### DUST PLUGS FOR SEALING MULTIPORT TERMINALS AND METHODS OF FABRICATING THE SAME

---

#### Abstract

Dust plug assemblies and methods of their fabrication are disclosed. In one embodiment, a dust plug assembly includes a dust plug body having a lanyard receiving feature, and a sealing sleeve attached to an end of the dust plug body. The sealing sleeve has a passageway therethrough, and the lanyard receiving feature is disposed within the passageway. The dust plug body and the sealing sleeve define a primary groove. The dust plug assembly further includes a lanyard having an attachment feature. The attachment feature is coupled to the lanyard receiving feature, and the lanyard and the sealing sleeve define a secondary groove.

## Background/Summary

PRIORITY APPLICATIONS [0001] This application is a divisional of U.S. patent application Ser. No. 17/975,829 filed on Oct. 28, 2022, the content of which is relied upon and incorporated herein by reference in its entirety, and the benefit of priority under 35 U.S.C. § 120 is hereby claimed.

### FIELD

[0002] The disclosure is directed to multiport terminals and, more particularly, to dust plug assemblies for sealing unused ports of multiport terminals.

### BACKGROUND

[0003] Optical fiber is increasingly being used for a variety of applications, including but not limited to broadband voice, video, and data transmission. As bandwidth demands increase optical fiber is migrating deeper into communication networks such as in fiber to the premises applications such as FTTx, 5G, and the like. As optical fiber extends deeper into communication networks there exists a need for building more complex and flexible fiber optic networks in a quick and easy manner.

[0004] A multiport terminal is a device having a plurality of ports for receiving fiber optic drop cables that are then run to a commercial building or residence. In many cases, there are more ports than are needed and thus the multiport terminal has unused ports. Dust plugs may be inserted into unused ports to seal the multiport terminal from environmental exposure. However, present dust plugs have drawbacks, such as parting lines that are needed due to the molding process. Further, present dust plugs are fabricated by overmolding a flexible lanyard over a rigid dust plug body, which is a costly process and prevents custom dust plugs (e.g., different colors, lanyard sizes or shapes, etc.) from being easily fabricated.

[0005] Consequently, there exists an unresolved need for effective dust plugs that minimize leakage, reduce manufacturing costs, and provide for easy customization.

### SUMMARY

[0006] Various embodiments of dust plug assemblies for sealing unused ports of a multiport terminal. The dust plug assemblies of the present disclosure do not require a molded component having a parting line in a groove, which eliminates a leak risk at the groove. The dust plug assemblies described herein provide a solution wherein the lanyard and the dust plug body are mechanically assembled rather than overmolded. Further, the lanyard captures a secondary sealing element on the dust plug body that is tapered and provides lead-in compressing during dust plug insertion, which is not possible with a simple O-ring design. The two-part design of the dust plug body and the sealing sleeve also eliminate the parting line on the groove for the secondary seal, which further minimizes leak risk.

[0007] In one embodiment, a dust plug assembly includes a dust plug body having a lanyard receiving feature, and a sealing sleeve attached to an end of the dust plug body. The sealing sleeve has a passageway therethrough, and the lanyard receiving feature is disposed within the passageway. The dust plug body and the sealing sleeve define a primary groove. The dust plug assembly further includes a lanyard having an attachment feature. The attachment feature is coupled to the lanyard receiving feature, and the lanyard and the sealing sleeve define a secondary groove.

[0008] In another embodiment, a dust plug assembly includes a dust plug body and a sealing sleeve attached to an end of the dust plug body. The sealing sleeve has a passageway therethrough, and the sealing sleeve includes a first latch arm and a second latch arm. The dust plug body and the sealing sleeve define a primary groove. The dust plug assembly further includes a lanyard comprising a barb. The first latch arm and the second latch arm retain the barb. The lanyard and the sealing sleeve define a secondary groove. The dust plug assembly further includes a primary sealing

member disposed in the primary groove, and a secondary sealing member disposed in the secondary groove.

