### KICK STAND DEVICE

---

#### Abstract

A kickstand device is provided that includes a mount portion for attachment to a wheeled implement and a pivotable member pivotally connected to the mount portion. The pivotable member is pivotable about a pivot axis between a first position to engage ground and retain the wheeled implement in an upright orientation and a second position away from ground engagement. The pivotable member transfers a torque to the mount portion when pivoting about the pivot axis from the second position to the first position.

#### Background/Summary

## TECHNICAL FIELD

[0001] The present disclosure is directed towards a kickstand that may be used for a bicycle, electric bicycle, motorcycle, moped or similar.

## BACKGROUND

[0002] A kickstand is used to maintain a bicycle, electric bicycle, motorcycle, moped or similar in an upright orientation while the bicycle, motorcycle, moped or similar is stationary (e.g., parked).

[0003] The bicycle, electric bicycle, motorcycle, moped or similar imparts one or more forces to the kickstand due to at least the weight thereof. Additional forces may be imparted to the kickstand from other sources, such as operator actuation, etc.

## SUMMARY

[0004] This summary is provided to introduce a selection of concepts in a simplified form that are further described below in the detailed description. This summary is not intended to identify key factors or essential features of the claimed subject matter, nor is it intended to be used to limit the scope of the claimed subject matter.

[0005] In accordance with one or more aspects, the present disclosure provides a kickstand device that includes a mount portion for attachment to a wheeled implement and a pivotable member pivotally connected to the mount portion. The pivotable member is pivotable between a first position to engage ground and retain the wheeled implement in an upright orientation and a second position away from ground engagement. The mount portion includes a first mount location for connection to the wheeled implement and a second mount location for connection to the wheeled implement, with the first mount location being in a fore direction of the wheeled implement and the second mount location being in an aft direction of the wheeled implement, and the pivotable member being pivotally connected to the mount portion such that a pivot axis about which the pivotable member pivots between the first position and the second position is in a plane and the first mount location is to a first side of the plane and the second mount location is to a second side of the plane.

[0006] In accordance with one or more aspects, the present disclosure provides a kickstand device that includes a mount portion for attachment to a wheeled implement and a pivotable member pivotally connected to the mount portion. The pivotable member is pivotable about a pivot axis between a first position to engage ground and retain the wheeled implement in an upright orientation and a second position away from ground engagement. The pivotable member transfers a torque to the mount portion when pivoting about the pivot axis from the second position to the first position.

[0007] In accordance with one or more aspects, the present disclosure provides a wheeled implement that includes a frame, a plurality of wheels rotatably connected to the frame, and a kickstand device. The kickstand device includes a mount portion for attachment to the frame and a pivotable member pivotally connected to the mount portion. The pivotable member is pivotable between a first position to engage ground and retain the wheeled implement in an upright orientation and a second position away from ground engagement. The mount portion includes a first mount location for connection to the frame and a second mount location for connection to the frame, with the first mount location being in a fore direction of the wheeled implement and the second mount location being in an aft direction of the wheeled implement, and the pivotable member being pivotally connected to the mount portion such that a pivot axis about which the pivotable member pivots between the first position and the second position is in a plane and the first mount location is to a first side of the plane and the second mount location is to a second side of the plane.

[0008] The following description and annexed drawings set forth certain illustrative aspects and implementations. These are indicative of but a few of the various ways in which one or more aspects may be employed. Other aspects, advantages, and/or novel features of the disclosure will

become apparent from the following detailed description when considered in conjunction with the annexed drawings.

---

## Description

### DESCRIPTION OF THE DRAWINGS

[0009] FIG. 1 is a schematized, torn-away perspective illustration of an example kickstand device mounted upon an example wheeled implement (e.g., a bicycle) in accordance with one or more aspects of the present disclosure, and with the kickstand in a first position.

[0010] FIG. 2 is a view similar to FIG. 1, but with some portions of the bicycle removed to show some additional portions of the kickstand.

[0011] FIG. 3 is a schematized, torn-away perspective illustration of the example kickstand device and example wheeled implement (e.g., bicycle) of FIG. 1 from a different view point and with the kickstand in a second position.

[0012] FIG. 4 is a view similar to FIG. 3, but with some portions of the bicycle removed to show some additional portions of the kickstand.

[0013] FIG. 5 is a schematized, perspective illustration of the example kickstand device of FIG. 1, and with the kickstand in the first position.

[0014] FIG. 6 is a plan view of the kickstand device shown in FIG. 5.

[0015] FIG. 7 is a side view of the kickstand device shown in FIG. 5.

[0016] FIG. 8 is a top view of the kickstand device shown in FIG. 5.

### DETAILED DESCRIPTION

[0017] The claimed subject matter is now described with reference to the drawings, wherein like reference numerals are used to refer to like elements throughout. In the following description, for purposes of explanation, numerous specific details are set forth in order to provide an understanding of the claimed subject matter. It is evident, however, that the claimed subject matter may be practiced without these specific details. In other instances, structures and devices are illustrated in schematic or block diagram form in order to facilitate describing the claimed subject matter. Relative size, orientation, etc. of parts, components, etc. may differ from that which is illustrated while not falling outside of the scope of the claimed subject matter.

