ACCUMULATING SYMBOLS TO ACTIVATE REEL SETS

PRIORITY CLAIM

[0001] This application is a continuation of, claims priority to and the benefit of U.S. patent application Ser. No. 17/490,951, filed on Sep. 30, 2021, the entire contents of which is incorporated by reference herein.

BACKGROUND

[0002] In various embodiments, the systems and methods of the present disclosure activate reel sets responsive to accumulations of symbols.

[0003] Gaming machines may provide players awards in primary games. Gaming machines generally require the player to place or make a wager to activate the primary or base game. The award may be based on the player obtaining a winning symbol or symbol combination and on the amount of the wager.

BRIEF SUMMARY

[0004] In certain embodiments, the present disclosure relates to a gaming system including a processor, and a memory device that stores a plurality of instructions. When executed by the processor in association with a sequence comprising a plurality of plays of a game and responsive to less than a first quantity of symbols accumulated, over the plurality of plays of the game, at a plurality of symbol display positions associated with a first reel set comprising a first plurality of displayed reels, the instructions cause the processor to determine a first total award comprising any awards associated with any symbols accumulated at any of the plurality of symbol display positions associated with the first reel set. The first total award is determined independent of any awards associated with any symbols accumulated at any of a plurality of symbol display positions associated with a second reel set comprising a second plurality of displayed reels. When executed by the processor in association with the sequence comprising the plurality of plays of the game and responsive to at least the first quantity of symbols accumulated, over the plurality of plays of the game, at the plurality of symbol display positions associated with the first reel set, the instructions cause the processor to determine a second total award comprising any awards associated with any symbols accumulated at any of the plurality of symbol display positions associated with the first reel set and any awards associated with any symbols accumulated at any of the plurality of symbol display positions associated with the second reel set. When executed by the processor, the instructions cause the processor to communicate data that results in a display, by a display device, of any determined total award.

[0005] In certain embodiments, the present disclosure relates to a gaming system including a processor, and a memory device that stores a plurality of instructions. When executed by the processor in association with a sequence comprising a plurality of plays of a game, the instructions cause the processor to communicate data that results in a display, by a display device, of a plurality of reel sets, wherein the plurality of reel sets comprises a first reel set in an active state, and a second reel set in an inactive state. When executed by the processor responsive to an occurrence of a first reel set activation event in association with the

second reel set, the instructions cause the processor to modify the second reel set from being in the inactive state to being in the active state. When executed by the processor responsive to an occurrence of a sequence award determination event, the instructions cause the processor to determine a total award, the determination being based on any accumulation of any symbols, over the plurality of plays of the game, at any symbol display positions associated with any of the plurality of reel sets in the active state when the sequence award determination event occurs, and communicate data that results in a display, by the display device, of the determined total award.

[0006] In certain embodiments, the present disclosure relates to a gaming system including a processor, and a memory device that stores a plurality of instructions. When executed by the processor in association with a sequence comprising a plurality of plays of a game, the instructions cause the processor to communicate data that results in a display, by a display device, of a plurality of reel sets, wherein each reel set comprises a plurality of symbol display positions, and when the sequence is triggered, each reel set is one of an active reel set and an inactive reel set. When executed by the processor, the instructions cause the processor to communicate data that results in a display, by the display device, of an accumulation of symbols, over the plurality of plays of the game, at a quantity of the symbol display positions associated with any of the active reel sets and any of the inactive reel sets. When executed by the processor responsive to an occurrence of a reel set activation event in association with any of the inactive reel sets, the instructions cause the processor to activate that reel set, wherein the reel set activation event occurs based on the accumulation of symbols at symbol display positions associated with any active reel sets. When executed by the processor responsive to an occurrence of sequence award determination event, the instructions cause the processor to determine a total award, wherein the total award is based on any symbols accumulated at any of the symbol display positions associated with any of the active reel sets and is independent of any symbols accumulated at any of the symbol display positions associated with any of the inactive reel sets, and communicate data that results in a display, by the display device, of the determined total award.

[0007] Additional features are described herein, and will be apparent from the following Detailed Description and the figures.

BRIEF DESCRIPTION OF THE FIGURES

[0008] FIG. 1 is a flow chart an example process for operating a gaming system that accumulates symbols to activate reel sets.

[0009] FIGS. 2A, 2B, 2C, 2D, 2E, 2F, 2G, and 2H are front views of one embodiment of the gaming system of the present disclosure illustrating a play of a sequence including the accumulation of symbols to activate reel sets.

[0010] FIG. 3 is a schematic block diagram of one embodiment of an electronic configuration of an example electronic gaming machine of the present disclosure.

[0011] FIGS. 4A and 4B are perspective views of example alternative embodiments of an electronic gaming machine of the present disclosure.

[0012] FIG. 4C is a front view of an example personal gaming device of the present disclosure.

DETAILED DESCRIPTION

[0013] In various embodiments, the present disclosure relates generally to gaming systems and methods that activate reel sets responsive to accumulations of symbols.

[0014] In certain embodiments, responsive to an occurrence of a sequence triggering event, the gaming system displays a plurality of reel sets. Each reel set includes a plurality of reels associated with a plurality of symbol display positions. One or more of the reel sets are initially active and zero, one or more of the reel sets are initially inactive. Each initially inactive reel set is associated with a quantity of symbols that must be accumulated at symbol display positions associated with active reel sets to activate that inactive reel set. For example, upon the triggering of the sequence, the gaming system activates a first reel set without activating a second reel set (which is activated upon ten symbols being accumulated at symbol display positions associated with active reel sets) or activating a third reel set (which is activated upon twenty symbols being accumulated at symbol display positions associated with active reel sets).

[0015] In operation of certain embodiments, for each play of a game of the triggered sequence, the gaming system randomly determines and displays zero, one or more symbols at zero, one or more available symbol display positions of zero, one or more of the displayed plurality of reel sets. For each randomly determined and displayed symbol at each symbol display position of each of the reel sets, the gaming system accumulates that symbol in association with that symbol display position. In these embodiments, the gaming system operates to display and accumulate zero, one or more symbols at zero, one or more symbol display positions associated with any active reel sets and/or any inactive reel sets. That is, a symbol display position associated with an active reel set or a symbol display position associated with an inactive reel set may each accumulate a symbol in association with the triggered sequence. It should be appreciated that once accumulated in association with a symbol display position, that accumulated symbol remains associated with that symbol display position for the duration of the triggered sequence such that a symbol display position associated with an accumulated symbol (or a quantity of accumulated symbols) from one play of the game of the triggered sequence is unavailable to display another symbol for another play of the game of the triggered sequence.

[0016] In certain embodiments, each accumulated symbol is associated with a displayed award. In certain such embodiments, the accumulation of a symbol associated with an award at a symbol display position of an active reel set results in that award being included in a total award determined at the conclusion of the triggered sequence, while the accumulation of a symbol associated with an award at a symbol display position of an inactive reel set results in that award not being included in a total award determined at the conclusion of the triggered sequence. As such, an accumulated symbol associated with an award may or may not result in that award being provided based on whether or not the symbol display position where that symbol is displayed at is associated with an active reel set and/or an inactive reel set when the sequence concludes. Such a configuration provides that certain awards associated with certain symbols may be displayed and accumulated as part of the triggered sequence but not necessarily provided during the triggered sequence. This accumulation of symbols associated with awards without such awards being provided increase the volatility of the

operation of the gaming system and triggers a near-miss reaction in certain users that increases the level of anticipation such user's experience.

[0017] In addition to determining, displaying and accumulating symbols at zero, one or more symbol display positions associated with zero, one or more reel sets (regardless of the state of each reel set being in an active state or an inactive state), the gaming system determines if the quantity of accumulated symbols at symbol display positions associated with active reel sets causes the activation of any inactive reel sets. In these embodiments, since each initially inactive reel set is associated with a quantity of symbols that must be accumulated at symbol display positions associated with active reel sets to activate that inactive reel set, the gaming system determines whether or not the quantity of symbols associated with each remaining inactive reel set has been accumulated (at symbol display positions associated with active reel sets) and if so, causes a modification of the state of that reel set from an inactive state to an active state. Continuing with the above example, following the determination, display and accumulation of zero, one or more symbols at zero, one or more symbol display positions associated with zero, one or more reel sets (and assuming that the first reel set remains the only active reel set), the gaming system determines if at least ten symbols have been accumulated at symbol display positions associated with the active reel sets (and if so, causes the activation of the second reel set) and/or if at least twenty symbols have been accumulated at symbol display positions associated with active reel sets (and if so, causes the activation of the third reel set).

[0018] It should be appreciated that while the determination, display and accumulation of a symbol at a symbol display position associated with an inactive reel set does not contribute to the determination of if a quantity of accumulated symbols at symbol display positions associated with active reel sets causes the activation of any inactive reel sets when that symbol is accumulated, that accumulated symbol may subsequently contribute to the determination of if a quantity of accumulated symbols at symbol display positions associated with active reel sets causes the activation of any inactive reel sets at a later point in time during the triggered sequence. In other words, a symbol accumulated at a symbol display position associated with an inactive reel set may operate to at least partially provide a delayed activation of an inactive reel set, wherein such a delayed activation depends on one or more events otherwise occurring during the triggered sequence. Continuing with the above example, while the accumulation of a symbol at a symbol display position associated with the inactive second reel set (or the inactive third reel set) does not initially factor into the determination of whether to activate any inactive reel sets based on a quantity of accumulated symbols at symbol display positions associated with active reel sets, if the second reel set were to become activated during the triggered sequence, then any accumulated symbols at any symbol display positions associated with the now active second reel set would factor into the determination of whether to activate an inactive reel sets based on a quantity of accumulated symbols at symbol display positions associated with active reel sets. As illustrated by this example, the accumulation of certain symbols and the order by which such symbols are accumulated (relative to the activation of zero, one or more reel sets) may trigger a cascading feature wherein the activation of one reel set (based on the quantity

of accumulated symbols associated with that reel set being achieved) results in the activation of multiple reel sets (based on the prior accumulation of symbols associated with inactive reel sets becoming associated with active reel sets to achieve the quantity of accumulated symbols associated with each of the reel sets).

[0019] This accumulation of zero, one or more symbols at zero, one or more symbol display positions over one or more plays of the game of the triggered sequence and this activation of zero, one or more reel sets continues until the gaming system determines that a sequence termination event has occurred. Upon the occurrence of the sequence termination event, such as upon the gaming system determining that no unplayed games remain associated with the triggered sequence, the gaming system determines a total award for the triggered sequence. In certain embodiments, the total award includes any awards associated with any accumulated symbols at any symbol display positions associated with any active reel sets, but does not include any awards associated with any accumulated symbols at any symbol display positions associated with any inactive reel sets. It should be appreciated that in such embodiments, while the accumulation of a symbol associated with an award at a symbol display position associated with an inactive reel set may not initially be part of any determined total award when that symbol is accumulated, the award associated with that symbol may subsequently be part of any determined total award if the reel set associated with the symbol display position where that symbol is accumulated subsequently becomes an active reel set during the triggered sequence. Put different, an award associated with a symbol that is accumulated at a symbol display position associated with an inactive reel set may change from not being available to being available based on one or more events (i.e., the potential activation of the inactive reel set) occurring during the triggered sequence. Such a configuration provides a change in operation of the gaming system (relative to prior gaming systems) whereby certain awards associated with certain symbols are determined and displayed during the triggered sequence but such awards may or may not ultimately be provided as part of the triggered sequence.

[0020] While certain embodiments described below are directed to accumulating symbols and activating reel sets in association with one or more plays of a secondary game, such as a bonus game, it should be appreciated that such embodiments may additionally or alternatively be employed in association with accumulating symbols and activating reel sets in association with one or more plays of a primary game, such as a wagering game. Moreover, while certain embodiments described below are directed to activating reel sets in order from a lowest ranking reel set to highest ranking reel set, it should be appreciated that such embodiments may alternatively be employed to activate reel sets in order from a highest ranking reel set to lowest ranking reel set. Furthermore, while certain embodiments described below are directed to accumulating symbols and activating reel sets in association with a plurality of reels, it should be appreciated that such embodiments may additionally or alternatively be employed in association with accumulating different game elements and activating sets of game elements, such as, but not limited to, accumulating playing cards and activating sets of playing cards, accumulating keno numbers and activating sets of keno numbers or accumulating bingo elements and activating sets of bingo elements.

[0021] Moreover, while certain embodiments described below are directed to the gaming system accumulating symbols and activating reel sets that are displayed by an electronic gaming machine ("EGM") such as a slot machine, a video poker machine, a video lottery terminal, a terminal associated with an electronic table game, a terminal associated with a live table game, a video keno machine, a video bingo machine and/or a sports betting terminal that offers sports betting opportunities, it should be appreciated that such embodiments may additionally or alternatively be employed in association with the gaming system accumulating symbols and activating reel sets that are displayed by a personal gaming device, such as desktop computers, laptop computers, tablet computers or computing devices, personal digital assistants, mobile phones, and other mobile computing devices that offer plays of wagering games (and in certain instances, sports betting opportunities). Furthermore, while the player's credit balance, the player's wager, and any awards are displayed as an amount of monetary credits or currency, in certain of the embodiments described below, one or more of such player's credit balance, such player's wager, and any awards provided to such a player may be for non-monetary credits, promotional credits, and/or player tracking points or credits.

[0022] FIG. 1 is a flowchart of an example process or method of operating the gaming system of the present disclosure. In various embodiments, the process is represented by a set of instructions stored in one or more memories and executed by one or more processors. Although the process is described with reference to the flowchart shown in FIG. 1, many other processes of performing the acts associated with this illustrated process may be employed. For example, the order of certain of the illustrated blocks or diamonds may be changed, certain of the illustrated blocks or diamonds may be optional, or certain of the illustrated blocks or diamonds may not be employed.

[0023] In various embodiments, upon an occurrence of a symbol accumulation sequence triggering event, the gaming system triggers a symbol accumulation sequence as indicated in block 102.

[0024] In certain embodiments, the symbol accumulation sequence comprises a plurality of initial plays of a secondary game, such as a free spin game, wherein the sequence triggering event occurs based on a displayed event associated with a play of a primary game. In another embodiment wherein the symbol accumulation sequence comprises a plurality of initial plays of a secondary game, such as a free spin game, the sequence triggering event occurs based on an event independent of any displayed event associated with the play of the primary game. In certain embodiments, the symbol accumulation sequence comprises a plurality of initial plays of a primary game, such as a primary wagering game, wherein the sequence triggering event includes the placement of a wager on one or more of the plays of the primary game. In certain embodiments, the quantity of initial plays of the game of the triggered symbol accumulation sequence is based on one or more displayed events or elements, such as based on a quantity of triggering symbols that caused the triggering of the symbol accumulation sequence. In certain embodiments, the quantity of initial plays of the game of the triggered symbol accumulation sequence is independent of any displayed events or elements.

[0025] For the triggered symbol accumulation sequence, as indicated in block 104 of FIG. 1, the gaming system displays a plurality of reel sets, wherein each reel set includes a plurality of reels and each reel set is associated with one or more symbol display positions. For example, as seen in FIG. 2A, the gaming system displays four reel sets 202a to 202d, wherein: (i) the first reel set 202a is associated with a plurality of symbol display positions 204a to 2040; (ii) the second reel set 202b is associated with a plurality of symbol display positions 206a to 2060; (iii) the third reel set 202c is associated with a plurality of symbol display positions 208a to 2080; and (iv) the fourth reel set 202d is associated with a plurality of symbol display positions 210a to 2100. In certain embodiments, each reel set is associated with the same quantity of symbol display positions. In certain embodiments, different reel sets are associated with different quantities of symbol display positions.

