Inventor(s)	Li; Yueh-Heng et al.

Magnetic multi-pole propulsion array system

Abstract

A magnetic multi-pole propulsion array system is applied to at least one external cathode and includes a plurality of magnetic multi-pole thrusters connected adjacent to each other. Each magnetic multi-pole thruster includes a propellant provider, a discharge chamber, an anode and a plurality of magnetic components. The propellant provider outputs propellant. The discharge chamber is connected with the propellant provider to accommodate the propellant. The anode is disposed inside the discharge chamber to generate an electric field. The plurality of magnetic components is respectively disposed on several sides of the discharge chamber. One of the several sides of the discharge chamber of the magnetic multi-pole thruster is applied for one side of a discharge chamber of another magnetic multi-pole thruster.

Background/Summary

BACKGROUND OF THE INVENTION

1. Field of the Invention

(1) The present invention relates to a propulsion array system, and more particularly, to a magnetic multi-pole propulsion array system with high thrust, low quality and long service life.

2. Description of the Prior Art

(2) A plasma thruster is widely used in the propulsion system and attitude control system of the satellite due to property of high efficiency and low thrust. For precisely controlling the plasma, the conventional plasma thruster requires a lot of elements and therefore increases the quality and manufacturing cost of the propulsion system. The plasma thruster needs to operate for a long time to control the orbit of the satellite; if the plasma thruster is failed or has reached the service life, the satellite mission is failure or end. Conventional improvement technology may enlarge the size of

the plasma thruster to increase the service life of the plasma thruster, but the magnetic field in the plasma thruster will be attenuated due to the enlarged size and strength of the magnetic field is insufficient and difficult to control plasma behavior. Thus, design of a thruster system with high thrust, low quality and long service life is an important issue in the related satellite industry.

SUMMARY OF THE INVENTION

- (3) The present invention provides a magnetic multi-pole propulsion array system with high thrust, low quality and long service life for solving above drawbacks.
- (4) According to the claimed invention, a magnetic multi-pole propulsion array system is applied to at least one external electron source. The magnetic multi-pole propulsion array system includes a plurality of magnetic multi-pole thrusters arranged adjacent to each other. Each magnetic multi-pole thruster includes a propellant provider, a discharge chamber, an anode and a plurality of magnetic components. The propellant provider is adapted to output propellant. The discharge chamber is connected with the propellant provider and adapted to accommodate the propellant. The anode is disposed inside the discharge chamber and adapted to generate an electric field. The plurality of magnetic components is respectively disposed on a plurality of sides of the discharge chamber. One of the plurality of sides of the discharge chamber of the magnetic multi-pole thruster is applied for one side of a discharge chamber of another magnetic multi-pole thruster.
- (5) According to the claimed invention, the magnetic multi-pole propulsion array system further comprises six magnetic multi-pole thrusters, the six magnetic multi-pole thrusters are connected adjacent to each other and surround the at least one external electron source. One of the plurality of magnetic components is disposed on a common side between two adjacent magnetic multi-pole thrusters of the plurality of magnetic multi-pole thrusters. Each magnetic component of the plurality of magnetic components comprises a first magnetic pole and a second magnetic pole, one magnetic component of the plurality of magnetic components is arranged in response to the first magnetic pole facing the discharge chamber, and another magnetic component adjacent to the foresaid one magnetic component of the plurality of magnetic components is arranged in response to the second magnetic pole facing the discharge chamber.
- (6) The magnetic multi-pole propulsion array system of the present invention can be applied for the propulsion system or the attitude control system of the satellite. The magnetic multi-pole propulsion array system can arrange the magnetic multi-pole thrusters adjacent to each other and surrounding the external electron source, and the scale of the thrust matrix can be enlarged or reduced in accordance with the design demand. The magnetic multi-pole thruster can be preferably designed as the magnetic six-pole thruster, which can provide the largest channel volume due to the array arrangement; an included angle of the adjacent magnetic components of the magnetic six-pole thruster is large and can provide the preferred magnetic field loop. A shape of the discharge chamber is not limited to the side number of the magnetic multi-pole thruster. Moreover, each magnetic multi-pole thruster can share some of the magnetic component and the related magnetic field loop with the adjacent magnetic multi-pole thruster, which can decrease the weight and manufacturing cost of the magnetic multi-pole propulsion array system, and further decrease satellite launch and orbit costs. Comparing to the prior art, the magnetic multi-pole propulsion array system of the present invention can still operate normally when some of the thrusters or the electron sources are damaged, so as to prolong the service life of the satellite and reduce the mission risk.
- (7) These and other objectives of the present invention will no doubt become obvious to those of ordinary skill in the art after reading the following detailed description of the preferred embodiment that is illustrated in the various figures and drawings.