[0018] It is to be appreciated that, in one or more non-limiting examples, the present disclosure provides a kickstand device that includes a mount portion for attachment to a wheeled implement and a pivotable member pivotally connected to the mount portion. The pivotable member is pivotable between a first position to engage ground and retain the wheeled implement in an upright orientation and a second position away from ground engagement. The mount portion includes a first mount location for connection to the wheeled implement and a second mount location for connection to the wheeled implement, with the first mount location being in a fore direction of the wheeled implement and the second mount location being in an aft direction of the wheeled implement, and the pivotable member being pivotally connected to the mount portion such that a pivot axis about which the pivotable member pivots between the first position and the second position is in a plane and the first mount location is to a first side of the plane and the second mount location is to a second side of the plane.

[0019] Also, it is to be appreciated that, in one or more non-limiting examples, the present disclosure provides a kickstand device that includes a mount portion for attachment to a wheeled implement and a pivotable member pivotally connected to the mount portion. The pivotable member is pivotable about a pivot axis between a first position to engage ground and retain the wheeled implement in an upright orientation and a second position away from ground engagement. The pivotable member transfers a torque to the mount portion when pivoting about the pivot axis from the second position to the first position.

[0020] Also, it is to be appreciated that, in one or more non-limiting examples, the present disclosure provides a wheeled implement that includes a frame, a plurality of wheels rotatably connected to the frame, and a kickstand device. The kickstand device includes a mount portion for attachment to the frame and a pivotable member pivotally connected to the mount portion. The pivotable member is pivotable between a first position to engage ground and retain the wheeled implement in an upright orientation and a second position away from ground engagement. The mount portion includes a first mount location for connection to the frame and a second mount location for connection to the frame, with the first mount location being in a fore direction of the wheeled implement and the second mount location being in an aft direction of the wheeled implement, and the pivotable member being pivotally connected to the mount portion such that a pivot axis about which the pivotable member pivots between the first position and the second position is in a plane and the first mount location is to a first side of the plane and the second mount location is to a second side of the plane.

[0021] Referring to FIGS. **1-4**, an example of a kickstand device **10** mounted upon an example wheeled implement **12** in accordance with one or more aspect of the present disclosure is shown. Within the shown example, the example wheeled implement is a bicycle. However, such is a non-limiting example and the wheeled implement may be something other than a bicycle, such as an electric bicycle, motorcycle, moped or similar. Thus, it is to be appreciated that a bicycle is just one example wheeled implement and that various different wheeled implements are possible, contemplated and within the scope of the present disclosure.

[0022] The wheeled implement **12** (e.g., bicycle) includes a frame **20** and plural ground-engaging wheels **22** (only one wheel is shown in FIGS. **1** and **3** due to the tear-away of those figures). Within the shown example, the wheeled implement **12** (e.g., bicycle) includes two ground-engaging wheels **22**. It is to be appreciated that two ground-engaging wheels **22** is just one example and that various different numbers (e.g., three, four, etc.) of wheels are possible, contemplated and within the scope of the present disclosure.

[0023] The wheeled implement **12** (e.g., bicycle) includes various other structures. For example, the wheeled implement **12** (e.g., bicycle) may include structures (e.g., a seat or saddle) for one or more persons to ride in/upon the wheeled implement. The wheeled implement **12** (e.g., bicycle) may include structures (e.g., handlebars) for steering or directing the wheeled implement. The wheeled implement **12** (e.g., bicycle) may include structures for motivating the wheeled implement. Examples of such structures for motivating may include a manually operated arrangement (e.g., foot pedals and a drive link/chain) to drive at least one wheel, a motor arrangement (e.g., electric, fuel operated, etc.) and associated drive link/chain to drive at least one wheel, a braking arrangement, etc. The wheeled implement **12** (e.g., bicycle) may include structures to permit the wheeled implement to be folded (e.g., for transport, storage, etc.). The wheeled implement **12** (e.g., bicycle) may include many other structures. All various/other structures, and variations for constructions and configurations thereof, are possible, contemplated and within the scope of the present disclosure.

[0024] Focusing upon the frame **20**, the frame may have a variety of constructions and configurations. Some or all of the frame **20** may be metal (e.g., steel), but other materials are possible, contemplated and within the scope of the present disclosure. In part, the frame **20** may vary dependent upon the type of wheeled implement (e.g., bicycle, motorcycle, moped, etc.), the number of wheels, etc. The variety of constructions and configurations are possible, contemplated and within the scope of the present disclosure.

[0025] Within the shown example, the shown wheel **22** is located within a yoke, or fork, portion **26** of the frame **20**. Within an example, such yoke portion **26** may be considered to include a chainstay portion of the wheeled implement **12** (e.g., bicycle). It is to be appreciated that each wheel **22** is mounted (e.g., upon the frame **20**) for rotation relative to the frame. Also, it is to be appreciated that each wheel **22** is mounted (e.g., upon the frame **20**) so as to allow a possible engagement with the

ground. Also, it is to be appreciated that the frame **20** has a forward portion and a rearward/aft portion. Such fore and aft designations are simply a designation convention based upon the typical direction in which the wheeled implement **12** (e.g., bicycle) moves during operation. Of course, it is to be appreciated that it is possible that the wheeled implement **12** (e.g., bicycle) could be operated in reverse (i.e., to move in a reverse direction). However, such reverse direction operation would normally occur only a minimal amount of time and need not disturb a fore-aft designation convention for the wheeled implement **12** (e.g., bicycle). With the fore-aft designation convention being appreciated, it is to be further appreciated that any line extending between the forward portion and the aft portion may be considered to be along a fore-aft direction. Line **30** is an example fore-aft direction line.