[0009] In yet another embodiment, a multiport assembly includes a housing comprising a plurality of ports and a dust plug assembly inserted in at least one port of the plurality of ports. The dust plug assembly includes a dust plug body having a lanyard receiving feature and a sealing sleeve attached to an end of the dust plug body. The sealing sleeve has a passageway therethrough, and the lanyard receiving feature is disposed within the passageway. The dust plug body and the sealing sleeve define a primary groove. The multiport assembly further includes a lanyard having an attachment feature. The attachment feature is coupled to the lanyard receiving feature. The lanyard and the sealing sleeve define a secondary groove. The multiport assembly further includes a primary sealing member disposed within the primary groove, wherein the primary sealing member provides a primary seal within an interior of the port, and a secondary sealing member disposed within the secondary groove, wherein the secondary sealing member provides a secondary seal at an opening of the port.

[0010] In yet another embodiment, a method of fabricating a dust plug assembly includes disposing a sealing sleeve over an end of a dust plug body, wherein the sealing sleeve includes a bonding ring and an energy directing feature extending from the bonding ring, the dust plug body includes an inner mating surface disposed within a passageway of the sealing sleeve, and the dust plug body and the sealing sleeve define a primary groove. The method also includes applying ultrasonic energy to the bonding ring such that the energy directing feature melts and forms an ultrasonic weld joint between the bonding ring and the inner mating surface, disposing a primary sealing member in the primary groove, disposing a secondary sealing member on an end of the sealing sleeve, and inserting an attachment feature of a lanyard into the passageway of the sealing sleeve and into a lanyard receiving feature of the dust plug body such that the lanyard receiving feature secures the attachment feature and the secondary sealing member is disposed within a secondary groove defined by the lanyard and the sealing sleeve.

[0011] Additional features and advantages will be set forth in the detailed description which follows, and in part will be readily apparent to those skilled in the art from that description or recognized by practicing the same as described herein, including the detailed description that follows, the claims, as well as the appended drawings.

[0012] It is to be understood that both the foregoing general description and the following detailed description present embodiments that are intended to provide an overview or framework for understanding the nature and character of the claims. The accompanying drawings are included to provide a further understanding of the disclosure and are incorporated into and constitute a part of this specification. The drawings illustrate various embodiments and together with the description serve to explain the principles and operation.

---

## Description

### BRIEF DESCRIPTION OF THE FIGURES

[0013] FIG. 1 illustrates an example multiport assembly according to one or more embodiments described and illustrated herein;

[0014] FIG. 2 is a perspective assembled view of an example dust plug assembly according to one or more embodiments described and illustrated herein;

[0015] FIG. 3 is a perspective exploded view of an example dust plug assembly according to one or more embodiments described and illustrated herein;

[0016] FIG. 4 is a cutaway view of an unassembled sealing sleeve and dust plug body according to one or more embodiments described and illustrated herein;

[0017] FIG. 5 is a cutaway view of an assembled sealing sleeve and dust plug body according to

one or more embodiments described and illustrated herein;

[0018] FIG. **6** is another cutaway view of an assembled sealing sleeve and dust plug body according to one or more embodiments described and illustrated herein;

[0019] FIG. **7** is another cutaway view of an assembled sealing sleeve and dust plug body according to one or more embodiments described and illustrated herein; and

[0020] FIG. **8** is a flowchart illustrating an example method of fabricating a dust plug assembly according to one or more embodiments described and illustrated herein.

#### DETAILED DESCRIPTION

[0021] References will now be made in detail to the embodiments of the disclosure, examples of which are illustrated in the accompanying drawings. Whenever possible, like reference numbers will be used to refer to like components or parts.

