Background/Summary

CROSS-REFERENCE TO RELATED APPLICATION(S)

[0001] This application claims priority to and benefits of Korean Patent Application No. 10-2024-0020667 under 35 U.S.C. § 119, filed on Feb. 13, 2024, in the Korean Intellectual Property Office, the entire contents of which are incorporated herein by reference.

BACKGROUND

1. Technical Field

[0002] Embodiments relate to a light-emitting device including a heterocyclic compound, an electronic apparatus including the light-emitting device, an electronic equipment including the light-emitting device, and the heterocyclic compound.

2. Description of the Related Art

[0003] Light-emitting devices are self-emissive devices that have wide viewing angles, high contrast ratios, short response times, and excellent characteristics in terms of luminance, driving voltage, and response speed.

[0004] In a light-emitting device, a first electrode may be located on a substrate, and a hole transport region, an emission layer, an electron transport region, and a second electrode may be sequentially arranged on the first electrode. Holes provided from the first electrode move toward the emission layer through the hole transport region, and electrons provided from the second electrode move toward the emission layer through the electron transport region. Carriers, such as holes and electrons, recombine in the emission layer to produce excitons. These excitons transition from an excited state to a ground state to thereby generate light.

[0005] It is to be understood that this background of the technology section is, in part, intended to provide useful background for understanding the technology. However, this background of the technology section may also include ideas, concepts, or recognitions that were not part of what was known or appreciated by those skilled in the pertinent art prior to a corresponding effective filing date of the subject matter disclosed herein.

SUMMARY

[0006] Embodiments include a light-emitting device including a heterocyclic compound, an electronic apparatus and electronic equipment each including the light-emitting device, and the heterocyclic compound.

[0007] Additional aspects will be set forth in part in the description which follows and, in part, will be apparent from the description, or may be learned by practice of the embodiments of the disclosure.

[0008] According to embodiments, a light-emitting device may include a first electrode, a second electrode facing the first electrode, an interlayer between the first electrode and the second electrode and including an emission layer, and a heterocyclic compound represented by Formula 1:

[0060] In the specification, it will be understood that when an element (or region, layer, part, etc.) is referred to as being “on”, “connected to”, or “coupled to” another element, it can be directly on, connected to, or coupled to the other element, or one or more intervening elements may be present therebetween. In a similar sense, when an element (or region, layer, part, etc.) is described as “covering” another element, it can directly cover the other element, or one or more intervening elements may be present therebetween.

[0061] In the specification, when an element is “directly on”, “directly connected to”, or “directly coupled to” another element, there are no intervening elements present. For example, “directly on” may mean that two layers or two elements are disposed without an additional element such as an adhesion element therebetween.

[0062] In the specification, the expressions used in the singular such as “a”, “an”, and “the” are intended to include the plural forms as well, unless the context clearly indicates otherwise.

[0063] In the specification, the term “and/or” includes any and all combinations of one or more of the associated listed items. For example, “A and/or B” may be understood to mean “A, B, or A and B”. The terms “and” and “or” may be used in the conjunctive or disjunctive sense and may be understood to be equivalent to “and/or”.

[0064] In the specification and the claims, the term “at least one of” is intended to include the meaning of “at least one selected from the group consisting of” for the purpose of its meaning and interpretation. For example, “at least one of A, B, and C” may be understood to mean A only, B only, C only, or any combination of two or more of A, B, and C, such as ABC, ACC, BC, or CC. When preceding a list of elements, the term, “at least one of”, modifies the entire list of elements and does not modify the individual elements of the list.

[0065] It will be understood that, although the terms first, second, etc. may be used herein to describe various elements, these elements should not be limited by these terms. These terms are only used to distinguish one element from another element. Thus, a first element could be termed a second element without departing from the teachings of the disclosure. Similarly, a second element could be termed a first element, without departing from the scope of the disclosure.

[0066] The spatially relative terms “below”, “beneath”, “lower”, “above”, “upper”, or the like, may be used herein for ease of description to describe the relations between one element or component and another element or component as illustrated in the drawings. It will be understood that the spatially relative terms are intended to encompass different orientations of the device in use or operation, in addition to the orientation depicted in the drawings. For example, in the case where a device illustrated in the drawing is turned over, the device positioned “below” or “beneath” another device may be placed “above” another device. Accordingly, the illustrative term “below” may include both the lower and upper positions. The device may also be oriented in other directions and thus the spatially relative terms may be interpreted differently depending on the orientations.