[0026] Another portion **32** of the frame **20** extends to meet with a closed end of the yoke (e.g., chainstay) portion **26** of the frame **20**. The other portion **32** may be a portion extending from other, more forward portions of the wheeled implement **12** (e.g., bicycle). Within one example, the other portion **32** may be at an end of a down tube that extends from a head tube at which a front fork/handlebars arrangement is located. Within one example, the other portion **32** may be part of a support for a sprocket. It is to be appreciated that the other portion **32** certainly may have a variety of constructions, configuration and/or functions. Such variations are possible, contemplated and within the scope of the present disclosure.

[0027] It is to be noted that the location of the other portion **32** of the frame **20** meeting within the closed end of the yoke **26** is generally at/near a lowest point of the frame of the wheeled implement **12** (e.g., bicycle). As such, herein the other portion **32** of the frame **20** is referred to as the lower frame portion **32**. Of course, such location need not be the absolute lowest point of the frame **20**. It is to be noted that the location of the lower frame portion **32** meeting within the closed end of the yoke **26** is generally at/near a fore/aft midway point of the wheeled implement **12** (e.g., bicycle). Of course, such location need not be the absolute fore-aft middle point of the wheeled implement **12** (e.g., bicycle).

[0028] The lower frame portion **32** and the yoke **26** are secured/fastened together. Within an example, the lower frame portion **32** and the yoke **26** are welded together. Of course, it is to be appreciated that such securing/fastening certainly may have a variety of constructions, configuration and/or functions. Such variations are possible, contemplated and within the scope of the present disclosure.

[0029] Associated with the securing/fastening of the lower frame portion **32** and the yoke **26** together, a plate portion **36** extends between some of the lower frame portion **32** and some of the yoke **26**. The plate portion **36** is secured/fastened in place to both of the lower frame portion **32** and the yoke **26**. Within an example, the plate portion **36** is welded to both the lower frame portion **32** and the yoke **26**. Of course, it is to be appreciated that such securing/fastening certainly may have a variety of constructions, configuration and/or functions. Such variations are possible, contemplated and within the scope of the present disclosure. The plate portion **36** may add some stability, rigidity, strength, or the like to the securing/fastening of the lower frame portion **32** and the yoke **26**. The plate portion **36** may also provide additional function discussed further below.

[0030] It is to be noted that various additional portions of the wheeled implement **12** (e.g., bicycle) may be at/near (e.g., in the vicinity) the location of the other portion **32** of the frame **20** meeting within the closed end of the yoke **26**. Such additional portions include a possible fender, a possible braking structure, etc. As such, it is to be appreciated that a certain amount of space congestion may be present at the location of the other portion **32** of the frame **20** meeting within the closed end of the yoke **26**.

[0031] The kickstand device **10** is for attachment to the wheeled implement **12** (e.g., bicycle). Within the shown example, the kickstand device **10** is attached to the frame **20**. Specifically in the shown example, the kickstand device **10** is attached at the location of the lower frame portion **32** meeting within the closed end of the yoke **26**. The kickstand device **10** includes a mount portion **42**

for attachment to the frame **20** of the wheeled implement **12** and a pivotable member **44** pivotally connected to the mount portion. Some or all of the kickstand device **10** may be metal (e.g., steel), but other materials are possible, contemplated and within the scope of the present disclosure.

[0032] Focusing upon the pivotable member **44**, the pivotable member is pivotable between a first position, which is shown in FIGS. **1**, **2** and **5-8**, and a second position, which is shown in FIGS. **3** and **4**. In the first position, the pivotable member **44** is to engage ground **46** (FIGS. **1** and **2**) and retain the wheeled implement **12** in an upright orientation when the wheeled implement is stationary. In the second position, the pivotable member **44** is away from ground engagement. The second position may be considered a storage or stowed position. The pivotable member **44** is in the second position during movement operation of the wheeled implement **12**.

[0033] The pivotable member **44** may have any of a variety of constructions and configurations. Such variations are possible, contemplated and within the scope of the present disclosure. Within the shown example, the pivotable member **44** includes at least one leg **48A** for extending to engage the ground **46** when in the first position. Specifically, within the shown example, the pivotable member **44** includes two legs **48A**, **48B** for extending to engage the ground **46**.

[0034] The legs **48A**, **48B** may have any of a variety of constructions and configurations. Within the shown example, each leg **48A**, **48B** including a respective foot portion **52A**, **52B** to engage ground when the pivotable member **44** is in the first position. Also, within the shown example, the legs **48A**, **48B** join together at a location adjacent to the mount portion **42** so that the pivotable member **44** is a unitary member. Various additional portions/features for the pivotable member **44** may be provided for strength, durability, functionality, appearance, etc. Such various additional portions/features are possible, contemplated and within the scope of the present disclosure.

