### RAZOR CARTRIDGE

---

#### Abstract

A razor cartridge is provided comprising: a housing and a blade assembly mounted to the housing. The blade assembly may comprise at least one razor blade defined by a substrate comprising a first portion and a second portion. The first portion may comprise first and second outer surfaces. The second portion may comprise first and second sections separated by a split line. The first section may comprise a first facet and an end facet. The second section may comprise an end facet. The end facets of the first and second sections may converge at a tip to define a cutting edge. A shoulder may be positioned between the first facet and the end facet of the first section and define a skin-contacting surface.

## Background/Summary

### FIELD OF THE INVENTION

[0001] The invention generally relates to razor blade cartridges and more particularly to razor blade cartridges having razor blades with a skin contacting shoulder.

### BACKGROUND OF THE INVENTION

[0002] Razor cartridges typically comprise a cartridge housing including cap and guard structures and one or more razor blade assemblies located between the cap and guard structures. A plane may extend between the upper surfaces of the cap and guard structures to define a shaving plane. The razor blade assemblies typically comprise razor blades having a symmetrical shape. It is well known that the shaving geometry of a razor cartridge is important in determining the shaving performance of the cartridge. The shaving geometry defines the position and orientation of the blades in relation to other skin contacting parts, in particular, the cap structure and guard structure of the razor cartridge. One parameter of the shaving geometry is blade exposure, which is the perpendicular distance by which the cutting edge of a blade protrudes above or below the shaving plane. While current razor blades perform adequately, in order for next generation products to perform better, improvements in shaving geometry such as blade shape can be made.

### SUMMARY OF THE INVENTION

[0003] In accordance with a first aspect of the disclosure, a razor cartridge is provided comprising: a housing and a blade assembly mounted to the housing. The blade assembly may comprise at least one razor blade defined by a substrate comprising a first portion and a second portion. The first portion may comprise first and second outer surfaces. The second portion may comprise first and second sections separated by a split line. The first section may comprise a first facet and an end facet. The second section may comprise an end facet. The end facets of the first and second sections may converge at a tip to define a cutting edge. A shoulder may be positioned between the first facet and the end facet of the first section and define a skin-contacting surface.

[0004] The end facet of the second section may comprise a second facet and the end facet of the first section may comprise a third facet.

[0005] The second section may further comprise a second facet extending from the second outer surface of the first portion. The end facet of the second section may comprise a fourth facet and the end facet of the first section may comprise a third facet.

[0006] The end facet of the second section may be located closer to the split line than the first facet and the end facet of the first section.

[0007] The first and second outer surfaces of the first portion of the substrate may be generally parallel to one another and the split line may pass through the tip and may be generally parallel to the first and second outer surfaces of the first portion.

[0008] The first and second sections of the second portion may define asymmetric first and second sections.

[0009] The first facet may extend directly from the first outer surface of the first portion.

[0010] The housing may comprise a cap structure and a guard structure. A shaving plane may be defined between the cap structure and the guard structure. The blade assembly may further comprise a blade support member to which the razor blade substrate is coupled. The blade support member may be configured such that the shoulder positioned between the first facet and the end

facet of the first section is positioned in or near the shaving plane. The shoulder may be positioned near the shaving plane when the shoulder is located above or below the shaving plane by a distance less than about 0.2 mm and less than about 0.5 mm, respectively, from the shaving plane.

[0011] The cartridge may further comprise first and second clips mounted to the housing and engaging opposing ends of the shoulder of the substrate defining the razor blade to secure the razor blade within the housing.

[0012] In accordance with a second aspect of the present disclosure, a razor cartridge is provided comprising a housing; a first blade assembly mounted to the housing, the first blade assembly comprising a first razor blade; and a second blade assembly mounted to the housing, the second blade assembly comprising a second razor blade. At least one of the first razor blade or the second razor blade may be defined by a substrate comprising a first portion comprising first and second outer surfaces and a second portion comprising first and second sections separated by a split line. The first section may comprise a first facet and an end facet. The second section may comprise an end facet. The end facets of the first and second sections may converge at a tip to define a cutting edge. A shoulder may be positioned between the first facet and the end facet of the first section and defines a skin-contacting surface.

[0013] The end facet of the second section may comprise a second facet and the end facet of the first section may comprise a third facet.

[0014] The second section may further comprise a second facet extending from the second outer surface of the first portion. The end facet of the second section may comprise a fourth facet and the end facet of the first section may comprise a third facet.

[0015] The end facet of the second section may be located closer to the split line than the first facet and the end facet of the first section.

[0016] The first and second outer surfaces of the first portion of the substrate may be generally parallel to one another and the split line may pass through the tip and may be generally parallel to the first and second outer surfaces of the first portion.

[0017] The first and second sections of the second portion may define asymmetric first and second sections.

[0018] The first facet may extend directly from the first outer surface of the first portion.

[0019] The housing may further comprise a cap structure and a guard structure. A shaving plane may be defined between the cap structure and the guard structure. The first blade assembly may further comprise a blade support member to which the first razor blade is coupled. The blade support member may be configured such that the shoulder of the substrate defining the first razor blade is positioned in or near the shaving plane. The shoulder may be positioned near the shaving plane when the shoulder is located above or below the shaving plane by a distance less than about 0.2 mm and less than about 0.5 mm, respectively, from the shaving plane.

[0020] The cartridge may further comprise first and second clips mounted to the housing and engaging opposing ends of the shoulder of the substrate defining the first razor blade to secure the first razor blade in the housing.

[0021] A shaving plane may be defined for the first razor blade by a plane extending from an uppermost surface portion of a skin contacting element in front of and behind the cutting edge of the first razor blade. The first blade assembly may further comprise a blade support member to which the first razor blade is coupled. The blade support member may be configured such that the shoulder of the first razor blade is positioned in or near the shaving plane.

