Kind Code	B2
Date of Patent	August 19, 2025
Inventor(s)	Qiu; Chunhe

---

### Paper towel holder

---

#### Abstract

A paper towel holder is provided and includes: a first support assembly, comprising a first mounting base and a first support member, wherein the first support member is rotatably connected to the first mounting base and is configured to support a to-be-hung object; a second support assembly, disposed on a side of the first support assembly, wherein the second support assembly comprises a second mounting base and a second support member, and the second support member is connected to the second mounting base; a first connection assembly; and a second connection assembly. One of the first support member and the second support member is connected to the first connection assembly, and the other one of the first support member and the second support member is connected to the second connection assembly.

Background/Summary

CROSS REFERENCE TO RELATED APPLICATIONS

(1) The present disclosure claims the priority of Chinese patent application No. 202321676508.4 filed on Jun. 28, 2023, and contents of which are incorporated herein in its entirety.

TECHNICAL FIELD

(2) The present disclosure relates to the field of paper towel holders, and in particular to a paper towel holder.

BACKGROUND

(3) As science and technology develop, paper towel holders are used in people's daily lives for hanging objects to be hung. In the art, a paper towel holder is arranged with a protruding tab. The protruding tab is disposed horizontally. The paper towel sleeves the protruding tab. However, an end of the protruding tab is a free end, connected to an external environment. When the paper towel

sleeves the protruding tab, the paper towel may easily be detached away from the protruding tab from the free end of the protruding tab. Therefore, the paper towel may easily be detached from the paper towel holder in the art.

## SUMMARY OF THE DISCLOSURE

- (4) The present disclosure provides a paper towel holder to solve the problem as described in the above.
  - (5) According to the present disclosure, following technical solutions are provided.
  - (6) A paper towel holder is provided and includes following components.
  - (7) A first support assembly includes: a first mounting base and a first support member, wherein the first support member is rotatably connected to the first mounting base.
  - (8) A second support assembly is disposed on a side of the first support assembly. The second support assembly includes a second mounting base and a second support member, and the second support member is connected to the second mounting base.
  - (9) One of the first support member and the second support member is connected to the first connection assembly, and the other one of the first support member and the second support member is connected to the second connection assembly. When the first support member and the second support member are approaching or moving away from each other, the first connection assembly is detachably connected to the second connection assembly. The first support member is configured to support a to-be-hung object.
  - (10) According to the paper towel holder provided in the present disclosure, when the first support member and the second support member are approaching each other, the first connection assembly is detachably connected to the second connection assembly. The first support member is configured to support the to-be-hung object. When the first connection assembly is detached from the second connection assembly, the first support member is disposed at the outside of the second support member. The to-be-hung object is placed to sleeve the first support member, such that the first support member may support the to-be-hung object. In this way, the object may be taken out of the first support member easily. In addition, the first support member rotates with respect to the first mounting base to gradually approach the second support member, such that the first connection assembly is connected to the second connection assembly. The connection between the first connection assembly and the second connection assembly prevents the to-be-hung object from being detached away from the paper towel holder, ensuring the paper towel holder to hang the to-be-hung object stably. Further, the object may be taken out of the frame easily by switching the connection status between the first connection assembly and the second connection assembly.
- 

## Description

### BRIEF DESCRIPTION OF THE DRAWINGS

- (1) In order to illustrate the technical solutions in the embodiments of the present disclosure more clearly, the accompanying drawings for describing the embodiments will be described briefly in the following. Apparently, the accompanying drawings in the following description show only some embodiments of the present disclosure, and any ordinary skilled person in the art may obtain other accompanying drawings based on the following drawings without creative work.
- (2) In order to understand the present disclosure more completely and beneficial effects, the present disclosure will be described by referring to the accompanying drawings. The same reference numeral in the following description indicates the same element.
- (3) FIG. 1 is a schematic view of a paper towel holder placed horizontally according to a first embodiment of the present disclosure.
- (4) FIG. 2 is a schematic view of the paper towel holder placed vertically according to the first embodiment of the present disclosure.