[0022] The concepts disclosed are related to dust plug assemblies for sealing unused ports of a multiport terminal. Present dust plug assemblies are fabricated by overmolding a flexible thermoplastic elastomer lanyard onto a rigid thermoplastic substrate dust plug body. It is desirable to assemble the dust plug body onto the lanyard at the end of the multiport terminal assembly process in order to employ alternate dust plug designs, configurations and/or colors of dust plugs depending on the terminal configuration. Current multiport terminal designs provide no lead-in at the opening of the port. The dust plug is flush to the face of the port when installed. However, this complicates the secondary seal because there is no tapered/chamfered surface to compress the secondary seal during dust plug insertion. Further, present dust plugs are single molded components that contain an O-ring groove that is molded with a parting line on the groove floor. The groove must be molded with a parting line on the groove floor, which poses a leak risk.

[0023] Embodiments of the present disclosure are directed to dust plug assemblies where the lanyard and the dust plug body are mechanically assembled rather than overmolded. This design eliminates the need for parting lines in grooves of the dust plug, which reduces overall leak risks. Further, in embodiments of the present disclosure, a secondary sealing element is a tapered seal that provides lean-in compression during dust plug insertion, which is not possible with a traditional secondary O-ring.

[0024] Various embodiments of dust plug assemblies and methods of fabricating dust plug assemblies are described in detail below.

[0025] Referring now to FIG. **1**, a non-limiting, fiber optic multiport assembly is illustrated. The fiber optic multiport assembly **100** includes a multiport terminal **102**, a plurality of fiber optic connectors **108**, and a plurality of dust plug assemblies **110**. The multiport terminal **102** is configured to enable fiber-to-the-infrastructure (FTTx) for optical communication networks. As a non-limiting example, the multiport terminal **102** may be an Evolv™ terminal manufactured and sold by Corning Optical Communications of Charlotte, NC.

[0026] The multiport terminal **102** has a multiport body **104** that includes a plurality of ports **106** operable to receive a plurality of fiber optic connectors **108**, such as fiber optic connector of drop cables, for example. The plurality of fiber optic connectors **108** may be PushLok™ connectors, as a non-limiting example.

[0027] In some instances, not all of the ports **106** of the multiport terminal **102** may be in use. For example, there may be more ports **106** than subscribers. To protect the internal components of the multiport terminal **102**, dust plug assemblies **110** are inserted in unused ports **106**. These dust plug assemblies **110** seal the unused ports **106** and protect the enclosure of the multiport terminal **102** from the environment.

[0028] Referring now to FIGS. **2** and **3**, an example dust plug assembly **110** according to one or more embodiments of the present disclosure is illustrated. FIG. **2** illustrates a perspective assembled view of the dust plug assembly **110**. FIG. **3** illustrates a perspective exploded view of the dust plug assembly **110**. The example dust plug assembly **110** generally includes a dust plug body **140**, a sealing sleeve **130**, and a lanyard **112**. The dust plug assembly **110** further includes a

primary sealing member **125** for providing a primary seal in the interior of a port **106** and a secondary sealing member **120** for providing a secondary seal at the opening of the port **106**. The dust plug body **140** and the sealing sleeve **130** may be molded from a rigid thermoplastic material (e.g., Ultem **2200**), for example. The lanyard **112** may be molded from a flexible thermoplastic elastomer (e.g., Hytrel **4556**), for example.

[0029] The dust plug body **140** comprises a first end **143**, a midsection **144**, and a second end **147**. The second end **147** is the end that is inserted into an open port **106** of the multiport terminal **102**. An outer surface of the midsection **144** includes an alignment groove **145** that is operable to receive an interior alignment feature (e.g., a tab or ridge, not shown) within the port **106** to ensure that the dust plug assembly **110** is inserted into the port **106** in only one orientation and to prevent rotation.

[0030] The first end **143** of the dust plug body **140** includes a lanyard receiving feature **142** to receive an attachment feature **115** of the lanyard **112**, as described in more detail below. In the illustrated embodiment, the lanyard receiving feature **142** is configured as two latch arms **141** each having an inwardly facing catch portion **146**. Other configurations are also possible. For example, more than two latch arms may be provided, or a socket may be used to receive a ball feature of the lanyard **112**.

