TECHNICAL FIELD
[0002] The present invention relates to a combination of fungicides. More specifically, the present invention relates to fungicidal combinations comprising succinate dehydrogenase inhibitor fungicides for controlling a broad spectrum of fungal diseases.
BACKGROUND OF THE INVENTION
[0003] Fungicides are an integral and important tool yielded by farmers to control diseases, as well as to improve yields and quality of the crops. There are various fungicides that have been developed over the years with many desirable attributes such as specificity, systemicity, curative and eradicant action and high activity at low use rates.
[0004] Succinate dehydrogenase inhibitor (SDHI) fungicides are known in the art to be broad spectrum and have a high potency. Pyrazolecarboxamides are a group of active compounds within the SDHI family of fungicides that are known to be more potent than most other SDHI fungicides. These molecules specifically bind to the ubiquinone-binding site (Q-site) of the mitochondrial complex II, thereby inhibiting fungal respiration. These fungicides are known to control a broad spectrum of fungal diseases.
[0005] Various other classes of fungicides are also known in the art, such as Quinone outside inhibitors (QoIs), ergosterol-biosynthesis inhibitors, fungicides that act on multiple sites, fungicides that affect mitosis etc. These fungicides have been mixed with SDHI fungicides to achieve a broad spectrum of disease control.
[0006] WO2006037632 teaches combinations of SDHI fungicides with a second active compound. WO2013127818 teaches combinations of SDHI fungicides with various herbicides. WO2006037634 teaches methods of controlling fungi using a combination of SDHI fungicide with various fungicides. However, the prior art does not teach the use of ternary or higher combinations of SDHI fungicides.
[0007] Multi-site fungicides are known to attack fungi at multiple sites. These fungicides are used for broad-spectrum disease control. Multi-site fungicides are especially important in resistance management as well as in control of widespread diseases. Multi-site fungicides are particularly useful for disease control because of their broad spectrum of activity, high tolerance by crop plants, and general usefulness for controlling fungal plant diseases not controlled by active compounds that act on only a single target site in the fungus.
[0008] Many multi-site fungicides have been combined with various SDHI fungicides for disease control. There is a need in the art to improve on the disease spectrum provided by these combinations, particularly with a view to overcoming the resistance being developed to these

fungicides.
[0009] There is therefore a need in the art for combinations of SDHIs with specific multi-site fungicides that helps improve spectrum and overcoming the resistance seen with these fungicides. As crop tolerances are decreasing, lower use rates being imposed and resistance being increasingly observed, there is a need for a combination of actives that allows for broader disease control spectrum that combines curative and preventive actives and has a lower dosage requirement for efficacious control of fungi.
[0010] Therefore, embodiments of the present invention may ameliorate one or more of the above mentioned problems:
One or More Advantages of the Present Invention
[0011] Therefore, embodiments of the present invention may provide combinations of fungicides that possess an enhanced efficacy over the individual fungicides used in isolation.
[0012] Another object of the present invention is to provide a fungicidal combination that causes an enhanced greening of the crops to which it is administered.
[0013] Another object of the present invention is to provide a fungicidal combination that causes late senescence to the crop to which it is applied thereby resulting into an increasing yield of the crop.
[0014] Yet another object of the present invention is to provide a fungicidal combination that results into reduced fungal disease incidence in the crops to which it is applied.
[0015] Another object of the present invention is to provide a fungicidal combination that achieves increased yield in the crops to which it is applied.
[0016] Some or all these and other objects of the invention are can be achieved by way of the invention described hereinafter.
SUMMARY OF THE INVENTION
[0017] Thus, an aspect of the present invention can provide a fungicidal combination comprising at least one succinate dehydrogenase inhibitor fungicide, at least one multi-site fungicide, and at least another fungicide.
[0018] Another aspect of the present invention can provide a fungicidal combination comprising at least one succinate dehydrogenase inhibitor fungicide, at least multi-site fungicide and at least two other fungicides.
[0019] Another aspect of the present invention can provide synergistic compositions comprising at least one succinate dehydrogenase inhibitor fungicide, at least multi-site fungicide, and at least one other fungicide.