- (5) FIG. 3 is a perspective view of the assembled paper towel holder according to the first embodiment of the present disclosure.
- (6) FIG. 4 is an explosive view of the paper towel holder according to the first embodiment of the present disclosure.
- (7) FIG. 5 is a perspective view of a first shaft sleeve of the paper towel holder according to the first embodiment of the present disclosure.
- (8) FIG. 6 is a perspective view of a second shaft sleeve of the paper towel holder according to the first embodiment of the present disclosure.
- (9) FIG. 7 is a cross sectional view of the paper towel holder shown in FIG. 3, taken along the line I-I.
- (10) FIG. 8 is an enlarged view of the portion A shown in FIG. 7.
- (11) FIG. 9 is an enlarged view of the portion B shown in FIG. 7.
- (12) FIG. 10 is an enlarged view of the portion C shown in FIG. 7.
- (13) FIG. 11 is an explosive view of a part of the paper towel holder according to the first embodiment of the present disclosure.
- (14) FIG. 12 is an explosive view of a first connection assembly of the paper towel holder according to the first embodiment of the present disclosure.
- (15) FIG. 13 is a perspective view of a part of the assembled paper towel holder according to the first embodiment of the present disclosure.
- (16) FIG. 14 is an explosive view of a second support assembly of the paper towel holder according to the first embodiment of the present disclosure.
- (17) FIG. 15 is a perspective view of the assembled second support assembly of the paper towel holder according to the first embodiment of the present disclosure.
- (18) FIG. 16 is a perspective view of the assembled paper towel holder according to a second embodiment of the present disclosure.
- (19) FIG. 17 is a perspective view of the assembled paper towel holder, being viewed from another viewing angle, according to a second embodiment of the present disclosure.
- (20) FIG. 18 is an explosive view of the paper towel holder according to the second embodiment of the present disclosure.
- (21) FIG. 19 is an explosive view of a part of the paper towel holder according to the second embodiment of the present disclosure.
- (22) FIG. 20 is another explosive view of a part of the paper towel holder according to the second embodiment of the present disclosure.
- (23) FIG. 21 is a perspective view of the assembled paper towel holder according to a third embodiment of the present disclosure.
- (24) FIG. 22 is an explosive view of the paper towel holder according to the third embodiment of the present disclosure.
- (25) FIG. 23 is a perspective view of the assembled paper towel holder, being viewed from another viewing angle, according to the third embodiment of the present disclosure.
- (26) FIG. 24 is an explosive view of a part of the paper towel holder according to the third embodiment of the present disclosure.
- (27) FIG. 25 is another explosive view of a part of the paper towel holder according to the third embodiment of the present disclosure.

#### DETAILED DESCRIPTION

(28) The technical solutions in the embodiments of the present disclosure will be clearly and completely described below by referring to the accompanying drawings in the embodiments of the present disclosure. Obviously, the described embodiments are only a part of, but not all of, the embodiments of the present disclosure. All other embodiments obtained by any ordinary skilled person in the art based on the embodiments of the present disclosure, without creative work, shall fall within the scope of the present disclosure.

#### First Embodiment

(29) As shown in FIG. 1 to FIG. 16, the present disclosure provides a paper towel holder **100**, configured to hold a paper towel. It can be understood that, the paper towel holder can be used to support other to-be-hung object, and the present disclosure does not limit the to-be-hung object. In some embodiments, the paper towel holder **100** is configured to hang a towel ring.

(30) The paper towel holder **100** includes a first support assembly **10**, a second support assembly **20**, a first connection assembly **30**, and a second connection assembly **40**. The first support assembly **10** is arranged opposite to the second support assembly **20**. The first support assembly **10** and the second support assembly **20** are mounted on a mounting surface **200**. The mounting surface **200** may be a surface of a wall, a surface of a platform, or a surface of a box, which will not be limited herein. In some embodiments, one of the first connection assembly **30** and the second connection assembly **40** may be mounted on the first support assembly **10**, and the other of the first connection assembly **30** and the second connection assembly **40** may be mounted on the second support assembly **20** correspondingly.

(31) As shown in FIG. 1 to FIG. 4, the first support assembly **10** includes a first mounting base **11** and a first support member **12**. The first mounting base **11** is configured to be mounted on the mounting surface **200**. The first support assembly **10** is disposed opposite to the second support assembly **20**. The first mounting base **11** and the second mounting base **21** may be arranged in a horizontal direction or in a vertical direction, depending on usage requirements.

(32) The first support member **12** is rotatably connected to the first mounting base **11**. The first support member **12** is disposed at a side of the first mounting base **11** and rotates along an axis of a connection between the first support member **12** and the first mounting base **11**. In this way, a position of the first support member **12** may be adjusted easily, enabling the user to place the to-be-hung object to sleeve the first support member **12** or to remove the object away from the first support member **12**. In some embodiments, the first support member **12** may be in a shape of a round rod, a flat plate, a prism, a square and so on, which will not be limited herein.

(33) The first support assembly **10** further includes a first connection arm **13**. The first connection arm **13** is disposed between the first mounting base **11** and the first support member **12**. An end of the first connection arm **13** is rotatably connected to the first mounting base **11**, and the other end of the first connection arm **13** is connected to the first support member **12**. The first connection arm **13** rotates relative to the first mounting base **11**, and the first support member **12** rotates as the first connection arm **13** is rotating, such that the first support member **12** rotates relative to the first mounting base **11**, and therefore, the position of the first support member **12** may be adjusted easily. In some embodiments, the first connection arm **13** and the first support member **12** may be two elements independent from each other, and the first connection arm **13** is fixedly connected to the first support member **12**. In some embodiments, the first connection arm **13** and the first support member **12** may be configured as a one-piece and integral structure.