[0031] The sealing sleeve **130** includes a passageway **P**, and is disposed on the first end **143** of the dust plug body **140**. FIG. **4** is a cutaway view of the sealing sleeve **130** and the dust plug body **140** prior to the sealing sleeve **130** being disposed on the first end **143** of the dust plug body **140**. FIG. **5** is a cutaway view of the sealing sleeve **130** disposed on the first end **143** of the dust plug body **140**.

[0032] The dust plug body **140** includes a transition from the midsection **144** to the first end **143** that defines an outer mating surface **148**. The first end **143** also includes an inner mating surface **149** from which the lanyard receiving feature **142** extends. The dust plug body may further include external threads **139** for mating with a dust cap, such as a dust cap from a connector.

[0033] The sealing sleeve **130** includes a first end **131** with a reduced outer diameter and a second end **133** also with a reduced outer diameter. As described in more detail below, the first end **131** and the second end **133** with reduced diameters form grooves for receiving sealing members.

[0034] The sealing sleeve **130** also includes an interior bonding ring **136**, which is a region within the passageway **P** of the sealing sleeve **130** having a reduced inner diameter. An energy directing feature **137** extends from a surface of the bonding ring **136** facing the dust plug body **140**. The example energy directing feature **137** is triangular in shape in cross section, and is configured to direct ultrasonic energy toward the inner mating surface **149** to form an ultrasonic weld joint **151**, as described in more detail below.

[0035] Referring to FIG. **5**, when the sealing sleeve **130** is disposed on the dust plug body **140**, the first end **143** of the dust plug body **140** is within the bonding ring **136** of the sealing sleeve **130**. The lanyard receiving feature **142** extends beyond the bonding ring **136**. The outer diameter of the first end **143** and the inner diameter of the bonding ring **136** may be such that the first end **143** is within the bonding ring **136** by an interference fit.

[0036] The energy directing feature **137** contacts the inner mating surface **149**. To bond the sealing sleeve **130** to the dust plug body **140**, ultrasonic energy is applied to the sealing sleeve **130** to melt the material of the energy directing feature **137** and the inner mating surface **149**, which causes reflow material to fuse and form a hermetic ultrasonic weld joint **151**. Other methods for bonding the sealing sleeve **130** to the dust plug body **140** may be utilized, such as by an adhesive, for example.

[0037] The second end **133** of the sealing sleeve **130** may abut the outer mating surface **148**. The second end **133** and the outer mating surface **148** define a primary groove **135** which receives a primary sealing member **125**, which in the illustrated embodiment is an O-ring.

[0038] Referring once again to FIGS. **2** and **3**, the lanyard **112** includes a pull portion **118**, a flange **114**, and an attachment feature **115**. It is noted that the pull portion **118** is illustrated as a stub without a pull tab for ease of illustration. Example pull tabs **116** are shown in FIG. **1**. The flange

**114** and a wall **134** of the sealing sleeve **130** (see FIG. 4) define a secondary groove **132** in which the secondary sealing member **120** is disposed. The example secondary sealing member **120** has a straight portion **122** and a tapered portion **121** extending from an end of the straight portion **122**. The flange **114** applies a compressive force on the straight portion **122** of the secondary sealing member **120** when the lanyard is inserted into the sealing sleeve **130**. The tapered portion **121** is configured to be compressed against an inner surface of the port **106** of the multiport terminal **102**. [0039] Referring now to FIG. 6, a cutaway view of the lanyard **112**, the sealing sleeve **130** and the dust plug body **140** is illustrated. The attachment feature **115** of the illustrated example is configured as a barb that is inserted into the passageway P of the sealing sleeve **130**, and further between the two latch arms **141**. The tapered shape of the barb pushes the two latch arms **141** outward until the end of the barb clears the catch portions **146** of the two latch arms **141**, at which point the two latch arms **141** snap back and the secure the barb of the attachment feature **115**. The catch portions **146** of the two latch arms are then disposed in grooves **152** between the barb and an inner wall **153** of the flange **114**. Thus, the attachment feature **115** and the lanyard receiving feature **142** cooperate to secure the lanyard **112** to the dust plug body **140**.

