### ADJUSTABLE NOSECONE

---

#### Abstract

A percutaneous valve delivery system may include an outer sheath and an inner catheter disposed within the outer sheath. The inner catheter may include a plurality of lumens formed therein. A tubular extension may extend distally from a distal end of the inner catheter, wherein the tubular extension is axially movable relative to the inner catheter. A nose cone may be attached to the tubular extension. A handle may be attached to the outer sheath, wherein the handle is configured to shift the outer sheath between a first position and a second position relative to the inner catheter. A valve replacement implant may be releasably coupled to the inner catheter.

## **Background/Summary**

**RELATED APPLICATIONS [0001]** This application is a continuation U.S. application Ser. No. 18/216,140, filed Jun. 29, 2023, which is a continuation of U.S. application Ser. No. 16/428,077, filed May 31, 2019, which is a continuation of U.S. application Ser. No. 15/197,893, filed Jun. 30, 2016, which claims priority to U.S. Provisional Application No. 62/188,223, filed Jul. 2, 2015, the entirety of which is hereby incorporated by reference.

### **TECHNICAL FIELD**

[0002] The present disclosure pertains to medical devices, and methods for manufacturing medical devices. More particularly, the present disclosure pertains to medical devices for delivering a replacement heart valve.

### **BACKGROUND**

[0003] A wide variety of intracorporeal medical devices have been developed for medical use, for example, intravascular use. Some of these devices include guidewires, catheters, medical device delivery systems (e.g., for stents, grafts, replacement valves, etc.), and the like. These devices are manufactured by any one of a variety of different manufacturing methods and may be used according to any one of a variety of methods. Of the known medical devices and methods, each has certain advantages and disadvantages. There is an ongoing need to provide alternative medical devices as well as alternative methods for manufacturing and using medical devices.

### **BRIEF SUMMARY**

[0004] In a first aspect, a percutaneous valve delivery system may comprise an outer sheath, an inner catheter disposed within the outer sheath, the inner catheter including a plurality of lumens formed therein, a tubular extension extending distally from a distal end of the inner catheter, wherein the tubular extension is axially movable relative to the inner catheter, a nose cone attached to the tubular extension, a handle attached to the outer sheath, wherein the handle is configured to shift the outer sheath between a first position and a second position relative to the inner catheter, and a valve replacement implant releasably coupled to the inner catheter.

[0005] In addition or alternatively, and in a second aspect, the tubular extension is fixedly attached to a hypotube slidably received within one of the plurality of lumens.

[0006] In addition or alternatively, and in a third aspect, the percutaneous valve delivery system may further comprise a luer connector attached to a proximal end of the hypotube, the luer connector being configured to engage a proximal end of the handle.

[0007] In addition or alternatively, and in a fourth aspect, the luer connector, the hypotube, the tubular extension, and the nose cone together form a nose cone subassembly having a guidewire lumen extending through the percutaneous valve delivery system, wherein the guidewire lumen is configured to slidably receive a guidewire therein.

[0008] In addition or alternatively, and in a fifth aspect, the luer connector is threadably attached to the proximal end of the hypotube.

[0009] In addition or alternatively, and in a sixth aspect, the luer connector includes a protrusion preventing distal axial movement of the luer connector past the proximal end of the handle.

[0010] In addition or alternatively, and in a seventh aspect, the nose cone subassembly is axially

movable relative to the inner catheter and the handle.

[0011] In addition or alternatively, and in an eighth aspect, the valve replacement implant is disposed about the tubular extension.

[0012] In addition or alternatively, and in a ninth aspect, the nose cone is fixedly attached at a distal end of the tubular extension.

[0013] In addition or alternatively, and in a tenth aspect, a proximal portion of the nose cone is configured to matingly engage a distal end of the outer sheath in the first position.

[0014] In addition or alternatively, and in an eleventh aspect, a percutaneous valve delivery system may comprise an outer sheath, an inner catheter disposed within the outer sheath, the inner catheter including a plurality of lumens formed therein, a tubular extension extending distally from a distal end of the inner catheter, wherein the tubular extension is axially movable relative to the inner catheter, a nose cone attached to the tubular extension, a handle attached to the outer sheath, wherein the handle is configured to shift the outer sheath between a first position and a second position relative to the inner catheter, the inner catheter being fixed to the handle, and a valve replacement implant releasably coupled to the inner catheter, the tubular extension extending through the valve replacement implant.

[0015] In addition or alternatively, and in a twelfth aspect, the tubular extension is fixedly attached to a hypotube slidably received within one of the plurality of lumens.

[0016] In addition or alternatively, and in a thirteenth aspect, a percutaneous valve delivery system may further comprise a luer connector attached to a proximal end of the hypotube, the luer connector being configured to engage a proximal end of the handle.

[0017] In addition or alternatively, and in a fourteenth aspect, the luer connector, the hypotube, the tubular extension, and the nose cone together form a nose cone subassembly having a guidewire lumen extending through the percutaneous valve delivery system, wherein the guidewire lumen is configured to slidably receive a guidewire therein.

[0018] In addition or alternatively, and in a fifteenth aspect, the luer connector is threadably attached to the proximal end of the hypotube.

[0019] In addition or alternatively, and in a sixteenth aspect, the luer connector includes a protrusion preventing distal axial movement of the luer connector past the proximal end of the handle.

[0020] In addition or alternatively, and in a seventeenth aspect, the nose cone subassembly is axially movable relative to the inner catheter and the handle.

[0021] In addition or alternatively, and in an eighteenth aspect, the nosecone is fixedly attached at a distal end of the tubular extension.

[0022] In addition or alternatively, and in a nineteenth aspect, a proximal portion of the nose cone is configured to abut a distal end of the outer sheath in the first position.

[0023] In addition or alternatively, and in a twentieth aspect, the nose cone is spaced distally from the outer sheath in the second position.

[0024] The above summary of some embodiments is not intended to describe each disclosed embodiment or every implementation of the present invention. The Figures, and Detailed Description, which follow, more particularly exemplify these embodiments.

---

## Description

### BRIEF DESCRIPTION OF THE DRAWINGS

[0025] FIG. 1 is side view of an example valve delivery system;

[0026] FIG. 2 is a partial perspective view of a portion of the example valve delivery system of FIG. 1;

[0027] FIG. 3 is a partial perspective view of a portion of the example valve delivery system of

FIG. 1;

[0028] FIG. 4 is a partial cut-away side view of the example valve delivery system of FIG. 1;

[0029] FIG. 5 is a partial cut-away side view of the example valve delivery system of FIG. 1;

[0030] FIG. 6 is a partial perspective view of a portion of the example valve delivery system of FIG. 1;

[0031] FIGS. 7-8 illustrate movement of a nosecone subassembly in a side view of the example valve delivery system of FIG. 1;

[0032] FIG. 9 is a side view of an example nosecone subassembly;

[0033] FIG. 10 is a perspective view of a portion of the example nosecone subassembly of FIG. 9; and

[0034] FIG. 11 is a side view of a portion of the example nosecone subassembly of FIG. 9.