[0067] The terms “about” or “approximately” as used herein is inclusive of the stated value and means within an acceptable range of deviation for the recited value as determined by one of ordinary skill in the art, considering the measurement in question and the error associated with measurement of the recited quantity (i.e., the limitations of the measurement system). For example, “about” may mean within one or more standard deviations, or within +20%, +10%, or +5% of the stated value.

[0068] It should be understood that the terms “comprises”, “comprising”, “includes”, “including”, “have”, “having”, “contains”, “containing”, and the like are intended to specify the presence of stated features, integers, steps, operations, elements, components, or combinations thereof in the disclosure, but do not preclude the presence or addition of one or more other features, integers, steps, operations, elements, components, or combinations thereof.

[0069] Unless otherwise defined or implied herein, all terms (including technical and scientific terms) used have the same meaning as commonly understood by those skilled in the art to which this disclosure pertains. It will be further understood that terms, such as those defined in commonly used dictionaries, should be interpreted as having a meaning that is consistent with their meaning in the context of the relevant art and should not be interpreted in an ideal or excessively formal sense unless clearly defined in the specification.

[0135] In embodiments, the light-emitting device may satisfy at least one of Conditions 1 to 4:

[Condition 1]

[0136] lowest unoccupied molecular orbital (LUMO) energy level (eV) of heterocyclic compound > LUMO energy level (eV) of transition metal-containing compound;

[Condition 2]

[0137] LUMO energy level (eV) of transition metal-containing compound > LUMO energy level (eV) of second compound;

[Condition 3]

[0138] highest occupied molecular orbital (HOMO) energy level (eV) of transition metal-containing compound > HOMO energy level (eV) of heterocyclic compound; and

[Condition 4]

[0139] HOMO energy level (eV) of heterocyclic compound > HOMO energy level (eV) of second compound.

[0140] The HOMO energy level and the LUMO energy level of each of the heterocyclic compound, the second compound, and the transition metal-containing compound may each be a negative value and may be measured according to a method of the related art.

[0141] In embodiments, an absolute value of a difference between a LUMO energy level of the transition metal-containing compound and a LUMO energy level of the second compound may be at least 0.1 eV but not more than 1.0 eV; or an absolute value of a difference between a LUMO energy level of the transition metal-containing compound and a LUMO energy level of the heterocyclic compound may be at least 0.1 eV but not more than 1.0 eV. For example, the blue light may have a maximum emission wavelength in a range of about 410 nm to about 490 nm, in a range of about 420 nm to about 480 nm, in a range of about 430 nm to about 475 nm, in a range of about 440 nm to about 475 nm, in a range of about 450 nm to about 475 nm, in a range of about 430 nm to about 470 nm, in a range of about 440 nm to about 470 nm, in a range of about 450 nm to about 470 nm, in a range of about 430 nm to about 465 nm, in a range of about 440 nm to about 465 nm, in a range of about 450 nm to about 465 nm, in a range of about 430 nm to about 460 nm, in a range of about 440 nm to about 460 nm, or in a range of about 450 nm to about 460 nm.

[0157] The auxiliary dopant in the first embodiment may include, for example, the delayed fluorescence compound represented by Formula 502 or Formula 503.

[0158] The host in the first and second embodiments may further include any host material (for example, a compound represented by Formula 301, a compound represented by 301-1, a compound represented by Formula 301-2, or any combination thereof).

[0165] The expression “(an interlayer and/or a capping layer) includes a heterocyclic compound represented by Formula 1” as used herein may include a case in which “(an interlayer and/or a capping layer) each includes an identical heterocyclic compound represented by Formula 1” and a case in which “(an interlayer and/or a capping layer) includes two or more different heterocyclic compounds each independently represented by Formula 1.”

[0166] For example, the interlayer and/or the capping layer may include, as the heterocyclic compound, Compound 1 only. In this regard, Compound 1 may be present in the emission layer of the light-emitting device. In embodiments, the interlayer may include, as the heterocyclic compound, Compounds 1 and 2. [0167] The term “interlayer” as used herein may refer to a single layer and/or all layers between the first electrode and the second electrode of the light-emitting device.