[0026] Additionally, as indicated in block 104, the gaming system initially designates each reel set as either an active reel set or an inactive reel set. In certain embodiments, for the triggered symbol accumulation sequence, the gaming system determines that one or more reel sets are initially in an active state and zero, one or more reel sets are initially in an inactive state. For example, as seen in FIG. 2A, the gaming system activates a first reel set 202a (i.e., the lowest rank reel set) without activating any of the remaining reel sets 202b to 202d.

[0027] In addition to initially designating each reel set as either an active reel set or an inactive reel set, as also indicated in block 104 of FIG. 1, the gaming system associates each initially inactive reel set with a quantity of symbols that must be accumulated in association with any active reel sets to activate that initially inactive reel set. In these embodiments, the gaming system associates each initially inactive reel set with a quantity of symbols required to be accumulated (at symbol display positions associated with any active reel sets) to cause a modification of that reel set from an inactive state to an active state. In certain embodiments, two or more initially inactive reel set are each associated with the same quantity of symbols that must be accumulated in association with any active reel sets to activate these initially inactive reel sets. In certain embodiments, different reel sets are each associated with different quantities of symbols that must be accumulated in association with any active reel sets to activate these initially inactive reel sets. For example, as seen in FIG. 2A, the gaming system associates: (i) initially inactive reel set 202b with ten symbols 212a required to be accumulated at symbol display positions associated with any active reel sets to activate initially inactive reel set 202b; (ii) initially inactive reel set 202c with twenty symbols 212b required to be accumulated at symbol display positions associated with any active reel sets to activate initially inactive reel set 202c; and (iii) initially inactive reel set 202d with forty symbols 212c required to be accumulated at symbol display positions associated with any active reel sets to activate initially inactive reel set 202d.

[0028] For the triggered symbol accumulation sequence, the gaming system determines if the symbol accumulation sequence includes at least one remaining unplayed game as indicated in diamond 106 of FIG. 1. In certain embodiments, the symbol accumulation sequence includes a plurality of initial plays of a game (such as three initial spins as seen in FIG. 2A) wherein that plurality of initial plays of the game

may be supplemented with additional plays of the game, such as responsive to a retriggering event (e.g., an accumulation of a symbol at an available symbol display position). In these embodiments, the gaming system determines if at least one unplayed game remains from the initial plurality of plays of the game of the triggered symbol accumulation sequence or any additional plays of the game provided in association with the symbol accumulation sequence subsequent to the occurrence of the symbol accumulation sequence triggering event. In certain other embodiments, the symbol accumulation sequence includes a plurality of initial plays of a game wherein that plurality of initial plays of the game may not be supplemented with additional plays of the game.

[0029] If the gaming system determines that at least one unplayed game remains associated with the symbol accumulation sequence, at each of zero, one or more symbol display positions not associated with an accumulated symbol, the gaming system determines and displays a symbol as indicated in blocks 108 and 110 of FIG. 1. In these embodiments, the gaming system determines and displays zero, one or more symbols at zero, one or more available symbol display positions (i.e., a symbol display position not associated with a prior accumulated symbol) regardless of the active/inactive status of the reel set associated with such symbol display positions. That is, independent of any determination of whether a reel set (and the individual symbol display positions associated with that reel set) qualifies as an active reel set or an inactive reel set, the gaming system operates to determine and display certain symbols at certain symbol display positions associated with certain reel sets. In certain embodiments wherein the gaming system employs independent or unisymbol reels (i.e., reels operable to displays a single symbol at a single symbol display position), the gaming system randomly determines, for each available symbol display position, whether or not to display any of a plurality of symbols at that available symbol display position.

[0030] In certain embodiments, each symbol is associated with an award. As described below, an award associated with a determined and displayed symbol may contribute to a total award for the triggered symbol accumulation sequence based on whether or not the reel set associated with the symbol display position where that symbol is accumulated at is an active reel set or an inactive reel set. In operation of certain embodiments, the gaming system randomly determines which symbols, if any, to display at which symbol display positions based on the award of that symbol. For example, a symbol with a relatively low award has a first probability of being randomly displayed at a symbol display position, and a symbol with a relatively high award has a second, lower probability of being randomly displayed at a symbol display position. In operation of certain embodiments, the gaming system additionally or alternatively randomly determines which symbols, if any, to display at which symbol display positions based on the symbol display position. For example, a symbol with a relatively high award has a first probability of being randomly displayed at a symbol display position associated with a relatively lower ranked reel set and a second, greater probability of being randomly displayed at a symbol display position associated with a relatively higher ranked reel set.

[0031] In addition to displaying zero, one or more symbols at zero, one or more available symbol display positions (i.e.,

symbol display positions not associated with any previously accumulated symbols), as indicated in block 112, the gaming system accumulates each displayed symbol in association with the symbol display position where that symbol is displayed at. In certain embodiments, the gaming system operates by accumulating up to one symbol at each symbol display position such that if a symbol was previously accumulated in association with a symbol display position, that accumulated symbol persists for subsequent plays of the game and the gaming system does not display nor accumulate any additional symbols at that symbol display position. In certain other embodiments, the gaming system operates by accumulating up to a designated quantity of at least two symbols at each symbol display position such that if the designated quantity of symbols were previously accumulated in association with a symbol display position, those accumulated symbols persist for subsequent plays of the game and the gaming system does not display nor accumulate any additional symbols at that symbol display position.

[0032] For example, following the triggering of a symbol accumulation sequence initially including three plays of the game and the determination that at least one play of the game remains of the triggered symbol accumulation sequence, for a first play of a game of the symbol accumulation sequence, as seen in FIG. 2B, the gaming system spins: (i) a plurality of unisymbol reels of the first, initially active reel set 202a that are associated with the plurality of symbol display positions 204a to 2040; (ii) a plurality of unisymbol reels of the second, initially inactive reel set 202b that are associated with the plurality of symbol display positions 206a to 2060; (iii) a plurality of unisymbol reels of the third, initially inactive reel set 202c that are associated with the plurality of symbol display positions 208a to 2080; and (iv) a plurality of unisymbol reels of the fourth, initially inactive reel set 202d that are associated with the plurality of symbol display positions 210a to 2100. As seen in FIG. 2C of this example, when stopped, each unisymbol reel may or may not display a symbol associated with an award 214. For this first play of the game of the symbol accumulation sequence wherein each of the symbol display positions are available to potentially display a symbol (i.e., none of the symbol display positions are unavailable due to being associated with a previously accumulated symbol), the gaming system displays symbols 214a to 214n associated with awards. The gaming system accumulates each of these fourteen symbols in association with its respective symbol display position. In this example, since at least one symbol was accumulated from this play of the game, the gaming system resets the quantity of plays of the game remaining for the triggered symbol accumulation sequence back to three plays of the game.

[0033] In this example, while only the first reel set 202a is active for this first play of the game of the triggered symbol accumulation sequence, the gaming system determines, displays and accumulates symbols (i.e., symbols 214a to 214c) at available symbol display positions associated with active reel set 202a and symbols (i.e., symbols 214d to 214n) at available symbol display positions associated with the remaining inactive reel sets 202b to 202d. As such, the activation or inactivation of any particular reel set does not factor into whether or not any symbols may be determined, displayed and accumulated at the available symbol display positions associated with that particular reel set. Such a configuration provides that the gaming system determines

and displays certain symbols associated with certain awards at certain symbol display positions which may or may not be part of subsequently activated reel sets to increase the level of engagement that the user has with the gaming system.

[0034] In addition to accumulating zero, one or more symbols, as indicated in block 114 of FIG. 1, the gaming system causes each symbol accumulated at each symbol display position associated with an active reel set to contribute to the quantity of symbols that must be accumulated to activate any inactive reel sets. In these embodiments, the gaming system employs the symbols accumulated at the symbol display positions of the active set(s) of reels to potentially activate additional otherwise inactive reel sets. That is, the gaming system accounts for the accumulation of symbols at symbol display positions associated with any active reel sets in determining whether or not the quantity of accumulated symbols has been achieved for any inactive reel sets. For example, as seen in FIG. 2C, to account for the accumulation of three symbols 214a to 214c at certain of the symbol display positions associated with the active first reel set 202a, the gaming system reduces the quantity of accumulated symbols required to activate each of the inactive reel sets 202b to 202d by three. As such, following the accumulation of three symbols at symbol display positions associated with the active reel sets as part of the first play of the game of the symbol accumulation sequence, initially inactive reel set 202b now requires seven more symbols 212a to be accumulated at symbol display positions associated with any active reel sets to activate initially inactive reel set 202b; initially inactive reel set 202c now requires seventeen more symbols 212b to be accumulated at symbol display positions associated with any active reel sets to activate initially inactive reel set 202c; and initially inactive reel set 202d now requires thirty-seven more symbols 212c to be accumulated at symbol display positions associated with any active reel sets to activate initially inactive reel set 202d. It should be appreciated that in these embodiments, while symbols may be accumulated at symbol display positions associated with active reel sets or inactive reel sets, the gaming system utilizes symbols accumulated at symbol display positions associated with active reel sets when tracking quantities of accumulated symbols to potentially activate otherwise inactive reel sets. As seen in this illustrated example, while the gaming system accumulated symbols at symbol display positions associated with inactive reel sets 202b to 202d, the gaming system did not utilize any of these accumulated symbols to reduce any quantities of symbols needed to be accumulated to activate any of these inactive reel sets.

[0035] Following the accumulation of symbols at zero, one or more symbol display positions associated with zero, one or more reel sets (regardless of the state of each reel set being in an active state or an inactive state) and the accounting of any symbols accumulated at any symbol display positions associated with any active reel sets toward the goal quantity of accumulated symbols associated with zero, one or more of any inactive reel sets, the gaming system determines if a reel set activation event has occurred in association with any of the inactive reel sets as indicated in diamond 116 of FIG. 1. In certain embodiments, a reel set activation event occurs in association with an inactive reel set if the quantity of symbols required to be accumulated (at symbol display positions associated with any active reel sets) associated with that inactive reel set has been achieved. For

example, referring back to FIG. 2A, a reel set activation occurs: (i) for inactive reel set **202b** if ten symbols have been accumulated at symbol display positions associated with any active reel sets; (ii) for inactive reel set **202c** if twenty symbols have been accumulated at symbol display positions associated with any active reel sets; and (iii) for inactive reel set **202d** if forty symbols have been accumulated at symbol display positions associated with any active reel sets.

[0036] If the gaming system determines that no reel set activation event occurred in association with any inactive reel sets, the gaming system returns to diamond **106** and again determines if the symbol accumulation sequence includes at least one remaining unplayed game. For example, as seen in FIG. 2C, upon the gaming system determining that none of the required quantities of symbols associated with any inactive reel sets have been accumulated at symbol display positions associated with active reel sets (i.e., less than ten symbols have been accumulated at symbol display positions associated with active reel sets to activate inactive reel set **202b**; less than twenty symbols have been accumulated at symbol display positions associated with active reel sets to activate inactive reel set **202c**; and less than forty symbols have been accumulated at symbol display positions associated with active reel sets to activate inactive reel set **202d**), the gaming system does not cause any reel set activation event to occur. In this case, the gaming system proceeds to determine if at least one unplayed game of the triggered symbol accumulation sequence remains and if so, displays another play of the game of the triggered symbol accumulation sequence.

[0037] For the next play of the game of the triggered symbol accumulation sequence, the gaming system again determines, displays and accumulates zero, one or more symbols at zero, one or more available symbol display positions as described above. For example, as seen in FIGS. 2D and 2E, for another play of the game of the triggered symbol accumulation sequence, the gaming system spins the plurality of unisymbol reels associated with the plurality of symbol display positions **204**, **206**, **208** and **210** not associated with any accumulated symbols (FIG. 2D). For this second play of the game of the symbol accumulation sequence only certain of the symbol display positions are available to potentially display a symbol (i.e., certain of the symbol display positions are unavailable due to being associated with a previously accumulated symbol). In this example, when these reels stop spinning, the gaming system displays symbols **2140** to **214gg** associated with awards (FIG. 2E). The gaming system accumulates each of these additional symbols in association with its respective symbol display position. In this example, since at least one symbol was accumulated from this play of the game, the gaming system resets the quantity of plays of the game remaining for the triggered symbol accumulation sequence back to three plays of the game.

[0038] In addition to accumulating such displayed symbols, the gaming system again determines if a reel set activation event has occurred in association with any of the inactive reel sets. In this case, since no reel set activation event occurred in association with any of the inactive reel sets (i.e., less than ten symbols have been accumulated at symbol display positions associated with active reel sets to activate inactive reel set **202b**; less than twenty symbols have been accumulated at symbol display positions associated with active reel sets to activate inactive reel set **202c**;

and less than forty symbols have been accumulated at symbol display positions associated with active reel sets to activate inactive reel set **202d**), the gaming system does not cause any reel set activation event to occur. Rather, the gaming system again determines if at least one unplayed game of the triggered symbol accumulation sequence remains and if so, displays another play of the game of the triggered symbol accumulation sequence.

[0039] For the next play of the game of the triggered symbol accumulation sequence, the gaming system again determines, displays and accumulates zero, one or more symbols at zero, one or more available symbol display positions as described above. For example, as seen in FIGS. 2F and 2G, for another play of the game of the triggered symbol accumulation sequence, the gaming system spins the plurality of unisymbol reels associated with the plurality of symbol display positions **204**, **206**, **208** and **210** not associated with any accumulated symbols (FIG. 2F). As seen, for this third play of the game of the symbol accumulation sequence only certain of the symbol display positions are available to potentially display a symbol (i.e., certain of the symbol display positions are unavailable due to being associated with a previously accumulated symbol). In this example, when these reels stop spinning, the gaming system displays symbols **214hh** to **214kk** associated with awards (FIG. 2E). The gaming system accumulates each of these additional symbols in association with its respective symbol display position. In this example, since at least one symbol was accumulated from this play of the game, the gaming system resets the quantity of plays of the game remaining for the triggered symbol accumulation sequence back to three plays of the game.

[0040] In addition to accumulating such displayed symbols, the gaming system again determines if a reel set activation event has occurred in association with any of the inactive reel sets. As described above, if the gaming system determines that no reel set activation event occurred in association with any inactive reel sets, the gaming system returns to diamond **106** and again determines if the symbol accumulation sequence includes at least one remaining unplayed game. On the other hand, if the gaming system determines that a reel set activation event occurred in association with an inactive reel set, the gaming system activates the reel set in which a reel set activation event occurred in association with as indicated in block **118** of FIG. 1. In certain embodiments wherein a reel set activation event occurs in association with an inactive reel set if the quantity of symbols required to be accumulated (at symbol display positions associated with any active reel sets) associated with that inactive reel set has been achieved, if the associated quantity of symbols has been accumulated (at symbol display positions associated with any active reel sets), the gaming system activates that reel set. For example, as seen in FIG. 2G, since ten symbols have been accumulated at symbol display positions associated with active reel sets, the gaming system determines that a reel set activation event has occurred in association with the second inactive reel sets and the gaming system activates reel set **202b**.

