioning block **118** to be folded relative to the third cushioning block **116**.

(156) To move from the flat configuration in FIG. **20**A to the folded configuration in FIG. **20**B, the first cushioning block **112**, the second cushioning block **114**, and the fourth cushioning block **118** are folded relative to the third cushioning block **116**, as indicated by the arrows. Although shown as being folded relative to the third cushioning block **116**, the cushioning blocks **112**, **114**, **116**, and **118** can be attached to one another in other configurations to be folded in different orientations, such as the first cushioning block **112**, the second cushioning block **114**, and the third cushioning block **116** being connected to the fourth cushioning block **118** by the corrugated fiberboard sheet **130** to fold relative to the fourth cushioning block **118**. Additionally, although described with reference to the corrugated fiberboard sheet **130**, other backing materials or connecting materials can be used, such as paper sheets. More generally, one cushioning bock (e.g., the first cushioning block **112**) can be connected to another cushioning block (e.g., the third cushioning block **116**) by a connecting material, with a gap formed therebetween to allow the one cushioning block (e.g., the first cushioning block **112**) to be folded from a flat configuration to a folded configuration.

(157) To hold the corner-shaped packing material **150** in the folded configuration, the corrugated layer **130** may include tabs **158** that are, for example, connected to or a part of the corrugated fiberboard sheet **130**, such as a portion of the fourth corrugated fiberboard sheet portion **138**. A peelable adhesive strip **159** can be applied to an inner surface of each tab **158** and used as an adhesive strip to hold the corner-shaped packing material **150** in the folded configuration. Instead of (or in addition to) a peelable adhesive strip **159**, other means of holding the corner-shaped packing material **150** in the folded configuration can be used. For example, instead of a peelable adhesive strip **159**, an adhesive can be applied to various locations of the corner-shaped packing material **150**, such as to the inner surface of the tabs **158**, for example. Additionally, or alternatively, an adhesive strip (e.g., tape) can be used. When an adhesive strip such as tape is used,

the tabs **158** can be omitted.
(158) FIGS. **21**A and **21**B show another corner-shaped packing material **160** that can be used as, for example, one of the corner-shaped packing materials **102** discussed above with reference to FIG. **1**. The corner-shaped packing material **160** is similar to the corner-shaped packing material **150** shown in FIGS. **20**A and **20**B and is configurable in a flat configuration and a folded configuration. The flat configuration is shown in FIG. **21**A and the folded configuration is shown in FIG. **21**B. As noted above, a single molded pulp cushioning panel can be used in the formation of the corner-shaped packing material **160**, and the corner-shaped packing material **160**, shown in FIGS. **21**A and **21**B, is formed from a single, foldable molded cushioning panel **170**, such as the cushioning panel **301** discussed above with reference to FIGS. **3**A and **3**B. Although described with reference to cushioning panel **301** (FIGS. **3**A and **3**B), any of the cushioning panels **300** (e.g., FIGS. **3**A to **3**G) discussed herein may be used.
(159) The foldable molded cushioning panel **170** includes a first projection section **162**, a second projection section **164**, a third projection section **166**, and a fourth projection section **168** arranged in a manner similar to the first cushioning block **112**, the second cushioning block **114**, the third cushioning block **116**, and the fourth cushioning block **118**, respectively, discussed above with respect to FIGS. **20**A and **20**B. Each of these projection sections **162**, **164**, **166**, and **168** are sections containing projections **320**, such as the cylindrical projections **331**.
(160) The foldable molded cushioning panel **170** includes a first connection portion **172** that spans between the first projection section **162** and the third projection section **166**. A connection portion of the foldable molded cushioning panel **170**, such as the first connection portion **172**, can be a portion of the cushioning panel **170** without the projections **320** formed thereon. The connecting portions can be a flat sheet portion of the foldable molded cushioning panel **170**. The first connection portion **172** connects the first projection section **162** with the third projection section **166** and allows the first projection section **162** to be folded, or otherwise rotated, relative to the third projection section **166**. In a similar manner, the second projection section **164** is spaced apart from and connected to the third projection section **166** by a second connection portion **174** to allow the second connection portion **174** to be folded, or otherwise rotated, relative to the third corner-shaped packing material **146**. Similarly, the fourth projection section **168** is spaced apart from and connected to the third projection section **166** by a third connection portion **176** to allow the fourth projection section **168** to be folded, or otherwise rotated, relative to the third projection section **166**.
(161) The foldable molded cushioning panel **170** can be folded from the flat configuration to the folded configuration and held in the folded configuration in a manner similar to the corner-shaped packing material **150** discussed above with reference to FIGS. **20**A and **20**B, and that discussion applies here. Additional layers discussed herein can be attached to each of the projection sections **162**, **164**, **166**, and **168** to form the various cushioning blocks discussed herein.
(162) FIGS. **22**A and **22**B show another corner-shaped packing material **146** that can be used as, for example, one of the corner-shaped packing materials **102** discussed above with reference to FIG. **1**. FIG. **22**A is a top view of the corner-shaped packing material **146**, and FIG. **22**B is a perspective view of the corner-shaped packing material **146**. The corner-shaped packing material **146**, shown in FIGS. **22**A and **22**B, is similar to the corner-shaped packing material **110** discussed above with reference to FIGS. **16**A and **16**B, and that discussion applies here. In the corner-shaped packing material **146**, shown in FIGS. **22**A and **22**B, however, each of the cushioning blocks **112**, **114**, **116**, and **118** are composite cushioning blocks, including a rigid layer **270**. The rigid layer **270** shown in FIGS. **22**A and **22**B includes one or more honeycomb panels **410**, but any of the rigid sheet panels **400** discussed herein can be used.
(163) More specifically, the first cushioning block **112** and the second cushioning block **114** include the cushioning block **205** discussed above with reference to FIG. **15**B. The third cushioning block **116** and the fourth cushioning block **118** include the cushioning block **204** discussed above

with reference to FIG. **15**A, but with a plurality of cushioning layers **210**, such as the first cushioning layer **212***a* and the second cushioning layer **212***b* discussed above with reference to FIG. **5**B. As noted above, however, different arrangements and numbers of cushioning layers **210** can be used.