---

## Description

### BRIEF DESCRIPTION OF THE DRAWINGS

[0022] While the specification concludes with claims particularly pointing out and distinctly

claiming the subject matter which is regarded as forming the present invention, it is believed that the invention will be better understood from the following description which is taken in conjunction with the accompanying drawings in which like designations are used to designate substantially identical elements, and in which:

[0023] FIG. 1 is a front view of a razor system comprising a handle and a razor cartridge in accordance with the present disclosure;

[0024] FIG. 2A is a cross-sectional view of the razor cartridge of FIG. 1;

[0025] FIG. 2B schematically illustrates cap and guard structures and first, second, third, fourth and fifth razor blade assemblies of a razor cartridge of the present disclosure;

[0026] FIG. 3A is a cross-sectional side view of an asymmetrical razor blade in accordance with a first embodiment of the present disclosure;

[0027] FIG. 3B illustrates an enlarged view of a tip portion of the razor blade of FIG. 3A;

[0028] FIG. 3C illustrates a bevel shoulder on the razor blade of FIGS. 3A and 3B located in a shaving plane;

[0029] FIG. 3D is a view taken along view line 3D-3D in FIG. 3A;

[0030] FIG. 4A is a cross-sectional side view of an asymmetrical razor blade in accordance with a second embodiment of the present disclosure; and

[0031] FIG. 4B illustrates an enlarged view of a tip portion of the razor blade of FIG. 4A.

## DETAILED DESCRIPTION OF THE INVENTION

### Introduction

[0032] The term “asymmetric blade,” as used herein, means a blade defined by a substrate having a first portion comprising a blade body and a second portion comprising a tip portion wherein a split line passes through a tip of the tip portion, extends through the first and second portions and separates the second portion into generally asymmetric first and second sections. The outer surface of the first section of the second portion is asymmetric with regards to the outer surface of the second section. The outer surface of the first section of the second portion may function as a skin-contacting surface, and the outer surface of the second section of the second portion may function as a hair-cutting surface.

[0033] A “bevel shoulder,” “bevel shoulder structure,” or “shoulder” which can be used interchangeably, are used herein to signify the structure on the outer surface of the first section of the second portion of the substrate of the razor blade. The bevel shoulder structure is disposed where facets meet in the first section, and the bevel shoulder defines a significant portion of the skin-contacting surface of the blade. The bevel shoulder can be smooth, rounded, or angled and is generally a linear structure running parallel to a cutting edge. The bevel shoulder structure of the present invention performs the bulk of the skin-contacting function of the blade and, hence, takes pressure off the tip. In providing minimal to no tip pressure, the shoulder provides a highly defined skin-guarding benefit built into the first section. In asymmetric blades with bevel shoulders on the outer surface of the first section of the second portion of the substrate of the blade of the present invention, cutting forces can remain much lower than if the blade substrate were symmetric. This is due to the fact that there is desirably substantially no bevel shoulder, or minimal shoulder, on the hair cutting side (e.g., second section of the second portion). Having a prominent bevel shoulder on the second section, the section which dominates hair cutting efficacy, would disadvantageously increase the hair cutting forces. The bevel shoulder of the present invention will be described in more detail below.

[0034] A “split line,” as used herein, means a line extending through the tip of the tip portion of the blade substrate, separates the second portion into asymmetrical first and second sections and is generally parallel with first and second generally parallel outer surfaces of the first portion defining the blade body of the blade substrate.

[0035] A “shaving plane,” as used herein, means a plane extending between upper surfaces of a cap structure of a razor cartridge housing and a guard structure of the razor cartridge housing. The

“shaving plane” can be a plane tangent to each of the cap structure and guard structure. In some embodiments, not all of the cap structure, guard structure and uppermost surface portions of the razor blades in a razor cartridge will be located within a same plane. For such embodiments, “shaving plane,” as used herein, is intended to mean a plane extending between the uppermost surface portions of two skin contacting elements, one immediately in front of and one immediately behind the razor blade tip of the razor blade. For a first blade in a sequence of blades, the shaving plane is defined by a plane extending from an upper surface, i.e., uppermost surface portion, of the guard structure on a first side of the first razor blade tip and an uppermost surface portion of a skin contacting element directly adjacent to and on a second side of the first blade tip. For an intermediate blade in a sequence of blades, the shaving plane is defined by a plane extending from the uppermost surface portions of adjacent skin contacting elements on either side of the intermediate razor blade tip. In the present invention where the uppermost surface portion on a razor blade may be defined by the bevel shoulder, the uppermost surface portion of the skin contacting element immediately behind the razor blade tip of the razor blade may comprise the razor blade's bevel shoulder. An uppermost surface portion on a skin contacting element on either side of a razor blade tip can be an uppermost surface on an adjacent razor blade, an element on the razor blade itself (such as a bevel shoulder), or a guard structure. For razor blade **18A** in FIG. 2B, the shaving plane is defined by a plane extending from the uppermost surface portion of razor blade **18B**, the blade directly in front of the blade **18A**, and the bevel shoulder (**41**, **81**) of the razor blade **18A**. The uppermost surface portion of razor blade **18B** as shown is a bevel shoulder as well (e.g., **41**, **81**). For a first blade in a sequence of blades, such as razor blade **18E** in FIG. 2B, the shaving plane is defined by a plane extending from the uppermost surface portion of a preceding guard structure **28** and the uppermost surface portion immediately behind the razor blade tip of the razor blade which in this instance may be the blade bevel shoulder (e.g., **41**, **81**) of razor blade **18E**.

[0036] With reference to FIG. 1, a shaving razor system **10** comprises a handle **12** and a razor cartridge **14**. In some examples, the razor cartridge **14** may be detachably mounted to the handle **12** with a connector **20** as shown, and in other examples, the razor cartridge **14** may be attached permanently to the handle **12**. The razor cartridge **14** may pivot relative to the handle **12**. The razor cartridge **14** may include a cartridge housing **16** having one or more blades **18**. Although five blades are shown in FIG. 1, it is understood that any number of blades, more or less, may be mounted within the razor cartridge **14**. The blades **18** may be mounted within the cartridge housing **16** and secured with clips **24a** and **24b** as shown. The cartridge housing **16** may further comprise a cap structure **22** located near a back of the cartridge housing **16** and one or more guard structures **28** located near a front of the cartridge housing **16**. The cap structure **22** may comprise one or more lubrication members (not labeled).