[0041] Following this activation of one or more reel sets, the gaming system returns to diamond **116** and again determines if a reel set activation event has occurred in association with any inactive reel sets. That is, since the activation of a previously inactive reel set may result in a modification of the quantity of accumulated symbols at symbol display

positions associated with active reel sets, the activation of one reel set may cause a chain reaction wherein one or more additional reel sets are also activated. Put differently, while any accumulated symbols at symbol display positions associated with a then inactive reel set were not previously accounted for in determining whether or not a reel set activation event occurred, these accumulated symbols at symbol display positions associated with the now active reel set are accounted for in determining whether or not a reel set activation event occurred with any inactive reel sets. In other words, while the determination, display and accumulation of a symbol at a symbol display position associated with an inactive reel set does not contribute to the determination of if a quantity of accumulated symbols at symbol display positions associated with active reel sets causes the activation of any inactive reel set when that symbol is accumulated, that symbol may subsequently contribute to the determination of if a quantity of accumulated symbols at symbol display positions associated with active reel sets causes the activation of any inactive reel set at a later point in time during the triggered sequence. This configuration provides that a symbol accumulated at a symbol display position associated with an inactive reel set may operate to at least partially provide a delayed activation of an inactive reel set, wherein such a delayed activation depends on one or more events otherwise occurring during the triggered sequence.

[0042] For example, as seen in FIG. 2G, since the accumulation of two more symbols at symbol display positions associated with active reel set **202a** resulted in the activation of reel set **202b**, and since twelve symbols had been previously accumulated at symbol display positions associated with reel set **202b**, these twelve symbols now contribute to the quantity of symbols required to be accumulated (at symbol display positions associated with any active reel sets) to cause a reel set activation event to occur in association with reel set **202c**. As such, since at least twenty symbols have now been accumulated between symbol display positions associated with initially active reel set **202a** and initially inactive, but now active reel set **202b**, the gaming system determines that a reel set activation event has occurred in association with reel set **202c** and correspondingly activates reels set **202c**.

[0043] Following this activation, the gaming system again determines if a reel set activation event has occurred in association with any inactive reel sets as described above. For example, after activating reel set **202c** (based on the quantity of accumulated symbols at symbol display positions associated with active reel sets **202a** and **202b**), the gaming system determines that the quantity of accumulated symbols at symbol display positions associated with active reel sets **202a**, **202b** and **202d** does not at least equal the forty symbols **212c** required to be accumulated at symbol display positions associated with any active reel sets to activate inactive reel set **202d**.

[0044] Following any subsequent activation of any inactive reel set or if the gaming system determines that no reel set activation event occurred in association with any inactive reel sets, the gaming system returns to diamond **106** and again determines if the symbol accumulation sequence includes at least one remaining unplayed game.

[0045] Upon the gaming system determining that no games remain in the triggered symbol accumulation sequence, as indicated in blocks **120** and **122** of FIG. 1, the gaming system determines and displays a total award based

on any awards of any accumulated symbols at any symbol display positions associated with any active reel sets. That is, upon an occurrence of a sequence award determination event, the gaming system proceeds to determine a total award for the triggered sequence wherein the active or inactive state of each reel set determines whether or not any awards may be available in association with the symbols accumulated at the symbol display positions associated with such reel sets. For example, as seen in FIG. 2H, following additional plays of the game of the triggered symbol accumulation sequence that resulted in the determination, display and accumulation of additional symbols **21411** to **21400** but not the additional activation of any inactive reel sets, the gaming system determines a total award based on the awards associated with the symbols accumulated at the symbol display positions associated with the active reel sets. In this example, since reel sets **202a** to **202c** are each active, the gaming system determines a total award of fifteen-thousand-three-hundred-fifty credits based on the awards of the symbols accumulated at symbol display positions associated with active reel sets **202a** to **202c**. It should be appreciated that in these embodiments, in determining the total award, the gaming system does not factor in any awards of any accumulated symbols at any symbol display positions associated with any inactive reel sets. For example, since reel set **202d** remains inactive, the gaming system does not account for the awards of the symbols accumulated at symbol display positions associated with reel set **202d** in determining the total award. Such a configuration provides that the graphical user interface employed by the gaming system displays certain awards associated with certain symbols even though such awards are not ultimately provided, to increase the amount of anticipation certain users experience.

[0046] In certain embodiments, zero, one or more awards associated with one or more symbols and/or a total award determined in association with a triggered symbol accumulation sequence includes one or more of: a quantity of monetary credits, a quantity of non-monetary credits, a quantity of promotional credits, a quantity of player tracking points, a progressive award, a modifier, such as a multiplier, a quantity of free plays of one or more games, a quantity of plays of one or more secondary or bonus games, a multiplier of a quantity of free plays of a game, one or more lottery based awards, such as lottery or drawing tickets, a wager match for one or more plays of one or more games, an increase in the average expected payback percentage for one or more plays of one or more games, one or more comps (e.g., a free dinner, a free night's stay at a hotel), a relatively high value product (e.g., a free car), one or more bonus credits usable for online play, a lump sum of player tracking points or credits, a multiplier for player tracking points or credits, an increase in a membership or player tracking level, one or more coupons or promotions usable within and/or outside of the gaming establishment (e.g., a 20% off coupon for use at a convenience store), virtual goods associated with the gaming system, virtual goods not associated with the gaming system, an access code usable to unlock content on an internet.

[0047] In certain embodiments, zero, one or more awards associated with one or more symbols and/or a total award determined in association with a triggered symbol accumulation sequence includes an activation of a feature of a game. In different embodiments, such features include any feature that results in a modification of one or more components,

aspects, or elements of one or more subsequent plays of a game, such as the modification of one or more game outcomes of one or more plays of a game (e.g., the symbols evaluated for the play(s) of the game), the modification of the payable utilized for one or more plays of the game and/or the modification of any award determined for one or more plays of the game. In different embodiments, such features include, but are not limited to: a feature which superimposed one or more symbols over the randomly generated symbols of the reels; a feature which replaces one or more symbols of the randomly generated symbols of the reels with a predetermined symbol pattern; a feature which replaces one or more symbols of the randomly generated symbols of the reels with a predetermined pattern of wild symbols; a modifier, such as a multiplier, feature; a book-end wild symbols feature; a stacked wild symbols feature; an expanding wild symbols feature; a nudging wild symbols feature; a feature modifying a quantity of wild symbols available to be generated; a retrigger symbol feature; an anti-terminator symbol feature; a locking reel feature; an expanding reel feature; a locking symbol position feature; a feature modifying a placed wager amount; a feature modifying a placed side wager amount; a feature modifying a number of wagered on paylines; a feature modifying a wager placed on one or more paylines (or on one or more designated paylines); a feature modifying a number of ways to win wagered on; a feature modifying a wager placed on one or more ways to win (or on one or more designated ways to win); a feature modifying a payable utilized for a play of a game; a feature modifying an average expected payback percentage of a play of a game; a feature modifying an average expected payout of a play of a game; a feature modifying one or more awards available; a feature modifying a range of awards available; a feature modifying a type of awards available; a feature modifying one or more progressive awards; a feature modifying which progressive awards are available to be won; a feature modifying one or more modifiers, such as multipliers, available; a feature modifying an activation of a reel (or a designated reel); a feature modifying an activation of a plurality of reels; a feature modifying a generated outcome (or a designated generated outcome); a feature modifying a generated outcome (or a designated generated outcome) associated with an award over a designated value; a feature modifying a generated outcome (or a designated generated outcome) on a designated payline; a feature modifying a generated outcome (or a designated generated outcome) in a scatter configuration; a feature modifying a winning way to win (or a designated winning way to win); a feature modifying a designated symbol or symbol combination; a feature modifying a generation of a designated symbol or symbol combination on a designated payline; a feature modifying a generation of a designated symbol or symbol combination in a scatter configuration; a feature modifying a quantity of picks in a selection game; a feature modifying a quantity of offers in an offer and acceptance game; a feature modifying a quantity of moves in a trail game; a feature modifying an amount of free spins provided; a feature modifying a game terminating or ending condition; a feature modifying how one or more aspects of one or more games (e.g., colors, speeds, sound) are displayed to a player; and/or a feature modifying any game play feature associated with any play of any game of the present disclosure.

[0048] In certain embodiments, the gaming system initially displays the initially active reel sets and the initially inactive reel sets. In certain embodiments, the gaming system initially displays the initially active reel sets while not displaying any initially inactive reel sets. In these embodiments, as zero, one or more additional reel sets become activated, the gaming system displays such activated reels sets spawning from previously active reel sets.

[0049] In certain embodiments, the gaming system initially displays the initially active reel sets and the initially inactive reel sets as the same size. In certain embodiments, the gaming system initially displays the initially active reel sets and the initially inactive reel sets as different sizes. In these embodiments, as zero, one or more additional reel sets become activated, the gaming system modifies the size of such activated reel sets to draw the user's attention to the activated reel set.

[0050] In different embodiments, as described above, a symbol accumulation sequence triggering event and/or a reel set activation event occurs based on an outcome associated with one or more plays of any primary games or any secondary games. In one embodiment, such determinations are symbol driven based on the generation of one or more designated symbols or symbol combinations. In various embodiments, a generation of a designated symbol (or sub-symbol) or a designated set of symbols (or sub-symbols) over one or more plays of a primary game (and/or a secondary game) causes such conditions to be satisfied and/or one or more of such events to occur.

[0051] In different embodiments, the gaming system does not provide any apparent reasons to the players for an occurrence of a symbol accumulation sequence triggering event and/or a reel set activation event. In these embodiments, such determinations are not triggered by an event in a primary game or based specifically on any of the plays of any primary games or any secondary games. That is, these events occur without any explanation or alternatively with simple explanations.

[0052] In one such embodiment, a symbol accumulation sequence triggering event and/or a reel set activation event occurs based on an amount of coin-in. In this embodiment, the gaming system determines if an amount of coin-in reaches or exceeds a designated amount of coin-in (i.e., a threshold coin-in amount). Upon the amount of coin-in wagered reaching or exceeding the threshold coin-in amount, the gaming system causes one or more of such events or conditions to occur. In another such embodiment, a symbol accumulation sequence triggering event and/or a reel set activation event occurs based on an amount of virtual currency-in. In this embodiment, the gaming system determines if an amount of virtual currency-in wagered reaches or exceeds a designated amount of virtual currency-in (i.e., a threshold virtual currency-in amount). Upon the amount of virtual currency-in wagered reaching or exceeding the threshold virtual currency-in amount, the gaming system causes one or more of such events or conditions to occur. In different embodiments, the threshold coin-in amount and/or the threshold virtual currency-in amount is predetermined, randomly determined, determined based on a player's status (such as determined through a player tracking system), determined based on a generated symbol or symbol combination, determined based on a random determination by the central controller, determined based on a random determination at the gaming device, determined based on one or

more side wagers placed, determined based on the player's primary game wager, determined based on time (such as the time of day) or determined based on any other suitable method or criteria.

[0053] In one such embodiment, a symbol accumulation sequence triggering event and/or a reel set activation event occurs based on an amount of coin-out. In this embodiment, the gaming system determines if an amount of coin-out reaches or exceeds a designated amount of coin-out (i.e., a threshold coin-out amount). Upon the amount of coin-out reaching or exceeding the threshold coin-out amount, the gaming system causes one or more of such events or conditions to occur. In another such embodiment, a symbol accumulation sequence triggering event and/or a reel set activation event occurs based on an amount of virtual currency-out. In this embodiment, the gaming system determines if an amount of virtual currency-out reaches or exceeds a designated amount of virtual currency-out (i.e., a threshold virtual currency-out amount). Upon the amount of virtual currency-out reaching or exceeding the threshold virtual currency-out amount, the gaming system causes one or more of such events or conditions to occur. In different embodiments, the threshold coin-out amount and/or the threshold virtual currency-out amount is predetermined, randomly determined, determined based on a player's status (such as determined through a player tracking system), determined based on a generated symbol or symbol combination, determined based on a random determination by the central controller, determined based on a random determination at the gaming device, determined based on one or more side wagers placed, determined based on the player's primary game wager, determined based on time (such as the time of day) or determined based on any other suitable method or criteria.

[0054] In different embodiments, a symbol accumulation sequence triggering event and/or a reel set activation event occurs based on a predefined variable reaching a defined parameter threshold. For example, when the 500,000th player has played an EGM (ascertained from a player tracking system), one or more of such events or conditions occur. In different embodiments, the predefined parameter thresholds include a length of time, a length of time after a certain dollar amount is hit, a wager level threshold for a specific device (which gaming device is the first to contribute \$250,000), a number of gaming devices active, or any other parameter that defines a suitable threshold.

[0055] In different embodiments, a symbol accumulation sequence triggering event and/or a reel set activation event occurs based on a quantity of games played. In this embodiment, a quantity of games played is set for when one or more of such events or conditions will occur. In one embodiment, such a set quantity of games played is based on historic data.

[0056] In different embodiments, a symbol accumulation sequence triggering event and/or a reel set activation event occurs based on time. In this embodiment, a time is set for when one or more of such events or conditions will occur. In one embodiment, such a set time is based on historic data.

[0057] In different embodiments, a symbol accumulation sequence triggering event and/or a reel set activation event occurs based upon gaming system operator defined player eligibility parameters stored on a player tracking system (such as via a player tracking card or other suitable manner). In this embodiment, the parameters for eligibility are defined by the gaming system operator based on any suitable crite-

rior. In one embodiment, the gaming system recognizes the player's identification (via the player tracking system) when the player inserts or otherwise associates their player tracking card in the EGM and/or logs into the player tracking system using a mobile device, such as a personal gaming device. The gaming system determines the player tracking level of the player and if the current player tracking level defined by the gaming system operator is eligible for one or more of such events or conditions. In one embodiment, the gaming system operator defines minimum bet levels required for such events or conditions to occur based on the player's card level.

[0058] In different embodiments, a symbol accumulation sequence triggering event and/or a reel set activation event occurs based on a system determination, including one or more random selections by the central controller. For example, as described above, the gaming system tracks all active EGMs and the wagers they placed, wherein based on the EGM's state as well as one or more wager pools associated with the EGM, the gaming system determines whether to one or more of such events or conditions will occur. In one such embodiment, the player who consistently places a higher wager is more likely to be associated with an occurrence of one or more of such events or conditions than a player who consistently places a minimum wager. It should be appreciated that the criteria for determining whether a player is in active status or inactive status for determining if one or more of such events occur may be the same as, substantially the same as, or different than the criteria for determining whether a player is in active status or inactive status for another one of such events to occur.

[0059] In different embodiments, a symbol accumulation sequence triggering event and/or a reel set activation event occurs based on a determination of if any numbers allotted to a gaming device match a randomly selected number. In this embodiment, upon or prior to each play of each gaming device, a gaming device selects a random number from a range of numbers and during each primary game, the gaming device allocates the first N numbers in the range, where N is the number of credits bet by the player in that primary game. At the end of the primary game, the randomly selected number is compared with the numbers allocated to the player and if a match occurs, one or more of such events or conditions occur.

[0060] It should be appreciated that any suitable manner of causing a symbol accumulation sequence triggering event and/or a reel set activation event to occur may be implemented in accordance with the gaming system and method of the present disclosure. It should be further appreciated that one or more of the above-described triggers pertaining to a symbol accumulation sequence triggering event and/or a reel set activation event occurring may be combined in one or more different embodiments.