(164) In each of the cushioning blocks **112**, **114**, **116**, and **118**, the cushioning layers **210** can be positioned on the product side. More specifically, the cushioning layers **210** are positioned adjacent to the product cavity **122** and positioned to define the product cavity **122** in the manner discussed above with reference to FIGS. **16**A and **16**B. Also, the rigid layer **270** and, more specifically, the honeycomb panel **410**, is positioned between the cushioning layers **210** and the corrugated fiberboard sheet **130**, which forms the container side of the corner-shaped packing material **146**.

(165) In some embodiments, the third cushioning block **116** and the fourth cushioning block **118** form peripheral edges of the packing materials **100** (FIG. **1**). The inventors have found that additional cushioning, such as additional cushioning layers **210**, can advantageously be placed around the peripheral edges as opposed to the face of the product **10** (FIG. **1**). The third cushioning block **116** and the fourth cushioning block **118** forming the peripheral edges can thus have more cushioning layers **210** than the first cushioning block **112** and the second cushioning block **114**.

(166) FIG. **23** shows another corner-shaped packing material **148** that can be used as, for example, one of the corner-shaped packing materials **102** discussed above with reference to FIG. **1**. As noted above, additional cushioning layers **210** can be placed on the peripheral edges as opposed to the face of the product **10** (FIG. **1**). The corner-shaped packing material **148** shown in FIG. **23** is similar to the corner-shaped packing material **146** shown in FIGS. **22**A and **22**B, but here, the cushioning layers **210** are omitted from the first cushioning block **112** and the second cushioning block **114**, resulting in only a honeycomb panel **410** and the corrugated fiberboard sheet **130**.

(167) FIG. **24**A shows a U-shaped packing material **180** that can be used as, for example, one of the U-shaped packing materials **104** discussed above with reference to FIG. **1**. The U-shaped packing material **180** is formed similarly to the U-shaped packing material **142** discussed above with reference to FIG. **17**. The U-shaped packing material **180** includes a third cushioning block **116** positioned as discussed above with reference to FIG. **17**. As with the corner-shaped packing material **146** discussed above with reference to FIGS. **22**A and **22**B, the third cushioning block **116** is a composite cushioning block including a rigid layer **270**. The rigid layer **270** of the third cushioning block **116** and the other cushioning blocks shown in FIG. **24** includes one or more honeycomb panel **410**, but any of the rigid sheet panels **400** discussed herein can be used. More specifically, the third cushioning block **116** includes the cushioning block **204** discussed above with reference to FIG. **15**A, but with a plurality of cushioning layers **210**, such as the first cushioning layer **212***a* and the second cushioning layer **212***b* discussed above with reference to FIG. **5**B.

(168) The U-shaped packing material **180** also includes a plurality of cushioning blocks positioned on a first side of the U-shaped packing material **180** similarly to the first cushioning block **112** discussed above with reference to FIG. **17**. More specifically, the U-shaped packing material **180** includes, on the first side, a first-side first-end cushioning block **181**, a first-side second-end cushioning block **183**, and a first-side intermediate cushioning block **185**. Each of the first-side first-end cushioning block **181**, the first-side second-end cushioning block **183**, and the first-side intermediate cushioning block **185** shown in FIG. **25** are composite cushioning blocks formed with one or more cushioning layers **210**, such as the cushioning layer **212** discussed above with reference to FIG. **5**B, and one or more rigid layers **270**, such as the honeycomb panel **410**. The first-side first-end cushioning block **181**, the first-side second-end cushioning block **183**, and the first-side intermediate cushioning block **185** are connected to each other by a corrugated fiberboard sheet **130** and, more specifically, a first corrugated fiberboard sheet portion **132** positioned on the first side of the U-shaped packing material **180**. Each of the first-side first-end cushioning block **181** and the first-side second-end cushioning block **183** is separated from the first-side intermediate cushioning block **185** by a first-side connection portion **187** of the corrugated fiberboard sheet **130**.

(169) Similarly, the U-shaped packing material **180** includes a plurality of cushioning blocks positioned on a second side of the U-shaped packing material **180**, similarly to the second cushioning block **114** discussed above with reference to FIG. **17**. More specifically, the U-shaped packing material **180** includes, on the first side, a second-side first-end cushioning block **182**, a second-side second-end cushioning block **184**, and a second-side intermediate cushioning block **186**. Each of the second-side first-end cushioning block **182**, the second-side second-end cushioning block **184**, and the second-side intermediate cushioning block **186** shown in FIG. **25** are formed with one or more cushioning layers **210**, such as the cushioning layer **212** discussed above with reference to FIG. **5**B. The second-side first-end cushioning block **182**, the second-side second-end cushioning block **184**, and the second-side intermediate cushioning block **186** are connected to each other by a corrugated fiberboard sheet **130** and, more specifically, a second corrugated fiberboard sheet portion **134** positioned on the second side of the U-shaped packing material **180**. Each of the second-side first-end cushioning block **182** and the second-side second-end cushioning block **184** is separated from the second-side intermediate cushioning block **186** by a second-side connection portion **188** of the corrugated fiberboard sheet **130**.
(170) The first-side first-end cushioning block **181** is positioned to oppose the second-side first-end cushioning block **182** with the product cavity **122** therebetween. The first-side second-end cushioning block **183** is positioned to oppose the second-side second-end cushioning block **184** with the product cavity **122** therebetween. The first-side intermediate cushioning block **185** is positioned to oppose the second-side intermediate cushioning block **186** with the product cavity **122** therebetween.
(171) While shown with certain configurations of cushioning blocks, the first-side first-end cushioning block **181**, the second-side first-end cushioning block **182**, the first-side second-end cushioning block **183**, the second-side second-end cushioning block **184**, the first-side intermediate cushioning block **185**, and the second-side intermediate cushioning block **186** can be formed using other cushioning blocks discussed herein. Indeed, the cushioning protection afforded by the first cushioning layer **212***a* and the second cushioning layer **212***b* of the third cushioning block **116** may be sufficient, and in such a case, the sides of the U-shaped packing material **180** can include a rigid layer **270**, like the honeycomb panel **410**, without a cushioning layer. Similarly, although shown as separate cushioning blocks, the first-side first-end cushioning block **181**, the first-side second-end cushioning block **183**, and the first-side intermediate cushioning block **185** can be one continuous elongated cushioning block, and similarly, the second-side first-end cushioning block **182**, the second-side second-end cushioning block **184**, and the second-side intermediate cushioning block **186** can be one continuous elongated cushioning block.
(172) FIG. **24**B shows a U-shaped packing material **190** that can be used as, for example, one of the U-shaped packing materials **104** discussed above with reference to FIG. **1**. The U-shaped packing material **190** is formed similarly to the U-shaped packing material **180** discussed above with reference to FIG. **24**A. Instead of having a plurality of cushioning blocks on the first side and the second side of the U-shaped packing material **190**, the U-shaped packing material **190** has one block on the first side, a first side bock **192**, and one block on the second side, a second side bock **194**. Each of the first side block **192** and the second side block **194** includes a rigid panel **400** and, more specifically, a rigid panel without a cushioning layer. The rigid panel **400** shown in FIG. **24**B is a honeycomb panel **410**, but any of the rigid panels discussed herein may be used. Where packing materials with only rigid panels, such as honeycomb panels have been known to fail, the addition of the cushioning layer on the underside (the third cushioning block **116**) has been found to provide sufficient cushioning for products **10**, such as TVs. Although shown with only a rigid panel **400**, the first side block **192** and the second side block **194** can include any of the cushioning blocks, such as the composite cushioning blocks discussed herein.
(173) FIG. **25**A to **25**C show other cushioning layers, which are referred to herein as irregular cushioning layers **500**, formed from a first cushioning panel **512** and a second cushioning panel