[0040] In some embodiments, alignment features may be provided to align the lanyard **112** with the dust plug body **140** as well as prevent rotation of the lanyard **112** with respect to the dust plug body **140**. Referring now to FIG. 7, another cutaway view of the lanyard **112**, sealing sleeve **130**, and the dust plug body **140** is provided. As shown in FIG. 7, as well as in FIG. 2, an alignment pin **117** extends from the attachment feature **115** or barb. The inner mating surface **149** of the dust plug body **140** has an alignment bore **150** sized and configured to receive the alignment pin **117**.

[0041] The alignment pin **117** is offset from a center of the attachment feature **115**. Similarly, the alignment bore **150** is offset from a center of the dust plug body **140**. Thus, the position of the alignment pin **117** and the alignment bore **150** ensures that the lanyard **112** can only be inserted into the dust plug body **140** in one orientation.

[0042] Referring now to FIG. 8, a flowchart **160** illustrating an example method of fabricating a dust plug assembly **110** is provided. At block **161**, a sealing sleeve **130** is disposed over an end of a dust plug body **140**. The sealing sleeve comprises a bonding ring **136** and an energy directing feature **137** extending from the bonding ring that contacts an inner mating surface **149** of the dust plug body **140**.

[0043] At block **162**, ultrasonic energy is applied to the sealing sleeve **130** proximate to the bonding ring **136** to form an ultrasonic weld joint **151** between the bonding ring **136** and the inner mating surface **149**. A primary sealing member **125** is disposed in a primary sealing groove defined by the sealing sleeve **130** and the dust plug body **140** at block **163**, and a secondary sealing member **120** is disposed on an end of the sealing sleeve **130**.

[0044] At block **165**, an attachment feature **115** of a lanyard **112** is inserted into the passageway P of the sealing sleeve **130** and into a lanyard receiving feature **142** of the dust plug body such that the lanyard receiving feature **142** secures the attachment feature **115** and the secondary sealing member **120** is disposed within a secondary groove defined by the lanyard **112** and the sealing sleeve **130**.

[0045] It should now be understood that embodiments of the present disclosure are directed to dust plug assemblies for sealing unused ports of a multiport terminal. The dust plug assemblies of the present disclosure may not have a molded component having a parting line in a groove, which eliminates a leak risk at the groove. The dust plug assemblies described herein provide a solution wherein the lanyard and the dust plug body are mechanically assembled rather than overmolded. Further, the lanyard captures a secondary sealing element on the dust plug body that is tapered and provides lead-in compression during dust plug insertion, which is not possible with a simple O-ring design. The two-part design of the dust plug body and the sealing sleeve also eliminate the parting line on the groove for the secondary seal, which further minimizes leak risk.

[0046] It is noted that recitations herein of a component of the embodiments being “configured” in

a particular way, “configured” to embody a particular property, or function in a particular manner, are structural recitations as opposed to recitations of intended use. More specifically, the references herein to the manner in which a component is “configured” denotes an existing physical condition of the component and, as such, is to be taken as a definite recitation of the structural characteristics of the component.

[0047] It is noted that one or more of the following claims utilize the term “wherein” as a transitional phrase. For the purposes of defining the embodiments of the present disclosure, it is noted that this term is introduced in the claims as an open-ended transitional phrase that is used to introduce a recitation of a series of characteristics of the structure and should be interpreted in like manner as the more commonly used open-ended preamble term “comprising.”