(34) As shown in FIG. 4 to FIG. 6, in an embodiment, the first connection arm **13** includes a first rotation shaft **131** and a second rotation shaft **132**. The first rotation shaft **131** is fixedly mounted on the first mounting base **11**. The second rotation shaft **132** sleeves the first rotation shaft **131** and is disposed at an outside of the first rotation shaft **131**. The second rotation shaft **132** may rotate relative to the first rotation shaft **131**. The second rotation shaft **132** is disposed between the first mounting base **11** and the first support member **12**. An end of the second rotation shaft **132** contacts a surface of the first mounting base **11**, and the other end of the second rotation shaft **132** contacts a surface of the first support member **12**. The two ends of the second rotation shaft **132** are clamped by the surface of the first mounting base **11** and the surface of the first support member **12**, such that the second rotation shaft **132** is prevented from being detached from the first mounting base **11** and the first support member **12**.

(35) As shown in FIG. 7, FIG. 8, and FIG. 12, the first rotation shaft **131** includes a first shaft sleeve **1311** and a second shaft sleeve **1312**. The first shaft sleeve **1311** is tubular and is

substantially hollow. The first shaft sleeve **1311** includes a first body **13111**, a first connection portion **13112**, and a first flange **13113**. The first connection portion **13112** and a first flange **13113** are formed at an end of the first body **13111**. The first connection portion **13112** is received in a first via **111** of the first mounting base **11** and is fixedly connected to the first mounting base **11** by welding. The first flange **13113** is formed at an outer periphery of a connection between the first connection portion **13112** and the first body **13111** and abuts against the surface of the first mounting base **11** facing towards the first support member **12**.

(36) The second shaft sleeve **1312** is tubular and is substantially hollow. The second shaft sleeve **1312** includes a second body **13121** and a second flange **13122** formed at an end of the second body **13121**. The second shaft sleeve **1312** rotatably sleeves the first body **13111** of the first shaft sleeve **1311**. The second flange **13122** of the second shaft sleeve **1312** is aligned with the first flange **13113** of the first shaft sleeve **1311**. Alternatively, the second flange **13122** of the second shaft sleeve **1312** covers the first flange **13113** of the first shaft sleeve **1311**. In some embodiments, the first sleeve **1311** is made of metal and is welded to the first mounting base **11**, and the second sleeve **1312** is made of plastic.

(37) As shown in FIG. 7 to FIG. 11, the first support member **12** includes a support portion **121**, a first end portion **122**, and a second end portion **123**. The support portion **121** may be a hollow tube or a solid column. The first end portion **122** is formed by extending from an end of the support portion **121**, and the second end portion **123** is formed by extending from the other end of the support portion **121**. A side of the first end portion **122** facing towards the first mounting base **11** defines a threaded hole **1221**. The threaded hole **1221** extends towards an interior of the first end portion **122** along a radial direction. The first support assembly **10** further includes a first threaded member **14**. An end of the first threaded member **14** passes through the first rotation shaft **131** and the second rotation shaft **132**. A nut end of the first threaded member **14** contacts an end face of the first connection portion **13112** of the first rotation shaft **131**. A threaded end of first threaded member **14** is threadably received into a threaded hole **1221**. In this way, the first threaded member **14** is connected the first mounting base **11**, the first connection arm **13**, and the first support member **12** in an axially direction. It will be understood that the support portion **121**, the first end portion **122**, and the second end portion **123** may be configured as a one-piece and integral structure; or the support portion **121**, the first end portion **122**, and the second end portion **123** may be configured as three separated structures and are fixedly connected with each other.

(38) The second rotation shaft **132** positions and is connected to the first support member **12**. Since the second rotation shaft **132** and the first support member **12** are positioned and connected with each other, installation accuracy between the second rotation shaft **132** and the first support member **12** may be improved. In this case, the end of the second rotation shaft **132** facing towards the first support member **12** is arranged with a first arc portion **1321**. The first support member **12** is embedded in the first arc portion **1321**. A circumferential wall of the first support member **12** is restricted by an inner wall of the first arc portion **1321**, preventing the first support member **12** from rotating relative to the second rotation shaft **132**. In this way, the first support member **12** and the second rotation shaft **132** may rotate synchronously, and the first support member **12** and the second rotation shaft **132** rotate simultaneously relative to the first mounting base **11**.

(39) In addition, the second rotation shaft **132** defines a first inner cavity **1322**. The first threaded member **14** extends through the first inner cavity **1322**. A first limiting member **15** is arranged inside the second rotation shaft **132**. The first limiting member **15** is received in the first inner cavity **1322** and is connected to the end of the second rotation shaft **132** facing towards the first support member **12**. In some embodiments, the first limiting member **15** is interference fit with or welded to the second rotation shaft **132**. While the first threaded member **14** extends through the second rotation shaft **132**, the first threaded member **14** extends into the first inner cavity **1322** along an axis of the second rotation shaft **132**. In addition, the first threaded member **14** extends through the first limiting member **15** and is limited by the first limiting member **15**, such that a

position of the first threaded member **14** in the radial direction may be limited.