[0061] It should be appreciated that in different embodiments, one or more of:

- [0062]** i. when a symbol accumulation sequence triggering event and/or a reel set activation event occurs;
- [0063]** ii. a quantity of reel sets to employ during the triggered symbol accumulation sequence;
- [0064]** iii. a quantity of symbol display positions to associate with each reel set;
- [0065]** iv. which reel sets are initially active and initially inactive upon the triggering of the symbol accumulation sequence;

[0066] v. a quantity of symbols associated with each inactive reel set that, if accumulated at symbol display positions associated with active reel sets, cause a reel set activation event to occur for that inactive reel set;

[0067] vi. which symbols to display at which symbol display positions;

[0068] vii. which awards to associate with which symbols;

[0069] viii. a quantity of symbols to accumulate at a symbol display position; and/or

[0070] ix. any determination of the present disclosure; is/are predetermined, randomly determined, randomly determined based on one or more weighted percentages, determined based on a symbol or symbol combination, determined independent of any symbols or symbol combinations, determined based on a random determination by a server, determined independent of a random determination by a server, determined based on at least one play of at least one game, determined independent of at least one play of at least one game, determined based on a player's selection, determined independent of a player's selection, determined based on one or more side wagers placed, determined independent of one or more side wagers placed, determined based on the player's primary game wager, determined independent of the player's primary game wager, determined based on time (such as the time of day), determined independent of time (such as the time of day), determined based on an amount of coin-in accumulated in one or more pools, determined independent of an amount of coin-in accumulated in one or more pools, determined based on a status of the player (i.e., a player tracking status), determined independent of a status of the player (i.e., a player tracking status), determined based on one or more other determinations of the present disclosure, determined independent of any other determination of the present disclosure or determined based on any other suitable method or criteria.

[0071] The above-described embodiments of the present disclosure may be implemented in accordance with or in conjunction with one or more of a variety of different types of gaming systems, such as, but not limited to, those described below.

[0072] The present disclosure contemplates a variety of different gaming systems each having one or more of a plurality of different features, attributes, or characteristics. A "gaming system" as used herein refers to various configurations of: (a) one or more servers; (b) one or more electronic gaming machines such as those located on a casino floor; and/or (c) one or more personal gaming devices. Thus, in various embodiments, the gaming system of the present disclosure includes: (a) one or more electronic gaming machines in combination with one or more servers; (b) one or more personal gaming devices in combination with one or more servers; (c) one or more personal gaming devices in combination with one or more electronic gaming machines; (d) one or more personal gaming devices, one or more electronic gaming machines, and one or more servers in combination with one another; (e) a single electronic gaming machine; (f) a plurality of electronic gaming machines in combination with one another; (g) a single personal gaming device; (h) a plurality of personal gaming devices in combination with one another; (i) a single server; and/or (j) a plurality of servers in combination with one another. For brevity and clarity and unless specifically stated otherwise, "EGM" as used herein represents one EGM or a plurality of

EGMs, "personal gaming device" as used herein represents one personal gaming device or a plurality of personal gaming devices, and "server" as used herein represents one server or a plurality of servers.

[0073] As noted above, in various embodiments, the gaming system includes an EGM (or personal gaming device) in combination with a server. In such embodiments, the EGM (or personal gaming device) is configured to communicate with the server through a data network or remote communication link. In certain such embodiments, the EGM (or personal gaming device) is configured to communicate with another EGM (or personal gaming device) through the same data network or remote communication link or through a different data network or remote communication link. For example, the gaming system includes a plurality of EGMs that are each configured to communicate with a server through a data network.

[0074] In certain embodiments in which the gaming system includes an EGM (or personal gaming device) in combination with a server, the server is any suitable computing device (such as a server) that includes at least one processor and at least one memory device or data storage device. As further described herein, the EGM (or personal gaming device) includes at least one EGM (or personal gaming device) processor configured to transmit and receive data or signals representing events, messages, commands, or any other suitable information between the EGM (or personal gaming device) and the server. The at least one processor of that EGM (or personal gaming device) is configured to execute the events, messages, or commands represented by such data or signals in conjunction with the operation of the EGM (or personal gaming device). Moreover, the at least one processor of the server is configured to transmit and receive data or signals representing events, messages, commands, or any other suitable information between the server and the EGM (or personal gaming device). The at least one processor of the server is configured to execute the events, messages, or commands represented by such data or signals in conjunction with the operation of the server. One, more than one, or each of the functions of the server may be performed by the at least one processor of the EGM (or personal gaming device). Further, one, more than one, or each of the functions of the at least one processor of the EGM (or personal gaming device) may be performed by the at least one processor of the server.

[0075] In certain such embodiments, computerized instructions for controlling any games (such as any primary or base games and/or any secondary or bonus games) displayed by the EGM (or personal gaming device) are executed by the server. In such "thin client" embodiments, the server remotely controls any games (or other suitable interfaces) displayed by the EGM (or personal gaming device), and the EGM (or personal gaming device) is utilized to display such games (or suitable interfaces) and to receive one or more inputs or commands. In other such embodiments, computerized instructions for controlling any games displayed by the EGM (or personal gaming device) are communicated from the server to the EGM (or personal gaming device) and are stored in at least one memory device of the EGM (or personal gaming device). In such "thick client" embodiments, the at least one processor of the EGM (or personal gaming device) executes the computerized instructions to control any games (or other suitable interfaces) displayed by the EGM (or personal gaming device).

[0076] In various embodiments in which the gaming system includes a plurality of EGMs (or personal gaming devices), one or more of the EGMs (or personal gaming devices) are thin client EGMs (or personal gaming devices) and one or more of the EGMs (or personal gaming devices) are thick client EGMs (or personal gaming devices). In other embodiments in which the gaming system includes one or more EGMs (or personal gaming devices), certain functions of one or more of the EGMs (or personal gaming devices) are implemented in a thin client environment, and certain other functions of one or more of the EGMs (or personal gaming devices) are implemented in a thick client environment. In one such embodiment in which the gaming system includes an EGM (or personal gaming device) and a server, computerized instructions for controlling any primary or base games displayed by the EGM (or personal gaming device) are communicated from the server to the EGM (or personal gaming device) in a thick client configuration, and computerized instructions for controlling any secondary or bonus games or other functions displayed by the EGM (or personal gaming device) are executed by the server in a thin client configuration.

[0077] In certain embodiments in which the gaming system includes: (a) an EGM (or personal gaming device) configured to communicate with a server through a data network; and/or (b) a plurality of EGMs (or personal gaming devices) configured to communicate with one another through a data network, the data network is a local area network (LAN) in which the EGMs (or personal gaming devices) are located substantially proximate to one another and/or the server. In one example, the EGMs (or personal gaming devices) and the server are located in a gaming establishment or a portion of a gaming establishment.

[0078] In other embodiments in which the gaming system includes: (a) an EGM (or personal gaming device) configured to communicate with a server through a data network; and/or (b) a plurality of EGMs (or personal gaming devices) configured to communicate with one another through a data network, the data network is a wide area network (WAN) in which one or more of the EGMs (or personal gaming devices) are not necessarily located substantially proximate to another one of the EGMs (or personal gaming devices) and/or the server. For example, one or more of the EGMs (or personal gaming devices) are located: (a) in an area of a gaming establishment different from an area of the gaming establishment in which the server is located; or (b) in a gaming establishment different from the gaming establishment in which the server is located. In another example, the server is not located within a gaming establishment in which the EGMs (or personal gaming devices) are located. In certain embodiments in which the data network is a WAN, the gaming system includes a server and an EGM (or personal gaming device) each located in a different gaming establishment in a same geographic area, such as a same city or a same state. Gaming systems in which the data network is a WAN are substantially identical to gaming systems in which the data network is a LAN, though the quantity of EGMs (or personal gaming devices) in such gaming systems may vary relative to one another.

[0079] In further embodiments in which the gaming system includes: (a) an EGM (or personal gaming device) configured to communicate with a server through a data network; and/or (b) a plurality of EGMs (or personal gaming devices) configured to communicate with one another

through a data network, the data network is an internet (such as the Internet) or an intranet. In certain such embodiments, an Internet browser of the EGM (or personal gaming device) is usable to access an Internet game page from any location where an Internet connection is available. In one such embodiment, after the EGM (or personal gaming device) accesses the Internet game page, the server identifies a player before enabling that player to place any wagers on any plays of any wagering games. In one example, the server identifies the player by requiring a player account of the player to be logged into via an input of a unique username and password combination assigned to the player. The server may, however, identify the player in any other suitable manner, such as by validating a player tracking identification number associated with the player; by reading a player tracking card or other smart card inserted into a card reader (as described below); by validating a unique player identification number associated with the player by the server; or by identifying the EGM (or personal gaming device), such as by identifying the MAC address or the IP address of the Internet facilitator. In various embodiments, once the server identifies the player, the server enables placement of one or more wagers on one or more plays of one or more primary or base games and/or one or more secondary or bonus games, and displays those plays via the Internet browser of the EGM (or personal gaming device).

[0080] The server and the EGM (or personal gaming device) are configured to connect to the data network or remote communications link in any suitable manner. In various embodiments, such a connection is accomplished via: a conventional phone line or other data transmission line, a digital subscriber line (DSL), a T-1 line, a coaxial cable, a fiber optic cable, a wireless or wired routing device, a mobile communications network connection (such as a cellular network or mobile Internet network), or any other suitable medium. The expansion in the quantity of computing devices and the quantity and speed of Internet connections in recent years increases opportunities for players to use a variety of EGMs (or personal gaming devices) to play games from an ever-increasing quantity of remote sites. Additionally, the enhanced bandwidth of digital wireless communications may render such technology suitable for some or all communications, particularly if such communications are encrypted. Higher data transmission speeds may be useful for enhancing the sophistication and response of the display and interaction with players.

[0081] FIG. 3 is a block diagram of an example EGM 1000 and FIGS. 4A and 4B include two different example EGMs 2000a and 2000b. The EGMs 1000, 2000a, and 2000b are merely example EGMs, and different EGMs may be implemented using different combinations of the components shown in the EGMs 1000, 2000a, and 2000b. Although the below refers to EGMs, in various embodiments personal gaming devices (such as personal gaming device 2000c of FIG. 4C) may include some or all of the below components.

[0082] In these embodiments, the EGM 1000 includes a master gaming controller 1012 configured to communicate with and to operate with a plurality of peripheral devices 1022.

[0083] The master gaming controller 1012 includes at least one processor 1010. The at least one processor 1010 is any suitable processing device or set of processing devices, such as a microprocessor, a microcontroller-based platform,

a suitable integrated circuit, or one or more application-specific integrated circuits (ASICs), configured to execute software enabling various configuration and reconfiguration tasks, such as: (1) communicating with a remote source (such as a server that stores authentication information or game information) via a communication interface **1006** of the master gaming controller **1012**; (2) converting signals read by an interface to a format corresponding to that used by software or memory of the EGM; (3) accessing memory to configure or reconfigure game parameters in the memory according to indicia read from the EGM; (4) communicating with interfaces and the peripheral devices **1022** (such as input/output devices); and/or (5) controlling the peripheral devices **1022**. In certain embodiments, one or more components of the master gaming controller **1012** (such as the at least one processor **1010**) reside within a housing of the EGM (described below), while in other embodiments at least one component of the master gaming controller **1012** resides outside of the housing of the EGM.

[0084] The master gaming controller **1012** also includes at least one memory device **1016**, which includes: (1) volatile memory (e.g., RAM **1009**, which can include non-volatile RAM, magnetic RAM, ferroelectric RAM, and any other suitable forms); (2) non-volatile memory **1019** (e.g., disk memory, FLASH memory, EPROMs, EEPROMs, memristor-based non-volatile solid-state memory, etc.); (3) unalterable memory (e.g., EPROMs **1008**); (4) read-only memory; and/or (5) a secondary memory storage device **1015**, such as a non-volatile memory device, configured to store gaming software related information (the gaming software related information and the memory may be used to store various audio files and games not currently being used and invoked in a configuration or reconfiguration). Any other suitable magnetic, optical, and/or semiconductor memory may operate in conjunction with the EGM of the present disclosure. In certain embodiments, the at least one memory device **1016** resides within the housing of the EGM (described below), while in other embodiments at least one component of the at least one memory device **1016** resides outside of the housing of the EGM. In these embodiments, any combination of one or more computer readable media may be utilized. The computer readable media may be a computer readable signal medium or a computer readable storage medium. A computer readable storage medium may be, for example, but not limited to, an electronic, magnetic, optical, electromagnetic, or semiconductor system, apparatus, or device, or any suitable combination of the foregoing. More specific examples (a non-exhaustive list) of the computer readable storage medium would include the following: a portable computer diskette, a hard disk, a random access memory (RAM), a read-only memory (ROM), an erasable programmable read-only memory (EPROM or Flash memory), an appropriate optical fiber with a repeater, a portable compact disc read-only memory (CD-ROM), an optical storage device, a magnetic storage device, or any suitable combination of the foregoing. In the context of this document, a computer readable storage medium may be any tangible medium that can contain, or store a program for use by or in connection with an instruction execution system, apparatus, or device.

[0085] A computer readable signal medium may include a propagated data signal with computer readable program code embodied therein, for example, in baseband or as part of a carrier wave. Such a propagated signal may take any of

a variety of forms, including, but not limited to, electromagnetic, optical, or any suitable combination thereof. A computer readable signal medium may be any computer readable medium that is not a computer readable storage medium and that can communicate, propagate, or transport a program for use by or in connection with an instruction execution system, apparatus, or device. Program code embodied on a computer readable signal medium may be transmitted using any appropriate medium, including but not limited to wireless, wireline, optical fiber cable, RF, etc., or any suitable combination of the foregoing.

[0086] The at least one memory device **1016** is configured to store, for example: (1) configuration software **1014**, such as all the parameters and settings for a game playable on the EGM; (2) associations **1018** between configuration indicia read from an EGM with one or more parameters and settings; (3) communication protocols configured to enable the at least one processor **1010** to communicate with the peripheral devices **1022**; and/or (4) communication transport protocols (such as TCP/IP, USB, Firewire, IEEE1394, Bluetooth, IEEE 802.11x (IEEE 802.11 standards), hipernlan/2, HomeRF, etc.) configured to enable the EGM to communicate with local and non-local devices using such protocols. In one implementation, the master gaming controller **1012** communicates with other devices using a serial communication protocol. A few non-limiting examples of serial communication protocols that other devices, such as peripherals (e.g., a bill validator or a ticket printer), may use to communicate with the master game controller **1012** include USB, RS-232, and Netplex (a proprietary protocol developed by IGT).

[0087] As will be appreciated by one skilled in the art, aspects of the present disclosure may be illustrated and described herein in any of a number of patentable classes or context including any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof. Accordingly, aspects of the present disclosure may be implemented entirely hardware, entirely software (including firmware, resident software, micro-code, etc.) or combining software and hardware implementation that may all generally be referred to herein as a "circuit," "module," "component," or "system." Furthermore, aspects of the present disclosure may take the form of a computer program product embodied in one or more computer readable media having computer readable program code embodied thereon.

[0088] Computer program code for carrying out operations for aspects of the present disclosure may be written in any combination of one or more programming languages, including an object oriented programming language such as Java, Scala, Smalltalk, Eiffel, JADE, Emerald, C++, C#, VB.NET, Python or the like, conventional procedural programming languages, such as the "C" programming language, Visual Basic, Fortran 2003, Perl, COBOL 2002, PHP, ABAP, dynamic programming languages such as Python, Ruby and Groovy, or other programming languages. The program code may execute entirely on the user's computer, partly on the user's computer, as a stand-alone software package, partly on the user's computer and partly on a remote computer or entirely on the remote computer or server. In the latter scenario, the remote computer may be connected to the user's computer through any type of network, including a local area network (LAN) or a wide area network (WAN), or the connection may be made to an

external computer (for example, through the Internet using an Internet Service Provider) or in a cloud computing environment or offered as a service such as a Software as a Service (SaaS).

[0089] Aspects of the present disclosure are described herein with reference to flowchart illustrations and/or block diagrams of methods, apparatuses (systems) and computer program products according to embodiments of the disclosure. It will be understood that each block of the flowchart illustrations and/or block diagrams, and combinations of blocks in the flowchart illustrations and/or block diagrams, can be implemented by computer program instructions. These computer program instructions may be provided to a processor of a general purpose computer, special purpose computer, or other programmable data processing apparatus to produce a machine, such that the instructions, which execute via the processor of the computer or other programmable instruction execution apparatus, create a mechanism for implementing the functions/acts specified in the flowchart and/or block diagram block or blocks.