Description

BRIEF DESCRIPTION OF THE DRAWINGS

- (1) FIG. 1 and FIG. 2 are diagrams of a magnetic multi-pole propulsion array system in different types according to an embodiment of the present invention.
- (2) FIG. 3 is a diagram of a magnetic multi-pole thruster according to the embodiment of the present invention.
- (3) FIG. 4 is a sectional view of the magnetic multi-pole thruster according to the embodiment of the present invention.
- (4) FIG. 5 is a diagram of the common magnetic field loop formed by magnetic pole arrangement of the magnetic multi-pole thrusters according to the embodiment of the present invention.
- (5) FIG. 6 is an action diagram of the magnetic multi-pole propulsion array system according to the embodiment of the present invention.
- (6) FIG. 7 and FIG. 8 are diagrams of the magnetic multi-pole propulsion array system in different operation states according to the embodiment of the present invention.

DETAILED DESCRIPTION

- (7) Please refer to FIG. 1 and FIG. 2. FIG. 1 and FIG. 2 are diagrams of a magnetic multi-pole propulsion array system **10** in different types according to an embodiment of the present invention. The magnetic multi-pole propulsion array system **10** can include a plurality of magnetic multi-pole thrusters **12** connected adjacent to each other. In one embodiment, the magnetic multi-pole thruster **12** can have six magnetic poles, and therefore a minimum scale of the magnetic multi-pole propulsion array system **10** includes six magnetic multi-pole thrusters **12** and is further matched with at least one external electron source **14**, as shown in FIG. 1. The scale of the magnetic multi-pole propulsion array system **10** can be enlarged to apply for several external electron sources **14**, and there are six magnetic multi-pole thrusters **12** surrounded around each external electron source **14**, as shown in FIG. 2.
- (8) Besides, the magnetic multi-pole thruster **12** may optionally have other numbers of magnetic poles. For example, the magnetic multi-pole thruster **12** may have three magnetic poles, and the minimum scale of the magnetic multi-pole propulsion array system **10** can include three magnetic multi-pole thrusters **12** connected adjacent to each other and surrounding one external electron source **14**; or, the magnetic multi-pole thruster **12** may have four magnetic poles, and the minimum scale of the magnetic multi-pole propulsion array system **10** can include four magnetic multi-pole thrusters **12** connected adjacent to each other and surrounding one external electron source **14**. A number of the magnetic poles of the magnetic multi-pole thruster **12** and the minimum scale of the magnetic multi-pole propulsion array system **10** are not limited to the above-mentioned embodiment, and depend on a design demand.
- (9) Please refer to FIG. 1 to FIG. 4. FIG. 3 is a diagram of the magnetic multi-pole thruster **12** according to the embodiment of the present invention. FIG. 4 is a sectional view of the magnetic multi-pole thruster **12** according to the embodiment of the present invention. The magnetic multi-pole thruster **12** can include a propellant provider **16**, a discharge chamber **18**, a propulsion anode **20** and a magnetic component **22**. The propellant provider **16** can be connected with the discharge chamber **18** and used to output propellant, and the propellant can pass through an ejection hole **24** to enter the discharge chamber **18**. The discharge chamber **18** can accommodate the propellant from the propellant provider **16**. The propellant is neutral gas atoms. The propulsion anode **20** can be disposed on a bottom inside the discharge chamber **18** and used to generate an electric field E . A field direction of the electric field E can be perpendicular to the propulsion anode **20** (or can be interpreted as the field direction is substantially parallel to a surface normal vector of the anode **20**), and can further uniformly cover the whole discharge chamber **18**. The electric field E shown in FIG. 3 is marked to show a direction instead of its covering range.
- (10) A number of the magnetic component **22** can correspond to a number of the magnetic multi-pole thruster **12** included by the minimum scale of the magnetic multi-pole propulsion array system

10. In one embodiment, the magnetic multi-pole thruster **12** can include six magnetic components **22** respectively disposed on six sides of the discharge chamber **18**. As shown in FIG. **1** and FIG. **2**, the discharge chambers **18** of the two adjacent magnetic multi-pole thrusters **12** can share the same side, and the magnetic component **22** which is disposed on the common side can provide the common magnetic field loop to the two adjacent magnetic multi-pole thrusters **12**. Therefore, the magnetic multi-pole propulsion array system **10** of the present invention can utilize design of the common magnetic field to decrease an element number of the thrusters, so as to effectively decrease a weight of the magnetic multi-pole propulsion array system **10** and provide preferred durability.