(40) Further, since the first threaded member **14** extends through the first limiting member **15**, the first limiting member **15** is prevented from interfering the first threaded member **14**, and positions of the first threaded member **14** and the second rotation shaft **132** may be limited to some extent. In some embodiments, the first limiting member **15** may be a circular rotation shaft and defines a first through hole **151**. The first threaded member **14** extends through the first through hole **151**. A gap is defined between a circumferential wall of the first threaded member **14** and an inner wall of the first limiting member **15** defining the first through hole **151**, i.e., a wall of the first through hole **151**. In this way, the inner wall of the first limiting member **15** defining the first through hole **151** may limit the circumferential wall of the first threaded member **14**.

(41) When the first support member **12** is rotating, the second rotation shaft **132** rotates accordingly. The second rotation shaft **132** is fixed with the second shaft sleeve **1312**, while the second shaft sleeve **1312** may be rotated relative to the first shaft sleeve **1311**. Alternatively, the second shaft sleeve **1312** is fixed to the first shaft sleeve **1311**, while the second rotation shaft **132** may be rotated relative to the second shaft sleeve **1312** and the first shaft sleeve **1311**. The second shaft sleeve **1312** allows the first support member **12** to rotate more smoothly.

(42) The second support assembly **20** includes a second mounting base **21**, a second support member **22**, and a second connection arm **23**. The second support member **22** is connected to the second mounting base **21**. The second mounting base **21** serves as a supporting element of the first support assembly **10** and is mounted on the mounting surface **200**. The second mounting base **21** is substantially flat. The second mounting base **21** defines a positioning hole **211**. The second support member **22** is substantially cylindrical. The second support member **22** is disposed at a side of the second mounting base **21** and is connected to the second mounting base **21** by the second connection arm **23**. The second support member **22** serves as a supporting element of the second support assembly **20** and is connected to the first connection assembly **30** or the second connection assembly **40**.

(43) The second connection arm **23** is disposed between the second mounting base **21** and the second support member **22**. An end of the second connection arm **23** is fixedly connected to the second mounting base **21**, and the other end of the second connection arm **23** is fixedly connected to the second support member **22**. The end of the second connection arm **23** is fixed to the second mounting base **21**, and the second connection arm **23** is fixed relative to the second mounting base **21**. The second support member **22** is fixed to the second mounting base **21** by the second connection arm **23**. In this way, the second support member **22** is ensured to be arranged at its position. In some embodiments, the second connection arm **23** and the second support member **22** may be two independent components and may be fixedly connected to each other by screwing, welding, gluing, and so on. The second connection arm **23** and the first support member **12** may alternatively be configured as a one-piece and integral structure.

(44) The second connection arm **23** includes an extension portion **231**, a protruding tab **232**, and a second arc portion **233**. The protruding tab **232** is formed at an end of the extension portion **231**. The second arc portion **233** is formed at the other end of the extension portion **231**. The extension portion **231** is tubular and is substantially hollow. The extension portion **231** is connected to the positioning hole **211** of the second mounting base **21** through the protruding tab **232**. The extension portion **231** acts on the second support member **22** through the second arc portion **233**.

(45) The protruding tab **232** is disposed at an upper end of the extension portion **231** and is substantially square. The protruding tab **232** is inserted in the positioning hole **211**. The protruding tab **231** is restricted by an inner wall of the second mounting base **21** defining the positioning hole **211**, preventing the second connection arm **23** from rotating relative to the second mounting base **21**, such that mounting accuracy between the second connection arm **23** and the second mounting base **21** is ensured. In some embodiments, a plurality of protruding tabs **232** may be arranged. The plurality of protruding tabs **232** are spaced apart from each other and distributed along a

circumference of the extension portion **231**. Alternatively, plurality of protruding tabs **232** are distributed symmetrically along the circumference of the extension portion **231**.

(46) The second arc portion **233** is disposed at a lower end of the extension portion **231**. In some embodiments, the second arc portion **233** may be an arc-shaped groove. The second support member **22** is embedded in the second arc portion **233**. The second arc portion **233** is connected to and positions the second support member **22**. A circumferential wall of the second support member **22** is limited by an inner wall of the second arc portion **233**, preventing the second support member **22** from rotating relative to the second connection arm **23** and ensuring the second support member **22** to be fixedly connected to the second mounting base **21**. In this way, the second support member **22** is maintained at rest, enabling the first support member **12** to move to approach or move away from the second support member **22**.

(47) In some embodiments, a length of the first support member **12** is greater than a length of the second support member **22**, and the first support member **12** is substantially configured to support the to-be-hung object.

(48) In addition, the second support assembly **20** further includes a second limiting member **24** and a second threaded member **25**. The second threaded member **25** extends through the second connection arm **23** and is connected to the second support member **22**. A second limiting member **24** is arranged inside the second connection arm **23**. The second limiting member **24** defines a second through hole **241**. The second threaded member **25** extends through the second through hole **241**.

(49) The extension portion **231** defines a second inner cavity **2311**. The second threaded member **25** extends through the second inner cavity **2311**. The second limiting member **24** is arranged inside the extension portion **231** and is received in the second inner cavity **2311**. Further, the second limiting member **24** is connected to an end of the extension portion **231** facing towards the second support member **22**. In some embodiments, the second limiting member **24** is interference fit or welded to the extension portion **231**. When the second threaded member **25** extends through the extension portion **231**, the second threaded member **25** extends into the second inner cavity **2311** along the axis of the extension portion **231**. Further, the second threaded member **25** extends through the second limiting member **24** and is limited by the second limiting member **24**. In this way, the second threaded member **25** may be limited in the radial direction.

