Background/Summary

TECHNICAL FIELD

(1) The present invention relates to an agricultural and horticultural insecticidal and acaricidal agent containing a benzimidazole compound or a salt thereof as an active ingredient and a method for using the same.

BACKGROUND ART

(2) Certain kinds of benzimidazole compounds have been documented as useful as insecticidal agents, medicines, and the like (e.g., see Patent Literatures 1 to 4). These literatures do not include any description about a benzimidazole compound wherein a sulfonyl group such as an alkylsulfonyl group is present at the 1-position nitrogen atom and a nitrogen atom of a nitrogen-containing heterocycle binds at position 2, and about an insecticidal effect thereof.

SUMMARY OF INVENTION

Technical Problem

(4) In crop production in the fields of agriculture, horticulture and the like, damages caused by pests and the like have been still serious, and there is a demand for developing an agricultural and horticultural insecticidal and acaricidal agent having a novel action, less impact on natural enemy useful insects, and imparted with penetration and translocation activity, from the viewpoints of emergence of resistant pests against existing drugs, impacts on environmental biology and labor saving of operation.

Solution to Problem

(5) The present inventors conducted extensive studies to solve the above problem and found that a benzimidazole compound represented by general formula (1) wherein a nitrogen atom of a

nitrogen-containing heterocyclic group binds at position 2 and a specific sulfonyl group is present at position 1 or a salt thereof demonstrates not only a good controlling effect on agricultural and horticultural pests but can solve the above problem, whereby the present invention has been accomplished.

(6) More specifically, the present invention relates to [1] a benzimidazole compound represented by a general formula (1)

(165) The endoparasite control agent comprising the benzimidazole compound represented by the general formula (1) of the present invention or a salt thereof as an active ingredient is effective for not only parasites that live in the body of an intermediate or final host, but also parasites that, live in the body of a reservoir host. The benzimidazole compound represented by the general formula (1) of the present invention or a salt thereof is effective for parasites at their every developmental stage. For example, in the case of protozoa, the compound is effective against their cysts, precystic forms and trophozoites; schizonts and amoeboid forms at the asexual stage; gametocytes, gametes and zygotes at the sexual stage; sporozoites; etc. In the case of nematodes, the compound, is effective against their eggs, larvae and adults. The compound of the present invention is capable of not only combating parasites in the living body, but also even preventing parasitic infection by application to the environment as a route of infection. For example, soil-borne infection, i.e.,

infection from soil of crop fields and parks; percutaneous infection from water in rivers, lakes, marshes, paddy fields, etc.; oral infection from feces of animals such as dogs and cats; oral infection, from saltwater fish, freshwater fish, crustaceans, shellfish, raw meat of domestic animals, etc.; infection from mosquitoes, gadflies, flies, cockroaches, mites and ticks, fleas, lice, assassin bugs, trombiculid mites, etc.; and the like can be prevented from occurring.

(166) When the compounds of the present invention are used to control endoparasites in pet mammals and birds, the compounds of the present invention may be administered in an effective amount together with pharmaceutically acceptable additives orally, parenterally by injection (intramuscular, subcutaneously, intravenously or intraperitoneally); percutaneously by dipping, spraying, bathing, washing, pouring-on and spotting-on and dusting, or intranasally. The compounds of the present invention may be administered through molded articles such as chips, plates, bands, collars, ear marks, limb bands and ID tags. The compounds of the present invention are administered in an arbitrary dosage form suitable for the administration route.

(167) The dosage form may be a solid preparation such as a dust, a granule, a wettable powder, a pellet, a tablet, a ball, a capsule and an molded article containing an active ingredient, a liquid preparation such as an injection fluid, an oral liquid, a liquid preparation applied to the skin or coelom, a pour-on preparation, a spot-on preparation, a flowable, an emulsion, and a semisolid preparation such as an ointment and a gel.