[0035] While the invention is amenable to various modifications and alternative forms, specifics thereof have been shown by way of example in the drawings and will be described in detail. It should be understood, however, that the intention is not to limit the invention to the particular embodiments described. On the contrary, the intention is to cover all modifications, equivalents, and alternatives falling within the spirit and scope of the invention.

#### DETAILED DESCRIPTION

[0036] The following description should be read with reference to the drawings, which are not necessarily to scale, wherein like reference numerals indicate like elements throughout the several views. The detailed description and drawings are intended to illustrate but not limit the claimed invention. Those skilled in the art will recognize that the various elements described and/or shown may be arranged in various combinations and configurations without departing from the scope of the disclosure. The detailed description and drawings illustrate example embodiments of the claimed invention.

[0037] For the following defined terms, these definitions shall be applied, unless a different definition is given in the claims or elsewhere in this specification.

[0038] All numeric values are herein assumed to be modified by the term “about,” whether or not explicitly indicated. The term “about”, in the context of numeric values, generally refers to a range of numbers that one of skill in the art would consider equivalent to the recited value (i.e., having the same function or result). In many instances, the term “about” may include numbers that are rounded to the nearest significant figure. Other uses of the term “about” (i.e., in a context other than numeric values) may be assumed to have their ordinary and customary definition(s), as understood from and consistent with the context of the specification, unless otherwise specified.

[0039] The recitation of numerical ranges by endpoints includes all numbers within that range, including the endpoints (e.g. 1 to 5 includes 1, 1.5, 2, 2.75, 3, 3.80, 4, and 5).

[0040] Although some suitable dimensions, ranges and/or values pertaining to various components, features and/or specifications are disclosed, one of skill in the art, incited by the present disclosure, would understand desired dimensions, ranges and/or values may deviate from those expressly disclosed.

[0041] As used in this specification and the appended claims, the singular forms “a”, “an”, and “the” include plural referents unless the content clearly dictates otherwise. As used in this specification and the appended claims, the term “or” is generally employed in its sense including “and/or” unless the content clearly dictates otherwise.

[0042] Relative terms such as “proximal”, “distal”, “advance”, “retract”, variants thereof, and the like, may be generally be considered with respect to the positioning, direction, and/or operation of various elements relative to a user/operator/manipulator of the device, wherein “proximal” and “retract” indicate or refer to closer to or toward the user and “distal” and “advance” indicate or refer to farther from or away from the user. Other relative terms, such as “upstream” and “downstream” refer to a direction of fluid flow within a lumen, such as a body lumen or blood vessel.

[0043] It is noted that references in the specification to “an embodiment”, “some embodiments”, “other embodiments”, etc., indicate that the embodiment(s) described may include a particular feature, structure, or characteristic, but every embodiment may not necessarily include the particular feature, structure, or characteristic. Moreover, such phrases are not necessarily referring to the same embodiment. Further, when a particular feature, structure, or characteristic is described in connection with an embodiment, it would be within the knowledge of one skilled in the art to effect such feature, structure, or characteristic in connection with other embodiments, whether or not explicitly described, unless clearly stated to the contrary. That is, the various individual elements described below, even if not explicitly shown in a particular combination, are nevertheless contemplated as being combinable or arrangeable with each other to form other additional embodiments or to complement and/or enrich the described embodiment(s), as would be understood by one of ordinary skill in the art.

[0044] For the purpose of clarity, certain identifying numerical nomenclature (e.g., first, second, third, fourth, etc.) may be used throughout the description and/or claims to name and/or differentiate between various described and/or claimed features. It is to be understood that the numerical nomenclature is not intended to be limiting and is exemplary only. In some embodiments, alterations of and deviations from previously-used numerical nomenclature may be made in the interest of brevity and clarity. That is, a feature identified as a “first” element may later be referred to as a “second” element, a “third” element, etc. or may be omitted entirely, and/or a different feature may be referred to as the “first” element. The meaning and/or designation in each instance will be apparent to the skilled practitioner.

[0045] Diseases and/or medical conditions that impact the cardiovascular system are prevalent in the United States and throughout the world. Traditionally, treatment of the cardiovascular system was often conducted by directly accessing the impacted part of the system. For example, treatment of a blockage in one or more of the coronary arteries was traditionally treated using coronary artery bypass surgery. As can be readily appreciated, such therapies are rather invasive to the patient and require significant recovery times and/or treatments. More recently, less invasive therapies have been developed, for example, where a blocked coronary artery could be accessed and treated via a percutaneous catheter (e.g., angioplasty). Such therapies have gained wide acceptance among patients and clinicians.

[0046] Some relatively common medical conditions may include or be the result of inefficiency, ineffectiveness, or complete failure of one or more of the valves within the heart. For example, failure of the aortic valve can have a serious effect on a human and could lead to serious health condition and/or death if not dealt with. Treatment of defective heart valves poses other challenges in that the treatment often requires the repair or outright replacement of the defective valve. Such therapies may be highly invasive to the patient. Disclosed herein are medical devices that may be used for delivering a medical device to a portion of the cardiovascular system in order to diagnose, treat, and/or repair the system. At least some of the medical devices disclosed herein may be used to deliver and implant a replacement heart valve (e.g., a replacement aortic valve). In addition, the devices disclosed herein may deliver the replacement heart valve percutaneously and, thus, may be much less invasive to the patient. The devices disclosed herein may also provide a number of additional desirable features and benefits as described in more detail below.

[0047] FIG. 1 is a side view of an example valve delivery system **10**. It should be noted that some features of the valve delivery system **10** are either not shown, or are shown schematically, in FIG. 1 for simplicity. Additional details regarding some of the components of the valve delivery system **10** are provided in other figures in greater detail. The valve delivery system **10** may be used to deliver and/or deploy a variety of medical devices to a number of locations within the anatomy. In at least some embodiments, the valve delivery system **10** is a replacement heart valve delivery system (e.g., a replacement aortic valve delivery system) that can be used for percutaneous delivery of a replacement heart valve. This, however, is not intended to be limiting as the valve delivery system

**10** may also be used for other interventions including mitral valve replacement, valve repair, valvuloplasty, and the like, or other similar interventions.