[0037] The substrate **30** may be coated. Coatings on the substrate **30** may be in the range of 200 to 1500 angstroms, preferably between 300 and 1000 angstroms.

[0038] FIG. 3A is a cross-sectional side view of an asymmetrical razor blade **18** in accordance with a first embodiment of the present disclosure. The razor blade **18** is defined by a substrate **30** comprising a first portion **32** comprising a blade body **132A** and a second portion **34** comprising a tip portion **134A**. In the embodiment of FIG. 3A, dotted line **33** extends between the first and second portions **32** and **34**. The razor blade **18** may be formed from stainless steel, other metals and/or alloys, plastic, or any other material or combinations thereof. The first portion **32** may comprise first and second generally parallel outer surfaces **32A** and **32B** and may be defined by the portion of the substrate **30** where there are no facets. The second portion **34** may comprise generally asymmetric first and second sections **36** and **38**, respectively, separated by a split line SL.sub.34, wherein the first and second sections **36** and **38** comprise third and fourth asymmetric outer surfaces **36A** and **38A**. The split line SL.sub.34 may pass through or emanate from a tip **46** of the tip portion **134A** and may be generally parallel with the first and second outer surfaces **32A** and **32B** of the first portion **32** of the blade substrate **30**, see FIG. 3A. The split line SL.sub.34 may

extend through the first portion **32**. In the example embodiment of FIGS. 3A and 3B, the split line SL.sub.34 does not separate the first and second portions **32** and **34** into equal halves. In the illustrated embodiment, the asymmetrical first and second sections **36** and **38** of the second portion **34** may extend longitudinally away from the tip **46** different distances.

[0039] The first section **36** comprises first and third bevels or facets **40** and **44** and the second section **38** comprises a second bevel or facet **42**. The first facet **40** may extend directly from the first outer surface **32A** and may be positioned between the first outer surface **32A** and the third facet **44**. The third facet **44** may extend directly from the first facet **40**. A bevel shoulder **41** may be defined where the first and third facets **40** and **44** meet. The bevel shoulder **41** is a structure that is generally linear (e.g., extending into the page and along the X direction) running parallel to a cutting edge **19** of the blade **18** as shown for instance in FIG. 3D. The bevel shoulder **41** may be smooth, rounded, or angled. The second facet **42** may extend directly from the second outer surface **32B**. The second and third facets **42** and **44** may define end facets that converge at the tip **46** to define the cutting edge **19** of the blade **18**, which performs the cutting of hair. As will be discussed further below, during use of the razor blade **18**, the bevel shoulder **41** between the first and third facets **40** and **44** may contact and move along the skin of a user. An angle  $\Theta'$  of the bevel shoulder **41**, see FIG. 3A, extending from the first facet **40** to the third facet **44** may be from 162 degrees to 176 degrees.

[0040] A length L.sub.40 of the first facet **40** may be greater than a length L.sub.42 and L.sub.44 of each of the second and third facets **42** and **44**, see FIGS. 3A and 3B. The length L.sub.44 of the third facet **44** may be less than the length of the second facet **42**. In the illustrated embodiment, the length L.sub.40 of the first facet **40** may be from 100 microns to 500 microns, the length L.sub.42 of the second facet **42** may be from 8 microns to 200 microns and the length L.sub.44 of the third facet **44** may be from 8 microns to 150 microns, preferably from 8 microns to 50 microns. The first facet **40** may extend inwardly from the first outer surface **32A** toward the second outer surface **32B** and the second facet **42** may extend inwardly from the second outer surface **32B** toward the first outer surface **32A**, see FIG. 3A. A plane P.sub.1 extending through a center of the first portion **32** parallel to the first and second outer surfaces **32A** and **32B** may extend through the first facet **40**, see FIG. 3A. As can be seen from FIG. 3A, the plane P.sub.1 bisects the first portion **32** into equal halves.

[0041] A first angle  $\beta_{\text{sub.1}}'$  between the first facet **40** and a first line extending from the first outer surface **32A** of the first portion **32** may be greater than a second angle  $\alpha_{\text{sub.2}}'$  between the second facet **42** and a second line extending from the second outer surface **32B** of the first portion **32**, see FIGS. 3A and 3B. A third angle  $\alpha_{\text{sub.1}}'$  between the third facet **44** and a third line extending from the first facet **40** may be greater than the second angle  $\alpha_{\text{sub.2}}'$  between the second facet **42** and the second line extending from the second outer surface **32B** of the first portion **32**. A wedge angle  $\phi'$  may extend between the second and third facets **42** and **44**, see FIG. 3B. A value of the wedge angle  $\phi'$  may be equal to the sum of a value of the first angle  $\beta_{\text{sub.1}}'$  a value of the second angle  $\alpha_{\text{sub.2}}'$  and a value of the third angle  $\alpha_{\text{sub.1}}'$  and may fall within a range of from 13.5 degrees to 30 degrees. A smaller wedge angle  $\phi'$  is advantageous as it may result in a sharper cutting edge of the blade **18**. The first angle  $\beta_{\text{sub.1}}'$  may fall within a range of from 8 degrees to 21 degrees; the second angle  $\alpha_{\text{sub.2}}'$  may fall within a range from 1 degree to 12 degrees, preferably from 2 degrees to 8 degrees; and the third angle  $\alpha_{\text{sub.1}}'$  may fall within a range from 4 degrees to 18 degrees, preferably from 8 to 18 degrees. The sum of the first angle  $\beta_{\text{sub.1}}'$  and the third angle  $\alpha_{\text{sub.1}}'$  is greater than or equal to a blade tangent angle  $\Omega$ , discussed below.