(168) A solid preparation may generally be used by oral administration or by percutaneous or by environmental application after dilution with water or the like. A solid preparation can be prepared by mixing an active ingredient with an appropriate vehicle, and with an adjuvant if necessary, and formulating the mixture into a desired dosage form. Examples of the vehicle include an inorganic vehicle such as a carbonate, a hydrogen carbonate, a phosphate, aluminum oxide, silica or clay or an organic vehicle such as a saccharide, cellulose, cereal flour or starch.

(169) An injection fluid may be administered intravenously, intramuscularly or subcutaneously. An injection fluid can be prepared by dissolving an active ingredient in an appropriate solvent and, if necessary, adding additives such as a solubilizer, an acid, a base, a buffering salt, an antioxidant and a protectant. (180) In the case where the endoparasite control agent of the present invention is used as a pharmaceutical for animals of non-human mammalian or avian species, the optimum amount (effective amount) of the active ingredient varies with the purpose (treatment or prevention), the kind of infectious parasite, the type and severity of infection, the dosage form, etc., but in general, the oral daily dose is in the range of about 0.0001 to 10000 mg/kg body weight and the parenteral daily dose is in the range of about 0.0001 to 10000 mg/kg body weight. Such a dose may be given as a single dose or divided into multiple doses.

(181) The concentration of the active ingredient in the endoparasite control agent of the present invention is generally about 0.001 to 100% by mass, preferably about 0.001 to 99% by mass, and more preferably about 0.005 to 20% by mass. The endoparasite control agent of the present invention may be a composition that can be directly administered, or a highly concentrated composition that needs to be diluted to a suitable concentration before use.

In such a combined use, two or more active ingredients may be mixed and formulated into a single preparation before administration, or two or more different preparations may be administered separately.

(183) The agricultural and horticultural insecticidal and acaricidal agent comprising the benzimidazole compound represented by the general formula (1) of the present invention or a salt thereof as an active ingredient has a remarkable control effect on the above-described pests which damage lowland crops, field crops, fruit trees, vegetables, other crops, ornamental flowering plants,

etc. The desired effect can be obtained when the agricultural and horticultural insecticidal and acaricidal agent is applied to nursery facilities for seedlings, paddy fields, fields, fruit trees, vegetables, other crops, ornamental flowering plants, etc. and their seeds, paddy water, foliage, cultivation media such as soil, or the like around the expected time of pest infestation, i.e., before the infestation or upon the confirmation of the infestation. In particularly preferable embodiments, the application of the agricultural and horticultural insecticidal and acaricidal agent utilizes so-called penetration and translocation. That is, nursery soil, soil in transplanting holes, plant foot, irrigation water, cultivation water in hydroponics, or the like is treated with the agricultural and horticultural insecticidal and acaricidal agent to allow crops, ornamental flowering plants, etc. to absorb the compound of the present invention through the roots via soil or otherwise.

(184) Examples of useful plants to which the agricultural and horticultural insecticidal and acaricidal agent of the present invention can be applied include, but are not particularly limited to, cereals (e.g., rice, barley, wheat, rye, oats, corn, etc.), legumes (e.g., soybeans, azuki beans, broad beans, green peas, kidney beans, peanuts, etc.), fruit trees and fruits (e.g., apples, citrus fruits, pears, grapes, peaches, plums, cherries, walnuts, chestnuts, almonds, bananas, etc.), leaf and fruit vegetables (e.g., cabbages, tomatoes, spinach, broccoli, lettuce, onions, green onions (chives and Welsh onions), green peppers, eggplants, strawberries, pepper crops, okra, Chinese chives, etc.), root vegetables (e.g., carrots, potatoes, sweet potatoes, taros, Japanese radishes, turnips, lotus roots, burdock roots, garlic, Chinese scallions, etc.), crops for processing (e.g., cotton, hemp, beet, hops, sugarcane, sugar beet, olives, rubber, coffee, tobacco, tea, etc.), gourds (e.g., Japanese pumpkins, cucumbers, watermelons, oriental sweet melons, melons, etc.), pasture grass (e.g., orchardgrass, *sorghum*, timothy, clover, alfalfa, etc.), lawn grass (e.g., Korean lawn grass, bent grass, etc.), spice and aromatic crops and ornamental crops (e.g., lavender, rosemary, thyme, parsley, pepper, ginger, etc.), ornamental flowering plants (e.g., chrysanthemum, rose, carnation, orchid, tulip, lily, etc.), garden trees (e.g., ginkgo trees, cherry trees, Japanese aucuba, etc.) and forest trees (e.g., *Abies sachalinensis*, *Picea jezoensis*, pine, yellow cedar, Japanese cedar, hinoki cypress, eucalyptus, etc.).