[0048] In some embodiments, the valve delivery system **10** may generally be described as a catheter system that includes an outer sheath **12** and an inner catheter **14** (a portion of which is shown in FIG. **1** in phantom line) disposed within and/or extending at least partially through the outer sheath **12**. In some embodiments, a valve replacement implant **16** may be releasably coupled to the inner catheter **14** and disposed within the outer sheath **12** during delivery of the valve replacement implant **16**. In some embodiments, a device handle **18** may be disposed at, attached to, and/or coupled to a proximal end of the outer sheath **12** and the inner catheter **14**, as seen in FIGS. **3-5** for example. In some embodiments, the outer sheath **12** may be axially translatable relative to the device handle **18** and/or the inner catheter **14**. In some embodiments, the inner catheter **14** may be fixedly attached to and/or fixed in position relative to the device handle **18**. In general, the device handle **18** may be configured to shift (i.e., translate, move, reposition, etc.) the outer sheath **12** between a first position and a second position relative to the inner catheter **14**, as well as aid in the deployment of the valve replacement implant **16**.

[0049] In use, the valve delivery system **10** may be advanced percutaneously through a patient's vasculature to a position adjacent to an area of interest. For example, valve delivery system **10** may be advanced through the vasculature to a position adjacent to a defective aortic valve. During delivery, the valve replacement implant **16** may be generally disposed in an elongated and low profile "delivery" configuration at, coupled to, and/or within the outer sheath **12** distally of the inner catheter **14**, wherein the outer sheath **12** is disposed at a first position relative to the inner catheter. Once positioned, the device handle **18** may be actuated to proximally retract the outer sheath **12** to a second position relative to the inner catheter **14**, which may be held stationary by the device handle **18**, to expose the valve replacement implant **16**. The valve replacement implant **16** may be actuated in order to expand implant into a generally shortened and larger profile "deployed" configuration suitable for implantation within the anatomy. After the valve replacement implant **16** is suitably deployed within the anatomy, the valve replacement implant **16** may be released and/or detached from the valve delivery system **10**, and the valve delivery system **10** may be removed from the vasculature, leaving the valve replacement implant **16** in place to function as, for example, a suitable replacement for the native aortic valve. In at least some interventions, the valve replacement implant **16** may be deployed within the native aortic valve (e.g., the native valve is left in place and not excised). Alternatively, the native aortic valve may be removed (e.g., such as through valvuloplasty, for example) and the valve replacement implant **16** may be deployed in its place as a replacement.

[0050] In some embodiments, the outer sheath **12** may define a proximal portion and a distal portion. In some embodiments, the distal portion may have a slightly enlarged or flared inner diameter, which may provide additional space for holding the medical device implant therein. In some embodiments, an inner diameter of the outer sheath **12** along the proximal portion may be in the range of about 0.254 to 1.27 cm (0.10 to 0.50 inches), or about 0.508 to 1.016 cm (0.20 to 0.40 inches), or about 0.508 to 0.762 cm (0.20 to 0.30 inches), or about  $0.56388 \pm 0.0508$  cm ( $0.222 \pm 0.002$  inches). In some embodiments, an inner diameter of the outer sheath **12** along the distal portion may be in the range of about 0.254 to 1.27 cm (0.10 to 0.50 inches), or about 0.508 to 1.016 cm (0.20 to 0.40 inches), or about 0.508 to 0.762 cm (0.20 to 0.30 inches), or about 0.579 to 0.5842 cm (0.228 to 0.230 inches). In some embodiments, at the distal end of the distal portion may be a distal tip, which may be flared or otherwise have a funnel-like shape. The funnel-like shape may increase the outer diameter (and the inner diameter) of the outer sheath **12** at the distal tip and in some embodiments may aid in the sheathing and/or re-sheathing of the medical device implant into the outer sheath **12**. In some embodiments, other than at the distal tip, the outer sheath **12** may have a generally constant outer diameter. For example, the outer sheath **12** may have an outer diameter in the range of about 0.254 to 1.27 cm (0.10 to 0.50 inches), or about 0.508 to 1.016

cm (0.20 to 0.40 inches), or about 0.508 to 0.762 cm (0.20 to 0.30 inches), or about 0.6858 cm (0.270 inches). These are just examples. Other embodiments are contemplated that have differing dimensions (including those appropriate for differently sized patients including children) and/or arrangements for the outer diameter and/or the inner diameter of the outer sheath **12**. These contemplated embodiments include delivery sheaths with flared or otherwise variable outer diameters, embodiments with constant inner diameters, combinations thereof, and the like. In some embodiments, the outer sheath **12** may also have a length that is appropriate for reaching the intended area of interest within the anatomy. For example, in some embodiments, the outer sheath **12** may have a length in the range of about 30 to 200 cm, or about 60 to 150 cm, or about 100 to 120 cm, or about 108±0.20 cm. In some embodiments, the outer sheath **12** and/or one or more portions of the outer sheath **12** may be curved. For example, in some embodiments, the distal portion of the outer sheath **12** may be curved. In one example, a radius of the curved distal portion (as measured from a central axis of the outer sheath **12**) may be in the range of about 2 to 6 cm (20 to 60 mm), or about 3 to 4 cm (30 to 40 mm), or about 3.675 cm (36.75 mm). Again, these dimensions are examples and are not intended to be limiting.

[0051] In some embodiments, the outer sheath **12** may be formed from a singular monolithic tube or unitary member. Alternatively, the outer sheath **12** may include a plurality of layers or portions. One or more of these layers may include a reinforcing structure such as a braid, coil, mesh, combinations thereof, or the like. For example, in some embodiments, the outer sheath **12** may include an inner liner or layer. In some embodiments, an intermediate or tier layer may be disposed on the inner liner. In some embodiments, a reinforcement may be disposed on the intermediate layer. In some embodiments, a topcoat or outer layer may be disposed on or over the reinforcement. In some embodiments, an outer coating (e.g., a lubricious coating, a hydrophilic coating, a hydrophobic coating, etc.) may be disposed on, over, and/or along portions or all of the topcoat or outer layer. These are just examples. Several alternative structural configurations are contemplated for the outer sheath **12** including embodiments including two or more layers that may be different, embodiments without a reinforcement, and the like, or other suitable configurations.