[0035] As mentioned, the pivotable member **44** is pivotable relative to the mount portion **42**. Such is provided via a pivot connection **56** between the pivotable member **44** and the mount portion **42**. The pivot connection **56** may have a variety of constructions and configurations. Such variations of constructions and configurations are possible, contemplated and within the scope of the present disclosure. Within the shown example, the pivot connection **56** includes a pivot pin (or axle) **58** (see FIGS. **6** and **8**) that extends through a bore portion **60** (see FIG. **6**) of the pivotable member **44** and two bore portions **62** (see FIG. **6**) of the mount portion **42**. The bore portions **62** of the mount portion **42** straddle the bore portion **60** of the pivotable member **44** and provide for a yoke that bounds the bore portion of the pivotable member, with the pivot pin **58** entrapped therein.

[0036] It is to be appreciated that the pivot pin (or axle) **58** and/or the bore portion **60** may have a variety of constructions, configurations, features, additional/associated/ancillary structures, etc. Such varieties are possible, contemplated and within the scope of the present disclosure. As some examples, the pivot pin (or axle) **58** and/or the bore portion **60** has additional/associated/ancillary structures of sliding bushings, bearings and/or similar. Such additional/associated/ancillary structures may help provide for smooth relative rotation, etc. It is to be appreciated and understood that the reference numerals **58** and **60** within the figures additionally identifies all of such possible varieties, including such additional/associated/ancillary structures that may be present. However, for the sake of being exceedingly clear, an additional reference numeral of **59** is provided within the figures (see FIG. **6**) to identify all of such possible varieties, including such additional/associated/ancillary structures that is/are, or may be, present. Accordingly, it is to be appreciated that reference numerals **58**, **60**, and **59** as needed, show structure, e.g., at least one of sliding bushings and bearings, for aiding relative rotation between the pivotable member **44** is pivotable relative to the mount portion **42**.

[0037] The pivotable member **44** pivots (e.g., rotates) relative to the mount portion **42** about the pivot pin **58**. As such, a pivot axis **66** (see FIGS. **3**, **4** and **6-8**) of the pivotable member **44** is at (e.g., along) the pivot pin **58**. It is to be appreciated that the pivot pin **58**, and thus the pivot axis **66**, is transverse to the fore-aft direction **30** of the wheeled implement **12**. Within the shown example, the pivot pin **58**, and thus the pivot axis **66**, is generally perpendicular to the fore-aft direction **30** of

the wheeled implement **12**. So, it can be considered that the pivot axis **66** is in a plane **70** (see FIGS. **7** and **8**). It is to be noted that within FIG. **8**, since the pivot axis **66** is in the plane **70**, both the pivot axis **66** and the plane **70** are being viewed from a top view and thus the pivot axis **66** is coincident with the plane **70** that being viewed from its edge.

[0038] The plane **70** extends transverse to the fore-aft direction **30** of the wheeled implement **12** (note that the fore-aft direction **30** is added to FIG. **7** for reference, with the plane **70** being viewed from a side edge). Moreover, within the shown example, the plane **70** containing the pivot axis **66** is generally perpendicular to the fore-aft direction **30** of the wheeled implement **12**. For reference, in the example shown in FIG. **6**, the plane **70** (not labeled in FIG. **6**) containing the axis **66** is the same as the plane of the sheet containing the drawing of FIG. **6**. Also for reference, in the example shown in FIGS. **7** and **8**, the plane **70** containing the axis **66** is generally perpendicular to the plane of the sheet containing those respective drawings.

[0039] A coil tension spring **74** and/or other biasing member also connects the pivotable member **44** to the mount portion **42** (shown fully connected in FIGS. **3** and **4**, partially disconnected in FIGS. **1**, **2** and **5-8**). The spring **74** can help hold the pivotable member **44** in each of the first and second positions. It should be noted that the ends of the spring **74** are located a short distance from the pivot axis **66**. Moreover, the spring **74** is elongated (i.e., within tension increased) when the pivotable member **44** is moved between the first and second positions. As such, the spring **74** acts as an over-center spring.

[0040] Focusing upon the mount portion **42**, the mount portion engages with the frame **20** at the location of the lower frame portion **32** meeting within the closed end of the yoke **26**. Within the shown example, the mount portion **42** engages within the plate portion **36** of the frame **20**. Also, the mount portion **42** engages within the lower frame portion **32** of the frame **20**. The mount portion **42** includes a plate portion **78** that abuts against a lower surface of the lower frame portion **32** and the plate portion **36** of the frame **20**.

[0041] The mount portion **42** includes a plurality of mount locations (e.g., **80A-80C**) for connection of the mount portion **42** to the wheeled implement **12**. It is to be appreciated that the mount locations (e.g., **80A-80C**) may have a variety of constructions and configuration. Such variations are possible, contemplated and within the scope of the present disclosure. Within the shown example, the mount locations (e.g., **80A-80C**) include bolt/nut arrangements. Within the shown example, three mount locations (e.g., **80A-80C**), and thus three bolt/nut arrangements, are present. Of course, a different plurality of mount locations is possible, contemplated and within the scope of the present disclosure.