[0090] These computer program instructions may also be stored in a computer readable medium that when executed can direct a computer, other programmable data processing apparatus, or other devices to function in a particular manner, such that the instructions when stored in the computer readable medium produce an article of manufacture including instructions which when executed, cause a computer to implement the function/act specified in the flowchart and/or block diagram block or blocks. The computer program instructions may also be loaded onto a computer, other programmable instruction execution apparatus, or other devices to cause a series of operational steps to be performed on the computer, other programmable apparatuses or other devices to produce a computer implemented process such that the instructions which execute on the computer or other programmable apparatus provide processes for implementing the functions/acts specified in the flowchart and/or block diagram block or blocks.

[0091] In certain embodiments, the at least one memory device **1016** is configured to store program code and instructions executable by the at least one processor of the EGM to control the EGM. The at least one memory device **1016** of the EGM also stores other operating data, such as image data, event data, input data, random number generators (RNGs) or pseudo-RNGs, payable data or information, and/or applicable game rules that relate to the play of one or more games on the EGM. In various embodiments, part or all of the program code and/or the operating data described above is stored in at least one detachable or removable memory device including, but not limited to, a cartridge, a disk, a CD ROM, a DVD, a USB memory device, or any other suitable non-transitory computer readable medium. In certain such embodiments, an operator (such as a gaming establishment operator) and/or a player uses such a removable memory device in an EGM to implement at least part of the present disclosure. In other embodiments, part or all of the program code and/or the operating data is downloaded to the at least one memory device of the EGM through any suitable data network described above (such as an Internet or intranet).

[0092] The at least one memory device **1016** also stores a plurality of device drivers **1042**. Examples of different types of device drivers include device drivers for EGM components and device drivers for the peripheral components

1022. Typically, the device drivers **1042** utilize various communication protocols that enable communication with a particular physical device. The device driver abstracts the hardware implementation of that device. For example, a device driver may be written for each type of card reader that could potentially be connected to the EGM. Non-limiting examples of communication protocols used to implement the device drivers include Netplex, USB, Serial, Ethernet **175**, Firewire, I/O debouncer, direct memory map, serial, PCI, parallel, RF, Bluetooth™, near-field communications (e.g., using near-field magnetics), 802.11 (WiFi), etc. In one embodiment, when one type of a particular device is exchanged for another type of the particular device, the at least one processor of the EGM loads the new device driver from the at least one memory device to enable communication with the new device. For instance, one type of card reader in the EGM can be replaced with a second different type of card reader when device drivers for both card readers are stored in the at least one memory device.

[0093] In certain embodiments, the software units stored in the at least one memory device **1016** can be upgraded as needed. For instance, when the at least one memory device **1016** is a hard drive, new games, new game options, new parameters, new settings for existing parameters, new settings for new parameters, new device drivers, and new communication protocols can be uploaded to the at least one memory device **1016** from the master game controller **1012** or from some other external device. As another example, when the at least one memory device **1016** includes a CD/DVD drive including a CD/DVD configured to store game options, parameters, and settings, the software stored in the at least one memory device **1016** can be upgraded by replacing a first CD/DVD with a second CD/DVD. In yet another example, when the at least one memory device **1016** uses flash memory **1019** or EPROM **1008** units configured to store games, game options, parameters, and settings, the software stored in the flash and/or EPROM memory units can be upgraded by replacing one or more memory units with new memory units that include the upgraded software. In another embodiment, one or more of the memory devices, such as the hard drive, may be employed in a game software download process from a remote software server.

[0094] In some embodiments, the at least one memory device **1016** also stores authentication and/or validation components **1044** configured to authenticate/validate specified EGM components and/or information, such as hardware components, software components, firmware components, peripheral device components, user input device components, information received from one or more user input devices, information stored in the at least one memory device **1016**, etc.

[0095] In certain embodiments, the peripheral devices **1022** include several device interfaces, such as: (1) at least one output device **1020** including at least one display device **1035**; (2) at least one input device **1030** (which may include contact and/or non-contact interfaces); (3) at least one transponder **1054**; (4) at least one wireless communication component **1056**; (5) at least one wired/wireless power distribution component **1058**; (6) at least one sensor **1060**; (7) at least one data preservation component **1062**; (8) at least one motion/gesture analysis and interpretation component **1064**; (9) at least one motion detection component **1066**; (10) at least one portable power source **1068**; (11) at least one geolocation module **1076**; (12) at least one user

identification module **1077**; (13) at least one player/device tracking module **1078**; and (14) at least one information filtering module **1079**.

[0096] The at least one output device **1020** includes at least one display device **1035** configured to display any game(s) displayed by the EGM and any suitable information associated with such game(s). In certain embodiments, the display devices are connected to or mounted on a housing of the EGM (described below). In various embodiments, the display devices serve as digital glass configured to advertise certain games or other aspects of the gaming establishment in which the EGM is located. In various embodiments, the EGM includes one or more of the following display devices: (a) a central display device; (b) a player tracking display configured to display various information regarding a player's player tracking status (as described below); (c) a secondary or upper display device in addition to the central display device and the player tracking display; (d) a credit display configured to display a current quantity of credits, amount of cash, account balance, or the equivalent; and (e) a bet display configured to display an amount wagered for one or more plays of one or more games. The example EGM **2000a** illustrated in FIG. 4A includes a central display device **2116**, a player tracking display **2140**, a credit display **2120**, and a bet display **2122**. The example EGM **2000b** illustrated in FIG. 4B includes a central display device **2116**, an upper display device **2118**, a player tracking display **2140**, a credit display **2120**, and a bet display **2122**.

[0097] In various embodiments, the display devices include, without limitation: a monitor, a television display, a plasma display, a liquid crystal display (LCD), a display based on light emitting diodes (LEDs), a display based on a plurality of organic light-emitting diodes (OLEDs), a display based on polymer light-emitting diodes (PLEDs), a display based on a plurality of surface-conduction electron-emitters (SEDs), a display including a projected and/or reflected image, or any other suitable electronic device or display mechanism. In certain embodiments, as described above, the display device includes a touch-screen with an associated touch-screen controller. The display devices may be of any suitable sizes, shapes, and configurations.

[0098] The display devices of the EGM are configured to display one or more game and/or non-game images, symbols, and indicia. In certain embodiments, the display devices of the EGM are configured to display any suitable visual representation or exhibition of the movement of objects; dynamic lighting; video images; images of people, characters, places, things, and faces of cards; and the like. In certain embodiments, the display devices of the EGM are configured to display one or more video reels, one or more video wheels, and/or one or more video dice. In other embodiments, certain of the displayed images, symbols, and indicia are in mechanical form. That is, in these embodiments, the display device includes any electromechanical device, such as one or more rotatable wheels, one or more reels, and/or one or more dice, configured to display at least one or a plurality of game or other suitable images, symbols, or indicia.

[0099] In various embodiments, the at least one output device **1020** includes a payout device. In these embodiments, after the EGM receives an actuation of a cashout device (described below), the EGM causes the payout device to provide a payment to the player. In one embodiment, the payout device is one or more of: (a) a ticket printer and

dispenser configured to print and dispense a ticket or credit slip associated with a monetary value, wherein the ticket or credit slip may be redeemed for its monetary value via a cashier, a kiosk, or other suitable redemption system; (b) a bill dispenser configured to dispense paper currency; (c) a coin dispenser configured to dispense coins or tokens (such as into a coin payout tray); and (d) any suitable combination thereof. The example EGMs **2000a** and **2000b** illustrated in FIGS. 4A and 4B each include a ticket printer and dispenser **2136**.

[0100] In certain embodiments, rather than dispensing bills, coins, or a physical ticket having a monetary value to the player following receipt of an actuation of the cashout device, the payout device is configured to cause a payment to be provided to the player in the form of an electronic funds transfer, such as via a direct deposit into a bank account, a casino account, or a prepaid account of the player; via a transfer of funds onto an electronically recordable identification card or smart card of the player; or via sending a virtual ticket having a monetary value to an electronic device of the player.

[0101] While any credit balances, any wagers, any values, and any awards are described herein as amounts of monetary credits or currency, one or more of such credit balances, such wagers, such values, and such awards may be for non-monetary credits, promotional credits, of player tracking points or credits.

[0102] In certain embodiments, the at least one output device **1020** is a sound generating device controlled by one or more sound cards. In one such embodiment, the sound generating device includes one or more speakers or other sound generating hardware and/or software configured to generate sounds, such as by playing music for any games or by playing music for other modes of the EGM, such as an attract mode. The example EGMs **2000a** and **2000b** illustrated in FIGS. 4A and 4B each include a plurality of speakers **2150**. In another such embodiment, the EGM provides dynamic sounds coupled with attractive multimedia images displayed on one or more of the display devices to provide an audio-visual representation or to otherwise display full-motion video with sound to attract players to the EGM. In certain embodiments, the EGM displays a sequence of audio and/or visual attraction messages during idle periods to attract potential players to the EGM. The videos may be customized to provide any appropriate information.

[0103] The at least one input device **1030** may include any suitable device that enables an input signal to be produced and received by the at least one processor **1010** of the EGM.

[0104] In one embodiment, the at least one input device **1030** includes a payment device configured to communicate with the at least one processor of the EGM to fund the EGM. In certain embodiments, the payment device includes one or more of: (a) a bill acceptor into which paper money is inserted to fund the EGM; (b) a ticket acceptor into which a ticket or a voucher is inserted to fund the EGM; (c) a coin slot into which coins or tokens are inserted to fund the EGM; (d) a reader or a validator for credit cards, debit cards, or credit slips into which a credit card, debit card, or credit slip is inserted to fund the EGM; (e) a player identification card reader into which a player identification card is inserted to fund the EGM; or (f) any suitable combination thereof. The

example EGMs **2000a** and **2000b** illustrated in FIGS. **4A** and **4B** each include a combined bill and ticket acceptor **2128** and a coin slot **2126**.

[0105] In one embodiment, the at least one input device **1030** includes a payment device configured to enable the EGM to be funded via an electronic funds transfer, such as a transfer of funds from a bank account. In another embodiment, the EGM includes a payment device configured to communicate with a mobile device of a player, such as a mobile phone, a radio frequency identification tag, or any other suitable wired or wireless device, to retrieve relevant information associated with that player to fund the EGM. When the EGM is funded, the at least one processor determines the amount of funds entered and displays the corresponding amount on a credit display or any other suitable display as described below.

[0106] In certain embodiments, the at least one input device **1030** includes at least one wagering or betting device. In various embodiments, the one or more wagering or betting devices are each: (1) a mechanical button supported by the housing of the EGM (such as a hard key or a programmable soft key), or (2) an icon displayed on a display device of the EGM (described below) that is actuatable via a touch screen of the EGM (described below) or via use of a suitable input device of the EGM (such as a mouse or a joystick). One such wagering or betting device is as a maximum wager or bet device that, when actuated, causes the EGM to place a maximum wager on a play of a game. Another such wagering or betting device is a repeat bet device that, when actuated, causes the EGM to place a wager that is equal to the previously-placed wager on a play of a game. A further such wagering or betting device is a bet one device that, when actuated, causes the EGM to increase the wager by one credit. Generally, upon actuation of one of the wagering or betting devices, the quantity of credits displayed in a credit meter (described below) decreases by the amount of credits wagered, while the quantity of credits displayed in a bet display (described below) increases by the amount of credits wagered.

[0107] In various embodiments, the at least one input device **1030** includes at least one game play activation device. In various embodiments, the one or more game play initiation devices are each: (1) a mechanical button supported by the housing of the EGM (such as a hard key or a programmable soft key), or (2) an icon displayed on a display device of the EGM (described below) that is actuatable via a touch screen of the EGM (described below) or via use of a suitable input device of the EGM (such as a mouse or a joystick). After a player appropriately funds the EGM and places a wager, the EGM activates the game play activation device to enable the player to actuate the game play activation device to initiate a play of a game on the EGM (or another suitable sequence of events associated with the EGM). After the EGM receives an actuation of the game play activation device, the EGM initiates the play of the game. The example EGMs **2000a** and **2000b** illustrated in FIGS. **4A** and **4B** each include a game play activation device in the form of a game play initiation button **2132**. In other embodiments, the EGM begins game play automatically upon appropriate funding rather than upon utilization of the game play activation device.

[0108] In other embodiments, the at least one input device **1030** includes a cashout device. In various embodiments, the cashout device is: (1) a mechanical button supported by the

housing of the EGM (such as a hard key or a programmable soft key), or (2) an icon displayed on a display device of the EGM (described below) that is actuatable via a touch screen of the EGM (described below) or via use of a suitable input device of the EGM (such as a mouse or a joystick). When the EGM receives an actuation of the cashout device from a player and the player has a positive (i.e., greater-than-zero) credit balance, the EGM initiates a payout associated with the player's credit balance. The example EGMs **2000a** and **2000b** illustrated in FIGS. **4A** and **4B** each include a cashout device in the form of a cashout button **2134**.

[0109] In various embodiments, the at least one input device **1030** includes a plurality of buttons that are programmable by the EGM operator to, when actuated, cause the EGM to perform particular functions. For instance, such buttons may be hard keys, programmable soft keys, or icons icon displayed on a display device of the EGM (described below) that are actuatable via a touch screen of the EGM (described below) or via use of a suitable input device of the EGM (such as a mouse or a joystick). The example EGMs **2000a** and **2000b** illustrated in FIGS. **4A** and **4B** each include a plurality of such buttons **2130**.

[0110] In certain embodiments, the at least one input device **1030** includes a touch-screen coupled to a touch-screen controller or other touch-sensitive display overlay to enable interaction with any images displayed on a display device (as described below). One such input device is a conventional touch-screen button panel. The touch-screen and the touch-screen controller are connected to a video controller. In these embodiments, signals are input to the EGM by touching the touch screen at the appropriate locations.

[0111] In embodiments including a player tracking system, as further described below, the at least one input device **1030** includes a card reader in communication with the at least one processor of the EGM. The example EGMs **2000a** and **2000b** illustrated in FIGS. **4A** and **4B** each include a card reader **2138**. The card reader is configured to read a player identification card inserted into the card reader.

[0112] The at least one wireless communication component **1056** includes one or more communication interfaces having different architectures and utilizing a variety of protocols, such as (but not limited to) 802.11 (WiFi); 802.15 (including Bluetooth™); 802.16 (WiMax); 802.22; cellular standards such as CDMA, CDMA2000, and WCDMA; Radio Frequency (e.g., RFID); infrared; and Near Field Magnetic communication protocols. The at least one wireless communication component **1056** transmits electrical, electromagnetic, or optical signals that carry digital data streams or analog signals representing various types of information.

[0113] The at least one wired/wireless power distribution component **1058** includes components or devices that are configured to provide power to other devices. For example, in one embodiment, the at least one power distribution component **1058** includes a magnetic induction system that is configured to provide wireless power to one or more user input devices near the EGM. In one embodiment, a user input device docking region is provided, and includes a power distribution component that is configured to recharge a user input device without requiring metal-to-metal contact. In one embodiment, the at least one power distribution component **1058** is configured to distribute power to one or

more internal components of the EGM, such as one or more rechargeable power sources (e.g., rechargeable batteries) located at the EGM.

[0114] In certain embodiments, the at least one sensor **1060** includes at least one of: optical sensors, pressure sensors, RF sensors, infrared sensors, image sensors, thermal sensors, and biometric sensors. The at least one sensor **1060** may be used for a variety of functions, such as: detecting movements and/or gestures of various objects within a predetermined proximity to the EGM; detecting the presence and/or identity of various persons (e.g., players, casino employees, etc.), devices (e.g., user input devices), and/or systems within a predetermined proximity to the EGM.