[0052] The dimensions and materials utilized for the various layers of the outer sheath **12** may also vary. For example, an inner liner may include a polymeric material such as fluorinated ethylene propylene (FEP) and may have a thickness in the range of about 0.00254 to 0.0127 cm (0.001 to 0.005 inches) or about 0.00762±0.00254 (0.003±0.001 inches), an intermediate layer may include a polymer material such as polyether block amide (e.g., PEBAX 6333) and may have a thickness in the range of about 0.00254 to 0.0127 cm (0.001 to 0.005 inches) or about 0.00508±0.00254 (0.002±0.001 inches), an outer coating may include a polymer material such as polyether block amide (e.g., PEBAX 7233) and may have a thickness in the range of about 0.00254 to 0.0254 cm (0.001 to 0.01 inches). In some embodiments, an outer coating may vary in thickness. For example, along a proximal portion, an outer coating may have greater thickness, such as about 0.0127 to about 0.0508 cm or about 0.02159 cm (0.005 to 0.02 inches or about 0.0085 inches), than along a distal portion and/or at a distal tip, which may be about 0.0127 to about 0.0508 cm or about 0.01651 cm (e.g., about 0.005 to 0.02 inches or about 0.0065 inches). These are just examples as other suitable materials may be used.

[0053] A reinforcement may also vary in form. In at least some embodiments, a reinforcement may take the form of a braid, coil, mesh, or the like. For example, in some embodiments, a reinforcement may include a metallic braid (e.g., stainless steel). In some of these embodiments, a reinforcement may also include additional structures such as one or more longitudinally-extending strands. For example, a reinforcement may include a pair of longitudinally-extending aramid and/or para aramid strands (for example, KEVLAR®) disposed on opposite sides of the braid. In some embodiments, these strands may or may not be woven into portions or all of the braid.

[0054] In some embodiments, a distal end region of the inner catheter **14** may include a step in outer diameter that defines a decreased outer diameter section. For example, a decreased outer

diameter section may have an outer diameter in the range of about 0.127 to 0.635 cm (0.05 to 0.25 inches), or about 0.254 to 0.508 cm (0.10 to 0.20 inches), or about  $0.38608 \pm 0.00762$  ( $0.152 \pm 0.003$  inches) as opposed to the remainder of the inner catheter 14 where the outer diameter may be in the range of about 0.127 to 0.762 cm (0.05 to 0.30 inches), or about 0.254 to 0.635 cm (0.10 to 0.25 inches), or about  $0.508 \pm 0.0254$  cm ( $0.20 \pm 0.01$  inches). The decreased outer diameter section may define a region where other components of the valve delivery system 10 may be attached.

[0055] In some embodiments, the inner catheter 14 may include a plurality of lumens formed therein. In some embodiments, the inner catheter 14 may be formed as an extruded polymeric shaft. Other forms are also contemplated including other polymer shafts or tubes, metallic shafts or tubes, reinforced shafts or tubes, or the like including other suitable materials such as those disclosed herein. In some embodiments, the polymeric shaft may be a singular monolithic or unitary member. In some embodiments, the polymeric shaft may include a plurality of portions or segments that are coupled together. The total length of the inner catheter 14 and/or the polymeric shaft may be in the range of about 60 to 150 cm, or about 80 to 120 cm, or about 100 to 115 cm, or about  $112 \pm 0.02$  cm. Just like the outer sheath 12, in some embodiments, the inner catheter 14 and/or the polymeric shaft may be curved, for example adjacent to a distal end thereof. In some embodiments, the polymeric shaft may have one or more sections with a differing hardness/stiffness (e.g., differing shore durometer). For example, the polymeric shaft may have a proximal region and an intermediate region. In some embodiments, the proximal region may include a generally stiff polymeric material such as a 72D polyether block amide (e.g., 72D PEBAX) and may have a length in the range of about 60 to 150 cm, or about 80 to 120 cm, or about 100 to 115 cm, or about  $109.5 \pm 0.02$  cm. In some embodiments, the intermediate region may include a 40D polyether block amide (e.g., 40D PEBAX) and may have a length in the range of about 5 to 25 mm, or about 10 to 20 mm, or about  $15 \pm 0.01$  mm. The decreased outer diameter section may also differ from the proximal region and/or the intermediate region and, in some embodiments, may include a 72D polyether block amide (e.g., 72D PEBAX) and may have a length in the range of about 0.5 to 2 cm (5 to 20 mm), or about 0.8 to 1.5 cm (8 to 15 mm), or about  $1 \pm 0.001$  cm ( $10 \pm 0.01$  mm). These are just examples. Other suitable polymers may also be used, such as, but not limited to, other polymers disclosed herein.

[0056] In some embodiments, the inner catheter 14 may include a plurality of lumens extending at least partially therethrough. For example, in some embodiments, the inner catheter 14 and/or the polymeric shaft may include a first lumen, a second lumen, a third lumen, and/or a fourth lumen. In general, the lumens extend along the entire length of the inner catheter 14 and/or the polymeric shaft. Other embodiments are contemplated, however, where one or more of lumens extend along only a portion of the length of inner catheter 14 and/or the polymeric shaft. For example, the fourth lumen may stop just short of the distal end of the inner catheter 14 and/or the polymeric shaft and/or be filled in at its distal end to effectively end the fourth lumen proximal of the distal end of the inner catheter 14 and/or the polymeric shaft.

[0057] Disposed within one of the lumens (e.g., a first lumen) may be one or more push- pull rods (not shown), which are used to expand and/or elongate the medical device implant when the device handle 18 is actuated by connecting a portion of the device handle 18 to the medical device implant to transmit rotational and/or axial motion thereto. In some embodiments, one or more of the lumens (e.g., the first lumen) may be lined with a low friction liner (e.g., a FEP liner). Disposed within a second lumen may be a pin release mandrel (not shown), which in some embodiments may facilitate release of the valve replacement implant 16. In some embodiments, the second lumen may be lined with a hypotube liner. In some embodiments, a third lumen may be a guidewire lumen. In some embodiments, the third lumen may be lined with a hypotube liner. In some embodiments, a fourth lumen may be used to house a non-stretch wire or member. The form of the non-stretch wire or member may vary. In some embodiments, the non-stretch wire or member may take the form of a stainless steel braid. The non-stretch wire or member may optionally include a pair of longitudinally-extending aramid and/or para aramid strands (for example, KEVLAR®)

disposed on opposite sides of the braid. In general rather than being “disposed within” the fourth lumen, the non-stretch wire or member may be embedded within the fourth lumen and/or the polymeric shaft. In addition, the non-stretch wire or member may extend to a position adjacent to the distal end portion but not fully to the distal end of the inner catheter **14** and/or the polymeric shaft. For example, a short distal segment of the fourth lumen may be filled in with polymer material adjacent to the distal end of inner catheter **14** and/or the polymeric shaft.