[0042] In view of the example mount locations (e.g., **80A-80C**) including bolt/nut arrangements, the frame **20** includes locations for receiving such bolt/nut arrangements. Within the shown example, the frame **20** includes holes for receiving the bolts, with the nuts being tightened onto the bolts to hold the bolts, and thus the mount portion **42** relative to the frame **20**. It is to be appreciated that the bolt/nut arrangements (e.g., **80A-80C**) may include other components/structures such as washers, bushing and the like. Examples of such other components/structures are shown within the figures.

[0043] Within the shown example, one (e.g., a first) bolt and nut arrangement (e.g., **80A**) is located to engage with the lower frame portion **32** of the frame **20** and two (e.g., a second and a third) bolt and nut arrangements (e.g., **80B** and **80C**) are located to engage with the plate portion **36** of the frame. Accordingly, the frame has a hole extending through the lower frame portion **32** of the frame **20** to receive the bolt of the first bolt and nut arrangement (e.g., **80A**) and the frame has holes extending through the plate portion **36** of the frame for receiving the bolts of the second and third bolt and nut arrangements (e.g., **80B** and **80C**).

[0044] An axis extending along the elongation of the bolt of the first bolt and nut arrangement (e.g., **80A**) is designated a first axis **82A**. An axis extending along the elongation of the bolt of the second bolt and nut arrangement (e.g., **80B**) is designated a second axis **82B**. An axis extending

along the elongation of the bolt of the third bolt and nut arrangement (e.g., **80C**) is designated a third axis **82C**.

[0045] As can be appreciated from FIGS. **7** and **8**, the axes **82A-82C** are generally parallel to the plane **70** in which the pivot axis **66** is located. Moreover, the axes **82A-82C** are located away from the plane **70** in which the pivot axis **66** is located. Specifically, the axes **82A-82C** are spaced along the fore-aft direction **30**, away from the plane **70**. As such, the axes **82A-82C**, and thus the mount locations (e.g., bolt and nut arrangements, **80A-80C**) are spaced along the fore-aft direction **30**, away from the pivot location of the pivotable member **44**.

[0046] It is to be noted that some (e.g., a portion or segment) of the mount portion **42** (e.g., **86A**) is located forward, along the fore-aft direction **30**, of the plane **70** in which the pivot axis **66** is located. Some (e.g., the first, **80A**) of the mount locations are located at the forward segment **86A** of the mount portion **42**. In the shown example, the first mount location **80A** is located at the forward segment **86A**. It is to be noted that some (e.g., a portion or segment) of the mount portion **42** (e.g., **86B**) is located rearward, along the fore-aft direction **30**, of the plane **70** in which the pivot axis **66** is located. See FIGS. **7** and **8**. Some (e.g., the second and third, **80B** and **80C**) of the mount locations are located at the aft (e.g., rearward) segment **86B** of the mount portion **42**. In the shown example, the second and third mount locations **80B** and **80C** are located at the aft (e.g., rearward) segment **86B**.

[0047] Accordingly, it is to be noted that some (e.g., the first, **80A**) of the mount locations are located forward, along the fore-aft direction **30**, of the plane **70** in which the pivot axis **66** is located. So, within the shown example, the first mount location/bolt and nut arrangement **80A** is located forward of the plane **70** in which the pivot axis **66** is located. It is to be noted that some (e.g., the second and third, **80B** and **80C**) of the mount locations are located rearward, along the fore-aft direction **30**, of the plane **70** in which the pivot axis **66** is located. So, within the shown example, the second and third mount locations/bolt and nut arrangements **80B** and **80C** are located rearward of the plane **70** in which the pivot axis **66** is located.

[0048] It is to be noted that the fore and aft (e.g., forward and rearward) segments **86A** and **86B** are identified generally via brackets in the FIGS. **7** and **8**. It is to be appreciated that the use of brackets is to be taken as a guideline and that variations of the demarcations of forward and rearward may be varied.

[0049] It is to be noted that force is imparted to the pivotable member **44** as the pivotable member proceeds toward the first position (see FIG. **7** for an example force/force direction shown therein). Such force includes force caused from the weight of the wheeled implement **12** and/or momentum of the wheeled implement **12** during movement of the pivotable member **44** toward the first position. It is to be appreciated that operation of the kickstand device **10** may include some elevation of a rearward portion (e.g., a rearward wheel **22**) of the wheeled implement **12** up away from ground **46** during movement of the pivotable member **44** toward the first position. It is to be appreciated that the kickstand device **10** may hold a rearward portion (e.g., a rearward wheel **22**) of the wheeled implement **12** up at some elevation away from ground **46** while the pivotable member **44** toward the first position. Such may be considered a parked condition. There may be force imparted when in the parked condition.