[0042] As noted above, the split line SL.sub.34 separating the generally asymmetric first and second sections **36** and **38** of the second portion **34** of the razor blade **18** passes through the tip **46** and is generally parallel with the first and second outer surfaces **32A** and **32B** of the first portion **32**, see FIG. 3A. A substantial portion of the second facet **42** may be located closer to the split line SL.sub.34 than a substantial portion of each of the first and third facets **40** and **44**, see FIGS. 3A

and 3B. With reference to FIG. 3B, at a first distance D.sub.SL1 of 4 micrometers from the tip 46 along the split line SL.sub.34, a sum of a first distance D.sub.SL1A perpendicular to the split line SL.sub.34 and extending from the split line SL.sub.34 to the third facet 44 and a second distance (reference not provided in FIG. 3B) perpendicular to the split line SL.sub.34 and extending from the split line SL.sub.34 to the second facet 42 may be between 1.0 micron to 2.3 microns. At a second distance D.sub.SL2 of 8 micrometers along the split line SL.sub.34 from the tip 46, a sum of a first distance D.sub.SL2A perpendicular to the split line SL.sub.34 and extending from the split line SL.sub.34 to the first or the third facet 40, 44 and a second distance D.sub.SL2B perpendicular to the split line SL.sub.34 and extending from the split line SL.sub.34 to the second facet 42 or the second outer surface 32B of the first portion 32 may be between 1.9 microns to 4.6 microns. At a third distance D.sub.SL3 of 16 micrometers along the split line SL.sub.34 from said tip 46, a sum of a first distance D.sub.SL3A perpendicular to the split line SL.sub.34 and extending from the split line SL.sub.34 to the first or the third facet 40, 44 and a second distance D.sub.SL3B perpendicular to the split line SL.sub.34 and extending from the split line SL.sub.34 to the second facet 42 or the second outer surface 32B of the first portion 32 may be between 3.8 microns to 9.2 microns.

[0043] FIG. 2A illustrates a cross-sectional view of the razor cartridge 14. The razor cartridge 14 further comprises first, second, third, fourth and fifth razor blade assemblies 180A-180E comprising first, second, third, fourth and fifth razor blades 18A-18E, wherein each of the razor blades 18A-18E is formed to correspond to the razor blade 18 illustrated in FIGS. 3A and 3B. The first blade assembly 180A may comprise the first blade 18A and a first blade support member or blade carrier 120A coupled to the first blade 18A. The second blade assembly 180B may comprise the second blade 18B and a second blade support member or blade carrier 120B coupled to the second blade 18B. The third blade assembly 180C may comprise the third blade 18C and a third blade support member or blade carrier 120C coupled to the third blade 18C. The fourth blade assembly 180D may comprise the fourth blade 18D and a fourth blade support member or blade carrier 120D coupled to the fourth blade 18D. The fifth blade assembly 180E may comprise the fifth blade 18E and a fifth blade support member or blade carrier 120E coupled to the fifth blade 18E. The blade support members 120A-120E may comprise, for example, stainless steel. The blade support members 120A-120E may be integral with their corresponding blades 18A-18E, or alternatively, the blades 18A-18E may be fixedly coupled to the respective blade support members 120A-120E, such as by welding, adhesive, or other suitable technique. Each blade assembly 180A-180E may be mounted within the cartridge housing 16 of the razor cartridge 14. The blade support members 120A-120E may be positioned within a respective blade slot 162A-162E extending in the cartridge housing 16, in an X direction, of the housing 16, see FIG. 1, and may be fixed or floating. For example, the blade support members 120A-120E may be resiliently mounted within the housing and may be biased to their raised, at-rest positions (that is, not loaded by shaving forces) via polymeric leaf-spring arms (not shown), one example of which is disclosed in U.S. Pat. No. 10,391,652, the entire disclosure of which is incorporated herein by reference. The blade assemblies 180A-180E may be secured by clips 24B (only one of which is illustrated in FIG. 2A) or other known assembly methods.

[0044] FIG. 2B schematically illustrates the cap structure 22, the guard structure 28 and the first, second, third, fourth and fifth razor blade assemblies 180A-180E of the razor cartridge 14 of FIG. 2A. With reference to FIG. 2B, a plane extending between the upper surfaces of the cap structure 22 and the guard structure 28 of the cartridge housing 16 of the razor cartridge 14 may define a shaving plane P.sub.S, i.e., a plane tangent to each of the cap structure and guard structure 22 and 28. For razor cartridge embodiments where not all of the cap structure, guard structure and uppermost portions of the razor blades are located within a same plane, the "shaving plane" for a given razor blade within such a razor cartridge may be defined as a plane extending between skin contacting elements immediately in front of and behind a razor blade tip of the given razor blade. For example, in a modified embodiment as shown in phantom in FIG. 2B, the uppermost portion of

blade **18E'** is located slightly below the locations of the blade **18E** shown in solid line as well as the upper surface of the guard structure **28**. The shaving plane  $P_{sub.S'}$  for the modified blade **18E'** extends from the upper surface of the guard structure **28'** to the uppermost portion of a skin contacting element behind the tip of the blade **18E**, which comprises the bevel shoulder of the blade **18E'**.

[0045] It is well known that the shaving geometry of a razor cartridge is important in determining the shaving performance of the cartridge. The shaving geometry defines the position and orientation of the blades in relation to other skin contacting parts, in particular, the cap structure and guard structure of the razor cartridge. One parameter of the shaving geometry is blade exposure, which is the perpendicular distance by which the cutting edge of a blade protrudes above or below the shaving plane. In the embodiment illustrated in FIG. 2B, the first, second, third, fourth and fifth blade support members **120A-120E** may be configured to position their respective blades **18A-18E** such that the bevel shoulder **41** of the substrate **30** defining each blade **18A-18E** is positioned in or near the shaving plane  $P_{sub.S}$ , see also FIGS. 3A-3C. More particularly, each of the blade support members **120A-120E** may comprise a lower portion **121A** and an upper portion **121B**, which extends at an angle of  $\Theta_{sub.121}$  of from 100 degrees to 125 degrees to the lower portion **121A**, see FIG. 2B. The upper portion **121B** of each blade support member **120A-120E** may be coupled to the outer surface **32B** of the first portion **32** of the substrate **30** defining the corresponding blades **18A-18E**. Due to the asymmetric shape of the substrate **30** and the angle  $\Theta_{sub.121}$  between the lower and upper portions **121A** and **121B** of each blade support member, the bevel shoulder **41** of the substrate **30** defining each blade **18A-18E** is positioned in or near the shaving plane  $P_{sub.S}$ , see also FIGS. 3A-3C.