(50) In another embodiment, the second connection arm **23** is rotatably connected to the second mounting base **21** and drives the second support member **22** to rotate along the axis of the second connection arm **23**. In this way, rotation of the second support member **22** may be achieved, improving versatility of the paper towel holder **100**.

(51) One of the first support member **12** and the second support member **22** is connected with the first connection assembly **30**, and the other one of the first support member **12** and the second support member **22** is connected with the second connection assembly **40**. When the first support member **12** and the second support member **22** are approaching each other, the first connection assembly **30** and the second connection assembly **40** are detachably connected with each other. The first support member **12** is configured to support the to-be-hung object. When the first connection assembly **30** is detached from the second connection assembly **40**, the first support member **12** is disposed at the outside of the second support member **22**. The user may place the to-be-hung object to sleeve or to be hung on the first support member **12** to allow the first support member **12** to support the to-be-hung object. In this way, the object may be taken out of the first support member **12** easily.

(52) Furthermore, the first support member **12** rotates with respect to the first mounting base **11** and gradually approaches the second support member **22**, enabling the first connection assembly **30** to be connected to the second connection assembly **40**. The connection between the first connection assembly **30** and the second connection assembly **40** prevents the to-be-hung object from being detached away from the first support member **12**, ensuring the paper towel holder **100** to hang the

to-be-hung object stably. Further, the object may be taken out of the paper towel holder **100** by switching the connection status between the first connection assembly **30** and the second connection assembly **40**.

(53) The first connection assembly **30** is arranged at the end of the first support member **12**. The second connection assembly **40** is arranged at the end of the second support member **22**. The second connection assembly **40** and the first connection assembly **30** may approach or move away from each other. When the first connection assembly **30** is detached from the second connection assembly **40**, the first support member **12** is disposed at the outside of the second support member **22**. The user may place the to-be-hung object to sleeve the first support member **12**, allowing the first support member **12** to support the to-be-hung object, and the object may be taken out of the first support member **12** easily.

(54) As shown in FIG. 7 and FIG. 10, the first connection assembly **30** defines a snapping slot **30a**, and the second connection assembly **40** defines an engaging portion **41**. When the paper towel holder is in a first usage state, for example when the to-be-hung object is sleeving the first support member **12**, the first support member **12** is rotated with respect to the first mounting base **11** to move to approach the second connection assembly **40**, and the engaging portion **41** is received in the snapping slot **30a**. When the paper towel holder is in a second usage state, for example when the to-be-hung object is taken out of the first support member **12**, the first support member **12** is rotated with respect to the first mounting base **11** to move away from the second connection assembly **40**, and the engaging portion **41** is detached from the snapping slot **30a**.

(55) A circumferential wall of the first connection assembly **30** is arranged with a gear-shaped contact portion **30d**, and the gear-shaped contact portion **30d** may be contacted by the user. The gear-shaped contact portion **30d** is disposed at an end of the first connection assembly **30** and rotates as the first connection assembly **30** is rotating, and at the same time, when the user contacts the gear-shaped contact portion **30d**, the first connection assembly **30** is triggered to rotate. In this way, a sensation of the user touching the first connection assembly **30** may be improved by the gear-shaped contact portion **30d**, enabling first connection assembly **30** to rotate easily.

(56) Specifically, as shown in FIG. 11 to FIG. 14, the first connection assembly **30** includes a first connection base **31**, a knob **32**, a third threaded member **33**, and a second connection base **34**. The second connection base **34** is connected to the first connection base **31**. The knob **32** is connected to the first connection base **31**. The third threaded member **33** is disposed at a side of the first connection base **31** and extends through the knob **32**.

(57) The first connection base **31** is configured to support the knob **32**, the third threaded member **33**, and the second connection base **34**. The first connection base **31** defines a receiving hole **311** and a first notch **312**. The receiving hole **311** is formed by an end of the first connection base **31** extending in an axial direction. The first notch **312** is formed by the circumferential wall of the first connection base **31** extending in a radial direction. The receiving hole **311** is communicated with the first notch **312**. The receiving hole **311** is configured to receive the second connection base **34**. In some embodiments, the receiving hole **311** is cylindrical. The other end face of the first connection base **31** defines a first rotation hole **30c**. The third threaded member **33** extends through the first rotation hole **30c** and the threaded hole **1221** of the first support member **12** to connect with the first connection assembly **30** to the first support member **12**.

(58) The second connection base **34** is received in the receiving hole **311** of the first connection base **31** and is disposed on a side of the first connection base **31** away from the knob **32**. The second connection base **34** includes a base body **341** and a third flange **342**. The third flange **342** is arranged on a circumferential wall of the base body **341** and projects outwardly.