[0050] The force imparted to the pivotable member **44** translates to rotational torque force being transmitted to the mount portion **42**. The rotational torque at the mount portion **42** is a rotational force generally at the pivot axis **66**. In FIG. **7**, the rotational torque is clockwise generally about the pivot axis **66**. Accordingly, an aft or rearward segment of the mount portion **42** tends to receive a downward (as viewed in FIG. **7**) force and a fore or forward segment of the mount portion **42** tends to receive an upward (as viewed in FIG. **7**) force. In general, the aft segment of the mount portion **42** is rearward of the plane **70** (e.g., right of the plane **70** as viewed in FIG. **7**) and the fore segment of the mount portion **42** is forward of the plane **70** (e.g., left of the plane **70** as viewed in FIG. **7**). It is to be appreciated that the downward (as viewed in FIG. **7**) force upon the aft segment of the

mount portion **42** may try to distend (e.g., bend) the aft segment of the mount portion **42** away from the frame **20**. To be clear, the downward force is a force that may try to bend the mount portion **42**. [0051] However, in accordance with at least an aspect of the present disclosure, the plane **70** containing the pivot axis **66**, and thus the pivot connection **56**, is located between at least some of the mount locations along the fore-aft direction **30**. With the shown example, the plane **70** containing the pivot axis **66**, and thus the pivot connection **56**, is located between the first mount location **80A** and the second and third mount locations **80B** and **80C**. Within the shown example and a specific example description, the plane **70** containing the pivot axis **66**, and thus the pivot connection **56**, is located between the first mount location **80A** and the second mount location **80B**. Within the shown example and a specific example description, the plane **70** containing the pivot axis **66**, and thus the pivot connection **56**, is located between the first mount location **80A** and the third mount location **80C**. Another way of considering the topic is that the fore and aft segments **86A** and **86B** of the mount portion **42** are located on opposed sides of the pivotal connection **66** of the pivot member to the mount portion. Each of the fore and aft segments **86A**, **86B** has at least one respective mount location **82A-82C** for connection to the wheeled implement **12**.

[0052] It is to be recalled that the pivotable member **44** is capable of transferring a force (e.g., a torque force) to the mount portion **42**. Such transfer of force may be associated with the pivotable member **44** proceeding toward the first position (see FIGS. **1**, **2** and **5-8**) and being engaged with the ground **46**. Also recall that the mount portion **42** has fore and aft segments **86A**, **86B**, with respective mount locations **80A** and **80B/80C**, that are located on opposed sides of the pivotal connection of the pivot member to the mount portion. Such positioning of mount locations **80A** and **80B/80C** helps to prevent bending of the mount portion **42**.

[0053] It is to be appreciated that spacings of the mount locations **80A-80C** from the plane **70** in the fore-aft direction may be varied and that such variation is possible, contemplated and within the scope of the present disclosure. With the shown example, the first mount location **80A** is at a distance A (see FIG. **8**), as measured to the axis **82A**, from the plane **70** in the fore-aft direction. Within a specific example, the distance A is 47 mm, but again a different distance is possible, contemplated and within the scope of the present disclosure. With the shown example, the second and third mount locations **80B** and **80C** are both at a distance B (see FIG. **8**), as measured to the axes **82B** and **82C**, from the plane **70** in the fore-aft direction. Within a specific example, the distance B is 21 mm, but again a different distance is possible, contemplated and within the scope of the present disclosure. It is also to be noted that the second and third mount locations **80B** and **80C** need not be at the same distance B (i.e., they may be at different, respective distances). Here also, such example(s) of mount location(s) (e.g., **80A-80C**) may help to prevent bending of the mount portion.

[0054] So, in accordance with at least one aspect of the present disclosure, with at least some of the plurality of mount locations being spaced from each other in a fore-aft direction of the wheeled implement, and the pivotable member being pivotally connected to the mount portion at a location such that a pivot axis about which the pivotable member pivots is in a plane that is located intermediate of the at least some of the plurality of mount locations in the fore-aft direction of the wheeled implement, such may help prevent bending of the mount portion **42**.

[0055] It is to be appreciated that spacings of the second and third mount locations **80B** and **80C** from each other in the lateral (e.g., left and right as viewed in FIG. **8**) direction may be varied and that such variation is possible, contemplated and within the scope of the present disclosure. With the shown example, the second mount location **80B** is at a distance C (see FIG. **8**) from the third mount location **80C**, as measured between the axes **82B** and **82C** in the lateral direction. Within a specific example, the distance C is 80 mm, but again a different distance is possible, contemplated and within the scope of the present disclosure. Similarly, it is to be appreciated that the spacings of the second and third mount locations **80B** and **80C** from the first mount location **80A** in the lateral (e.g., left and right as viewed in FIG. **8**) direction may be varied and that such variation is possible,

contemplated and within the scope of the present disclosure. With the shown example, the second mount location **80B** is at a distance **D** (see FIG. **8**) from the first mount location **80A**, as measured between the axes **82A** and **82B** in the lateral direction. Within a specific example, the distance **D** is 40 mm, but again a different distance is possible, contemplated and within the scope of the present disclosure.