[0058] In some embodiments, the valve delivery system **10** may include a tubular extension **62** extending distally from a distal end of the inner catheter **14**, as seen in FIG. **2** for example. In some embodiments, the tubular extension **62** may be axially movable and/or translatable relative to the inner catheter **14**. In some embodiments, a nose cone **64** may be fixedly attached to the tubular extension **62** at a distal end of the tubular extension **62**. The nose cone **64** generally may be designed to have an atraumatic shape. In some embodiments, a proximal portion of the nose cone **64** may be configured to matingly engage a distal end of the outer sheath in the first position, and in some embodiments, the nose cone **64** may include a ridge **66** that is configured to abut the distal end or distal tip of the outer sheath **12** in the first position, such as during delivery of the valve replacement implant **16** for example. As readily seen in the Figures, in some embodiments, the valve replacement implant **16** may be disposed about and/or may surround the tubular extension **62**.

[0059] In some embodiments, the tubular extension **62** may be fixedly attached to a hypotube **60** slidably received within one of the plurality of lumens of the inner catheter **14**. In some embodiments, a luer connector **58** may be attached to a proximal end of the hypotube **60**. In some embodiments, the luer connector **58** may be configured to engage a proximal end of the device handle **18**, as seen in FIG. **6** for example. In some embodiments, the luer connector **58**, the hypotube **60**, the tubular extension **62**, and the nose cone **64** may together form a nose cone subassembly having a guidewire lumen extending therethrough, and thus may define a guidewire lumen extending through the percutaneous valve delivery system **10**. In some embodiments, the guidewire lumen may be configured to slidably receive a guidewire **50** therein, as seen in FIGS. **6-8**.

[0060] FIG. **9** illustrates an example nose cone subassembly including a luer connector **58**, a hypotube **60**, a tubular extension **62**, and a nose cone **64**, the nose cone subassembly having a guidewire lumen extending therethrough. In some embodiments, the luer connector **58** may be threadably attached to the proximal end of the hypotube **60**. In some embodiments, a distal end of the hypotube **60** may be fixedly attached to a proximal end of the tubular extension **62**, such that an axial lumen of the hypotube **60** is in fluid communication with an axial lumen of the tubular extension **62**, thereby forming at least a central portion of the guidewire lumen of the nose cone subassembly. In some embodiments, the nose cone subassembly may be axially movable, translatable, and/or actuatable relative to the inner catheter **14** and/or the device handle **18**. In some embodiments, the nose cone **64** may include a lumen extending therethrough and in fluid communication with the lumen of the tubular extension **62** so as to form a distal portion of the guidewire lumen.

[0061] FIG. **10** illustrates an example luer connector **58** having a generally elongated tubular body. In some embodiments, the luer connector **58** may include a protrusion **56** disposed at or adjacent to, and extending radially outward from, a proximal end of the luer connector **58**. In some embodiments, the protrusion **56** may be an annular or ring-like protrusion. In at least some embodiments, the protrusion **56** may prevent distal axial movement of the luer connector **58**, and therefore the nose cone subassembly to which the luer connector **58** is attached, past the proximal end of the device handle **18** and/or the rotatable control knob **122**. In some embodiments, the protrusion **56** may be configured to engage with and/or abut the proximal end of the device handle **18** and/or a corresponding mating recess in the proximal end of the device handle **18** and/or the rotatable control knob **122**. In some embodiments, the luer connector **58** may include one or more

guide bars **54** extending generally parallel to a central axis of the luer connector **58** and extending laterally outward from an outer surface of the elongated tubular body of the luer connector **58**. In some embodiments, the one or more guide bars **54** may permit the luer connector **58** to slidably engage the device handle **18** while preventing rotational movement of the luer connector **58** relative to the device handle **18** when the one or more guide bars **54** is engaged with the device handle **18**. In some embodiments, the one or more guide bars **54** may permit the luer connector **58** to slidably engage the device handle **18** while also permitting rotational movement of the luer connector **58** relative to the device handle **18** when the one or more guide bars **54** is engaged with the device handle. In some embodiments, the one or more guide bars **54** may form a helical or spiral configuration enabling the luer connector **58** to be removably threaded or screwed into the proximal end of the device handle **18** to prevent axial movement or translation of the nose cone subassembly when the luer connector **58** is engaged with the device handle **18**.

[0062] FIG. **11** illustrates an example hypotube **60**. In some embodiments, the hypotube **60** may include a lumen extending therethrough. In some embodiments, the hypotube **60** may include an externally threaded proximal end **70** configured to threadably engage an internally threaded lumen of the luer connector **58**. In some embodiments, the lumen of the hypotube **60** may be in fluid communication with the lumen of the luer connector **58** so as to form a proximal portion of the guidewire lumen of the nose cone subassembly. In some embodiments, the hypotube **60** may include a plurality of apertures **72** extending laterally through a side wall of the hypotube **60** adjacent to a distal end of the hypotube **60**. In some embodiments, the plurality of apertures **72** may be regularly or evenly spaced about the circumference of the hypotube **60**. In some embodiments, the plurality of apertures **72** may be irregularly or unevenly spaced about the circumference of the hypotube **60**. In at least some embodiments, the plurality of apertures may be configured to engage with and/or receive one or more portions of the tubular extension **62** therein to form a mechanical connection fixedly attaching the hypotube **60** to the tubular extension **62**. In some embodiments, each of the plurality of apertures may engage or receive one portion of the tubular extension **62** extending radially outward from an outer surface of the tubular extension **62**. In some embodiments, the lumen of the hypotube **60** may be in fluid communication with a lumen of the tubular extension **62** so as to form a central portion of the guidewire lumen of the nose cone subassembly.

[0063] As can be seen in FIGS. **3-5**, the device handle **18** includes a handle housing **120**. In some embodiments, the device handle **18** may also include a rotatable control knob **122** disposed on or about the handle housing **120** (e.g., at a proximal end of the handle housing **120**) and may be used to move one or more of the components of the valve delivery system **10** (e.g., the outer sheath **12**, the push-pull rods, the pin release mandrel, etc.). In some embodiments, the device handle **18** may include a rotatable collar **156** disposed about the handle housing **120**. In some embodiments, the rotatable collar **156** may be disposed adjacent the rotatable control knob **122**. In some embodiments, the rotatable control knob **122** may be disposed about a proximal portion of the rotatable collar **156**. In some embodiments, a slidable door **124** may also be disposed about the handle housing **120**. In some embodiments, the slidable door **124** may translate distally to expose a distal portion of the rotatable collar **156** which may be positioned generally under the slidable door **124**. In some embodiments, the rotatable collar **156** may be rotated to move one or more components of the valve delivery system **10**. In some embodiments, the device handle **18** may also include one or more apertures and/or flush ports that can be used to flush the valve delivery system **10**. In some embodiments, a distal flush port and a proximal flush port may be accessible from an exterior of the handle housing **120** through a distal aperture and a proximal aperture, respectively.