[0115] The at least one data preservation component **1062** is configured to detect or sense one or more events and/or conditions that, for example, may result in damage to the EGM and/or that may result in loss of information associated with the EGM. Additionally, the data preservation system **1062** may be operable to initiate one or more appropriate action(s) in response to the detection of such events/conditions.

[0116] The at least one motion/gesture analysis and interpretation component **1064** is configured to analyze and/or interpret information relating to detected player movements and/or gestures to determine appropriate player input information relating to the detected player movements and/or gestures. For example, in one embodiment, the at least one motion/gesture analysis and interpretation component **1064** is configured to perform one or more of the following functions: analyze the detected gross motion or gestures of a player; interpret the player's motion or gestures (e.g., in the context of a casino game being played) to identify instructions or input from the player; utilize the interpreted instructions/input to advance the game state; etc. In other embodiments, at least a portion of these additional functions may be implemented at a remote system or device.

[0117] The at least one portable power source **1068** enables the EGM to operate in a mobile environment. For example, in one embodiment, the EGM **300** includes one or more rechargeable batteries.

[0118] The at least one geolocation module **1076** is configured to acquire geolocation information from one or more remote sources and use the acquired geolocation information to determine information relating to a relative and/or absolute position of the EGM. For example, in one implementation, the at least one geolocation module **1076** is configured to receive GPS signal information for use in determining the position or location of the EGM. In another implementation, the at least one geolocation module **1076** is configured to receive multiple wireless signals from multiple remote devices (e.g., EGMs, servers, wireless access points, etc.) and use the signal information to compute position/location information relating to the position or location of the EGM.

[0119] The at least one user identification module **1077** is configured to determine the identity of the current user or current owner of the EGM. For example, in one embodiment, the current user is required to perform a login process at the EGM in order to access one or more features. Alternatively, the EGM is configured to automatically determine the identity of the current user based on one or more external signals, such as an RFID tag or badge worn by the current user and that provides a wireless signal to the EGM

that is used to determine the identity of the current user. In at least one embodiment, various security features are incorporated into the EGM to prevent unauthorized users from accessing confidential or sensitive information.

[0120] The at least one information filtering module **1079** is configured to perform filtering (e.g., based on specified criteria) of selected information to be displayed at one or more displays **1035** of the EGM.

[0121] In various embodiments, the EGM includes a plurality of communication ports configured to enable the at least one processor of the EGM to communicate with and to operate with external peripherals, such as: accelerometers, arcade sticks, bar code readers, bill validators, biometric input devices, bonus devices, button panels, card readers, coin dispensers, coin hoppers, display screens or other displays or video sources, expansion buses, information panels, keypads, lights, mass storage devices, microphones, motion sensors, motors, printers, reels, SCSI ports, solenoids, speakers, thumbsticks, ticket readers, touch screens, trackballs, touchpads, wheels, and wireless communication devices.

[0122] As generally described above, in certain embodiments, such as the example EGMs **2000a** and **2000b** illustrated in FIGS. **4A** and **4B**, the EGM has a support structure, housing, or cabinet that provides support for a plurality of the input devices and the output devices of the EGM. Further, the EGM is configured such that a player may operate it while standing or sitting. In various embodiments, the EGM is positioned on a base or stand, or is configured as a pub-style tabletop game (not shown) that a player may operate typically while sitting. As illustrated by the different example EGMs **2000a** and **2000b** shown in FIGS. **4A** and **4B**, EGMs may have varying housing and display configurations.

[0123] In certain embodiments, the EGM is a device that has obtained approval from a regulatory gaming commission, and in other embodiments, the EGM is a device that has not obtained approval from a regulatory gaming commission.

[0124] The EGMs described above are merely three examples of different types of EGMs. Certain of these example EGMs may include one or more elements that may not be included in all gaming systems, and these example EGMs may not include one or more elements that are included in other gaming systems. For example, certain EGMs include a coin acceptor while others do not.

[0125] In various embodiments, an EGM may be implemented in one of a variety of different configurations. In various embodiments, the EGM may be implemented as one of: (a) a dedicated EGM in which computerized game programs executable by the EGM for controlling any primary or base games (referred to herein as "primary games") and/or any secondary or bonus games or other functions (referred to herein as "secondary games") displayed by the EGM are provided with the EGM before delivery to a gaming establishment or before being provided to a player; and (b) a changeable EGM in which computerized game programs executable by the EGM for controlling any primary games and/or secondary games displayed by the EGM are downloadable or otherwise transferred to the EGM through a data network or remote communication link; from a USB drive, flash memory card, or other suitable memory device; or in any other suitable manner after the EGM is

physically located in a gaming establishment or after the EGM is provided to a player.

[0126] As generally explained above, in various embodiments in which the gaming system includes a server and a changeable EGM, the at least one memory device of the server stores different game programs and instructions executable by the at least one processor of the changeable EGM to control one or more primary games and/or secondary games displayed by the changeable EGM. More specifically, each such executable game program represents a different game or a different type of game that the at least one changeable EGM is configured to operate. In one example, certain of the game programs are executable by the changeable EGM to operate games having the same or substantially the same game play but different paytables. In different embodiments, each executable game program is associated with a primary game, a secondary game, or both. In certain embodiments, an executable game program is executable by the at least one processor of the at least one changeable EGM as a secondary game to be played simultaneously with a play of a primary game (which may be downloaded to or otherwise stored on the at least one changeable EGM), or vice versa.

[0127] In operation of such embodiments, the server is configured to communicate one or more of the stored executable game programs to the at least one processor of the changeable EGM. In different embodiments, a stored executable game program is communicated or delivered to the at least one processor of the changeable EGM by: (a) embedding the executable game program in a device or a component (such as a microchip to be inserted into the changeable EGM); (b) writing the executable game program onto a disc or other media; or (c) uploading or streaming the executable game program over a data network (such as a dedicated data network). After the executable game program is communicated from the server to the changeable EGM, the at least one processor of the changeable EGM executes the executable game program to enable the primary game and/or the secondary game associated with that executable game program to be played using the display device(s) and/or the input device(s) of the changeable EGM. That is, when an executable game program is communicated to the at least one processor of the changeable EGM, the at least one processor of the changeable EGM changes the game or the type of game that may be played using the changeable EGM.

[0128] In certain embodiments, the gaming system randomly determines any game outcome(s) (such as a win outcome) and/or award(s) (such as a quantity of credits to award for the win outcome) for a play of a primary game and/or a play of a secondary game based on probability data. In certain such embodiments, this random determination is provided through utilization of an RNG, such as a true RNG or a pseudo RNG, or any other suitable randomization process. In one such embodiment, each game outcome or award is associated with a probability, and the gaming system generates the game outcome(s) and/or the award(s) to be provided based on the associated probabilities. In these embodiments, since the gaming system generates game outcomes and/or awards randomly or based on one or more probability calculations, there is no certainty that the gaming system will ever provide any specific game outcome and/or award.

[0129] In certain embodiments, the gaming system maintains one or more predetermined pools or sets of predetermined game outcomes and/or awards. In certain such embodiments, upon generation or receipt of a game outcome and/or award request, the gaming system independently selects one of the predetermined game outcomes and/or awards from the one or more pools or sets. The gaming system flags or marks the selected game outcome and/or award as used. Once a game outcome or an award is flagged as used, it is prevented from further selection from its respective pool or set; that is, the gaming system does not select that game outcome or award upon another game outcome and/or award request. The gaming system provides the selected game outcome and/or award.

[0130] In certain embodiments, the gaming system determines a predetermined game outcome and/or award based on the results of a bingo, keno, or lottery game. In certain such embodiments, the gaming system utilizes one or more bingo, keno, or lottery games to determine the predetermined game outcome and/or award provided for a primary game and/or a secondary game. The gaming system is provided or associated with a bingo card. Each bingo card consists of a matrix or array of elements, wherein each element is designated with separate indicia. After a bingo card is provided, the gaming system randomly selects or draws a plurality of the elements. As each element is selected, a determination is made as to whether the selected element is present on the bingo card. If the selected element is present on the bingo card, that selected element on the provided bingo card is marked or flagged. This process of selecting elements and marking any selected elements on the provided bingo cards continues until one or more predetermined patterns are marked on one or more of the provided bingo cards. After one or more predetermined patterns are marked on one or more of the provided bingo cards, game outcome and/or award is determined based, at least in part, on the selected elements on the provided bingo cards.

[0131] In certain embodiments in which the gaming system includes a server and an EGM, the EGM is configured to communicate with the server for monitoring purposes only. In such embodiments, the EGM determines the game outcome(s) and/or award(s) to be provided in any of the manners described above, and the server monitors the activities and events occurring on the EGM. In one such embodiment, the gaming system includes a real-time or online accounting and gaming information system configured to communicate with the server. In this embodiment, the accounting and gaming information system includes: (a) a player database configured to store player profiles, (b) a player tracking module configured to track players (as described below), and (c) a credit system configured to provide automated transactions.

[0132] As noted above, in various embodiments, the gaming system includes one or more executable game programs executable by at least one processor of the gaming system to provide one or more primary games and one or more secondary games. The primary game(s) and the secondary game(s) may comprise any suitable games and/or wagering games, such as, but not limited to: electro-mechanical or video slot or spinning reel type games; video card games such as video draw poker, multi-hand video draw poker, other video poker games, video blackjack games, and video baccarat games; video keno games; video bingo games; and video selection games.

[0133] In certain embodiments in which the primary game is a slot or spinning reel type game, the gaming system includes one or more reels in either an electromechanical form with mechanical rotating reels or in a video form with simulated reels and movement thereof. Each reel displays a plurality of indicia or symbols, such as bells, hearts, fruits, numbers, letters, bars, or other images that typically correspond to a theme associated with the gaming system. In certain such embodiments, the gaming system includes one or more paylines associated with the reels. The example EGM 2000b shown in FIG. 4B includes a payline 1152 and a plurality of reels 1154. In certain embodiments, one or more of the reels are independent reels or unisymbol reels. In such embodiments, each independent reel generates and displays one symbol.

[0134] In various embodiments, one or more of the paylines is horizontal, vertical, circular, diagonal, angled, or any suitable combination thereof. In other embodiments, each of one or more of the paylines is associated with a plurality of adjacent symbol display areas on a requisite number of adjacent reels. In one such embodiment, one or more paylines are formed between at least two symbol display areas that are adjacent to each other by either sharing a common side or sharing a common corner (i.e., such paylines are connected paylines). The gaming system enables a wager to be placed on one or more of such paylines to activate such paylines. In other embodiments in which one or more paylines are formed between at least two adjacent symbol display areas, the gaming system enables a wager to be placed on a plurality of symbol display areas, which activates those symbol display areas.

[0135] In various embodiments, the gaming system provides one or more awards after a spin of the reels when specified types and/or configurations of the indicia or symbols on the reels occur on an active payline or otherwise occur in a winning pattern, occur on the requisite number of adjacent reels, and/or occur in a scatter pay arrangement.

[0136] In certain embodiments, the gaming system employs a way to win award determination. In these embodiments, any outcome to be provided is determined based on a number of associated symbols that are generated in active symbol display areas on the requisite number of adjacent reels (i.e., not on paylines passing through any displayed winning symbol combinations). If a winning symbol combination is generated on the reels, one award for that occurrence of the generated winning symbol combination is provided.

[0137] In various embodiments, the gaming system includes a progressive award. Typically, a progressive award includes an initial amount and an additional amount funded through a portion of each wager placed to initiate a play of a primary game. When one or more triggering events occurs, the gaming system provides at least a portion of the progressive award. After the gaming system provides the progressive award, an amount of the progressive award is reset to the initial amount and a portion of each subsequent wager is allocated to the next progressive award.

[0138] As generally noted above, in addition to providing winning credits or other awards for one or more plays of the primary game(s), in various embodiments the gaming system provides credits or other awards for one or more plays of one or more secondary games. The secondary game typically enables an award to be obtained in addition to any award obtained through play of the primary game(s). The

secondary game(s) typically produces a higher level of player excitement than the primary game(s) because the secondary game(s) provides a greater expectation of winning than the primary game(s) and is accompanied with more attractive or unusual features than the primary game(s). The secondary game(s) may be any type of suitable game, either similar to or completely different from the primary game.

[0139] In various embodiments, the gaming system automatically provides or initiates the secondary game upon the occurrence of a triggering event or the satisfaction of a qualifying condition. In other embodiments, the gaming system initiates the secondary game upon the occurrence of the triggering event or the satisfaction of the qualifying condition and upon receipt of an initiation input. In certain embodiments, the triggering event or qualifying condition is a selected outcome in the primary game(s) or a particular arrangement of one or more indicia on a display device for a play of the primary game(s), such as a "BONUS" symbol appearing on three adjacent reels along a payline following a spin of the reels for a play of the primary game. In other embodiments, the triggering event or qualifying condition occurs based on a certain amount of game play (such as number of games, number of credits, amount of time) being exceeded, or based on a specified number of points being earned during game play. Any suitable triggering event or qualifying condition or any suitable combination of a plurality of different triggering events or qualifying conditions may be employed.

[0140] In other embodiments, at least one processor of the gaming system randomly determines when to provide one or more plays of one or more secondary games. In one such embodiment, no apparent reason is provided for providing the secondary game. In this embodiment, qualifying for a secondary game is not triggered by the occurrence of an event in any primary game or based specifically on any of the plays of any primary game. That is, qualification is provided without any explanation or, alternatively, with a simple explanation. In another such embodiment, the gaming system determines qualification for a secondary game at least partially based on a game triggered or symbol triggered event, such as at least partially based on play of a primary game.

[0141] In various embodiments, after qualification for a secondary game has been determined, the secondary game participation may be enhanced through continued play on the primary game. Thus, in certain embodiments, for each secondary game qualifying event, such as a secondary game symbol, that is obtained, a given number of secondary game wagering points or credits is accumulated in a "secondary game meter" configured to accrue the secondary game wagering credits or entries toward eventual participation in the secondary game. In one such embodiment, the occurrence of multiple such secondary game qualifying events in the primary game results in an arithmetic or exponential increase in the number of secondary game wagering credits awarded. In another such embodiment, any extra secondary game wagering credits may be redeemed during the secondary game to extend play of the secondary game.

[0142] In certain embodiments, no separate entry fee or buy-in for the secondary game is required. That is, entry into the secondary game cannot be purchased; rather, in these embodiments entry must be won or earned through play of the primary game, thereby encouraging play of the primary

game. In other embodiments, qualification for the secondary game is accomplished through a simple “buy-in.” For example, qualification through other specified activities is unsuccessful, payment of a fee or placement of an additional wager “buys-in” to the secondary game. In certain embodiments, a separate side wager must be placed on the secondary game or a wager of a designated amount must be placed on the primary game to enable qualification for the secondary game. In these embodiments, the secondary game triggering event must occur and the side wager (or designated primary game wager amount) must have been placed for the secondary game to trigger.

[0143] In various embodiments in which the gaming system includes a plurality of EGMs, the EGMs are configured to communicate with one another to provide a group gaming environment. In certain such embodiments, the EGMs enable players of those EGMs to work in conjunction with one another, such as by enabling the players to play together as a team or group, to win one or more awards. In other such embodiments, the EGMs enable players of those EGMs to compete against one another for one or more awards. In one such embodiment, the EGMs enable the players of those EGMs to participate in one or more gaming tournaments for one or more awards.