[0046] With reference to FIGS. 3B and 3C, the bevel shoulder **41** is considered to be positioned in or near the shaving plane  $P_{sub.S}$  when a portion of the bevel shoulder **41**, which shoulder **41** extends in the X direction, see FIGS. 1 and 3A, lies within the shaving plane  $P_{sub.S}$ , i.e., the shaving plane  $P_{sub.S}$  is tangent to the portion of the bevel shoulder **41**, or a portion of the bevel shoulder **41** is located slightly above the shaving plane  $P_{sub.S}$  by a distance  $D_{sub.1}$  less than about 0.2 mm from the shaving plane  $P_s$  or slightly below the shaving plane  $P_{sub.S}$  by a distance  $D_{sub.2}$  of less than about 0.5 mm from the shaving plane  $P_s$ , see FIG. 3C. When the bevel shoulder **41** is positioned in or near the shaving plane  $P_{sub.S}$ , the cutting edge **19** of the blade **18** may be spaced below the shaving plane  $P_{sub.S}$  by a perpendicular distance  $D_{sub.46}$  due to the asymmetrical shape of the blade **18** and the angle  $\Theta_{sub.121}$  between the lower and upper portions **121A** and **121B** of the corresponding blade support member. The perpendicular distance  $D_{sub.46}$  may fall within a range of from 0 microns to 46.4 microns and preferably comprises 20 microns, see FIG. 3B. Because the cutting edge **19** of the blade **18** is preferably located below the shaving plane  $P_{sub.S}$ , the cutting edge **19** is spaced away from the skin during shaving so as to improve shaving comfort and reduce skin irritation. Also, because the angle  $\Theta'$  of the bevel shoulder **41** is large, the bevel shoulder **41** defines a generally smooth surface for engaging the skin of the user, thereby reducing friction as the blade moves across the skin during shaving, see also FIG. 2B. As noted above, the blades **18A-18E** may be mounted within the cartridge housing **16** and secured with clips **24A** and **24B**. Because the bevel shoulder **41** of the substrate **30** defining each blade **18A-18E** is positioned in or near the shaving plane  $P_{sub.S}$ , see also FIGS. 3A-3C, the clips **24A** and **24B** engage the bevel shoulder **41** of each blade **18A-18E**, see FIG. 2A. Prior art razor blades were registered with features during a welding operation to secure the blades to corresponding blade support members. The registration features would oftentimes damage or crush the ends of the blade tips. In prior art razor cartridges where blade tips were positioned in or near the shaving plane, the clips would engage ends of the blade tips. However, because the ends of the blade tips were crushed during a prior welding operation, engagement of the crushed blade tip ends by the clips resulted in inconsistent location of the blade cutting edges relative to the shaving plane. In the present invention, because the clips **24A** and **24B** engage the bevel shoulder **41** of each blade **18A-**

**18E**, which shoulder **41** typically is not damaged during a prior welding operation, the location of a blade cutting edge **19** along its entire extent is more consistently and predictably located relative to the shaving plane.

[0047] Another important factor in the shaving geometry is the blade tangent angle  $\Omega$ , see FIG. 3A, which is the angle at which the split line SL.sub.34 for the asymmetric blade **18** intersects the shaving plane S.sub.P. In the embodiment of FIGS. 3A and 3B, the blade tangent angle  $\Omega$  may fall within a range from 10 degrees to 36 degrees and preferably is 17 degrees.

[0048] FIG. 4A is a cross-sectional side view of an asymmetric razor blade **50** in accordance with a second embodiment of the present disclosure. The razor blade **50** is defined by a substrate **70** comprising a first portion **72** comprising a blade body and a second portion **74** comprising a tip portion. In the embodiment of FIG. 4A, dotted line **73** extends between the first and second portions **72** and **74**. The razor blade **50** may be formed from stainless steel, other metals and/or alloys, plastic, or any other material or combinations thereof. The first portion **72** may comprise first and second generally parallel outer surfaces **72A** and **72B**, respectively. The second portion **74** may comprise generally asymmetric first and second sections **76** and **78**, respectively, separated by a split line SL.sub.74, wherein the first and second sections **76** and **78** comprise third and fourth asymmetric outer surfaces **76A** and **78A**. The split line SL.sub.74 may pass through a tip **88** of the tip portion **74** and may be generally parallel with the first and second outer surfaces **72A** and **72B** of the first portion **72** of the blade substrate **70**, see FIG. 3A. The split line SL.sub.74 may extend through the first portion **72**. In the example embodiment of FIGS. 4A and 4B, the split line SL.sub.74 does not separate the first and second portions **72** and **74** into equal halves.

[0049] The first section **76** comprises first and third facets **80** and **84** and the second section **78** comprises second and fourth facets **82** and **86**. The first facet **80** may extend directly from the first outer surface **72A** and may be positioned between the first outer surface **72A** and the third facet **84**. The third facet **84** may extend directly from the first facet **80**. A bevel shoulder **81** may be defined where the first and third facets **80** and **84** meet. The bevel shoulder **81** may be smooth, rounded, or angled. The bevel shoulder **81** is a structure that is generally linear (e.g., extending into the page or along the X direction) running parallel to the cutting edge **50A** as shown for instance in FIG. 3D. The second facet **82** may extend directly from the second outer surface **72B** and may be positioned between the second outer surface **72B** and the fourth facet **86**. The fourth facet **86** may extend directly from the second facet **82**. The third and fourth facets **84** and **86** may define end facets that converge at the tip **88** to define a cutting edge **50A** of the blade **50**, which performs the cutting of hair. As will be discussed further below, during use of the razor blade **50**, the first bevel shoulder **81** between the first and third facets **80** and **84** may contact and move along the skin of a user. An angle  $\Theta$  of the bevel shoulder **81**, see FIG. 4A, extending from the first facet **80** to the third facet **84** may be from 162 degrees to 176 degrees.