514. The irregular cushioning layers **500** discussed herein can be used as any one of the cushioning layers discussed above, particularly where the cushioning layers abut or otherwise come into contact with the product **10**. FIG. **25**A shows an irregular cushioning layer **510** that can be used to form a cushioning block. The first cushioning panel **512** and the second cushioning panel **514** are similar to the first cushioning panel **220** (see, e.g., FIG. **2**) and the second cushioning panel **230** (see, e.g., FIG. **2**). When the cushioning panel, such as the first cushioning panel **512**, is a molded cushioning panel, the first cushioning panel **512** can be molded to a variety of shapes. For example, the first cushioning panel **512** and, more specifically, the product side and a product-side surface **124** of a cushioning block formed using the irregular cushioning layer **510** can be shaped to conform to the shape of the product **10**, such as an irregularly shaped product **12**. Accordingly, the irregular cushioning layer **510** and, more specifically, the first cushioning panel **512** formed therefrom can include product-side recesses **516**, product-side protrusions **518**, or both formed on the product side of a cushioning block formed using the irregular cushioning layer **510**. The product-side recesses **516** and product-side protrusions **518** can thus be formed on the back-side surface **314** of the first cushioning panel **512**.

(174) FIG. **25**B shows another irregular cushioning layer **520** that is similar to the irregular cushioning layer **510** discussed above with reference to FIG. **25**A. The irregular cushioning layer **520** is formed from a first cushioning panel **522** and a second cushioning panel **524**, similar to the first cushioning panel **512** and the second cushioning panel **514**, respectively. In the first cushioning panel **512** and the second cushioning panel **514** discussed above, the projections **320** (e.g., the first projections **224** and the second projections **234**) on the projection side of the first cushioning panel **512** and second cushioning panel **514** can have a repeating or regular pattern arrangement. As depicted in FIG. **25**B, however, the first projections **224** can be a non-repeating pattern, such as omitted over a projection free portion **526** of the first cushioning panel **522**, such as a portion of the first cushioning panel **522** that includes a product-side recesses **516**.

(175) FIG. **25**C shows another irregular cushioning layer **530** that is similar to the irregular cushioning layer **520** discussed above with reference to FIG. **25**B. The irregular cushioning layer **530** is formed from a first cushioning panel **532** and a second cushioning panel **534**, similar to the first cushioning panel **522** and the second cushioning panel **524**, respectively. In FIG. **25**C, the first projections **224** of the first cushioning panel **532** are omitted and the second projections **234** of the second cushioning panel **534** have a non-repeating pattern, such as an enlarged projection **536** abutting the projection free portion **526**.

(176) FIGS. **26**A to **30**C show various configurations of the cushioning blocks discussed herein forming a shipping container. While the packing materials **100** (FIG. **1**) discussed herein may be separate from the shipping box **20** (FIG. **1**) and placed inside the shipping box **20**, other configurations may be used, such as those discussed below, to form a shipping container.

(177) FIGS. **26**A and **26**B show a shipping container **600** formed using the cushioning blocks **200** (see, e.g., FIG. **2**) discussed herein. The shipping container **600** is configurable in a flat configuration and a folded configuration. The flat configuration is shown in FIG. **26**A and the folded configuration is shown in FIG. **26**B. The shipping container **600** includes a corrugated fiberboard sheet **610**, similar to the corrugated fiberboard sheet **130** discussed above. The corrugated fiberboard sheet **610** is sectioned to form a plurality of sections that can be folded from the flat state to the folded state and form a box in the folded state. Various patterns for sectioning the fiberboard sheet **610** can be used. Although the shipping container **600** can have other shapes, the shipping container **600** shown in FIG. **26**B is a rectangular shipping container, and the plurality of sections of the fiberboard sheet **610** include a front section **611**, a left-side section **612**, a right-side section **613**, a back section **614**, a first top flap **615**, a second top flap **616**, a first bottom flap **617**, and a second bottom flap **618**. A cushioning block **200** can be attached to each section of the plurality of sections of the fiberboard sheet **610** in a manner similar to that discussed above with reference to FIGS. **20**A and **20**B. More specifically, the shipping container **600** can include a front

cushioning block **621**, a left-side cushioning block **622**, a right-side cushioning block **623**, a back cushioning block **624**, a first top cushioning block **625**, a second top cushioning block **626**, a first bottom cushioning block **627**, and a second bottom cushioning block **628**, attached to an inner surface of the front section **611**, the left-side section **612**, the right-side section **613**, the back section **614**, the first top flap **615**, the second top flap **616**, the first bottom flap **617**, and the second bottom flap **618**, respectively.

(178) Each of the cushioning blocks **621**, **622**, **623**, **624**, **625**, **626**, **627**, and **628**, can be separated from each other with a gap therebetween. The corrugated fiberboard sheet **610** can thus include connection portions **619** between adjacent cushioning blocks **621**, **622**, **623**, **624**, **625**, **626**, **627**, and **628**. The connection portions **619** are similar to the connection positions discussed above, such as first connection portion **152**. The connection portions **619** allow adjacent cushioning blocks **621**, **622**, **623**, **624**, **625**, **626**, **627**, and **628** to be folded relative to each other from the flat configuration shown in FIG. **26**A to the folded configuration shown in FIG. **26**B, to form the shipping container **600** with a product cavity **122** formed therein for a product to be shipped. The shipping container **600** can be held in the folded configuration using the methods for shipping boxes, such as a strip of adhesive (e.g., tape) or adhesive applied to overlapping portions of the shipping container **600**.