[0064] FIGS. **4** and **5** illustrate a side view of the device handle **18** with a portion of the handle housing **120** removed, exposing at least some of the interior components. Here it can be seen that the outer sheath **12** may be fixedly attached to a sheath adapter. The sheath adapter may be attached to a sheath carriage, which may be threaded onto a lead screw. The distal flush port may be

disposed on the sheath adapter. In general, the distal flush port provides access to the interior or lumen of the outer sheath **12** (e.g., access to space between the inner catheter **14** and the outer sheath **12**) so that a clinician can flush fluid through the lumen of the outer sheath **12** to remove any unwanted materials (e.g., air, fluid, contaminants, etc.) therein prior to use of the valve delivery system **10**. In at least some embodiments, the distal flush port has a luer type connector (e.g., a one-way luer connector) that allows a device such as a syringe with a corresponding connector to be attached thereto for flushing.

[0065] Extending through and proximally from the sheath adapter is the inner catheter **14**. A proximal end of the inner catheter **14** is selectively attached (e.g., releasably locked) to a diverter block. The diverter block may be attached to a support body. The proximal flush port may be disposed on the support body and can be used to flush the lumen(s) of the inner catheter **14** and/or the polymeric shaft, and may function similarly to the distal flush port, for example. In general, the diverter block and/or the support body may have one or more passageways or lumens formed therein.

[0066] In some embodiments, the push-pull rods and/or the pin release mandrel may extend from a mechanism operatively connected to the rotatable control knob **122**, the slidable door **124**, and/or the rotatable collar **156** through respective passageways or lumens in the diverter block and/or the support body and into the lumen(s) of the inner catheter **14** and/or the polymeric shaft.

Alternatively, the proximal ends of the push-pull rods and/or the pin release mandrel may each be attached to a shaft or hypotube (e.g., solid in cross-section, tubular, etc.), and each of the shafts or hypotubes may extend proximally therefrom through one of the one or more passageways or lumens to the mechanism operatively connected to the rotatable control knob **122**, the slidable door **124**, and/or the rotatable collar **156**. For example, a first shaft or hypotube and a second shaft or hypotube may extend through the passageways or lumens in the diverter block, and in some embodiments, the first shaft or hypotube may extend through a first passageway or lumen and the second shaft or hypotube may extend through a second passageway or lumen that is separate or distinct from the first passageway or lumen. In at least some embodiments, the first shaft may be attached to the pin release mandrel. In at least some embodiments, the second shaft may be attached to the push-pull rods. It should be noted that at in least some embodiments of the valve delivery system **10**, three push-pull rods are utilized. In these embodiments, the three push-pull rods may come together (e.g., brought into contact with one another or otherwise brought into relatively close proximity with one another) adjacent to the distal end of the inner catheter **14** and enter the first passageway or lumen. At one or more positions along their length, the push-pull rods may be fixedly attached to one another. For example, in some embodiments, the push-pull rods may be welded together about 10.16 cm (about 4.00 inches) proximally from their distal ends. In some embodiments, the push-pull rods may be welded together proximate their proximal ends in addition to or instead of the distal weld. Proximally thereafter, the push-pull rods may extend to the second shaft.

[0067] The device handle **18** is generally configured for coordinated movement of multiple structures of the valve delivery system **10**. For example, the device handle **18** is configured to allow a user to move the outer sheath **12** (e.g., relative to the inner catheter **14**), move the push-pull rods, and move the pin release mandrel. Moreover, the device handle **18** is configured so that the appropriate structure can be moved at the appropriate time during the intervention so that the valve replacement implant **16** can be delivered in an efficient manner.

[0068] To help facilitate the coordinated movement, the device handle **18** may include one or more mechanisms disposed therein which may translate, transfer, and/or convert motion (e.g., rotational motion) of the rotatable control knob **122**, the slidable door **124**, and/or the rotatable collar **156** into axial motion, movement, and/or translation at a distal end of the valve delivery system **10**.

[0069] FIGS. **4** and **5** partially illustrate some of the coordinated motion achieved by the device handle **18**. It should be noted that some elements of the valve delivery system **10** are not shown in

FIGS. 4 and 5 for clarity. For example, FIG. 4 illustrates a first position of the outer sheath **12** relative to inner catheter **14**, wherein the nose cone **64** matingly engages a distal end of the outer sheath **12** to fully sheath (e.g., contain) the valve replacement implant **16** within the outer sheath **12** in a delivery configuration. While in this position, the sheath carriage (with the distal flush port) is positioned adjacent to the distal end of the device handle **18**. Upon rotation of the rotatable control knob **122** (e.g., in the clockwise direction), the lead screw begins to rotate, causing the sheath carriage to move along the lead screw in the proximal direction, resulting in proximal movement of the outer sheath **12** toward a second position relative to the inner catheter **14** and/or the nose cone **64** (e.g., “unsheathing” the valve replacement implant **16**), as seen in FIG. 5 for example.

[0070] Eventually, sufficient actuation of the rotatable control knob **122**, the slidable door **124**, and/or the rotatable collar **156**, and the operatively connected mechanism(s) of the device handle **18**, may actuate the valve replacement implant **16** from the delivery configuration to the deployed configuration, and may further release and/or detach the valve replacement implant **16** from the inner catheter **14** and/or the valve delivery system **10**.

[0071] In some cases, during deployment of the valve replacement implant **16**, a physician or user of the valve delivery system **10** may find a reason or desire to withdraw the nose cone **64** proximally (i.e., away from a wall of the ventricle and closer to the inner catheter **14**). Since the nose cone subassembly may be slidably received within a lumen of the inner catheter **14**, and the inner catheter is fixed relative to the device handle **18**, proximal withdrawal of the luer connector **58** relative to the device handle **18** will cause a commensurate proximal movement of the nose cone **64** relative to the valve replacement implant **16**, as seen in FIGS. 7 and 8 for example.

[0072] Following deployment of the valve replacement implant **16**, the rotatable control knob **122** may be rotated to move the sheath carriage distally within the handle housing **120**, thereby moving the outer sheath **12** from the second position relative to the inner catheter **14** distally to the first position relative to the inner catheter **14** so as to cover or re-sheath the elements of the valve delivery system **10** disposed at the distal end. The valve delivery system **10** may then be removed from the patient's anatomy.