Also included are plants provided with tolerance to acetyl-CoA carboxylase inhibitors such as trioxime herbicides and aryloxy phenoxy propionic acid herbicides by a classical breeding technique, for example, SR corn and the like.

(187) Plants provided with tolerance to acetyl-CoA carboxylase inhibitors are described in Proc. Natl. Acad. Sci. USA, 87, 7175-7179 (1990), and the like. Further, acetyl-CoA carboxylase mutants resistant to acetyl-CoA carboxylase inhibitors are reported in Weed Science, 53, 728-746 (2005), and the like, and by introducing the gene of such an acetyl-CoA carboxylase mutant into plants by a gene recombination technique, or introducing a resistance-conferring mutation into acetyl-CoA carboxylase of plants, plants tolerant to acetyl-CoA carboxylase inhibitors can be engineered. Alternatively, by introducing a nucleic acid causing base substitution mutation into plant cells (a typical example of this technique is chimera-plasty technique (Gura T. 1999. Repairing the Genome's Spelling Mistakes. Science 285: 316-318)) to allow site-specific substitution mutation in

the amino acids encoded by an acetyl-CoA carboxylase gene, an ALS gene or the like of plants, plants tolerant to acetyl-CoA carboxylase inhibitors, ALS inhibitors or the like can be engineered. The agricultural and horticultural insecticidal and acaricidal agent of the present invention can be applied to these plants as well.

The hybrid toxin can be produced by combining some domains of these proteins differently from the original combination in nature with the use of a recombination technique. As the partially deficient toxin, a Cry1Ab toxin in which a part of the amino acid sequence is deleted is known. In the modified toxin, one or more amino acids of a naturally occurring toxin are substituted.

(190) Examples of the foregoing toxins and genetically modified plants capable of synthesizing these toxins are described in EP-A-0 374 753, WO 93/07278, WO 95/34656, EP-A-0 427 529, EP-A-451 878, WO 03/052073, etc.

(191) Due to the toxins contained in such genetically modified plants, the plants exhibit resistance to pests, in particular, Coleopteran insect pests, Hemipteran insect pests, Dipteran insect pests, Lepidopteran insect pests and nematodes. The above-described technologies and the agricultural and horticultural insecticidal and acaricidal agent of the present invention can be used in combination or used systematically.

(192) In order to control target pests, the agricultural and horticultural insecticidal and acaricidal agent of the present invention, with or without appropriate dilution or suspension in water etc., is applied to plants potentially infested with the target insect pests or nematodes in an amount effective for the control of the insect pests or nematodes. For example, in order to control insect pests and nematodes that may damage crop plants such as fruit trees, cereals and vegetables, foliar application and seed treatment such as dipping, dust coating and calcium peroxide coating can be performed. Further, treatment of soil or the like may also be performed to allow plants to absorb agrochemicals through their roots. Examples of such treatment include whole soil incorporation, planting row treatment, bed soil incorporation, plug seedling treatment, planting hole treatment, plant foot treatment, top-dressing, treatment of nursery boxes for paddy rice, and submerged application. In addition, application to culture media in hydroponics, smoking treatment, trunk injection and the like can also be performed.

(193) Further, the agricultural and horticultural insecticidal and acaricidal agent of the present invention, with or without appropriate dilution or suspension in water etc., can be applied to sites potentially infested with pests in an amount effective for the control of the pests. For example, it can be directly applied to stored grain pests, house pests, sanitary pests, forest pests, etc., and also be used for coating of residential building materials, for smoking treatment, or as a bait formulation.