(179) FIGS. **27**A and **27**B show a shipping container **601** formed using the cushioning blocks **200** (see, e.g., FIG. **2**) discussed herein. The shipping container **601** is similar to the shipping container **600** discussed above with reference to FIGS. **26**A and **26**B. The shipping container **601** is configurable in a flat configuration and a folded configuration. The flat configuration is shown in FIG. **27**A and the folded configuration is shown in FIG. **27**B. An advantage of using the cushioning blocks **200** discussed herein is that the cushioning blocks **200** can be configurated to conform more directly to the product **10** and, in particular, a product **10** that does not have a rectangular shape. The cushioning blocks **621**, **622**, **623**, **624**, **625**, **626**, **627**, and **628** can have positions with additional layers added thereto to better conform to the shape of the product **10** and form a product cavity **122** that has a non-rectangular cross-sectional. As shown in FIGS. **27**A and **27**B, for example, the front cushioning block **621** and the back cushioning block **624** each include portions with additional layers **632**, such as additional cushioning layers, formed thereon. To accommodate additional layers **632**, other cushioning blocks **621**, **622**, **623**, **624**, **625**, **626**, **627**, and **628**, such as the first top cushioning block **625**, the second top cushioning block **626**, the first bottom cushioning block **627**, and the second bottom cushioning block **628**, can include cutouts **634** to accommodate additional layers **632**.

(180) FIGS. **28**A and **28**B show a shipping container **602** formed using the cushioning blocks **200** (see, e.g., FIG. **2**) discussed herein. The shipping container **602** is similar to the shipping container **601** discussed above with reference to FIGS. **27**A and **27**B. The shipping container **602** is configurable in a flat configuration and a folded configuration. The flat configuration is shown in FIG. **28**A, and the folded configuration is shown in FIG. **28**B. As noted above, irregular cushioning layers **500** can be advantageously used to form irregular cushioning blocks **636**. As shown in FIGS. **28**A and **28**B, one or more of the cushioning blocks can be an irregular cushioning block **636**, such as the back cushioning block **624**, for example. Other cushioning blocks, such as the second top cushioning block **626** and the second bottom cushioning block **628**, can be shaped to accommodate the irregular cushioning blocks **636** when in the folded configuration.

(181) FIGS. **29**A and **29**B show another shipping container **603**. The shipping container **603** is similar to the shipping container **602** shown in FIGS. **28**A and **28**B and is configurable in a flat configuration and a folded configuration. The flat configuration is shown in FIG. **29**A, and the folded configuration is shown in FIG. **29**B. Instead of using the corrugated fiberboard sheet **610**, the shipping container **603** is formed from a single, foldable molded cushioning panel **640**, similar to the cushioning panel **301** discussed above with reference to FIGS. **3**A and **3**B, and the corner-shaped packing material **160** discussed above with reference to FIGS. **21**A and **21**B. Although described with reference to cushioning panel **301** (FIGS. **3**A and **3**B), any of the cushioning panels

300 (e.g., FIGS. **3**A to **3**G) discussed herein may be used.
(182) The foldable molded cushioning panel **640** includes a front projection section **641**, a left-side projection section **642**, a right-side projection section **643**, a back projection section **644**, a first top flap projection section **645**, a second top flap projection section **646**, a first bottom flap projection section **647**, and a second bottom flap projection section **648** arranged in a manner similar to the front section **611**, the left-side section **612**, the right-side section **613**, the back section **614**, the first top flap **615**, the second top flap **616**, the first bottom flap **617**, and the second bottom flap **618**, discussed above. Each of these projection sections **641**, **642**, **643**, **644**, **645**, **646**, **647**, and **648** are sections containing projections **320**, such as the cylindrical projections **331**.
(183) The foldable molded cushioning panel **640** also includes connection portions **649** similar to the first connection portion **172** discussed above with reference to FIGS. **21**A and **21**B. The connection portions **649** are positioned between adjacent projection sections **641**, **642**, **643**, **644**, **645**, **646**, **647**, and **648** to allow the projection sections **641**, **642**, **643**, **644**, **645**, **646**, **647**, and **648** to be folded relative to each other in the manner discussed above, as with the foldable molded cushioning panel **170** in FIGS. **21**A and **21**B, additional layers discussed herein can be attached to each of the projection sections **641**, **642**, **643**, **644**, **645**, **646**, **647**, and **648** to form the various cushioning blocks discussed herein.
(184) FIGS. **30**A and **30**C show another shipping container **604** (FIG. **30**C). The shipping container **604** shown in FIGS. **30**A and **30**C is similar to the shipping container **603** discussed above with reference to FIGS. **29**A and **29**B. Instead of being formed from one foldable molded cushioning panel, the shipping container **603** shown in FIGS. **30**A to **30**C is formed from a plurality of foldable molded cushioning panels. FIG. **30**A shows a first foldable molded cushioning panel **652**, and FIG. **30**B shows a second foldable molded cushioning panel **654**. Each of the first foldable molded cushioning panel **652** and the second foldable molded cushioning panel **654** can be any of the cushioning panels **300** (e.g., FIGS. **3**A to **3**G) discussed herein, such as the cushioning panel **301** with cylindrical projections **331**, for example. The first foldable molded cushioning panel **652** can be positioned relative to the second foldable molded cushioning panel **654** to form a cushioning layer **650** (FIG. **30**C), similarly to the first cushioning panel **220** (FIG. **2**) and the second cushioning panel **230** (FIG. **2**) in the manner discussed above. The first foldable molded cushioning panel **652** is an inner cushioning panel that can be positioned adjacent to the product **10** (FIG. **30**C) and can be an irregular cushioning sheet, similar to the first cushioning panel **512** (FIG. **16**A) discussed above. The first foldable molded cushioning panel **652** is shown in a flat configuration in FIG. **30**A, and the second foldable molded cushioning panel **654** is shown in a flat configuration in FIG. **30**B.
(185) FIG. **30**C shows the first foldable molded cushioning panel **652** and the second foldable molded cushioning panel **654** in a folded configuration to form the shipping container **604**. The first foldable molded cushioning panel **652** can be folded to form the product cavity **122**. The cushioning layer **650**, including each of the first foldable molded cushioning panel **652** and the second foldable molded cushioning panel **654**, can be folded to surround the product **10**. The first foldable molded cushioning panel **652** and the second foldable molded cushioning panel **654** can each be folded independently to form the cushioning layer **650**. For example, the first foldable molded cushioning panel **652** can be folded and then the second foldable molded cushioning panel **654** can be folded around the first foldable molded cushioning panel **652** to form the cushioning layer **650** and the shipping container **604**. Alternatively, the first foldable molded cushioning panel **652** and second foldable molded cushioning panel **654** can be placed together in the flat configuration and then folded together. The first foldable molded cushioning panel **652**, whether alone or connected to the second foldable molded cushioning panel **654**, can also be folded around the product **10**.
(186) FIG. **31** shows an alternative cushioning panel **700**. The cushioning layers **210** (FIG. **2**) used in the cushioning blocks **200** (FIG. **2**) discussed above are formed using the molded paper pulp