[0056] It is to be appreciated that the pivot pin **58**, and specifically the pivot axis **66**, is located below the plate portion **78** of the mount portion **42**. Within an example, the pivot axis **66**, is located at a distance **E** (see FIG. **6**) below a bottom surface of the plate portion **78**. Within a specific example, the distance **E** is 29.5 mm. But, it is to be noted that variation (e.g., distance variation) is possible, contemplated and within the scope of the present disclosure. Distance between the plate portion and the pivot axis **66** may be a factor in the force that may try to bend the mount portion **42**. Thus, in accordance with at least one aspect of the present invention, the mount locations **80A** and **80B/80C** help to prevent bending of the mount portion **42**.

[0057] In accordance with at least one aspect of the present disclosure, at least some of the plurality of mount locations includes at least one mount location forward of the plane in which the pivotable member pivots and at least one mount location rearward of the plane in which the pivotable member pivots. In accordance with at least one aspect of the present disclosure, the at least one mount location rearward of the plane in which the pivotable member pivots includes two mount locations. In accordance with at least one aspect of the present disclosure, at least one of the plurality of mount locations includes a mount hole for receiving a fastener. In accordance with at least one aspect of the present disclosure, the fastener includes a bolt. In accordance with at least one aspect of the present disclosure, each of the plurality of mount locations includes a mount hole for receiving a fastener. In accordance with at least one aspect of the present disclosure, each fastener is a bolt.

[0058] In accordance with at least one aspect of the present disclosure, the pivotable member includes at least one leg, with the leg including a foot portion to engage ground when the pivotable member is in the first position. In accordance with at least one aspect of the present disclosure, the pivotable member includes two legs, with each leg including a respective foot portion to engage ground when the pivotable member is in the first position. In accordance with at least one aspect of the present disclosure, the mount portion is configured to attach to a frame of the wheeled implement. In accordance with at least one aspect of the present disclosure, the mount portion includes at least an additional portion configured to interact within the frame of the wheeled implement. In accordance with at least one aspect of the present disclosure, the additional portion of the mount portion includes a plate segment.

[0059] Recall that the pivotable member may transfer a torque to the mount portion associated with the pivotable member proceeding toward the first position and being engaged with the ground. Also, recall that the mount portion has fore and aft segments that are located on opposed sides of the pivotal connection of the pivot member to the mount portion, and each of the fore and aft segments has at least one respective mount location for connection to the wheeled implement.

[0060] So, in accordance with at least one aspect of the present disclosure, at least one mount location is forward of a plane in which the pivotable member pivots and at least one mount location is rearward of the plane in which the pivotable member pivots.

[0061] In accordance with at least one aspect of the present disclosure, the at least one mount location rearward of the plane in which the pivotable member pivots includes two mount locations. In accordance with at least one aspect of the present disclosure, at least some of the mount locations includes a mount hole for receiving a fastener. In accordance with at least one aspect of the present disclosure, the fastener includes a bolt. In accordance with at least one aspect of the present disclosure, each of the mount locations includes a mount hole for receiving a fastener. In accordance with at least one aspect of the present disclosure, each fastener is a bolt.

[0062] It is to be appreciated that the broad interpretations and options are within the scope of the

present disclosure.

[0063] As mentioned, it is contemplated that examples presented within the present disclosure are non-limiting. The details are such non-limiting examples and are provided only to illustrate just one, of many, options to provide the device. Again, many options for providing the device are contemplated and are within the scope of the present disclosure.

[0064] It is to be appreciated and understood that all of the discussed examples within the scope of the present disclosures are usable alone or in combinations. Moreover, all of the examples within the scope of the present disclosure are usable within various use environments. Accordingly, such variations, options, etc. are within the scope of the present disclosure. All of the terms, phrases, etc. are to be broadly interpreted.

[0065] It is to be appreciated that various examples and/or aspects are provided by the present disclosure. Some of such are presented above. Other examples are contemplated and are with the scope of the present disclosure.

[0066] Although the subject matter has been described in language specific to structural features or methodological acts, it is to be understood that the subject matter defined in the appended claims is not necessarily limited to the specific features or acts described above. Rather, the specific features and acts described above are disclosed as example forms of implementing at least some of the claims.

[0067] Various operations of embodiments are provided herein. The order in which some or all of the operations described should not be construed to imply that these operations are necessarily order dependent. Alternative ordering will be appreciated having the benefit of this description. Further, it will be understood that not all operations are necessarily present in each embodiment provided herein. Also, it will be understood that not all operations are necessary in some embodiments.

[0068] Many modifications may be made to the instant disclosure without departing from the scope or spirit of the claimed subject matter. Unless specified otherwise, “first,” “second,” or the like are not intended to imply a temporal aspect, a spatial aspect, an ordering, etc. Rather, such terms are merely used as identifiers, names, etc. for features, elements, items, etc. For example, a first location and a second location correspond to location A and location B or two different or two identical locations or the same location.

[0069] Moreover, “exemplary” and/or the like is used herein to mean serving as an example, instance, illustration, etc., and not necessarily as advantageous. As used in this application, “or” is intended to mean an inclusive “or” rather than an exclusive “or”. In addition, “a” and “an” as used in this application are to be construed to mean “one or more” unless specified otherwise or clear from context to be directed to a singular form. Also, at least one of A and B or the like means A or B or both A and B. Furthermore, to the extent that “includes”, “having”, “has”, “with”, or variants thereof are used in either the detailed description or the claims, such terms are intended to be inclusive in a manner similar to “comprising”.