(11) Please refer to FIG. **5**. FIG. **5** is a diagram of the common magnetic field loop formed by magnetic pole arrangement of the magnetic multi-pole thrusters **12** according to the embodiment of the present invention. The magnetic component **22** which is disposed on the common side can have two magnetic poles respectively facing the two adjacent magnetic multi-pole thrusters **12**, such as the magnetic component **22** marked by a dotted frame F1. The magnetic component **22** which is disposed on the non-common side can have two magnetic poles respectively facing the external electron source **14** and an orientation opposite to the external electron source **14**, such as the magnetic component **22** marked by a dotted frame F2. Moreover, the present invention may optionally rotate the magnetic component **22** shown in FIG. **5** by ninety degrees to apply for other possible embodiment, which means the two magnetic poles of the magnetic component **22** disposed on the common side can respectively face two opposite ends of the common side; this embodiment is not shown in the figures.

(12) The two magnetic poles of the magnetic component **22** can be defined as a first magnetic pole and a second magnetic pole, which respectively belong to the N pole and the S pole. As shown in FIG. **5**, one magnetic component **22** of the six magnetic components **22** can be arranged by facing the first magnetic pole toward inner of the discharge chamber **18**, and two magnetic components **22** adjacent to the foresaid one magnetic component **22** can be arranged by facing the second magnetic pole toward the inner of the discharge chamber **18**; that is to say, the plurality of magnetic components **22** of the same magnetic multi-pole thruster **12** can be arranged in a manner of staggered magnetic poles, and the magnetic field loop B formed by the magnetic multi-pole thruster **12** can be substantially perpendicular to the electric field E and used to constrain electrons e provided by the external electron source **14** inside the discharge chamber **18**. The electric field E can be substantially parallel to an electron ejection direction of the external electron source **14**, so as to attract the electrons e provided by the external electron source **14** to move into the discharge chamber **18**.

(13) In the present invention, the magnetic component **22** can be a permanent magnet or an electromagnet. The magnetic component **22** made of the permanent magnet does not have extra power supply and has advantages of lightweight, and can maintain the predetermined magnetic field loop B for a long time. The magnetic component **22** made of the electromagnet can have the power supply and a detector (which is not shown in the figures); the detector can detect the electron ejection flow from the external electron source **14**, and then change current intensity of the power supply to vary a magnetic field strength of the magnetic component **22** in accordance with a detection result, so as to have more possible applications.

(14) Please refer to FIG. **6**. FIG. **6** is an action diagram of the magnetic multi-pole propulsion array system **10** according to the embodiment of the present invention. First, the propulsion anode **20** can be actuated to generate the electric field E, and the propellant provider **16** can be actuated simultaneously to eject the propellant into the discharge chamber **18**. Then, the external electron source **14** can provide the electron ejection flow; in the meantime, the magnetic component **22** made of the permanent magnet can provide the stable magnetic field loop B, or the magnetic component **22** made of the electromagnet can provide the proper magnetic field loop B in accordance with the intensity of the electron ejection flow. The electrons e from the external

electron source **14** can be affected by the electric field E and moved toward the inner of the discharge chamber **18**, and further be constrained at a front part of the discharge chamber **18** by the magnetic field loop B. The electrons e in high speed can hit the neutral gas atoms n to generate the electrons e and the ions i. The electrons e can be constrained by the magnetic field loop B to extend the time staying inside the discharge chamber **18**, so as to increase probability of the electron e hitting the neutral gas atom n to generate the ion i. The electric field E generated by the propulsion anode **20** and the electrons can be used to speed up ejection of the ions i for thrust of the magnetic multi-pole thruster **12**; meanwhile, the external electron source **14** can neutralize the ions i exiting the magnetic multi-pole thruster **12** to maintain electrical neutrality of the whole system.

(15) Please refer to FIG. 7 and FIG. 8. FIG. 7 and FIG. 8 are diagrams of the magnetic multi-pole propulsion array system **10** in different operation states according to the embodiment of the present invention. As shown in FIG. 7, if the magnetic multi-pole propulsion array system **10** has one or a less number of the magnetic multi-pole thruster **12** being failed, such as the magnetic multi-pole thruster **12** drawn in the dotted line, the magnetic multi-pole thrusters **12** around the failed magnetic multi-pole thrusters **12** can be still in a normally working state, and overall operation of the magnetic multi-pole propulsion array system **10** can be also in the normally working state. As shown in FIG. 8, the magnetic multi-pole propulsion array system **10** may have one or a less number of the external electron source **14** being failed, such as the external electron source **14** drawn in the dotted line; although the failed external electron source **14** cannot provide the electrons e, the magnetic multi-pole thruster **12** around the failed external electron source **14** can acquire the electrons e from other external electron source **14** in the normally working state, and the overall operation of the magnetic multi-pole propulsion array system **10** can be also in the normally working state.