Description

DETAILED DESCRIPTION
[0021] The term ‘disease control’ as used herein denotes control and prevention of a disease. Controlling effects include all deviation from natural development, for example: killing, retardation, decrease of the fugal disease. The term ‘plants’ refers to all physical parts of a plant, including seeds, seedlings, saplings, roots, tubers, stems, stalks, foliage and fruits. The term “locus” of a plant as used herein is intended to embrace the place on which the plants are growing, where the plant propagation materials of the plants are sown or where the plant propagation materials of the plants will be placed into the soil. The term “plant propagation material” is understood to denote generative parts of a plant, such as seeds, vegetative material such as cuttings or tubers, roots, fruits, tubers, bulbs, rhizomes and parts of plants, germinated plants and young plants which

are to be transplanted after germination or after emergence from the soil. These young plants may be protected before transplantation by a total or partial treatment by immersion. The term "agriculturally acceptable amount of active" refers to an amount of an active that kills or inhibits the plant disease for which control is desired, in an amount not significantly toxic to the plant being treated.

[0022] Succinate dehydrogenase inhibitor (SDHI) fungicides play an important role in plant protection against many phytopathogenic fungi. These molecules specifically bind to the ubiquinone-binding site (Q-site) of the mitochondrial complex II, thereby inhibiting fungal respiration. Multi-site contact fungicides attack multiple sites within the fugal cells.

[0023] It has surprisingly been found that the addition of a multi-site fungicide to the combinations of succinate dehydrogenase inhibitors with at least another fungicide resulted in surprising and unexpected advantages. It was surprising that the addition of a multi-site fungicide fungicide to the combination of a succinate dehydrogenase inhibitor with at least another fungicide resulted in an enhancement of the efficacy, and a surprising reduction in fungal disease incidence, seen only with the combination of succinate dehydrogenase inhibitors with at least multi-site fungicide and atleast one other fungicide that is not an SDHI. It has further been found that the addition of a multi-site fungicide to these combinations and application of these combinations during the flowering stage of the crop delayed the senescence in the crop to which they were applied, which led to better greening in the crop thereby increasing the level of photosynthesis occurring within the plant, thereby leading to a greater yield from the crop to which they were applied.

[0024] These surprising advantages of the combinations of the invention were not observed when the multi-site fungicide was not present in the combination. Therefore, these unexpected advantages of the combination of the present invention could be attributed to the inclusion of a multi-site fungicide to the combination of a succinate dehydrogenase inhibitor with at least one or two other fungicides.

[0025] The present inventors have found that in the absence of the multi-site fungicide of the present invention, the combination of SDHI fungicides+at least another fungicide or at least two other fungicides shows a reduction of control effectiveness by continuous use over successive years. It was found that the addition of the multi-site fungicide not only enhanced the percentage control, but also reverted the observed control to the original level, which was surprising. Thus, the gradual decay in the percentage efficacy seen by the use of "SDHIs+at least another fungicide+(optionally) at least another fungicide" over the years was reversed with the addition of the multi-site fungicide.

[0026] Thus, in an aspect, the present invention provides a fungicidal combination comprising:

EXAMPLES
[0807] Studies were conducted to study the addition of multi-site fungicide to succinate dehydrogenase inhibitor fungicides and at least one other fungicide and the contribution of the multi-site fungicide to the efficacy of these mixtures. Experiments were conducted over a period of two years to study the effect of the addition of multi-site fungicides on the efficacy of succinate dehydrogenase inhibitors alone and when combined with a co-fungicide. Doses tested were at rates of 2000 g/ha for tribasic copper sulfate (TBCS), 150 ml/ha for the ergosterol biosynthesis inhibitor, 200 ml/ha for the Quinone outside inhibitor, 1000 g/ha and 200 ml/ha for succinate dehydrogenase inhibitor fungicides. The combinations were tested for efficacy of disease control in soybean for the control of Asian soybean rust. The trials were carried out at various locations in India. The test were conducted on soybean cultivar Monsoy 9144 RR. A commercially available actives were used.
TABLE-US-00002 TABLE 1 Table 1 shows the efficacy of tribasic copper sulfate (TBCS) when added to combinations containing succinate dehydrogenase inhibitor fungicides and ergosterol biosynthesis inhibitor. Mean percent disease control Treatment Dose rates (ml/g/ha) 2015/16