[0073] The materials that can be used for the various components of the valve delivery system **10** (and/or other systems and components disclosed herein) and the various tubular members disclosed herein may include those commonly associated with medical devices. For example, in some embodiments, the outer sheath **12**, the inner catheter **14**, and/or the hypotube **60**, (as well as other components disclosed herein) may be made from a metal, metal alloy, polymer (some examples of which are disclosed below), a metal-polymer composite, ceramics, combinations thereof, and the like, or other suitable material. Some examples of suitable metals and metal alloys include stainless steel, such as 304 V, 304 L, and 316 LV stainless steel; mild steel; nickel-titanium alloy such as linear-elastic and/or super-elastic nitinol; other nickel alloys such as nickel-chromium-molybdenum alloys (e.g., UNS: N06625 such as INCONEL® 625, UNS: N06022 such as HASTELLOY® C-22®, UNS: N10276 such as HASTELLOY® C276®, other HASTELLOY® alloys, and the like), nickel-copper alloys (e.g., UNS: N04400 such as MONEL® 400, NICKELVAC® 400, NICORROS® 400, and the like), nickel-cobalt-chromium-molybdenum alloys (e.g., UNS: R30035 such as MP35-NR and the like), nickel-molybdenum alloys (e.g., UNS: N10665 such as HASTELLOY® ALLOY B2®), other nickel-chromium alloys, other nickel-molybdenum alloys, other nickel-cobalt alloys, other nickel-iron alloys, other nickel-copper alloys, other nickel-tungsten or tungsten alloys, and the like; cobalt-chromium alloys; cobalt-chromium-molybdenum alloys (e.g., UNS: R30003 such as ELGILOY®, PHYNOX®, and the like); platinum enriched stainless steel; titanium; combinations thereof; and the like; or any other suitable material.

[0074] As alluded to herein, within the family of commercially available nickel-titanium or nitinol alloys, is a category designated “linear elastic” or “non-super-elastic” which, although may be similar in chemistry to conventional shape memory and super elastic varieties, may exhibit distinct and useful mechanical properties. Linear elastic and/or non-super-elastic nitinol may be

distinguished from super elastic nitinol in that the linear elastic and/or non-super-elastic nitinol does not display a substantial “superelastic plateau” or “flag region” in its stress/strain curve like super elastic nitinol does. Instead, in the linear elastic and/or non-super-elastic nitinol, as recoverable strain increases, the stress continues to increase in a substantially linear, or a somewhat, but not necessarily entirely linear relationship until plastic deformation begins or at least in a relationship that is more linear than the super elastic plateau and/or flag region that may be seen with super elastic nitinol. Thus, for the purposes of this disclosure linear elastic and/or non-super-elastic nitinol may also be termed “substantially” linear elastic and/or non-super-elastic nitinol. [0075] In some cases, linear elastic and/or non-super-elastic nitinol may also be distinguishable from super elastic nitinol in that linear elastic and/or non-super-elastic nitinol may accept up to about 2-5% strain while remaining substantially elastic (e.g., before plastically deforming) whereas super elastic nitinol may accept up to about 8% strain before plastically deforming. Both of these materials can be distinguished from other linear elastic materials such as stainless steel (that can also be distinguished based on its composition), which may accept only about 0.2 to 0.44 percent strain before plastically deforming.

[0076] In some embodiments, the linear elastic and/or non-super-elastic nickel-titanium alloy is an alloy that does not show any martensite/austenite phase changes that are detectable by differential scanning calorimetry (DSC) and dynamic metal thermal analysis (DMTA) analysis over a large temperature range. For example, in some embodiments, there may be no martensite/austenite phase changes detectable by DSC and DMTA analysis in the range of about -60 degrees Celsius (C) to about 120° C. in the linear elastic and/or non-super-elastic nickel-titanium alloy. The mechanical bending properties of such material may therefore be generally inert to the effect of temperature over this very broad range of temperature. In some embodiments, the mechanical bending properties of the linear elastic and/or non-super-elastic nickel-titanium alloy at ambient or room temperature are substantially the same as the mechanical properties at body temperature, for example, in that they do not display a super-clastic plateau and/or flag region. In other words, across a broad temperature range, the linear elastic and/or non-super-elastic nickel-titanium alloy maintains its linear elastic and/or non-super-elastic characteristics and/or properties.

[0077] In some embodiments, the linear elastic and/or non-super-clastic nickel-titanium alloy may be in the range of about 50 to about 60 weight percent nickel, with the remainder being essentially titanium. In some embodiments, the composition is in the range of about 54 to about 57 weight percent nickel. One example of a suitable nickel-titanium alloy is FHP-NT alloy commercially available from Furukawa Techno Material Co. of Kanagawa, Japan. Some examples of nickel titanium alloys are disclosed in U.S. Pat. Nos. 5,238,004 and 6,508,803, which are incorporated herein by reference. Other suitable materials may include ULTANIUM™ (available from Neo-Metrics) and GUM METAL™ (available from Toyota). In some other embodiments, a superelastic alloy, for example a superelastic nitinol can be used to achieve desired properties.

[0078] In at least some embodiments, portions or all of the outer sheath **12** and/or the inner catheter **14** may also be doped with, made of, or otherwise include a radiopaque material. Radiopaque materials are understood to be materials capable of producing a relatively bright image on a fluoroscopy screen or another imaging technique during a medical procedure. This relatively bright image may aid the user of the valve delivery system **10** in determining its location. Some examples of radiopaque materials can include, but are not limited to, gold, platinum, palladium, tantalum, tungsten alloy, polymer material loaded with a radiopaque filler, and the like. Additionally, other radiopaque marker bands and/or coils may also be incorporated into the design of the valve delivery system **10** to achieve the same result.

[0079] In some embodiments, a degree of Magnetic Resonance Imaging (MRI) compatibility is imparted into the valve delivery system **10**. For example, the outer sheath **12** and/or the inner catheter **14**, or portions thereof, may be made of a material that does not substantially distort the image and create substantial artifacts (i.e., gaps in the image). Certain ferromagnetic materials, for

example, may not be suitable because they may create artifacts in an MRI image. The outer sheath **12** and/or the inner catheter **14**, or portions thereof, may also be made from a material that the MRI machine can image. Some materials that exhibit these characteristics include, for example, tungsten, cobalt-chromium-molybdenum alloys (e.g., UNS: R30003 such as ELGILOY®, PHYNEX®, and the like), nickel-cobalt-chromium-molybdenum alloys (e.g., UNS: R30035 such as MP35-NR and the like), nitinol, and the like, and others.