[0232] In an embodiment, the heterocyclic compound represented by Formula 1 may be represented by one of Formulae 1-1 to 1-8:

##STR00012##

[0233] In Formulae 1-1 to 1-8, [0234] R.sub.11, R.sub.12, R.sub.21, R.sub.22, R.sub.3, R.sub.41 to R.sub.43, a₁₁, a₁₂, a₂₁, a₂₂, a₃, a₄₁ to a₄₃, L.sub.1, n₁, and Ar.sub.1 are the same as described herein.

[0240] In Formula 1, unless otherwise defined, Q.sub.1 to Q.sub.3, Q.sub.11 to Q.sub.13, Q.sub.21 to Q.sub.23, and Q.sub.31 to Q.sub.33 may each independently be: hydrogen; deuterium; —F; —Cl; —Br; —I; a hydroxyl group; a cyano group; a nitro group; a C.sub.1-C.sub.60 alkyl group; a C.sub.2-C.sub.60 alkenyl group; a C.sub.2-C.sub.60 alkynyl group; a C.sub.1-C.sub.60 alkoxy group; or a C.sub.5-C.sub.60 carbocyclic group or a C.sub.1-C.sub.60 heterocyclic group, each unsubstituted or substituted with deuterium, —F, a cyano group, a C.sub.1-C.sub.60 alkyl group, a C.sub.1-C.sub.60 alkoxy group, a phenyl group, a biphenyl group, or any combination thereof.

[0241] The heterocyclic compound represented by Formula 1 may have a structure in which a bicarbazole moiety includes a triphenylsilyl substituent and a phenyl substituent. The phenyl substituent may be bonded to the bicarbazole moiety at a para position to a nitrogen atom thereof, which is a HOMO-rich site of the carbazole moiety, to make the HOMO energy level shallow, thereby facilitating hole injection and suppressing an increase in driving voltage due to the bulkiness of the triphenylsilyl substituent. As the steric effect of molecules is enhanced by the inclusion of the triphenylsilyl substituent, a dihedral angle between atoms may increase, and

expansion of conjugation may be suppressed, resulting in high triplet energy. Thus, the heterocyclic compound according to embodiments may be used as a blue phosphorescence and TADF-emitting host and may have high luminescence efficiency. In the heterocyclic compound, the increased bulkiness may hinder the interaction with other molecules (such as with a dopant) and may suppress the formation of an exciplex, which may lead to improved glass transition temperature and thermal stability of molecules. Accordingly, by applying the heterocyclic compound as a blue phosphorescence and TADF host, an electronic device (for example, an organic light-emitting device) may have a low driving voltage and high efficiency.

[Delayed Fluorescence Material]

[0470] The emission layer may include a delayed fluorescence material.

[0471] In the specification, a delayed fluorescence material may be any compound that is capable of emitting delayed fluorescence, based on a delayed fluorescence emission mechanism.

[0472] The delayed fluorescence material included in the emission layer may serve as a host or as a dopant, depending on the types of other materials included in the emission layer.

[0473] In an embodiment, a difference between a triplet energy level (eV) of the delayed fluorescence material and a singlet energy level (eV) of the delayed fluorescence material may be at least 0 eV but not more than 0.5 eV. When a difference between the triplet energy level (eV) of the delayed fluorescence material and the singlet energy level (eV) of the delayed fluorescence material is within the range described above, up-conversion from a triplet state to a singlet state of the delayed fluorescence material may effectively occur, and thus, the light-emitting device **10** may have improved luminescence efficiency.

[Quantum Dot]

[0476] The emission layer may include a quantum dot.

[0477] In the specification, a quantum dot may be a crystal of a semiconductor compound, and may include any material capable of emitting light of various emission wavelengths according to a size of the crystal.

[0478] A diameter of a quantum dot may be, for example, in a range of about 1 nm to about 10 nm.

[0479] The quantum dot may be synthesized by a wet chemical process, a metal organic chemical vapor deposition process, a molecular beam epitaxy process, or any process similar thereto.

[0480] The wet chemical process is a method that includes mixing a precursor material with an organic solvent and growing a quantum dot particle crystal. When the crystal grows, the organic solvent naturally serves as a dispersant coordinated on the surface of the quantum dot crystal and controls the growth of the crystal so that the growth of quantum dot particles can be controlled through a process which costs less, and may be more readily performed than vapor deposition methods, such as metal organic chemical vapor deposition (MOCVD) or molecular beam epitaxy (MBE),

[0481] A quantum dot may include a Group II-VI semiconductor compound, a Group III-V semiconductor compound, a Group III-VI semiconductor compound, a Group I-III-VI semiconductor compound, a Group IV-VI semiconductor compound, a Group IV element or compound, or any combination thereof.