[0144] In various embodiments, the gaming system includes one or more player tracking systems. Such player tracking systems enable operators of the gaming system (such as casinos or other gaming establishments) to recognize the value of customer loyalty by identifying frequent customers and rewarding them for their patronage. Such a player tracking system is configured to track a player’s gaming activity. In one such embodiment, the player tracking system does so through the use of player tracking cards. In this embodiment, a player is issued a player identification card that has an encoded player identification number that uniquely identifies the player. When the player’s playing tracking card is inserted into a card reader of the gaming system to begin a gaming session, the card reader reads the player identification number off the player tracking card to identify the player. The gaming system timely tracks any suitable information or data relating to the identified player’s gaming session. The gaming system also timely tracks when the player tracking card is removed to conclude play for that gaming session. In another embodiment, rather than requiring insertion of a player tracking card into the card reader, the gaming system utilizes one or more portable devices, such as a mobile phone, a radio frequency identification tag, or any other suitable wireless device, to track when a gaming session begins and ends. In another embodiment, the gaming system utilizes any suitable biometric technology or ticket technology to track when a gaming session begins and ends.

[0145] In such embodiments, during one or more gaming sessions, the gaming system tracks any suitable information or data, such as any amounts wagered, average wager amounts, and/or the time at which these wagers are placed. In different embodiments, for one or more players, the player tracking system includes the player’s account number, the player’s card number, the player’s first name, the player’s surname, the player’s preferred name, the player’s player tracking ranking, any promotion status associated with the player’s player tracking card, the player’s address, the player’s birthday, the player’s anniversary, the player’s recent gaming sessions, or any other suitable data. In various embodiments, such tracked information and/or any suitable

feature associated with the player tracking system is displayed on a player tracking display. In various embodiments, such tracked information and/or any suitable feature associated with the player tracking system is displayed via one or more service windows that are displayed on the central display device and/or the upper display device.

[0146] In various embodiments, the gaming system includes one or more servers configured to communicate with a personal gaming device—such as a smartphone, a tablet computer, a desktop computer, or a laptop computer—to enable web-based game play using the personal gaming device. In various embodiments, the player must first access a gaming website via an Internet browser of the personal gaming device or execute an application (commonly called an “app”) installed on the personal gaming device before the player can use the personal gaming device to participate in web-based game play. In certain embodiments, the one or more servers and the personal gaming device operate in a thin-client environment. In these embodiments, the personal gaming device receives inputs via one or more input devices (such as a touch screen and/or physical buttons), the personal gaming device sends the received inputs to the one or more servers, the one or more servers make various determinations based on the inputs and determine content to be displayed (such as a randomly determined game outcome and corresponding award), the one or more servers send the content to the personal gaming device, and the personal gaming device displays the content.

[0147] In certain such embodiments, the one or more servers must identify the player before enabling game play on the personal gaming device (or, in some embodiments, before enabling monetary wager-based game play on the personal gaming device). In these embodiments, the player must identify herself to the one or more servers, such as by inputting the player’s unique username and password combination, providing an input to a biometric sensor (e.g., a fingerprint sensor, a retinal sensor, a voice sensor, or a facial-recognition sensor), or providing any other suitable information.

[0148] Once identified, the one or more servers enable the player to establish an account balance from which the player can draw credits usable to wager on plays of a game. In certain embodiments, the one or more servers enable the player to initiate an electronic funds transfer to transfer funds from a bank account to the player’s account balance. In other embodiments, the one or more servers enable the player to make a payment using the player’s credit card, debit card, or other suitable device to add money to the player’s account balance. In other embodiments, the one or more servers enable the player to add money to the player’s account balance via a peer-to-peer type application, such as PayPal or Venmo. The one or more servers also enable the player to cash out the player’s account balance (or part of it) in any suitable manner, such as via an electronic funds transfer, by initiating creation of a paper check that is mailed to the player, or by initiating printing of a voucher at a kiosk in a gaming establishment.

[0149] In certain embodiments, the one or more servers include a payment server that handles establishing and cashing out players’ account balances and a separate game server configured to determine the outcome and any associated award for a play of a game. In these embodiments, the game server is configured to communicate with the personal gaming device and the payment device, and the personal

gaming device and the payment device are not configured to directly communicate with one another. In these embodiments, when the game server receives data representing a request to start a play of a game at a desired wager, the game server sends data representing the desired wager to the payment server. The payment server determines whether the player's account balance can cover the desired wager (i.e., includes a monetary balance at least equal to the desired wager).

[0150] If the payment server determines that the player's account balance cannot cover the desired wager, the payment server notifies the game server, which then instructs the personal gaming device to display a suitable notification to the player that the player's account balance is too low to place the desired wager. If the payment server determines that the player's account balance can cover the desired wager, the payment server deducts the desired wager from the account balance and notifies the game server. The game server then determines an outcome and any associated award for the play of the game. The game server notifies the payment server of any nonzero award, and the payment server increases the player's account balance by the nonzero award. The game server sends data representing the outcome and any award to the personal gaming device, which displays the outcome and any award.

[0151] In certain embodiments, the one or more servers enable web-based game play using a personal gaming device only if the personal gaming device satisfies one or more jurisdictional requirements. In one embodiment, the one or more servers enable web-based game play using the personal gaming device only if the personal gaming device is located within a designated geographic area (such as within certain state or county lines or within the boundaries of a gaming establishment). In this embodiment, the geolocation module of the personal gaming device determines the location of the personal gaming device and sends the location to the one or more servers, which determine whether the personal gaming device is located within the designated geographic area. In various embodiments, the one or more servers enable non-monetary wager-based game play if the personal gaming device is located outside of the designated geographic area.

[0152] In various embodiments, the gaming system includes an EGM configured to communicate with a personal gaming device—such as a smartphone, a tablet computer, a desktop computer, or a laptop computer—to enable tethered mobile game play using the personal gaming device. Generally, in these embodiments, the EGM establishes communication with the personal gaming device and enables the player to play games on the EGM remotely via the personal gaming device. In certain embodiments, the gaming system includes a geo-fence system that enables tethered game play within a particular geographic area but not outside of that geographic area.

[0153] In certain embodiments, the gaming system is configured to communicate with a social network server that hosts or partially hosts a social networking website via a data network (such as the Internet) to integrate a player's gaming experience with the player's social networking account. This enables the gaming system to send certain information to the social network server that the social network server can use to create content (such as text, an image, and/or a video) and post it to the player's wall, newsfeed, or similar area of the social networking website accessible by the player's con-

nections (and in certain cases the public) such that the player's connections can view that information. This also enables the gaming system to receive certain information from the social network server, such as the player's likes or dislikes or the player's list of connections. In certain embodiments, the gaming system enables the player to link the player's player account to the player's social networking account(s). This enables the gaming system to, once it identifies the player and initiates a gaming session (such as via the player logging in to a website (or an application) on the player's personal gaming device or via the player inserting the player's player tracking card into an EGM), link that gaming session to the player's social networking account(s). In other embodiments, the gaming system enables the player to link the player's social networking account(s) to individual gaming sessions when desired by providing the required login information.

[0154] For instance, in one embodiment, if a player wins a particular award (e.g., a progressive award or a jackpot award) or an award that exceeds a certain threshold (e.g., an award exceeding \$1,000), the gaming system sends information about the award to the social network server to enable the server to create associated content (such as a screenshot of the outcome and associated award) and to post that content to the player's wall (or other suitable area) of the social networking website for the player's connections to see (and to entice them to play). In another embodiment, if a player joins a multiplayer game and there is another seat available, the gaming system sends that information to the social network server to enable the server to create associated content (such as text indicating a vacancy for that particular game) and to post that content to the player's wall (or other suitable area) of the social networking website for the player's connections to see (and to entice them to fill the vacancy). In another embodiment, if the player consents, the gaming system sends advertisement information or offer information to the social network server to enable the social network server to create associated content (such as text or an image reflecting an advertisement and/or an offer) and to post that content to the player's wall (or other suitable area) of the social networking website for the player's connections to see. In another embodiment, the gaming system enables the player to recommend a game to the player's connections by posting a recommendation to the player's wall (or other suitable area) of the social networking website.

[0155] Certain of the gaming systems described herein, such as EGMs located in a casino or another gaming establishment, include certain components and/or are configured to operate in certain manners that differentiate these systems from general purpose computing devices, i.e., certain personal gaming devices such as desktop computers and laptop computers.

[0156] For instance, EGMs are highly regulated to ensure fairness and, in many cases, EGMs are configured to award monetary awards up to multiple millions of dollars. To satisfy security and regulatory requirements in a gaming environment, hardware and/or software architectures are implemented in EGMs that differ significantly from those of general purpose computing devices. For purposes of illustration, a description of EGMs relative to general purpose computing devices and some examples of these additional (or different) hardware and/or software architectures found in EGMs are described below.

[0157] At first glance, one might think that adapting general purpose computing device technologies to the gaming industry and EGMs would be a simple proposition because both general purpose computing devices and EGMs employ processors that control a variety of devices. However, due to at least: (1) the regulatory requirements placed on EGMs, (2) the harsh environment in which EGMs operate, (3) security requirements, and (4) fault tolerance requirements, adapting general purpose computing device technologies to EGMs can be quite difficult. Further, techniques and methods for solving a problem in the general purpose computing device industry, such as device compatibility and connectivity issues, might not be adequate in the gaming industry. For instance, a fault or a weakness tolerated in a general purpose computing device, such as security holes in software or frequent crashes, is not tolerated in an EGM because in an EGM these faults can lead to a direct loss of funds from the EGM, such as stolen cash or loss of revenue when the EGM is not operating properly or when the random outcome determination is manipulated.

[0158] Certain differences between general purpose computing devices and EGMs are described below. A first difference between EGMs and general purpose computing devices is that EGMs are state-based systems. A state-based system stores and maintains its current state in a non-volatile memory such that, in the event of a power failure or other malfunction, the state-based system can return to that state when the power is restored or the malfunction is remedied. For instance, for a state-based EGM, if the EGM displays an award for a game of chance but the power to the EGM fails before the EGM provides the award to the player, the EGM stores the pre-power failure state in a non-volatile memory, returns to that state upon restoration of power, and provides the award to the player. This requirement affects the software and hardware design on EGMs. General purpose computing devices are not state-based machines, and a majority of data is usually lost when a malfunction occurs on a general purpose computing device.

[0159] A second difference between EGMs and general purpose computing devices is that, for regulatory purposes, the software on the EGM utilized to operate the EGM has been designed to be static and monolithic to prevent cheating by the operator of the EGM. For instance, one solution that has been employed in the gaming industry to prevent cheating and to satisfy regulatory requirements has been to manufacture an EGM that can use a proprietary processor running instructions to provide the game of chance from an EPROM or other form of non-volatile memory. The coding instructions on the EPROM are static (non-changeable) and must be approved by a gaming regulators in a particular jurisdiction and installed in the presence of a person representing the gaming jurisdiction. Any changes to any part of the software required to generate the game of chance, such as adding a new device driver used to operate a device during generation of the game of chance, can require burning a new EPROM approved by the gaming jurisdiction and reinstalling the new EPROM on the EGM in the presence of a gaming regulator. Regardless of whether the EPROM solution is used, to gain approval in most gaming jurisdictions, an EGM must demonstrate sufficient safeguards that prevent an operator or a player of an EGM from manipulating the EGM's hardware and software in a manner that gives him an unfair, and in some cases illegal, advantage.

[0160] A third difference between EGMs and general purpose computing devices is authentication-EGMs storing code are configured to authenticate the code to determine if the code is unaltered before executing the code. If the code has been altered, the EGM prevents the code from being executed. The code authentication requirements in the gaming industry affect both hardware and software designs on EGMs. Certain EGMs use hash functions to authenticate code. For instance, one EGM stores game program code, a hash function, and an authentication hash (which may be encrypted). Before executing the game program code, the EGM hashes the game program code using the hash function to obtain a result hash and compares the result hash to the authentication hash. If the result hash matches the authentication hash, the EGM determines that the game program code is valid and executes the game program code. If the result hash does not match the authentication hash, the EGM determines that the game program code has been altered (i.e., may have been tampered with) and prevents execution of the game program code.

[0161] A fourth difference between EGMs and general purpose computing devices is that EGMs have unique peripheral device requirements that differ from those of a general purpose computing device, such as peripheral device security requirements not usually addressed by general purpose computing devices. For instance, monetary devices, such as coin dispensers, bill validators, and ticket printers and computing devices that are used to govern the input and output of cash or other items having monetary value (such as tickets) to and from an EGM have security requirements that are not typically addressed in general purpose computing devices. Therefore, many general purpose computing device techniques and methods developed to facilitate device connectivity and device compatibility do not address the emphasis placed on security in the gaming industry.

[0162] To address some of the issues described above, a number of hardware/software components and architectures are utilized in EGMs that are not typically found in general purpose computing devices. These hardware/software components and architectures, as described below in more detail, include but are not limited to watchdog timers, voltage monitoring systems, state-based software architecture and supporting hardware, specialized communication interfaces, security monitoring, and trusted memory.

[0163] Certain EGMs use a watchdog timer to provide a software failure detection mechanism. In a normally-operating EGM, the operating software periodically accesses control registers in the watchdog timer subsystem to "re-trigger" the watchdog. Should the operating software fail to access the control registers within a preset timeframe, the watchdog timer will timeout and generate a system reset. Typical watchdog timer circuits include a loadable timeout counter register to enable the operating software to set the timeout interval within a certain range of time. A differentiating feature of some circuits is that the operating software cannot completely disable the function of the watchdog timer. In other words, the watchdog timer always functions from the time power is applied to the board.

[0164] Certain EGMs use several power supply voltages to operate portions of the computer circuitry. These can be generated in a central power supply or locally on the computer board. If any of these voltages falls out of the tolerance limits of the circuitry they power, unpredictable operation of the EGM may result. Though most modern

general purpose computing devices include voltage monitoring circuitry, these types of circuits only report voltage status to the operating software. Out of tolerance voltages can cause software malfunction, creating a potential uncontrolled condition in the general purpose computing device. Certain EGMs have power supplies with relatively tighter voltage margins than that required by the operating circuitry. In addition, the voltage monitoring circuitry implemented in certain EGMs typically has two thresholds of control. The first threshold generates a software event that can be detected by the operating software and an error condition then generated. This threshold is triggered when a power supply voltage falls out of the tolerance range of the power supply, but is still within the operating range of the circuitry. The second threshold is set when a power supply voltage falls out of the operating tolerance of the circuitry. In this case, the circuitry generates a reset, halting operation of the EGM.

[0165] As described above, certain EGMs are state-based machines. Different functions of the game provided by the EGM (e.g., bet, play, result, points in the graphical presentation, etc.) may be defined as a state. When the EGM moves a game from one state to another, the EGM stores critical data regarding the game software in a custom non-volatile memory subsystem. This ensures that the player's wager and credits are preserved and to minimize potential disputes in the event of a malfunction on the EGM. In general, the EGM does not advance from a first state to a second state until critical information that enables the first state to be reconstructed has been stored. This feature enables the EGM to recover operation to the current state of play in the event of a malfunction, loss of power, etc. that occurred just before the malfunction. In at least one embodiment, the EGM is configured to store such critical information using atomic transactions.

[0166] Generally, an atomic operation in computer science refers to a set of operations that can be combined so that they appear to the rest of the system to be a single operation with only two possible outcomes: success or failure. As related to data storage, an atomic transaction may be characterized as series of database operations which either all occur, or all do not occur. A guarantee of atomicity prevents updates to the database occurring only partially, which can result in data corruption.