panel as the cushioning panel, but other cushioning panels may be used to form the cushioning blocks. This cushioning panel **700** is formed from a sheet that includes projections **720** that are allowed to deform when a load is exerted thereon. More specifically in FIG. **31**, the cushioning panel **700** includes a plurality of flutes **722** formed in the sheet that also includes a base layer **712**. The base layer **712** is similar to the base layers **310** (FIG. **3**B) discussed above. The flutes **722** form the projections **720** of the cushioning panel **700**. These flutes **722** are spaced apart from each other, and this spaced apart configuration allows the flutes **722** to deform relative to the base layer **712**, providing cushioning. The cushioning panel **700** can be formed from various cellulosic sheets discussed above. The corrugated fiberboard sheet **710** can be folded, or otherwise formed, into the flutes **722**. The flutes **722** are elongated and extend parallel to each other. The flutes **722** can have various shapes, as will be discussed further below.

(187) The cushioning panel **700** shown in FIG. **31** includes flutes **722** that are triangularly shaped, which are referred to herein as triangular flutes **732**. For clarity, with other cushioning panels discussed herein, these cushioning panels are referred to as triangularly fluted cushioning panels **730**. The triangular flutes **732** include a plurality of cell walls that define a triangularly shaped cell, which is referred to as a triangular cell **734**. The plurality of cell walls includes a distal wall **742**, forming the base of the triangle, and is similar to the distal ends **322** (see, FIG. **3**B) discussed above. The first transverse wall **744** is distal from the base layer **712**. The plurality of cell walls also includes a first transverse wall **744** and a second transverse wall **746**. The first transverse wall **744** and the second transverse wall **746** can be a portion of the corrugated fiberboard sheet **710** that extends transversely from the base layer **712** or a surface thereof. The corrugated fiberboard sheet **710** can be a continuous sheet, and each of the first transverse wall **744** and the second transverse wall **746** connects one of the base layer **712** with the distal wall **742**, forming a side of one of the triangular cells **734**. The ends of the first transverse wall **744** and the second transverse wall **746** are closer to each other on the base layer **712** side than the ends on the distal wall **742**, forming an apex **736** of the triangular cell **734**. The first transverse wall **744** and the second transverse wall **746** can abut each other at the second transverse wall **746**, but, as shown in FIG. **31**, for example, the ends of each of the first transverse wall **744** and the second transverse wall **746** can be spaced apart from each other to form a gap in the base layer **712**. The sizing and spacing of the flutes **722**, such as the triangular flutes **732**, including the gap at the apex **736** can be varied to provide different cushioning properties.

(188) FIG. **32** shows the triangularly fluted cushioning panel **730** used as a cushioning layer **210** of a cushioning block **208**. The triangularly fluted cushioning panel **730** can be used in a manner similar to any one of the cushioning panels discussed above. As shown in FIG. **32**, for example, the triangularly fluted cushioning panel **730** is used to form a composite cushioning block with a rigid layer **270** formed of a honeycomb panel **410**.

(189) FIG. **33** shows rigid sheet panel **400** and, more specifically, a shaped corrugated fiberboard rigid sheet panel **402**. The shaped corrugated fiberboard rigid sheet panel **402**, shown in FIG. **33**, includes a first surface and a second surface. For ease of reference herein, the first surface will be referred to as a top surface **432** and the second surface will be referred to as a bottom surface **434**, but depending upon use, the surfaces may have different orientations, such as outer surfaces and inner surfaces. The shaped corrugated fiberboard rigid sheet panel **402** can be formed from a corrugated fiberboard sheet **436** that is folded or otherwise shaped to form a plurality of triangularly shaped cells and, more specifically, a plurality of first triangular cells **440** and a plurality of second triangular cells **450**. The first triangular cells **440** and second triangular cells **450** are arranged in an alternating pattern with each of the first triangular cells **440** adjacent to and, more specifically, between two of the second triangular cells **450** and, similarly, with the exception of an end cell, each of the second triangular cells **450** is adjacent to and, more specifically, between two of the first triangular cells **440**. The end cells, however, are adjacent to only one cell. If one of the first triangular cells **440** is on the end (an end cell), the end cell of the first triangular cells **440**