[0482] Examples of a Group II-VI semiconductor compound may include: a binary compound, such as CdS, CdSe, CdTe, ZnS, ZnSe, ZnTe, ZnO, HgS, HgSe, HgTe, MgSe, or MgS; a ternary compound, such as CdSeS, CdSeTe, CdSTe, ZnSeS, ZnSeTe, ZnSTe, HgSeS, HgSeTe, HgSTe, CdZnS, CdZnSe, CdZnTe, CdHgS, CdHgSe, CdHgTe, HgZnS, HgZnSe, HgZnTe, MgZnSe, or MgZnS; a quaternary compound, such as CdZnSeS, CdZnSeTe, CdZnSTe, CdHgSeS, CdHgSeTe, CdHgSTe, HgZnSeS, HgZnSeTe, or HgZnSTe; and any combination thereof.

[0483] Examples of a Group III-V semiconductor compound may include: a binary compound, such as GaN, GaP, GaAs, GaSb, AlN, AlP, AlAs, AlSb, InN, InP, InAs, or InSb; a ternary compound, such as GaNP, GaNAs, GaNSb, GaPAs, GaPSb, AlNP, AlNAs, AlNSb, AlPAs, AlPSb, InGaP, InNP, InAlP, InNAs, InNSb, InPAs, or InPSb; a quaternary compound, such as GaAlNP, GaAlNAs, GaAlNSb, GaAlPAs, GaAlPSb, GaInNP, GaInNAs, GaInNSb, GaInPAs, GaInPSb, InAlNP, InAlNAs, InAlNSb, InAlPAs, or InAlPSb; and any combination thereof. In an embodiment, a Group III-V semiconductor compound may further include a Group II element. Examples of a Group III-V semiconductor compound further including a Group II element may include InZnP, InGaZnP, InAlZnP, etc.

[0485] Examples of a Group I-III-VI semiconductor compound may include: a ternary compound, such as AgInS, AgInS.sub.2, CuInS, CuInS.sub.2, CuGaO.sub.2, AgGaO.sub.2, or AgAlO.sub.2; and any combination thereof.

[0486] Examples of a Group IV-VI semiconductor compound may include: a binary compound, such as SnS, SnSe, SnTe, PbS, PbSe, or PbTe; a ternary compound, such as SnSeS, SnSeTe, SnSTe,

PbSeS, PbSeTe, PbSTe, SnPbS, SnPbSe, or SnPbTe; a quaternary compound, such as SnPbSSe, SnPbSeTe, or SnPbSTe; and any combination thereof.

[0487] Examples of a Group IV element or compound may include: a single element material, such as Si or Ge; a binary compound, such as SiC or SiGe; and any combination thereof.

[0488] Each element included in a compound, such as a binary compound, a ternary compound, or a quaternary compound, may be present in a particle at a uniform concentration or at a non-uniform concentration.

[0489] In an embodiment, a quantum dot may have a single structure in which the concentration of each element in the quantum dot is uniform, or a quantum dot may have a core-shell structure. For example, when a quantum dot has a core-shell structure, a material included in the core and a material included in the shell may be different from each other.

[0490] The shell of a quantum dot may serve as a protective layer that prevents chemical degeneration of the core to maintain semiconductor characteristics, and/or may serve as a charging layer that imparts electrophoretic characteristics to the quantum dot. The shell may be single-layered or multilayered. An interface between the core and the shell may have a concentration gradient in which the concentration of an element that is present in the shell decreases toward the core.

[0491] A shell of a quantum dot may include a metal oxide, a metalloid oxide, a non-metal oxide, a semiconductor compound, or any combination thereof. Examples of a metal oxide, a metalloid oxide, or a non-metal oxide may include: a binary compound, such as SiO₂, Al₂O₃, TiO₂, ZnO, MnO, Mn₂O₃, Mn₃O₄, CuO, FeO, Fe₂O₃, Fe₃O₄, CoO, Co₃O₄, or NiO; a ternary compound, such as MgAl₂O₄, CoFe₂O₄, NiFe₂O₄, or CoMn₂O₄; and any combination thereof.