(59) In some embodiments, the base body **341** is interference fit with the receiving hole **311**. Therefore, the second connection base **34** is fixedly connected to the first connection base **31**, and the first notch **312** is aligned with the snapping slot **30a**. In this case, when the first connection base **31** is rotating, the second connection base **32** rotates accordingly. When the first notch **312** is on a

rotation plane of the first support member **12**, the engaging portion **41** may be disengaged from the snapping slot **30a**, and the object may be hung on or taken out of the first support member **12**. When the first notch **312** deviates from the rotation plane of the first support member **12**, the engaging portion **41** is blocked by the second connection base **34** and cannot be disengaged from the snapping slot **30a**, such that the to-be-hung object is maintained on the first support member **12**.

(60) In some embodiments, the base body **341** may be in clearance fit with the receiving hole **311**. The first connection base **31** may be rotated relative to the second connection base **34**. In this case, the snapping slot **30a** is disposed on the rotation plane of the first support member **12**, and the first connection base **31** may rotate. When the first notch **312** is aligned with the snapping slot **30a**, and when the first support member **12** is rotating, the engaging portion **41** may be disengaged from the snapping slot **30a**, and the object may be hung on or taken out of the first support member **12**. When the first notch **312** is misaligned with the snapping slot **30a**, the engaging portion **41** is blocked by the second connection base **34** and cannot be disengaged from the snapping slot **30a**, and the to-be-hung object is maintained on the first support member **12**.

(61) The snapping slot **30a** is defined in the base body **341** and is located corresponding to the first notch **312**. The snapping slot **30a** is communicated with the first notch **312**. The second connection assembly **40** may extend through the notch **312** to be received in or detached away from the snapping slot **30a**. In this way, the first connection assembly **30** and the second connection assembly **40** may be snapped with each other or detached away from each other. In some embodiments, the snapping slot **30a** may be step-shaped. The first connection base **31** is made of metal, and the second connection base **34** is made of plastic.

(62) The snapping slot **30a** is formed by the end face of the flange **342** extending axially, and the snapping slot **30a** allows an opening **30b** to be defined in a side wall of the first connection assembly **30**. In some embodiments, the snapping slot **30a** is a stepped slot, and the engaging portion **41** is stepped. The engaging portion **41** is received in the snapping slot **30a** through the opening **30b** in the circumferential side wall of the first connection assembly **30**.

(63) An end of the first connection base **31** is connected to the knob **32**, and the third threaded member **33** extends through the first connection base **31**. The third threaded member **33** extends through the first connection base **31** and the knob **32** and is threaded into the threaded hole **1221** of the first support member **12**. The knob **32** defines a via **321** and a recess **322**. A threaded portion of the third threaded member **33** extends through the via **321**. The recess **321** is communicated through the via **321** and receives a threaded end portion of the third threaded member **33**. In this case, the threaded end portion of the third threaded member **33** is disposed between the knob **32** and the first connection base **31** and is received.

(64) Since a gap is defined between an inner wall of the knob **32** defining the via **321** and an outer wall of the threaded portion of the third threaded member **33**, such that the knob **32** to be rotated with respect to the first support member **12**, and the first connection base **31** connected to the knob **32** is rotated with respect to the first support member **12**. In this way, the second connection base **34** is rotated, allowing an orientation of the snapping slot **30a** to be adjusted, and therefore, the connection status between the first connection assembly **30** and the second connection assembly **40** may be adjusted. An outer surface of the knob **32** is arranged with the gear-shaped contact portion **30d**, such that a sensation and a friction of the knob **32** may be improved by the gear-shaped contact portion **30d**.

(65) In some embodiments, the first connection base **31** and the knob **32** are configured as a one-piece structure. Alternatively, the first connection base **31** and the knob **32** are two separated elements welded to each other to reduce a cost of processing the first connection assembly **30**. In some embodiments, the first connection base **31** and the knob **32** are both metal structures.

(66) In some embodiments, the knob **32** may be omitted. In this case, while the frame is in use, the first connection base **13** may be rotated directly. In some embodiments, the first connection base **31** may further be omitted. In this case, the second connection base **34** is rotatably connected to the

first support member **12**. As shown in FIG. **15** and FIG. **16**, in addition, the second connection assembly **40** is connected to the second support member **22** and is stationary relative to the second support member **22**. The second connection assembly **40** extends from an end of the second support member **22** outwardly. The second connection assembly **40** may be a stepped shaft and is inserted in the snapping slot **30a**.

#### Second Embodiment

(67) As shown in FIG. **17** to FIG. **21**, compared to the first embodiment, positions of the first connection assembly **30** and the second connection assembly **40** are adjusted in the present embodiment. In the present embodiment, the first connection assembly **30** is arranged on the second support member **22**, and the second connection assembly **40** is arranged on the first support member **12**. The first connection assembly **30** defines the snapping slot **30a**. The second connection assembly **40** is arranged with the engaging portion **41**. The engaging portion **41** is snapped with the snapping slot **30a**.