(16) In conclusion, the magnetic multi-pole propulsion array system of the present invention can be applied for the propulsion system or the attitude control system of the satellite. The magnetic multi-pole propulsion array system can arrange the magnetic multi-pole thrusters adjacent to each other and surrounding the external electron source, and the scale of the thrust matrix can be enlarged or reduced in accordance with the design demand. The magnetic multi-pole thruster can be preferably designed as the magnetic six-pole thruster, which can provide the largest channel volume due to the array arrangement; an included angle of the adjacent magnetic components of the magnetic six-pole thruster is large and can provide the preferred magnetic field loop. A shape of the discharge chamber is not limited to the side number of the magnetic multi-pole thruster. Moreover, each magnetic multi-pole thruster can share some of the magnetic component and the related magnetic field loop with the adjacent magnetic multi-pole thruster, which can decrease the weight and manufacturing cost of the magnetic multi-pole propulsion array system, and further decrease satellite launch and orbit costs. Comparing to the prior art, the magnetic multi-pole propulsion array system of the present invention can still operate normally when some of the thrusters or the electron sources are damaged, so as to prolong the service life of the satellite and reduce the mission risk.

(17) Those skilled in the art will readily observe that numerous modifications and alterations of the device and method may be made while retaining the teachings of the invention. Accordingly, the above disclosure should be construed as limited only by the metes and bounds of the appended claims.

Claims

1. A magnetic multi-pole propulsion array system applied to at least one external electron source, the magnetic multi-pole propulsion array system comprising: a plurality of magnetic multi-pole thrusters connected adjacent to each other and surrounding the at least one external electron source, each of the plurality of magnetic multi-pole thrusters comprising: a propellant provider adapted to

output propellant; a discharge chamber connected with the propellant provider and adapted to accommodate the propellant; an anode disposed inside the discharge chamber and adapted to generate an electric field; and a plurality of magnetic components respectively disposed on a plurality of sides of the discharge chamber, one of the plurality of sides of the discharge chamber of the magnetic multi-pole thruster being applied for one side of a discharge chamber of another magnetic multi-pole thruster.

2. The magnetic multi-pole propulsion array system of claim 1, wherein the magnetic multi-pole propulsion array system further comprises six magnetic multi-pole thrusters.

3. The magnetic multi-pole propulsion array system of claim 1, wherein one of the plurality of magnetic components is disposed on a common side between two adjacent magnetic multi-pole thrusters of the plurality of magnetic multi-pole thrusters.

4. The magnetic multi-pole propulsion array system of claim 3, wherein two magnetic poles of the magnetic component respectively face the two adjacent magnetic multi-pole thrusters.

5. The magnetic multi-pole propulsion array system of claim 3, wherein two magnetic poles of the magnetic component respectively face the at least one external electron source and an orientation opposite to the at least one external electron source.

6. The magnetic multi-pole propulsion array system of claim 3, wherein two magnetic poles of the magnetic component respectively face two opposite ends of the common side.

7. The magnetic multi-pole propulsion array system of claim 1, wherein each magnetic component of the plurality of magnetic components comprises a first magnetic pole and a second magnetic pole, one magnetic component of the plurality of magnetic components is arranged in response to the first magnetic pole facing the discharge chamber, and another magnetic component adjacent to the foresaid one magnetic component of the plurality of magnetic components is arranged in response to the second magnetic pole facing the discharge chamber.

8. The magnetic multi-pole propulsion array system of claim 1, wherein electrons provided by the at least one external electron source is constrained inside the discharge chamber via a magnetic field loop formed by the plurality of magnetic components.

9. The magnetic multi-pole propulsion array system of claim 1, wherein a field direction of the electric field generated by the anode is substantially parallel to an electron ejection direction of the at least one external electron source, so as to attract electrons provided by the at least one external electron source to move into the discharge chamber.

10. The magnetic multi-pole propulsion array system of claim 1, wherein any magnetic component of the plurality of magnetic components is a permanent magnet or an electromagnet, a magnetic field strength of the electromagnet is varied in accordance with an electron ejection flow from the at least one external electron source.