[0048] Although the disclosure has been illustrated and described herein with reference to explanatory embodiments and specific examples thereof, it will be readily apparent to those of ordinary skill in the art that other embodiments and examples can perform similar functions and/or achieve like results. For instance, the connection port insert may be configured as individual sleeves that are inserted into a passageway of a device, thereby allowing the selection of different configurations of connector ports for a device to tailor the device to the desired external connector. All such equivalent embodiments and examples are within the spirit and scope of the disclosure and are intended to be covered by the appended claims. It will also be apparent to those skilled in the art that various modifications and variations can be made to the concepts disclosed without departing from the spirit and scope of the same. Thus, it is intended that the present application cover the modifications and variations provided they come within the scope of the appended claims and their equivalents.

## Claims

1. A dust plug assembly comprising: a dust plug body; a sealing sleeve attached to an end of the dust plug body, wherein: the sealing sleeve has a passageway therethrough; the sealing sleeve comprises a first latch arm and a second latch arm; and the dust plug body and the sealing sleeve define a primary groove; a lanyard comprising a barb, wherein: the first latch arm and the second latch arm retain the barb; and the lanyard and the sealing sleeve define a secondary groove; a primary sealing member disposed in the primary groove; and a secondary sealing member disposed in the secondary groove.
2. The dust plug assembly of claim 1, wherein: the sealing sleeve further comprises a bonding ring within the passageway; the dust plug body further comprises an inner mating surface; and the dust plug assembly further comprises an ultrasonic weld joint between the bonding ring and the inner mating surface.
3. The dust plug assembly of claim 1, wherein: the dust plug body further comprises an outer mating surface; an end of the sealing sleeve contacts the outer mating surface; and the primary groove is at the outer mating surface.
4. The dust plug assembly of claim 1, wherein: the lanyard further comprises an alignment pin extending from an end of the barb; the dust plug body further comprises an alignment bore; and the alignment pin is disposed within the alignment bore.
5. The dust plug assembly of claim 1, wherein the primary sealing member is an O-ring and the secondary sealing member is a tapered sealing member.
6. The dust plug assembly of claim 1, wherein the dust plug body further comprises an outer alignment groove.
7. A multiport assembly comprising: a housing comprising a plurality of ports; a dust plug assembly inserted in at least one port of the plurality of ports, the dust plug assembly comprising: a dust plug body comprising a lanyard receiving feature; a sealing sleeve attached to an end of the dust plug body, wherein: the sealing sleeve has a passageway therethrough; the lanyard receiving

feature is disposed within the passageway; and the dust plug body and the sealing sleeve define a primary groove; and a lanyard comprising an attachment feature, wherein: the attachment feature is coupled to the lanyard receiving feature; the lanyard and the sealing sleeve define a secondary groove; a primary sealing member disposed within the primary groove, wherein the primary sealing member provides a primary seal within an interior of the port; and a secondary sealing member disposed within the secondary groove, wherein the secondary sealing member provides a secondary seal at an opening of the port.

**8.** The multiport assembly of claim 7, wherein: the sealing sleeve further comprises a bonding ring within the passageway; the dust plug body further comprises an inner mating surface; and the dust plug assembly further comprises an ultrasonic weld joint between the bonding ring and the inner mating surface.

**9.** The multiport assembly of claim 7, wherein: the dust plug body further comprises an outer mating surface; an end of the sealing sleeve contacts the outer mating surface; and the primary groove is at the outer mating surface.

**10.** The multiport assembly of claim 7, wherein the lanyard receiving feature comprises a first latch arm and a second latch arm.

**11.** The multiport assembly of claim 10, wherein: the attachment feature of the lanyard comprises a barb; and catch portions of the first latch arm and the second latch arm retain the barb.

**12.** The multiport assembly of claim 11, wherein: the attachment feature further comprises an alignment pin extending from an end of the barb; the lanyard receiving feature further comprises an alignment bore; and the alignment pin is disposed within the alignment bore.

**13.** The multiport assembly of claim 7, wherein the primary sealing member is an O-ring and the secondary sealing member is a tapered sealing member.

**14.** The multiport assembly of claim 7, wherein: each port of the plurality of ports comprises an alignment feature; and the dust plug body further comprises an outer alignment groove operable to receive the alignment feature.