[0050] A length L.sub.80, L.sub.82 of the first and second facets **80** and **82** may be greater than a length L.sub.84, L.sub.86 of each of the third and fourth facets **84** and **86**, see FIG. 4A. As shown in FIG. 4A, the length of the second facet **82** may be greater than the length of the first facet **80**. The length L.sub.84 of the third facet **84** may be greater than or less than the length L.sub.86 of the fourth facet **86**. In the illustrated embodiment, the length L.sub.80 of the first facet **80** may be from 100 microns to 500 microns, the length L.sub.82 of the second facet **82** may be from 100 microns to 1000 microns, the length L.sub.84 of the third facet **84** may be from 8 microns to 150 microns, preferably from 8 microns to 50 microns and the length L.sub.86 of the fourth facet **86** may be from 8 microns to 200 microns. The first facet **80** may extend inwardly at a first angle  $\beta$ .sub.1 from the first parallel outer surface **72A**, the second facet **82** may extend inwardly at a second angle  $\beta$ .sub.2 from the second parallel outer surface **72B**, the third facet **84** may extend inwardly at a third angle  $\alpha$ .sub.1 from the first facet **80** and the fourth facet **86** may extend inwardly at a fourth angle  $\alpha$ .sub.2 from the second facet **82**, see FIG. 4A. A plane P.sub.2 extending through a center of the first portion **72** parallel to the first and second outer surfaces **72A** and **72B** extends through the

first facet **80**, see FIG. 4A.

[0051] The first angle  $\beta_{\text{sub.1}}$  between the first facet **80** and a first line extending from the first outer surface **72A** of the first portion **72** may be greater than the second angle  $\beta_{\text{sub.2}}$  between the second facet **82** and a second line extending from the second outer surface **72B** of the first portion **72**. The third angle  $\alpha_{\text{sub.1}}$  between the third facet **84** and a third line extending from the first facet **80** may be greater than the fourth angle  $\alpha_{\text{sub.2}}$  between the fourth facet **86** and a fourth line extending from the second facet **82**. A wedge angle  $\phi$  may extend between the third and fourth facets **84** and **86**. A value of the wedge angle  $\phi$  may equal to the sum of a value of the first angle  $\beta_{\text{sub.1}}$ , a value of the second angle  $\beta_{\text{sub.2}}$ ; a value of the third angle  $\alpha_{\text{sub.1}}$  and a value of the fourth angle  $\alpha_{\text{sub.2}}$ . The first angle  $\beta_{\text{sub.1}}$  may fall within a range of from 8 degrees to 18 degrees; the second angle  $\beta_{\text{sub.2}}$  may fall within a range from 0.5 degrees to 6.0 degrees; the third angle  $\alpha_{\text{sub.1}}$  may fall within a range from 4 degrees to 18 degrees and preferably from 8 degrees to 18 degrees; and the fourth angle  $\alpha_{\text{sub.2}}$  may fall within a range from 1 degree to 12 degrees and preferably from 2 degrees to 8 degrees. A summation of the first and second angles  $\beta_{\text{sub.1}}$  and  $\beta_{\text{sub.2}}$  may fall within a range of from 8.5 degrees to 24 degrees. A summation of the first and third angles  $\beta_{\text{sub.1}}$  and  $\alpha_{\text{sub.1}}$  may fall within a range of from 12 degrees to 28.5 degrees. A summation of the second and fourth angles  $\beta_{\text{sub.2}}$  and  $\alpha_{\text{sub.2}}$  may fall within a range of from 1.5 degrees to 18 degrees. A difference between the first and second angles  $\beta_{\text{sub.1}}$  and  $\beta_{\text{sub.2}}$  results in the asymmetric first and second sections **36** and **38** and may fall within a range of from 4 degrees to 17.5 degrees. Preferably, the second angle  $\beta_{\text{sub.2}}$  is small so that the overall thickness  $T_{\text{sub.50}}$  of the blade **50** can be minimized. A summation of the first, second, third and fourth angles  $\beta_{\text{sub.1}}$ ,  $\beta_{\text{sub.2}}$ ,  $\alpha_{\text{sub.1}}$  and  $\alpha_{\text{sub.2}}$ , which defines the wedge angle  $\phi$ , may fall within a range of from 13.5 degrees to 30 degrees. A smaller wedge angle  $\phi$  is advantageous as it may result in a sharper cutting edge **50A** of the blade **50**.

[0052] As noted above, the split line  $SL_{\text{sub.74}}$  separating the generally asymmetric first and second sections **76** and **78** of the second portion **74** of the razor blade **50** passes through the tip **88** and is generally parallel with the first and second outer surfaces **72A** and **72B** of the first portion **72**, see FIG. 4A. A substantial portion of the second and fourth facets **82** and **86** may be located closer to the split line  $SL_{\text{sub.74}}$  than a substantial portion of each of the first and third facets **80** and **84**, see FIGS. 4A and 4B.

[0053] Referring to FIG. 4B, at a first distance  $D_{\text{sub.SL10}}$  of 4 micrometers along the split line  $SL_{\text{sub.74}}$  from the tip **88**, a sum of a first distance  $D_{\text{sub.SL10A}}$  perpendicular to the split line  $SL_{\text{sub.74}}$  and extending from the split line  $SL_{\text{sub.74}}$  to the third facet **84** and a second distance (reference not provided in FIG. 4B) perpendicular to the split line  $SL_{\text{sub.74}}$  and extending from the split line  $SL_{\text{sub.74}}$  to the fourth facet **86** may be between 1.0 microns to 2.3 microns. At a second distance  $D_{\text{sub.SL11}}$  of 8 micrometers along the split line  $SL_{\text{sub.74}}$  from the tip **88**, a sum of a first distance  $D_{\text{sub.SL11A}}$  perpendicular to the split line  $SL_{\text{sub.74}}$  and extending from the split line  $SL_{\text{sub.74}}$  to the first or the third facet **80**, **84** and a second distance  $D_{\text{sub.SL11B}}$  perpendicular to the split line  $SL_{\text{sub.74}}$  and extending from the split line  $SL_{\text{sub.74}}$  to the second or the fourth facet **82**, **86** is between 1.9 microns to 4.6 microns. At a third distance  $D_{\text{sub.SL12}}$  of 16 micrometers along the split line  $SL_{\text{sub.74}}$  from said tip **46**, a sum of a first distance  $D_{\text{sub.SL12A}}$  perpendicular to the split line  $SL_{\text{sub.34}}$  and extending from the split line  $SL_{\text{sub.74}}$  to the first or the third facet **80**, **84** and a second distance  $D_{\text{sub.SL12B}}$  perpendicular to the split line  $SL_{\text{sub.74}}$  and extending from the split line  $SL_{\text{sub.74}}$  to the second or the fourth facet **82**, **86** is between 3.8 to 9.2 microns.