is adjacent to one of the second triangular cells **450** and, similarly, if one of the second triangular cells **450** is on the end (an end cell), the end cell of the second triangular cells **450** is adjacent to one of the first triangular cells **440**. Each of the plurality of triangular cells (i.e., the first triangular cells **440** and the second triangular cells **450**) have a longitudinal axis, which, in the depicted embodiment, extends in a direction parallel to the top surface **432**, the bottom surface **434**, or both.
(190) Each of the first triangular cells **440** includes a base portion, which is referred to herein as a first base portion **442**. The first base portion **442** is a portion of the corrugated fiberboard sheet **436**, and collectively, the plurality of first base portions **442** forms a top wall. The top surface **432** is an outer surface of the top wall. Similarly, each of the second triangular cells **450** includes a base portion, which is referred to herein as a second base portion **452**. The second base portion **452** is a portion of the corrugated fiberboard sheet **436**, and collectively, the plurality of second base portions **452** forms a bottom wall. The bottom surface **434** is an outer surface of the bottom wall. The first triangular cells **440** and the second triangular cells **450** are thus arranged in an interlocking pattern.
(191) The shaped corrugated fiberboard rigid sheet panel **402** also includes a plurality of transverse walls **438**. A transverse wall **438** can be a portion of the corrugated fiberboard sheet **436** that extends transversely to the top surface **432** and the bottom surface **434**. The shaped corrugated fiberboard rigid sheet panel **402** can be formed from a continuous sheet (i.e., the corrugated fiberboard sheet **436**), and each transverse wall **438** connects one of the first base portions **442** with one of the second base portions **452**, forming a side of one of the triangularly shaped cells. The transverse wall **438** separates one first triangular cell **440** from an adjacent second triangular cell **450**. Two transverse walls **438** are brought together opposite a base portion to form the apex of the triangular cell. More specifically, two transverse walls **438** may be brought together opposite the first base portion **442** to form a first apex **444** of one of the first triangular cells **440**, and two transverse walls **438** may be brought together opposite the second base portion **452** to form a second apex **454** of one of the second triangular cells **450**. The transverse walls **438** attach to the ends of the first base portion **442** and the second base portion **452**. In the depicted embodiment, each end of the first base portion **442** abuts an end of an adjacent first base portion **442** at the second apex **454**, and each end of the second base portion **452** abuts an end of an adjacent second base portion **452** at the first apex **444**. In some embodiments, an adhesive may be at each of the first apexes **444** and each of the second apexes **454**.
(192) The transverse walls **438** of the depicted embodiment have the same length and thus the first triangular cells **440** and the second triangular cells **450** may be isosceles triangles or equilateral triangles. In some embodiments, the first base portion **442** and/or the second base portion **452** is the same length as each of the transverse walls **438**, but in other embodiments, the first base portion **442** and/or the second base portion **452** has a length that is greater or less than each of the transverse walls **438**. The first triangular cells **440** and the second triangular cells **450** are each acute isosceles triangles in FIG. **1**, but other shapes may be used, such as obtuse triangles. The numbers, size, and density of the cells may be varied according to the overall crush, burst, and flexibility desired. The angles of the vertices and length of the first base portion **442**, the second base portion **452**, and the transverse walls **438** of the triangular cells may be varied to adjust the properties of the shaped corrugated fiberboard rigid sheet panel **402**.
(193) FIG. **34** shows the shaped corrugated fiberboard rigid sheet panel **402** used as the rigid layer **270** of a cushioning block **209**. The shaped corrugated fiberboard rigid sheet panel **402** can be used in a manner similar to any one of the rigid sheet panels discussed above. As shown in FIG. **34**, for example, the shaped corrugated fiberboard rigid sheet panel **402** is used to form a composite cushioning block with the triangularly fluted cushioning panel **730**.
(194) FIG. **35** shows another alternative cushioning panel **700**. As noted above, the flutes **722** can have various shapes, and the cushioning panel **700** shown in FIG. **35** has projections **720** that are V-shaped or waved shaped. For clarity with other cushioning panels discussed herein, this cushioning

panel is referred to as a V-shaped cushioning panel **750**. The V-shaped cushioning panel **750** can be formed from a cellulosic sheet discussed herein, such as a corrugated fiberboard sheet **752**. The V-shaped cushioning panel **750** includes a plurality of macro flutes **760** that are arranged parallel to each other. These macro flutes **760** will be referred to as macro flutes **760** to distinguish these flutes from the interior flutes of the corrugated fiberboard sheet **752** forming the V-shaped cushioning panel **750**. The macro flutes **760** of the V-shaped cushioning panel **750** are parallel to the interior flutes.

(195) The macro flutes **760** can have a generally triangular shape (or V-shape) with a first planar surface **762** connected to a second planar surface **764** at a peak **766**. Adjacent macro flutes **760** are connected to each other at a valley **768**, providing a structure of a plurality of alternating ridges (the peaks **766**) and grooves (the valleys **768**). The macro flutes **760** are shown as having the same height and spacing, but they are not so limited and may have different heights and spacings.

(196) FIG. **36** shows the V-shaped cushioning panel **750** used as a cushioning layer **210** of a cushioning block **754**. The V-shaped cushioning panel **750** can be used in a manner similar to any one of the cushioning panels discussed above. As shown in FIG. **36**, for example, the V-shaped cushioning panel **750** is used to form a composite cushioning block with a rigid layer **270** formed of a honeycomb panel **410**.

(197) FIGS. **37**A and **37**B show another alternative cushioning panel **700**. For clarity with other cushioning panels discussed herein, this cushioning panel is referred to as a finned cushioning panel **770**. FIG. **11**A is a perspective view of the finned cushioning panel **770**, and FIG. **37**B is a detail view, showing detail **37**B in FIG. **37**A of the finned cushioning panel **770**. The projections **720** of the finned cushioning panel **770** are fins **780** that are arranged parallel to each other. The finned cushioning panel **770** can be formed from a cellulosic sheet discussed herein, such as a corrugated fiberboard sheet **772**. The fins **780** of the finned cushioning panel **770** can be parallel to the interior flutes of the corrugated fiberboard sheet **772** used to form the finned cushioning panel **770**. The fins **780** can be separated from each other by a base section **774** of the finned cushioning panel **770**. The base section **774** is generally planar. The base section **774** can be similar to the base layers discussed above. Each of the fins **780** is connected to a base section **774**, and the fins **780** project from the base section **774**.

(198) As shown in FIG. **37**B, the fins **780** of this embodiment have a U-shape or a horseshoe shape, and each fin **780** includes a first projecting portion **782** connected to a second projecting portion **784** at a peak **786**. The peak **786** is similar to the distal ends of the projections discussed above. The end of each of the first projecting portion **782** and the second projecting portion **784** that is connected to the base section **774** is a base end portion **788**. The base end portion **788** is the end of the first projecting portion **782** or the second projecting portion **784** opposite the peak **786**. The first projecting portion **782** and the second projecting portion **784** can be continuously connected to each other at the peak **786** and can be a continuation of the same corrugated material at the peak **786** without being cut or separated.