[0167] To ensure the success of atomic transactions relating to critical information to be stored in the EGM memory before a failure event (e.g., malfunction, loss of power, etc.), memory that includes one or more of the following criteria be used: direct memory access capability; data read/write capability which meets or exceeds minimum read/write access characteristics (such as at least 5.08 Mbytes/sec (Read) and/or at least 38.0 Mbytes/sec (Write)). Memory devices that meet or exceed the above criteria may be referred to as "fault-tolerant" memory devices.

[0168] Typically, battery-backed RAM devices may be configured to function as fault-tolerant devices according to the above criteria, whereas flash RAM and/or disk drive memory are typically not configurable to function as fault-tolerant devices according to the above criteria. Accordingly, battery-backed RAM devices are typically used to preserve EGM critical data, although other types of non-volatile memory devices may be employed. These memory devices are typically not used in typical general purpose computing devices.

[0169] Thus, in at least one embodiment, the EGM is configured to store critical information in fault-tolerant memory (e.g., battery-backed RAM devices) using atomic transactions. Further, in at least one embodiment, the fault-tolerant memory is able to successfully complete all desired atomic transactions (e.g., relating to the storage of EGM critical information) within a time period of 200 milliseconds or less. In at least one embodiment, the time period of 200 milliseconds represents a maximum amount of time for which sufficient power may be available to the various EGM components after a power outage event has occurred at the EGM.

[0170] As described previously, the EGM may not advance from a first state to a second state until critical information that enables the first state to be reconstructed has been atomically stored. After the state of the EGM is restored during the play of a game of chance, game play may resume and the game may be completed in a manner that is no different than if the malfunction had not occurred. Thus, for example, when a malfunction occurs during a game of chance, the EGM may be restored to a state in the game of chance just before when the malfunction occurred. The restored state may include metering information and graphical information that was displayed on the EGM in the state before the malfunction. For example, when the malfunction occurs during the play of a card game after the cards have been dealt, the EGM may be restored with the cards that were previously displayed as part of the card game. As another example, a bonus game may be triggered during the play of a game of chance in which a player is required to make a number of selections on a video display screen. When a malfunction has occurred after the player has made one or more selections, the EGM may be restored to a state that shows the graphical presentation just before the malfunction including an indication of selections that have already been made by the player. In general, the EGM may be restored to any state in a plurality of states that occur in the game of chance that occurs while the game of chance is played or to states that occur between the play of a game of chance.

[0171] Game history information regarding previous games played such as an amount wagered, the outcome of the game, and the like may also be stored in a non-volatile memory device. The information stored in the non-volatile memory may be detailed enough to reconstruct a portion of the graphical presentation that was previously presented on the EGM and the state of the EGM (e.g., credits) at the time the game of chance was played. The game history information may be utilized in the event of a dispute. For example, a player may decide that in a previous game of chance that they did not receive credit for an award that they believed they won. The game history information may be used to reconstruct the state of the EGM before, during, and/or after the disputed game to demonstrate whether the player was correct or not in the player's assertion.

[0172] Another feature of EGMs is that they often include unique interfaces, including serial interfaces, to connect to specific subsystems internal and external to the EGM. The serial devices may have electrical interface requirements that differ from the "standard" EIA serial interfaces provided by general purpose computing devices. These interfaces may include, for example, Fiber Optic Serial, optically coupled serial interfaces, current loop style serial interfaces, etc. In addition, to conserve serial interfaces internally in the

EGM, serial devices may be connected in a shared, daisy-chain fashion in which multiple peripheral devices are connected to a single serial channel.

[0173] The serial interfaces may be used to transmit information using communication protocols that are unique to the gaming industry. For example, IGT's Netplex is a proprietary communication protocol used for serial communication between EGMs. As another example, SAS is a communication protocol used to transmit information, such as metering information, from an EGM to a remote device. Often SAS is used in conjunction with a player tracking system.

[0174] Certain EGMs may alternatively be treated as peripheral devices to a casino communication controller and connected in a shared daisy chain fashion to a single serial interface. In both cases, the peripheral devices are assigned device addresses. If so, the serial controller circuitry must implement a method to generate or detect unique device addresses. General purpose computing device serial ports are not able to do this.

[0175] Security monitoring circuits detect intrusion into an EGM by monitoring security switches attached to access doors in the EGM cabinet. Access violations result in suspension of game play and can trigger additional security operations to preserve the current state of game play. These circuits also function when power is off by use of a battery backup. In power-off operation, these circuits continue to monitor the access doors of the EGM. When power is restored, the EGM can determine whether any security violations occurred while power was off, e.g., via software for reading status registers. This can trigger event log entries and further data authentication operations by the EGM software.

[0176] Trusted memory devices and/or trusted memory sources are included in an EGM to ensure the authenticity of the software that may be stored on less secure memory subsystems, such as mass storage devices. Trusted memory devices and controlling circuitry are typically designed to not enable modification of the code and data stored in the memory device while the memory device is installed in the EGM. The code and data stored in these devices may include authentication algorithms, random number generators, authentication keys, operating system kernels, etc. The purpose of these trusted memory devices is to provide gaming regulatory authorities a root trusted authority within the computing environment of the EGM that can be tracked and verified as original. This may be accomplished via removal of the trusted memory device from the EGM computer and verification of the secure memory device contents is a separate third party verification device. Once the trusted memory device is verified as authentic, and based on the approval of the verification algorithms included in the trusted device, the EGM is enabled to verify the authenticity of additional code and data that may be located in the gaming computer assembly, such as code and data stored on hard disk drives.

[0177] In at least one embodiment, at least a portion of the trusted memory devices/sources may correspond to memory that cannot easily be altered (e.g., "unalterable memory") such as EPROMs, PROMs, Bios, Extended Bios, and/or other memory sources that are able to be configured, verified, and/or authenticated (e.g., for authenticity) in a secure and controlled manner.

[0178] According to one embodiment, when a trusted information source is in communication with a remote device via a network, the remote device may employ a verification scheme to verify the identity of the trusted information source. For example, the trusted information source and the remote device may exchange information using public and private encryption keys to verify each other's identities. In another embodiment, the remote device and the trusted information source may engage in methods using zero knowledge proofs to authenticate each of their respective identities.

[0179] EGMs storing trusted information may utilize apparatuses or methods to detect and prevent tampering. For instance, trusted information stored in a trusted memory device may be encrypted to prevent its misuse. In addition, the trusted memory device may be secured behind a locked door. Further, one or more sensors may be coupled to the memory device to detect tampering with the memory device and provide some record of the tampering. In yet another example, the memory device storing trusted information might be designed to detect tampering attempts and clear or erase itself when an attempt at tampering has been detected.

[0180] Mass storage devices used in a general purpose computing devices typically enable code and data to be read from and written to the mass storage device. In a gaming environment, modification of the gaming code stored on a mass storage device is strictly controlled and would only be enabled under specific maintenance type events with electronic and physical enablers required. Though this level of security could be provided by software, EGMs that include mass storage devices include hardware level mass storage data protection circuitry that operates at the circuit level to monitor attempts to modify data on the mass storage device and will generate both software and hardware error triggers should a data modification be attempted without the proper electronic and physical enablers being present.

[0181] It should be appreciated that the terminology used herein is for the purpose of describing particular aspects only and is not intended to be limiting of the disclosure. For example, the singular forms "a", "an" and "the" are intended to include the plural forms as well, unless the context clearly indicates otherwise. In another example, the terms "including" and "comprising" and variations thereof, when used in this specification, specify the presence of stated features, steps, operations, elements, and/or components, but do not preclude the presence or addition of one or more other features, steps, operations, elements, components, and/or groups thereof. Additionally, a listing of items does not imply that any or all of the items are mutually exclusive nor does a listing of items imply that any or all of the items are collectively exhaustive of anything or in a particular order, unless expressly specified otherwise. Moreover, as used herein, the term "and/or" includes any and all combinations of one or more of the associated listed items. It should be further appreciated that headings of sections provided in this document and the title are for convenience only, and are not to be taken as limiting the disclosure in any way. Furthermore, unless expressly specified otherwise, devices that are in communication with each other need not be in continuous communication with each other and may communicate directly or indirectly through one or more intermediaries.

[0182] Various changes and modifications to the present embodiments described herein will be apparent to those skilled in the art. For example, a description of an embodi-

ment with several components in communication with each other does not imply that all such components are required, or that each of the disclosed components must communicate with every other component. On the contrary a variety of optional components are described to illustrate the wide variety of possible embodiments of the present disclosure. As such, these changes and modifications can be made without departing from the spirit and scope of the present subject matter and without diminishing its intended technical scope. It is therefore intended that such changes and modifications be covered by the appended claims.

The invention is claimed as follows:

1. A system comprising:
 - a processor; and
 - a memory device that stores a plurality of instructions that, when executed by the processor in association with a sequence comprising a plurality of activations, cause the processor to:
 - responsive to less than a first quantity of symbols accumulated, over the plurality of activations, at a plurality of symbol display positions associated with a first reel set comprising a first plurality of displayed reels, cause a display, by a display device, of a first total award comprising any awards associated with any symbols accumulated at any of the plurality of symbol display positions associated with the first reel set, wherein the first total award is independent of any awards associated with any symbols accumulated at any of a plurality of symbol display positions associated with a second reel set comprising a second plurality of displayed reels, and
 - responsive to at least the first quantity of symbols accumulated, over the plurality of activations, at the plurality of symbol display positions associated with the first reel set, cause a display, by the display device, of a second total award comprising any awards associated with any symbols accumulated at any of the plurality of symbol display positions associated with the first reel set and any awards associated with any symbols accumulated at any of the plurality of symbol display positions associated with the second reel set.
2. The system of claim 1, wherein the memory device stores a plurality of further instructions that, when executed by the processor responsive to at least a second quantity of symbols accumulated, over the plurality of activations, at the plurality of symbol display positions associated with the first reel set and the second reel set, cause the processor to cause a display, by the display device, of a third total award comprising any awards associated with any symbols accumulated at any of the plurality of symbol display positions associated with the first reel set, any awards associated with any symbols accumulated at any of the plurality of symbol display positions associated with the second reel set, and any awards associated with any symbols accumulated at any of a plurality of symbol display positions associated with a third reel set comprising a third plurality of reels.
3. The system of claim 2, wherein the second quantity of symbols accumulated, over the plurality of activations, at the plurality of symbol display positions associated with the first reel set and the second reel set is greater than the first quantity of symbols accumulated, over the plurality of activations, at the plurality of symbol display positions associated with the first reel set.
4. The system of claim 3, wherein the second quantity of symbols are accumulated at the plurality of symbol display positions associated with the first reel set and the second reel set prior to the first quantity of symbols are accumulated at the plurality of symbol display positions associated with the first reel set.
5. The system of claim 3, wherein the second quantity of symbols are accumulated at the plurality of symbol display positions associated with the first reel set and the second reel set based on the first quantity of symbols being accumulated at the plurality of symbol display positions associated with the first reel set.
6. The system of claim 3, wherein the memory device stores a plurality of further instructions that, when executed by the processor responsive to at least a third quantity of symbols accumulated, over the plurality activations, at the plurality of symbol display positions associated with the first reel set, the second reel set and the third reel set, cause the processor to cause a display, by the display device, of a fourth total award comprising any awards associated with any symbols accumulated at any of the plurality of symbol display positions associated with the first reel set, any awards associated with any symbols accumulated at any of the plurality of symbol display positions associated with the second reel set, any awards associated with any symbols accumulated at any of the plurality of symbol display positions associated with the third reel set, and any awards associated with any symbols accumulated at any of a plurality of symbol display positions associated with a fourth reel set comprising a fourth plurality of reels.
7. The system of claim 1, wherein the first quantity of symbols comprises a quantity resulting from a symbol being accumulated, over the plurality of activations, at each of the plurality of symbol display positions associated with the first reel set.
8. The system of claim 1, wherein a first symbol display position associated with the second reel set has a first probability of accumulating any symbol for any of the activations and a first symbol display position associated with the first reel set has a second, different probability of accumulating any symbol for any of the activations.
9. A system comprising:
 - a processor; and
 - a memory device that stores a plurality of instructions that, when executed by the processor in association with a sequence comprising a plurality of activations, cause the processor to:
 - cause a display, by a display device, of a plurality of reel sets, wherein the plurality of reel sets comprises a first reel set in an active state, and a second reel set in an inactive state,
 - responsive to an occurrence of a first reel set activation event in association with the second reel set, cause a display, by the display device, of a modification of the second reel set from being in the inactive state to being in the active state, and
 - responsive to an occurrence of a sequence award event, cause a display, by the display device, of a total award based on any accumulation of any symbols, over the plurality of activations, at any symbol display positions associated with any of the plurality of reel sets in the active state when the sequence award event occurs.

10. The system of claim 9, wherein the first reel set activation event comprises an accumulation of a first quantity of symbols at a first quantity of symbol display positions associated with the first reel set in the active state.

11. The system of claim 10, wherein the first reel set activation event occurs independent of any accumulation of any quantity of symbols at any symbol display positions associated with the second reel set in the inactive state.

12. The system of claim 9, wherein the plurality of reel sets comprises a third reel set in the inactive state and the memory device stores a plurality of further instructions that, when executed by the processor responsive to an occurrence of a second, different reel set activation event in association with the third reel set, cause the processor to modify the third reel set from being in the inactive state to being in the active state.

13. The system of claim 12, wherein the first reel set activation event comprises an accumulation of a first quantity of symbols at a first quantity of symbol display positions associated with the first reel set in the active state and the second, different reel set activation event comprises an accumulation of a second, greater quantity of symbols at a second quantity of symbol display positions associated with the first reel set in the active state and the second reel set in the active state.

14. The system of claim 13, wherein the second, different reel set activation event occurs independent of any accumulation of any quantity of symbols at any symbol display positions associated with the third reel set in the inactive state.

15. The system of claim 13, wherein the second, greater quantity of symbols are accumulated at the second quantity of symbol display positions associated with the first reel set and the second reel set prior to the first quantity of symbols are accumulated at the first quantity of symbol display positions associated with the first reel set.

16. The system of claim 9, wherein the total award is based on any awards associated with any symbols accumulated at any symbol display positions associated with any reel sets in the active state when the sequence award event occurs.

17. The system of claim 9, wherein the sequence award event occurs when no unused activations remain associated with the sequence.

18. A system comprising:

a processor; and

a memory device that stores a plurality of instructions that, when executed by the processor in association with a sequence comprising a plurality of activations, cause the processor to:

cause a display, by a display device, of a plurality of reel sets, wherein:

each reel set comprises a plurality of symbol display positions, and

when the sequence is triggered, each reel set is one of an active reel set and an inactive reel set,

cause a display, by the display device, of an accumulation of symbols, over the plurality of activations, at a quantity of the symbol display positions associated with any of the active reel sets and any of the inactive reel sets,

responsive to an occurrence of a reel set activation event in association with any of the inactive reel sets, cause a display, by the display device, of an activation of that reel set, wherein the reel set activation event occurs based on the accumulation of symbols at symbol display positions associated with any active reel sets, and

responsive to an occurrence of sequence award event, cause a display, by the display device, of a total award based on any symbols accumulated at any of the symbol display positions associated with any of the active reel sets and is independent of any symbols accumulated at any of the symbol display positions associated with any of the inactive reel sets.

19. The system of claim 18, wherein different inactive reel sets are associated with different reel set activation events associated with different quantities of symbols accumulated at symbol display positions associated with any active reel sets.

20. The system of claim 18, wherein an occurrence of a first reel set activation event associated with a first inactive reel set causes both an activation of the first reel set and, based on the accumulation of symbols at the symbol display positions associated with the activated first reel set, an occurrence of a second reel set activation event associated with a second inactive reel set.