[0070] Also, although the disclosure has been illustrated and described with respect to one or more implementations, equivalent alterations and modifications will occur to others skilled in the art based upon a reading and understanding of this specification and the annexed drawings. The disclosure includes all such modifications and alterations and is limited only by the scope of the following claims. In particular regard to the various functions performed by the above-described components (e.g., elements, resources, etc.), the terms used to describe such components are intended to correspond, unless otherwise indicated, to any component which performs the specified function of the described component (e.g., that is functionally equivalent), even though not structurally equivalent to the disclosed structure. In addition, while a particular feature of the disclosure may have been disclosed with respect to only one of several implementations, such feature may be combined with one or more other features of the other implementations as may be desired and advantageous for any given or particular application.

## Claims

1. A kickstand device comprising: a mount portion for attachment to a wheeled implement; and a pivotable member pivotally connected to the mount portion, the pivotable member being pivotable between a first position to engage ground and retain the wheeled implement in an upright orientation and a second position away from ground engagement; wherein the mount portion comprises a first mount location for connection to the wheeled implement and a second mount location for connection to the wheeled implement, with the first mount location being in a fore direction of the wheeled implement and the second mount location being in an aft direction of the wheeled implement, and the pivotable member being pivotally connected to the mount portion such that a pivot axis about which the pivotable member pivots between the first position and the second position is in a plane and the first mount location is to a first side of the plane and the second mount location is to a second side of the plane.
2. The device as set forth in claim 1, wherein the mount portion comprises a third mount location in the aft direction of the wheeled implement and to the second side of the plane.
3. The device as set forth in claim 2, wherein the mount portion comprises a fourth mount location in the fore direction of the wheeled implement and to the first side of the plane.
4. The device as set forth in claim 1, wherein the mount portion comprises a third mount location in the fore direction of the wheeled implement and to the first side of the plane.
5. The device as set forth in claim 4, wherein the mount portion comprises a fourth mount location in the aft direction of the wheeled implement and to the second side of the plane.
6. The device as set forth in claim 1, including at least one of sliding bushings and bearings for aiding relative rotation between the pivotable member and the mount portion.
7. The device as set forth in claim 1, wherein the pivotable member comprises a leg, with the leg comprising a foot portion to engage ground when the pivotable member is in the first position.
8. The device as set forth in claim 7, wherein the pivotable member comprises a second leg, with the second leg comprising a second foot portion to engage ground when the pivotable member is in the first position.
9. The device as set forth in claim 8, wherein the second leg is diametrically opposite the first leg relative to the mount portion.
10. The device as set forth in claim 7, comprising a biasing member to facilitate movement of the leg between the first position and the second position.
11. The device as set forth in claim 1, wherein the mount portion is configured to attach to a frame of the wheeled implement.
12. The device as set forth in claim 11, wherein the mount portion comprises an additional portion configured to interact within the frame of the wheeled implement.
13. A kickstand device comprising: a mount portion for attachment to a wheeled implement; and a pivotable member pivotally connected to the mount portion, the pivotable member pivotable about a pivot axis between a first position to engage ground and retain the wheeled implement in an upright orientation and a second position away from ground engagement; wherein the pivotable member transfers a torque to the mount portion when pivoting about the pivot axis from the second position to the first position.
14. The device as set forth in claim 13, wherein the mount portion comprises a first mount location for connection to the wheeled implement and a second mount location for connection to the wheeled implement, with the first mount location being in a fore direction of the wheeled implement and the second mount location being in an aft direction of the wheeled implement, and the first mount location is to a first side of a plane within which the pivot axis lies and the second mount location is to a second side of the plane.
15. The device as set forth in claim 14, wherein the mount portion comprises a third mount location

in the aft direction of the wheeled implement and to the second side of the plane.

**16.** The device as set forth in claim 14, wherein the mount portion comprises a third mount location in the fore direction of the wheeled implement and to the first side of the plane.

**17.** The device as set forth in claim 14, wherein at least one of the first mount location or the second mount location comprise a portion that defines a mount hole for receiving a fastener.

**18.** The device as set forth in claim 17, wherein the fastener comprises a bolt.

**19.** The device as set forth in claim 13, comprising a biasing member to facilitate pivoting of the pivotable member about the pivot axis.

**20.** A wheeled implement comprising: a frame; a plurality of wheels rotatably connected to the frame; and a kickstand device comprising: a mount portion for attachment to the frame; and a pivotable member pivotally connected to the mount portion, the pivotable member being pivotable between a first position to engage ground and retain the wheeled implement in an upright orientation and a second position away from ground engagement; wherein the mount portion comprises a first mount location for connection to the frame and a second mount location for connection to the frame, with the first mount location being in a fore direction of the wheeled implement and the second mount location being in an aft direction of the wheeled implement, and the pivotable member being pivotally connected to the mount portion such that a pivot axis about which the pivotable member pivots between the first position and the second position is in a plane and the first mount location is to a first side of the plane and the second mount location is to a second side of the plane.

---