(199) Other portions of the first projecting portion **782** and the second projecting portion **784** (beyond the peak **786**) may also be connected to each other. For example, an adhesive may be applied between an interior surface of the first projecting portion **782**, an interior surface of the second projecting portion **784**, or both. Although the adhesive may be applied to the full length of the interior surface of the first projecting portion **782** and/or the interior surface of the second projecting portion **784**, the adhesive can be applied between the base end portion **788** of the interior surface of the first projecting portion **782** and/or the base end portion **788** the interior surface of the second projecting portion **784**. In this way, the first projecting portion **782** and the second projecting portion **784** are also connected to each other at the base end portion **788**. Connecting the first projecting portion **782** and the second projecting portion **784** at the base end portion **788** helps prevent the fin **780** from spreading out when a force is applied to the peak **786**, for example, and thus provides rigidity to the fin **780** and a protective (cushioning) effect of the finned cushioning

panel **770** overall. Among other things, the spacing between the fin **780** (e.g., the length of the base section **774**) can be varied to adjust the cushioning properties of the finned cushioning panel **770**.
(200) FIG. **38** shows the finned cushioning panel **770** used as a cushioning layer **210** of a cushioning block **776**. The finned cushioning panel **770** can be used in a manner similar to any one of the cushioning panels discussed above. As shown in FIG. **36**, for example, the finned cushioning panel **770** is used to form a composite cushioning block with a rigid layer **270** formed of a honeycomb panel **410**.
(201) FIGS. **39**A and **39**B show a cushioning block **460** having a cushioning layer **210**, such as the cushioning layer **211** discussed above, and a rigid layer **270**. FIG. **39**A is an exploded view of the cushioning block **460**, and FIG. **39**B is a perspective view of the cushioning block **460**. Although shown with the cushioning layer **211** discussed above with reference to FIGS. **4**A and **4**B, any of the cushioning layers discussed herein can be used. The rigid layer **270** includes one or more rigid sheet panels **400**. The rigid sheet panel **400** shown in FIGS. **39**A and **39**B is referred to herein as a lattice-structured rigid sheet panel **404**. The lattice-structured rigid sheet panel **404** can be used in any of the cushioning blocks discussed herein.
(202) The lattice-structured rigid sheet panel **404** includes a plurality of strips including first strips **462** and second strips **464** positioned transversely to each other to form a lattice structure **466** with a plurality of cells **468**. The first strips **462** and the second strips **464** have a width that is oriented in the thickness direction of the cushioning block **460**. The first strips **462** and the second strips **464** can be positioned such that the cells **468** are oriented in the thickness direction of the cushioning block **460**. The first strips **462** and the second strips **464** can be positioned orthogonal to the outer side **238** of the second cushioning panel **230**. The cells **468** are shown as rectangular cells with the first strips **462** being positioned orthogonally relative to the second strips **464**, but other angles can be used.
(203) The lattice structure **466** can be formed in different ways. The lattice structure **466** can be formed as a molded pulp structure with the first strips **462** and the second strips **464** being integrally formed with each other. Alternatively, the first strips **462** and the second strips **464** can be formed as separate strips and then interlocked with each other. For example, the first strips **462**, the second strips **464**, or both, can have slits formed therein to interlock with the other strip. The first strips **462** and the second strips **464** can be corrugated fiberboard strips that are interlocked with each other. When the first strips **462** and the second strips **464** are corrugated fiberboard strips, the flutes of the corrugated fiberboard can be oriented in the thickness direction of the cushioning block **460**.
(204) As noted above, adhesive can be used in various contexts. Any suitable adhesive may be used, but throughout the embodiments discussed herein, the adhesive is preferably a biodegradable adhesive.
(205) Throughout the embodiments discussed herein, various features are described as being similar to one another. Accordingly, the discussion of one feature also applies to the features that are similar to that feature. In some cases, the same reference numerals are used to describe the same or similar features throughout. Additionally, various layers are described separately above, but as noted, these layers can be combined in various combinations, including those not explicitly illustrated, to form packing materials and, more specifically, various different cushioning blocks.
(206) Although this invention has been described with respect to certain specific exemplary embodiments, many additional modifications and variations will be apparent to those skilled in the art in light of this disclosure. It is, therefore, to be understood that this invention may be practiced otherwise than as specifically described. Thus, the exemplary embodiments of the invention should be considered in all respects to be illustrative and not restrictive, and the scope of the invention to be determined by any claims supportable by this application and the equivalents thereof, rather than by the foregoing description.

Claims

1. A packing material comprising: one or more cushioning layers, each cushioning layer including: a first molded pulp cushioning panel comprising a plurality of cellulosic fibers molded into a panel having a first base layer and a plurality of first projections extending therefrom, each of the first projections having a distal end that is distal from the first base layer; and a second molded pulp cushioning panel comprising a plurality of cellulosic fibers molded into a panel having a second base layer and a plurality of second projections extending therefrom, each of the second projections having a distal end that is distal from the second base layer, wherein the first molded pulp cushioning panel is positioned with the plurality of first projections projecting toward the second molded pulp cushioning panel, and wherein the second molded pulp cushioning panel is positioned with the plurality of second projections projecting toward the first molded pulp cushioning panel, and at least a portion of the second projections of the plurality of second projections being second contacting projections, the distal ends of the second contacting projections contacting the first molded pulp cushioning panel.
2. The packing material of claim 1, wherein the first molded pulp cushioning panel and the second molded pulp cushioning panel are a first portion and a second portion of a foldable molded pulp panel having a connection portion connecting the first portion and the second portion.
3. The packing material of claim 1, wherein at least a portion of the second contacting projections are internal second contacting projections, and each internal second contacting projection is positioned between two or more adjacent first projections of the plurality of first projections.
4. The packing material of claim 1, wherein at least a portion of the first projections of the plurality of first projections are first contacting projections, the distal ends of the first contacting projections contacting the second molded pulp cushioning panel.
5. The packing material of claim 4, wherein at least a portion of the second contacting projections are internal second contacting projections, and each internal second contacting projection is positioned between two or more adjacent first projections of the plurality of first projections.
6. The packing material of claim 4, wherein the first contacting projections contact the second molded pulp cushioning panel by the distal end of each first contacting projection contacting at least one of the plurality of second projections, and wherein the second contacting projections contact the first molded pulp cushioning panel by the distal end of each second contacting projection contacting at least one of the plurality of first projections.
7. The packing material of claim 6, wherein the first contacting projections and the second contacting projections are positioned to directly oppose each other with the distal end of each first contacting projection contacting a distal end of a corresponding second contacting projection.
8. The packing material of claim 1, comprising two or more cushioning layers including a first cushioning layer and a second cushioning layer, wherein, for each cushioning layer, the first base layer has an inner side and an outer side, the inner side of the first base layer being positioned to oppose the second molded pulp cushioning panel and the plurality of first projections extending from the inner side of the first base layer, and the second base layer has an inner side and an outer side, the inner side of the second base layer being positioned to oppose the first molded pulp cushioning panel and the plurality of second projections extending from the inner side of the second base layer, and wherein the outer side of one of the first base layer or the second base layer of the first cushioning layer abuts the outer side of one of the first base layer or the second base layer of the second cushioning layer.
9. The packing material of claim 1, wherein the first projections, the second projections, or both are elongated ridges extending parallel to each other.
10. The packing material of claim 1, wherein each first projection of the plurality of first projections has a first geometric shape, and wherein each second projection of the plurality of

second projections has a second geometric shape, the second geometric shape being a different geometric shape than the first geometric shape.