[0054] The razor blade **50** of FIGS. 4A and 4B may be used in place of one or more of the razor blades **18**, **18A-18E** used in the razor cartridge **14** of FIGS. 1 and 2A. Just as the razor blades **18A-18E** are coupled to first, second, third, fourth and fifth blade support members **120A-120E**, each razor blade **50** used in the razor cartridge **14** would also be coupled to a corresponding blade support member. The blade support member would then be positioned within a respective blade

slot extending in the cartridge housing and may be fixed or floating. Each blade assembly including the blade **50** may be secured by clips or other known assembly methods.

[0055] As discussed above with regards to FIG. 2B, each of the blade support members may comprise a lower portion **121A** and an upper portion **121B**, which extends at an angle of  $\Theta_{\text{sub.121}}$  from 100 degrees to 125 degrees to the lower portion **121A**. The upper portion **121B** of each blade support member may be coupled to the second facet **82** of the second portion **74** of the substrate **70** defining the corresponding blade **50**. Due to the asymmetric shape of the substrate **70** and the angle  $\Theta_{\text{sub.121}}$  between the lower and upper portions **121A** and **121B** of each blade support member, the bevel shoulder **81** of the substrate **30** defining each blade **50** is positioned in or near the shaving plane  $P_s$ . see also FIGS. 4A-4B.

[0056] As noted above, the second facet **82** may extend inwardly at a second angle  $\beta_{\text{sub.2}}$  from the second parallel outer surface **72B**. Because the upper portion **121B** of each blade support member is coupled to the second facet **82** of its corresponding blade **50**, rather than the outer surface of the first portion as with the blade **18** of FIGS. 3A-3C, the cutting edge **50A** of the blade **50** is located further away from the shaving plane  $P_s$  than the cutting edge **19** of the blade **18** of the embodiment of FIGS. 3A-3C. Because the cutting edge **50A** is located further away from the shaving plane  $P_s$ , an advantageous benefit of improved comfort during shaving is provided.

[0057] With reference to FIG. 4B, the bevel shoulder **81** is considered to be positioned in or near the shaving plane  $P_{\text{sub.S}}$  when a portion of the bevel shoulder **81**, which shoulder **81** extends in the X direction, see FIGS. 1 and 4B, lies within the shaving plane  $P_{\text{sub.S}}$ , i.e., the shaving plane  $P_{\text{sub.S}}$  is tangent to the portion of the bevel shoulder **81**, or a portion of the bevel shoulder **81** is located slightly above the shaving plane  $P_{\text{sub.S}}$  by a distance (see distance  $D_{\text{sub.1}}$  in FIG. 3C) of less than about 0.2 mm from the shaving plane  $P_{\text{sub.S}}$  or slightly below the shaving plane  $P_{\text{sub.S}}$  by a distance (see distance  $D_{\text{sub.2}}$  in FIG. 3C) of less than about 0.5 mm from the shaving plane  $P_s$ . When the bevel shoulder **81** is positioned in or near the shaving plane  $P_{\text{sub.S}}$ , the cutting edge **50A** of the blade **50** may be spaced below the shaving plane  $P_{\text{sub.S}}$  by a perpendicular distance  $D_{\text{sub.76}}$  due to the asymmetrical shape of the blade **50** and the angle  $\Theta_{\text{sub.121}}$  between the lower and upper portions **121A** and **121B** of the corresponding blade support member. When the upper portion **121B** of a blade support member is coupled to the second facet **82** of a blade **50**, the distance  $D_{\text{sub.76}}$  can be varied by varying the second angle  $\beta_{\text{sub.2}}$  between the second facet **82** and the second parallel outer surface **72B** of the blade **50**. The perpendicular distance  $D_{\text{sub.76}}$  may fall within a range of from 0 microns to 46.4 microns, see FIG. 4B. Because the cutting edge **50A** of the blade **50** may be located below the shaving plane  $P_{\text{sub.S}}$ , the cutting edge **50A** is spaced away from the skin during shaving so as to improve shaving comfort and reduce skin irritation. Also, because the angle  $\Theta$  of the bevel shoulder **81** is large, the bevel shoulder **81** defines a generally smooth surface for engaging the skin of the user, thereby reducing friction as the blade **50** moves across the skin during shaving.

[0058] When the razor blade **50** is used in a razor cartridge, the blade tangent angle  $\Omega$  may fall within a range from 10 degrees to 36 degrees and preferably 17 degrees.

[0059] Representative embodiments of the present disclosure described above can be described as follows:

A. A razor cartridge comprising: [0060] a housing; [0061] a blade assembly mounted to the housing, the blade assembly comprising at least one razor blade defined by a substrate comprising: [0062] a first portion comprising first and second outer surfaces; and [0063] a second portion comprising first and second sections separated by a split line, wherein the first section comprises a first facet and an end facet, the second section comprises an end facet, the end facets of the first and second sections converge at a tip to define a cutting edge, wherein a shoulder is positioned between the first facet and the end facet of the first section and defines a skin-contacting surface.

B. The razor cartridge according to Paragraph A, wherein the end facet of the second section comprises a second facet and the end facet of the first section comprises a third facet.

C. The razor cartridge according to Paragraph A, wherein the second section further comprises a second facet extending from the second outer surface of the first portion, the end facet of the second section comprises a fourth facet and the end facet of the first section comprises a third facet.