(68) The second connection assembly **40** is arranged on the first support member **12**. The second connection assembly **40** rotates as the first support member **12** rotates and gradually approaches or moves away from the first connection assembly **30**. Since the first connection assembly **30** is arranged on the second support member **22** and is maintained at rest, the snap connection between the snapping slot **30a** and the engaging portion **41** may be achieved easily.

#### Third Embodiment

(69) As shown in FIG. **22** to FIG. **25**, compared to the first embodiment, the first connection assembly **30** in the present embodiment is arranged with an insertion shaft **35**. The insertion shaft **35** extends through the first connection assembly **30** and may further be inserted into or detached from the snapping slot **41** of the second connection assembly **40**. In the present embodiment, the insertion shaft **35** may be extendably and retractably connected to the first connection assembly **30** and may be extended and retracted along the axis of the first connection assembly **30** to be inserted into or detached from the snapping slot **41** of the second connection assembly **40**. In this way, the first connection assembly **30** is connected to the insertion slot **41** through the insertion shaft **35**, and therefore, the first connection assembly **30** is connected to the second connection assembly **40**.

(70) The present disclosure provides a paper towel holder **100**, one of the first support member **12** and the second support member **22** is connected with the first connection assembly **30**, and the other one of the first support member **12** and the second support member **22** is connected with the second connection assembly **40**. When the first support member **12** and the second support member **22** are approaching each other, the first connection assembly **30** and the second connection assembly **40** are detachably connected with each other. The first support member **12** is configured to support the to-be-hung object. When the first connection assembly **30** is detached from the second connection assembly **40**, the first support member **12** is disposed at the outside of the second support member **22**. The user may place the to-be-hung object to sleeve the first support member **12**, such that the first support member **12** may support the object easily, and the object may be taken out of the first support member **12**. In addition, the first support member **12** rotates with respect to the first mounting base **11** and gradually approaches the second support member to allow the first connection assembly **30** to be connected to the second connection assembly **40**. The connection between the first connection assembly **30** and the second connection assembly **40** may prevent the object from being detached away from the paper towel holder **100**, ensuring the paper towel holder **100** to hang the object stably. Further, the object may be taken out of the paper towel holder **100** by switching the connection status between the first connection assembly **30** and the second connection assembly **40**.

(71) In the above-mentioned embodiments, the description of each embodiment has its own focus, and any feature that is not described in detail in one embodiment may be referred to the relevant descriptions in other embodiments.

(72) In the description of the present disclosure, the terms “first” and “second” are used for

descriptive purposes only and shall not be understood as indicating or implying relative importance or implicitly specifying the number of technical features. Therefore, the feature qualified with “first” and “second” may explicitly or implicitly include one or more features.

(73) The above examples are only used to help understand the method and the essential idea of the present disclosure. Further, any ordinary skilled person in the art may perform changes in the specific implementation and the scope of the present disclosure based on the concept of the present disclosure. The content of the present disclosure shall not be interpreted as a limitation of the present disclosure.

## Claims

1. A paper towel holder, comprising: a first support assembly, comprising a first mounting base and a first support member, wherein the first support member is rotatably connected to the first mounting base and is configured to support a to-be-hung object; a second support assembly, disposed on a side of the first support assembly, wherein the second support assembly comprises a second mounting base and a second support member, and the second support member is connected to the second mounting base; a first connection assembly; and a second connection assembly; wherein one of the first support member and the second support member is rotatably connected to the first connection assembly, and the other one of the first support member and the second support member is connected to the second connection assembly; the first connection assembly is detachably connected to the second connection assembly; the first connection assembly comprises a connection base and defines a snapping slot, the connection base defines a notch; the second connection assembly is arranged with an engaging portion; the first connection base is configured to rotate to reach an unlock state, in the unlock state, the snapping slot is aligned with the notch, and the engaging portion is capable of being received in or taken out of the snapping slot; the first connection base is further configured to rotate to reach a lock state, in the lock state, the snapping slot is misaligned with the notch, and the engaging portion is unable to be received in or taken out of the snapping slot; when the engaging portion is received in the snapping slot, the first connection assembly is connected to the second connection assembly to hold the to-be-hung object; when the engaging portion is taken out of the snapping slot, the first connection assembly is detached from the second connection assembly to release the to-be-hung object.
2. The paper towel holder according to claim 1, wherein the first support assembly further comprises a first connection arm, an end of the first connection arm is rotatably connected to the first mounting base, and the other end of the first connection arm is connected to the first support member.
3. The paper towel holder according to claim 2, wherein the first connection arm comprises a first rotation shaft and a second rotation shaft, the first rotation shaft is fixedly mounted on the first mounting base; the second rotation shaft rotatably sleeves the first rotation shaft and is disposed between the first mounting base and the first support member, and the second rotation shaft is connected to the first support member.
4. The paper towel holder according to claim 3, wherein an end of the second rotation shaft facing towards the first support member is arranged with a first arc portion, the first support member is a cylindrical rod, and the first support member is embedded in the first arc portion.
5. The paper towel holder according to claim 1, wherein when the first connection assembly is approaching the second connection assembly, the engaging portion is configured to be snapped in the snapping slot; and when the first connection assembly is moving away from the second connection assembly, the engaging portion is configured to be disengaged from the snapping slot.
6. The paper towel holder according to claim 5, wherein the snapping slot is formed by an end face of the first connection assembly extending in an axial direction, and an opening is defined in a side wall of the first connection assembly.