[0080] A sheath or covering (not shown) may be disposed over portions or all of the outer sheath **12** and/or the inner catheter **14** that may define a generally smooth outer surface for the valve delivery system **10**. In other embodiments, however, such a sheath or covering may be absent from a portion of all of the valve delivery system **10**, such that the outer sheath **12** and the inner catheter **14**, either individually or together, may form an outer surface. The sheath or covering may be made from a polymer or other suitable material. Some examples of suitable polymers for the sheath or covering, the outer sheath **12**, the inner catheter **14**, the tubular extension **62**, and/or other polymeric components of the valve delivery system may include polytetrafluoroethylene (PTFE), ethylene tetrafluoroethylene (ETFE), fluorinated ethylene propylene (FEP), polyoxymethylene (POM, for example, DELRIN® available from DuPont), polyether block ester, polyurethane (for example, Polyurethane 85A), polypropylene (PP), polyvinylchloride (PVC), polyether-ester (for example, ARNITEL® available from DSM Engineering Plastics), ether or ester based copolymers (for example, butylene/poly (alkylene ether) phthalate and/or other polyester elastomers such as HYTREL® available from DuPont), polyamide (for example, DURETHAN® available from Bayer or CRISTAMID® available from Elf Atochem), elastomeric polyamides, block polyamide/ethers, polyether block amide (PEBA, for example available under the trade name PEBAX®), ethylene vinyl acetate copolymers (EVA), silicones, polyethylene (PE), Marlex high-density polyethylene, Marlex low-density polyethylene, linear low density polyethylene (for example REXELL®), polyester, polybutylene terephthalate (PBT), polyethylene terephthalate (PET), polytrimethylene terephthalate, polyethylene naphthalate (PEN), polyetheretherketone (PEEK), polyimide (PI), polyetherimide (PEI), polyphenylene sulfide (PPS), polyphenylene oxide (PPO), poly paraphenylene terephthalamide (for example, KEVLAR®), polysulfone, nylon, nylon-12 (such as GRILAMID® available from EMS American Grilon), perfluoro (propyl vinyl ether) (PFA), ethylene vinyl alcohol, polyolefin, polystyrene, epoxy, polyvinylidene chloride (PVdC), poly (styrene-*b*-isobutylene-*b*-styrene) (for example, SIBS and/or SIBS 50A), polycarbonates, ionomers, biocompatible polymers, other suitable materials, or mixtures, combinations, copolymers thereof, polymer/metal composites, and the like. In some embodiments the sheath can be blended with a liquid crystal polymer (LCP). For example, the mixture can contain up to about 6 percent LCP.

[0081] In some embodiments, the exterior surface of the valve delivery system **10** (including, for example, the exterior surface of the outer sheath **12** and the inner catheter **14**) may be sandblasted, bead blasted, sodium bicarbonate-blasted, electropolished, etc. In these as well as in some other embodiments, a coating, for example a lubricious, a hydrophilic, a protective, or other type of coating may be applied over portions or all of the sheath, or in embodiments without a sheath over a portion of the outer sheath **12** and/or the inner catheter **14**, or other portions of the valve delivery system **10**. Alternatively, the sheath may comprise a lubricious, hydrophilic, protective, or other type of coating. Hydrophobic coatings such as fluoropolymers provide a dry lubricity which improves device handling and device exchanges. Lubricious coatings improve steerability and improve lesion crossing capability. Suitable lubricious polymers are well known in the art and may include silicone and the like, hydrophilic polymers such as high-density polyethylene (HDPE), polytetrafluoroethylene (PTFE), polyarylene oxides, polyvinylpyrrolidones, polyvinylalcohols, hydroxy alkyl celluloses, algins, saccharides, caprolactones, and the like, and mixtures and combinations thereof. Hydrophilic polymers may be blended among themselves or with formulated amounts of water insoluble compounds (including some polymers) to yield coatings with suitable

lubricity, bonding, and solubility.

[0082] The coating and/or sheath may be formed, for example, by coating, extrusion, co-extrusion, interrupted layer co-extrusion (ILC), or fusing several segments end-to-end. The layer may have a uniform stiffness or a gradual reduction in stiffness from the proximal end to the distal end thereof. The gradual reduction in stiffness may be continuous as by ILC or may be stepped as by fusing together separate extruded tubular segments. The outer layer may be impregnated with a radiopaque filler material to facilitate radiographic visualization. Those skilled in the art will recognize that these

[0083] It should be understood that this disclosure is, in many respects, only illustrative. Changes may be made in details, particularly in matters of shape, size, and arrangement of steps without exceeding the scope of the invention. This may include, to the extent that it is appropriate, the use of any of the features of one example embodiment being used in other embodiments. The invention's scope is, of course, defined in the language in which the appended claims are expressed.

## Claims

1. 1. A percutaneous valve delivery system, comprising: an outer sheath; an inner catheter disposed within the outer sheath, the inner catheter including a plurality of lumens formed therein; a tubular member slidably received within one of the plurality of lumens and extending distally from a distal end of the inner catheter; a nose cone fixedly attached to a distal end of the tubular member; a handle attached to the outer sheath, wherein the handle is configured to shift the outer sheath between a first position and a second position relative to the inner catheter; and a valve replacement implant releasably coupled to the inner catheter.
  2. The percutaneous valve delivery system of claim 1, wherein the tubular member includes a hypotube slidably received within one of the plurality of lumens.
  3. The percutaneous valve delivery system of claim 2, further comprising a luer connector attached to a proximal end of the hypotube, the luer connector being configured to engage a proximal end of the handle.
  4. The percutaneous valve delivery system of claim 3, wherein the luer connector, the tubular member including the hypotube, and the nose cone together form a nose cone subassembly having a guidewire lumen extending through the percutaneous valve delivery system, wherein the guidewire lumen is configured to slidably receive a guidewire therein.
  5. The percutaneous valve delivery system of claim 3, wherein the luer connector is threadably attached to the proximal end of the hypotube.
  6. The percutaneous valve delivery system of claim 3, wherein the luer connector includes a protrusion preventing distal axial movement of the luer connector past the proximal end of the handle.
  7. The percutaneous valve delivery system of claim 3, wherein the nose cone subassembly is axially movable relative to the inner catheter and the handle.
  8. The percutaneous valve delivery system of claim 1, wherein the valve replacement implant is disposed about the tubular member.
  9. The percutaneous valve delivery system of claim 1, wherein the nose cone is fixedly attached at a distal end of the tubular member.
-