(194) Exemplary methods of seed treatment include dipping of seeds in a diluted or undiluted fluid of a liquid or solid formulation for the permeation of agrochemicals into the seeds; mixing or dust coating of seeds with a solid or liquid formulation for the adherence of the formulation onto the surfaces of the seeds; coating of seeds with a mixture of an agrochemical and an adhesive carrier such as resins and polymers; and application of a solid or liquid formulation to the vicinity of seeds at the same time as seeding.

(195) The term “seed” in the above-mentioned seed treatment refers to a plant body which is in the early stages of cultivation and used for plant propagation. The examples include, in addition to a so-called seed, a plant body for vegetative propagation, such as a bulb, a tuber, a seed potato, a bulbil, a propagule, a discoid stem and a stem used for cuttage.

(196) The term “soil” or “cultivation medium” in the method of the present invention for using an agricultural and horticultural insecticide refers to a support medium for crop cultivation, in particular a support medium which allows crop plants to spread their roots therein, and the materials are not particularly limited as long as they allow plants to grow. Examples of the support medium include what is called soils, seedling mats and water, and specific examples of the materials include sand, pumice, vermiculite, diatomite, agar, gelatinous substances, high-molecular-weight substances, rock wool, glass wool, wood chip and bark.

(197) Exemplary methods of the application to crop foliage or to stored grain pests, house pests, sanitary pests, forest pests, etc. include application of a liquid formulation, such as an emulsifiable concentrate and a flowable, or a solid formulation, such as a wettable powder and a water-dispersible granule, after appropriate dilution in water; dust application; and smoking.

(198) Exemplary methods of soil application include application of a water-diluted or undiluted liquid formulation to the foot of plants, nursery beds for seedlings, or the like; application of a granule to the foot of plants, nursery beds for seedlings, or the like; application of a dust, a wettable powder, a water-dispersible granule, a granule or the like onto soil and subsequent incorporation of the formulation into the whole soil before seeding or transplanting; and application of a dust, a wettable powder, a water-dispersible granule, a granule or the like to planting holes, planting rows or the like before seeding or planting.

(199) To nursery boxes for paddy rice, for example, a dust, a water-dispersible granule, a granule or the like can be applied, although the suitable formulation may vary depending on the application timing, in other words, depending on the cultivation stage such as seeding time, greening period and planting time. A formulation such as a dust, a water-dispersible granule and a granule may be mixed with nursery soil. For example, such a formulation is incorporated into bed soil, covering soil or the whole soil. Simply, nursery soil and such a formulation may be alternately layered.

(200) In the application to paddy fields, a solid formulation, such as a jumbo, a pack, a granule and a water-dispersible granule, or a liquid formulation, such as a flowable and an emulsifiable concentrate, is applied usually to flooded paddy fields. In a rice planting period, a suitable formulation, as it is or after mixed with a fertilizer, may be applied onto soil or injected into soil. In addition, an emulsifiable concentrate, a flowable or the like may be applied to the source of water supply for paddy fields, such as a water inlet and an irrigation device. In this case, treatment can be accomplished with the supply of water and thus achieved in a labor-saving manner.

(201) In the case of field crops, their seeds, cultivation media in the vicinity of their plants, or the like may be treated in the period of seeding to seedling culture. In the case of plants of which the seeds are directly sown in the field, in addition to direct seed treatment, plant foot treatment during cultivation is preferable. Specifically, the treatment can be performed by, for example, applying a granule onto soil, or drenching soil with a formulation in a water-diluted or undiluted liquid form. Another preferable treatment is incorporation of a granule into cultivation media before seeding.

(202) In the case of culture plants to be transplanted, preferable examples of the treatment in the period of seeding to seedling culture include, in addition to direct seed treatment, drench treatment of nursery beds for seedlings with a formulation in a liquid form; and granule application to

nursery beds for seedlings. Also included are treatment of planting holes with a granule; and incorporation of a granule into cultivation media in the vicinity of planting points at the time of fix planting.