2016/17 Prothioconazole + Benzovindiflupyr 150 + 200 89.34 88.47 Prothioconazole + Benzovindiflupyr + TBCS 150 + 200 + 2000 92.01 92.32 Prothioconazole + Isopyrazam 150 + 1000 89.34 88.47 Prothioconazole + Isopyrazam + TBCS 150 + 1000 + 2000 92.01 91.04 Prothioconazole + Penthoipyrad 150 + 1000 90.68 89.75 Prothioconazole + Penthiopyrad + TBCS 150 + 1000 + 2000 92.01 92.32

[0808] Table 1 clearly demonstrates the increase in control when tribasic copper sulfate (TBCS) is added to the combination of ergosterol biosynthesis inhibitors and succinate dehydrogenase inhibitor fungicides.

TABLE-US-00003 TABLE 2 Table 2 demonstrates effiacacy when tribasic copper sulfate (TBCS) is added to combinations of succinate dehydrogenase inhibitor fungicides and quinone outside inhibitor fungicides and ergosterol biosynthesis inhibitors. [0809] Table 2 clearly demonstrates the importance of adding tribasic copper sulfate (TBCS) to the combination. The addition of TBCS improved disease control.

TABLE-US-00004 TABLE 3 Table 3 shows the efficacy of chlorothalonil when added to combinations containing succinate dehydrogenase inhibitor fungicides and ergosterol biosynthesis inhibitor. Mean percent disease control Treatment Dose rates (ml/g/ha) 2015/16 2016/17 Prothioconazole + Benzovindifloupyr 150 + 200 90.78 88.35 Prothioconazole + Benzovindifloupyr + Chlorothalonil 150 + 200 + 1500 92.32 92.44 Prothioconazole + Isopyrazam 150 + 1000 87.71 86.38 Prothioconazole + Isopyrazam + Chlorothalonil 150 + 1000 + 1500 90.78 90.92 Prothioconazole + Penthiopyrad 150 + 1000 89.24 87.89 Prothioconazole + Penthiopyrad + Chlorothalonil 150 + 1000 + 1500 92.32 92.44

[0810] Table 3 clearly demonstrates the increase in control when chlorothalonil is added to the combination of ergosterol biosynthesis inhibitors and succinate dehydrogenase inhibitor fungicides.

TABLE-US-00005 TABLE 4 Table 4 demonstrates efficacy when chlorothalonil is added to combinations of succinate dehydrogenase inhibitor fungicides and quinone outside inhibitor fungicides and ergosterol biosynthesis inhibitors. Mean percent disease control Treatment Dose rates (ml/g/ha) 2015/16 2016/17 Prothioconazole + Benzovindifloupyr + 150 + 200 + 500 90.02 91.8 Azoxystrobin Prothioconazole + Benzovindifloupyr + 150 + 200 + 500 + 1500 95.4 95.54 Azoxystrobin + Chlorothalonil

[0811] Table 4 clearly demonstrates the importance of adding chlorothalonil (TBCS) to the combination. The addition of chlorothalonil improved disease control

[0812] It was thus found that the incorporation of multi-site fungicide greatly increased efficacy and disease control of the succinate dehydrogenase inhibitor fungicide treatments when mixed with other fungicides. It was thus concluded that the addition of multi-site fungicide such as chlorothalonil, and TBCS greatly enhanced the efficacy of the combination and surprisingly gave a synergistic effect. The addition of a multi-site fungicide increased disease control and improved yield of plants. The instant invention is more specifically explained by above examples. However, it should be understood that the scope of the present invention is not limited by the examples in any manner. It will be appreciated by any person skilled in this art that the present invention includes aforesaid examples and further can be modified and altered within the technical scope of the present invention