7. The paper towel holder according to claim 6, wherein the first connection assembly further comprises a second connection base, the first connection base further defines a through hole, the second connection base is received inside the first connection base, the snapping slot is defined in the second connection base, the first notch corresponds to the opening of the snapping slot defined in the side wall.
8. The paper towel holder according to claim 7, wherein the first connection base is rotatable with respect to the second connection base.
9. The paper towel holder according to claim 7, wherein the first connection base is fixedly connected to the second connection base.
10. The paper towel holder according to claim 6, wherein the first connection assembly further comprises a knob, the knob is fixedly connected to the first connection base; and the first connection base is configured to rotate, driven by the knob being rotating.
11. The paper towel holder according to claim 10, wherein a circumferential wall of the knob is arranged with a gear-shaped contact face.
12. The paper towel holder according to claim 1, wherein the second support assembly further comprises a second connection arm, the second connection arm is disposed between the second mounting base and the second support member, an end of the second connection arm is connected to the second mounting base, and the other end of the second connection arm is connected to the second support member.
13. The paper towel holder according to claim 1, wherein a length of the first support member is greater than a length of the second support member.
14. The paper towel holder according to claim 1, wherein the first connection assembly is arranged on the second support member, the second connection assembly is arranged on the first support member, the first connection member defines a snapping slot, the second connection member is arranged with a snap sleeve, the snap sleeve is snapped to the snapping slot.
15. The paper towel holder according to claim 1, wherein the first connection assembly is arranged with an insertion shaft, the insertion shaft extends through the first connection assembly and is capable of being inserted into or being detached away from an insertion slot in the second connection assembly in an axial direction.
16. The paper towel holder according to claim 15, wherein the insertion shaft is retractably connected to the first connection assembly and is configured to extend and retract along an axis of the first connection assembly to be inserted into or to be disengaged from the insertion slot of the second connection assembly.
17. A paper towel holder, comprising: a first support assembly, comprising a first mounting base and a first support member, wherein the first support member is rotatably connected to the first mounting base and is configured to support a to-be-hung object; a second support assembly, disposed on a side of the first support assembly, wherein the second support assembly comprises a second mounting base and a second support member, and the second support member is connected to the second mounting base; a first connection assembly; and a second connection assembly; wherein one of the first support member and the second support member is rotatably connected to the first connection assembly, and the other one of the first support member and the second support member is connected to the second connection assembly; the first connection assembly is detachably connected to the second connection assembly; a first state, the first connection assembly is connected to the second connection assembly to hold the to-be-hung object; in a second state, the first connection assembly is detached from the second connection assembly to release the to-be-hung object; wherein, the first support assembly further comprises a first connection arm rotatably connected to the first mounting base, the first connection arm comprises a first rotation shaft; wherein the first rotation shaft comprises a first shaft sleeve and a second shaft sleeve, the first shaft sleeve is fixedly connected to the first mounting base, the second shaft sleeve sleeves the first shaft sleeve, and the second rotation shaft sleeves the second shaft sleeve.

18. The paper towel holder according to claim 17, wherein the first support member defines a threaded hole; the first support assembly further comprises a first threaded member, the first threaded member extends through the first rotation shaft and the second rotation shaft, a nut end of the first threaded member contacts an end portion of the first rotation shaft, and a threaded end of the first threaded member is threadly connected the threaded hole.

19. The paper towel holder according to claim 18, wherein the second rotation shaft defines an inner cavity; a first limiting member is arranged inside the second rotation shaft, the first limiting member is in clearance fit with the inner cavity, the first threaded member extends through the first limiting member.

20. A paper towel holder, comprising: a first support assembly, comprising a first mounting base and a first support member, wherein the first support member is rotatably connected to the first mounting base and is configured to support a to-be-hung object; a second support assembly, disposed on a side of the first support assembly, wherein the second support assembly comprises a second mounting base and a second support member, and the second support member is connected to the second mounting base; a first connection assembly; and a second connection assembly; wherein one of the first support member and the second support member is rotatably connected to the first connection assembly, and the other one of the first support member and the second support member is connected to the second connection assembly; the first connection assembly is detachably connected to the second connection assembly; a first state, the first connection assembly is connected to the second connection assembly to hold the to-be-hung object; in a second state, the first connection assembly is detached from the second connection assembly to release the to-be-hung object; wherein the second support assembly further comprises a second connection arm, the second connection arm is disposed between the second mounting base and the second support member, an end of the second connection arm is connected to the second mounting base, and the other end of the second connection arm is connected to the second support member; wherein the second mounting base defines a positioning hole, an end of the second connection arm away from the second support member is arranged with a protruding tab, and the protruding tab is inserted in the positioning hole.

---