11. The packing material of claim 1, wherein each first projection of the plurality of first projections has a first geometric shape, and wherein each second projection of the plurality of second projections has a second geometric shape, the second geometric shape being the same geometric shape as the first geometric shape.

12. The packing material of claim 1, wherein, for each cushioning layer, the second base layer has an inner side and an outer side, the inner side of the second base layer being positioned to oppose the first molded pulp cushioning panel and the plurality of second projections extending from the inner side of the second base layer, each second projection of the plurality of second projections having a tip and a length from the inner side to the tip, the plurality of second projections having a plurality of different lengths.

13. A composite packing material comprising: one or more cushioning layers arranged to have a product side and an outer side, each cushioning layer including: a first molded pulp cushioning comprising a plurality of cellulosic fibers molded into a panel having a first base layer and a plurality of first projections extending therefrom; and a second molded pulp cushioning panel comprising a plurality of cellulosic fibers molded into a panel having a second base layer and a plurality of second projections extending therefrom, wherein the first molded pulp cushioning panel and the second molded pulp cushioning panel are positioned to contact each other with the plurality of first projections projecting toward the second molded pulp cushioning panel and the plurality of second projections projecting toward the first molded pulp cushioning panel; and a cellulosic sheet positioned on the outer side of the one or more cushioning layers.

14. The composite packing material of claim 13, wherein the cellulosic sheet is a corrugated fiberboard sheet.

15. The composite packing material of claim 14, further comprising a rigid panel positioned between one of the cushioning layers and the cellulosic sheet, the rigid panel being formed of a cellulosic material, wherein the rigid panel has a rigidity greater than that of each cushioning layer when a load is applied in a thickness direction of the rigid panel or the cushioning layer.

16. The composite packing material of claim 13, wherein the cellulosic sheet is a honeycomb panel including a plurality of cells extending in a thickness direction of the packing material, and the plurality of first projections and the plurality of second projections extend in the thickness direction of the packing material.

17. A composite packing material comprising: a cushioning layer including a molded pulp cushioning panel comprising a plurality of cellulosic fibers molded into a panel having a base layer and a plurality of projections extending therefrom, each of the projections having a distal end that is distal from the base layer, layer; and a rigid panel contacting the cushioning layer, the rigid panel being formed of a cellulosic material, wherein the rigid panel has a rigidity greater than that of the molded pulp cushioning panel when a load is applied in a thickness direction of the rigid panel or the molded pulp cushioning panel.

18. The composite packing material of claim 17, wherein the rigid panel is a honeycomb panel including a plurality of cells extending in a thickness direction of the packing material.

19. The composite packing material of claim 17, wherein the rigid panel is a lattice-structured panel having cells oriented in the thickness direction of the rigid panel.

20. The composite packing material of claim 17, wherein the plurality of projections extends from the base layer in a direction away from the rigid panel.

21. The composite packing material of claim 17, wherein the plurality of projections extends from the base layer in a direction toward from the rigid panel, the rigid panel including a first surface the distal ends of the plurality of projections contacting the first surface.

22. A packing material comprising: one or more cushioning blocks capable of being positioned around an object-to-be-shipped on a product side of each cushioning block, each cushioning block

comprising: one or more cushioning layers, each cushioning layer including: a first molded pulp cushioning panel comprising a plurality of cellulosic fibers molded into a panel having a first base layer and a plurality of first projections extending therefrom, each of the first projections having a distal end that is distal from the first base layer; and a second molded pulp cushioning panel comprising a plurality of cellulosic fibers molded into a panel having a second base layer and a plurality of second projections extending therefrom, each of the second projections having a distal end that is distal from the second base layer, wherein the first molded pulp cushioning panel is positioned with the plurality of first projections projecting toward the second molded pulp cushioning panel, and the second molded pulp cushioning panel is positioned with the plurality of second projections projecting toward the first molded pulp cushioning panel.

23. The packing material of claim 22, wherein each cushioning block further comprises a rigid panel contacting one of the cushioning layers.

24. The packing material of claim 23, wherein the rigid panel is a honeycomb panel having a plurality of cells extending in a direction to extend toward the product side of the cushioning block, the honeycomb panel being formed of a cellulosic material.

25. The packing material of claim 23, wherein the one or more cushioning layers are positioned closer to the product side of each cushioning block than the rigid panel.

26. The packing material of claim 22, wherein each cushioning block further comprises a cellulosic outer sheet, the cellulosic outer sheet being a corrugated fiberboard sheet.

27. The packing material of claim 26, wherein each cushioning block further comprises a rigid panel contacting one of the cushioning layers, the corrugated fiberboard sheet contacting one of the cushioning layers or the rigid panel.

28. The packing material of claim 22, wherein the one or more cushioning blocks includes a first cushioning block and a second cushioning block arranged transversely each other to form an L-shape and a product cavity therebetween.

29. The packing material of claim 22, further comprising a corrugated fiberboard sheet including a first portion, a second portion, and a connecting portion connecting the first portion with the second portion, wherein the one or more cushioning blocks includes a first cushioning block and a second cushioning block, the first cushioning block including the first portion of the corrugated fiberboard sheet and the second cushioning block including the second portion of the corrugated fiberboard sheet.

30. The packing material of claim 22, further comprising: a corrugated fiberboard sheet including a plurality of backing portions connected to each other by a plurality of connecting portions, each connecting portion connecting one backing portion with another backing portion; and a plurality of the cushioning blocks, each cushioning block further comprising a backing portion of the plurality of backing portions, wherein the plurality of backing portions connected to each other in a manner to be foldable into a shipping box.