[0492] Examples of a semiconductor compound may include, as described herein: a Group II-VI semiconductor compound; a Group III-V semiconductor compound; a Group III-VI semiconductor compound; a Group I-III-VI semiconductor compound; a Group IV-VI semiconductor compound; and any combination thereof. For example, the semiconductor compound may include CdS, CdSe, CdTe, ZnS, ZnSe, ZnTe, ZnSeS, ZnTeS, GaAs, GaP, GaSb, HgS, HgSe, HgTe, InAs, InP, InGaP, InSb, AlAs, AlP, AlSb, or any combination thereof.

[0493] A full width at half maximum (FWHM) of an emission spectrum of a quantum dot may be equal to or less than about 45 nm. For example, a FWHM of an emission spectrum of a quantum dot may be equal to or less than about 40 nm. For example, a FWHM of an emission spectrum of a quantum dot may be equal to or less than about 30 nm. Within these ranges, color purity or color reproducibility may be increased. Light emitted through a quantum dot may be emitted in all directions, so that a wide viewing angle may be improved.

[0494] In embodiments, a quantum dot may be in the form of a spherical particle, a pyramidal particle, a multi-arm particle, a cubic nanoparticle, a nanotube particle, a nanowire particle, a nanofiber particle, or a nanoplate particle.

[0495] Since an energy band gap may be adjusted by controlling a size of the quantum dot, light having various wavelength bands may be obtained from a quantum dot emission layer.

Accordingly, by using quantum dots of different sizes, a light-emitting device that emits light of various wavelengths may be implemented. In embodiments, the size of the quantum dot may be adjusted to emit red light, green light, and/or blue light. Example 1

[0690] As an anode, a Corning 15 Ω/cm² (1,200 Å) ITO glass substrate was cut to a size of 50 mm×50 mm×0.5 mm, sonicated with isopropyl alcohol and pure water each for 5 minutes, and cleaned by exposure to ultraviolet rays and ozone for 30 minutes. The ITO glass substrate was provided to a vacuum deposition apparatus.

[0691] HATCN was formed on the substrate as a hole injection layer having a thickness of 100 Å, and BCFN, which is a first hole transport material, was vacuum-deposited thereon at a thickness of 600 Å. SiCzCz, which is a hole transport material, was vacuum-deposited as a second hole transporting compound to form a hole transport layer having a thickness of 50 Å.

[0692] SiTrzCz2 and Compound 6 as a host and PtON-TBBI as a phosphorescent dopant were co-deposited at a weight ratio of 60:27:13 on the hole transport layer to form an emission layer having a thickness of 350 Å.

[0693] On the emission layer, mSiTrz was deposited as a first electron transport layer having a thickness of 50 Å, and mSiTrz and LiQ were co-deposited as a second electron transport layer at a weight ratio of 1:1 to form an electron transport layer having a thickness of 350 Å. LiF, which is a halogenated alkaline metal, was deposited on the electron transport layer to form an electron injection layer having a thickness of 15 Å, and Al was vacuum-deposited to form a LiF/Al electrode having a thickness of 80 Å, thereby completing the manufacture of an organic light-emitting device.

Examples 2 to 8 and Comparative Examples 1 to 6

[0694] Organic light-emitting devices were manufactured in the same manner as in Example 1, except that, in forming an emission layer, Compound 6 as a host was changed as shown in Table 3.

Evaluation Example 2

[0695] To evaluate the characteristics of the organic light-emitting devices according to Examples 1 to 8 and Comparative Examples 1 to 6, driving voltage at a current density of 10 mA/cm², current density, and maximum quantum efficiency were measured.

[0696] The driving voltage and current density of the organic light-emitting devices were measured by using a source meter (Keithley Instrument Inc., 2400 series), and the maximum quantum efficiency was measured by using the external quantum efficiency measurement device C9920-2-12 of Hamamatsu Photonics Inc.

[0697] In evaluating the maximum quantum efficiency, the luminance/current density was measured by using a luminance meter that was calibrated for wavelength sensitivity, and the maximum quantum efficiency was converted by assuming an angular luminance distribution (Lambertian) which introduced a perfect reflecting diffuser.

[0698] Table 3 below shows the evaluation results of the characteristics of the organic light-emitting devices.

[0699] From Table 3, it was confirmed that the organic light-emitting devices according to Examples 1 to 8 had a lower driving voltage and higher maximum quantum efficiency than the organic light-emitting devices according to Comparative Examples 1 to 6.

[0700] By using the heterocyclic compound, a light-emitting device having a lower driving voltage, higher efficiency, and longer lifespan, and a high-quality electronic apparatus including the light-emitting device may be manufactured.