D. The razor cartridge according to any one of Paragraphs A-C, wherein the end facet of the second section is located closer to the split line than the first facet and the end facet of the first section.

E. The razor cartridge according to any one of Paragraphs A-D, wherein the first and second outer surfaces of the first portion of the substrate are generally parallel to one another and the split line passes through the tip and is generally parallel to the first and second outer surfaces of the first portion.

F. The razor cartridge according to any one of Paragraphs A-E, wherein the first and second sections of the second portion define asymmetric first and second sections.

G. The razor cartridge according to any one of Paragraphs A-F, wherein the first facet extends directly from the first outer surface of the first portion.

H. The razor cartridge according to any one of Paragraphs A-G, wherein the housing comprises a cap structure and a guard structure, a shaving plane is defined between the cap structure and the guard structure, the blade assembly further comprises a blade support member to which the razor blade substrate is coupled, the blade support member is configured such that the shoulder positioned between the first facet and the end facet of the first section is positioned in or near the shaving plane.

I. The cartridge according to Paragraph H, wherein the shoulder is positioned near the shaving plane when the shoulder is located above or below the shaving plane by a distance less than about 0.2 mm and less than about 0.5 mm, respectively, from the shaving plane.

J. The cartridge according to any one of Paragraphs A-I, further comprising first and second clips mounting to the housing and engaging opposing ends of the shoulder of the substrate defining the razor blade to secure the razor blade within the housing.

K. A razor cartridge comprising: [0064] a housing; [0065] a first blade assembly mounted to the housing, the first blade assembly comprising a first razor blade; [0066] a second blade assembly mounted to the housing, the second blade assembly comprising a second razor blade; [0067] at least one of the first razor blade or the second razor blade is defined by a substrate comprising: [0068] a first portion comprising first and second outer surfaces; and [0069] a second portion comprising first and second sections separated by a split line, wherein the first section comprises a first facet and an end facet, the second section comprises an end facet, the end facets of the first and second sections converge at a tip to define a cutting edge, wherein a shoulder is positioned between the first facet and the end facet of the first section and defines a skin-contacting surface.

L. The razor cartridge according to Paragraph K, wherein the end facet of the second section comprises a second facet and the end facet of the first section comprises a third facet.

M. The razor cartridge according to Paragraph K, wherein the second section further comprises a second facet extending from the second outer surface of the first portion, the end facet of the second section comprises a fourth facet and the end facet of the first section comprises a third facet.

N. The razor cartridge according to any one of Paragraphs K-M, wherein the end facet of the second section is located closer to the split line than the first facet and the end facet of the first section.

O. The razor cartridge according to any one of Paragraphs K-N, wherein the first and second outer surfaces of the first portion of the substrate are generally parallel to one another and the split line passes through the tip and is generally parallel to the first and second outer surfaces of the first portion.

P. The razor cartridge according to any one of Paragraphs K-O, wherein the first and second sections of the second portion define asymmetric first and second sections.

Q. The razor cartridge according to any one of Paragraphs K-P, wherein the first facet extends directly from the first outer surface of the first portion.

R. The razor cartridge according to any one of Paragraphs K-Q, wherein the first razor blade is defined by the substrate comprising the first and second portions and including the shoulder positioned between the first facet and the end facet of the first section, the housing further comprises a cap structure and a guard structure and a shaving plane is defined between the cap structure and the guard structure, and the first blade assembly further comprises a blade support member to which the first razor blade is coupled, the blade support member is configured such that the shoulder of the substrate defining the first razor blade is positioned in or near the shaving plane.

S. The cartridge according to Paragraph R, wherein the shoulder is positioned near the shaving plane when the shoulder is located above or below the shaving plane by a distance less than about 0.2 mm and less than about 0.5 mm, respectively, from the shaving plane.

T. The cartridge according to any one of Paragraphs K-S, further comprising first and second clips mounting to the housing and engaging opposing ends of the shoulder of the substrate defining the first razor blade to secure the first razor blade in the housing.

U. The razor cartridge according to any one of Paragraphs K-Q or T, wherein the first razor blade is defined by the substrate comprising the first and second portions and including the shoulder positioned between the first facet and the end facet of the first section, a shaving plane is defined for the first razor blade by a plane extending from an uppermost surface portion of a skin contacting element in front of and behind the cutting edge of the first razor blade, and the first blade assembly further comprises a blade support member to which the first razor blade is coupled, the blade support member is configured such that the shoulder of the first razor blade is positioned in or near the shaving plane.

[0070] The illustrations presented herein are not intended to be actual views of any particular substrate, apparatus (e.g., device, system, etc.), or method, but are merely idealized and/or schematic representations that are employed to describe and illustrate various embodiments of the disclosure.

[0071] The dimensions and values disclosed herein are not to be understood as being strictly limited to the exact numerical values recited. Instead, unless otherwise specified, each such dimension is intended to mean both the recited value and a functionally equivalent range surrounding that value. For example, a dimension disclosed as “40 mm” is intended to mean “about 40 mm.”

[0072] Every document cited herein, including any cross referenced or related patent or application and any patent application or patent to which this application claims priority or benefit thereof, is hereby incorporated herein by reference in its entirety unless expressly excluded or otherwise limited. The citation of any document is not an admission that it is prior art with respect to any invention disclosed or claimed herein or that it alone, or in any combination with any other reference or references, teaches, suggests or discloses any such invention. Further, to the extent that any meaning or definition of a term in this document conflicts with any meaning or definition of the same term in a document incorporated by reference, the meaning or definition assigned to that term in this document shall govern.

[0073] While particular embodiments of the present invention have been illustrated and described, it would be obvious to those skilled in the art that various other changes and modifications can be made without departing from the spirit and scope of the invention. It is therefore intended to cover in the appended claims all such changes and modifications that are within the scope of this invention.

## Claims

1. A razor cartridge comprising: a housing; a blade assembly mounted to the housing, the blade assembly comprising at least one razor blade defined by a substrate comprising: a first portion comprising first and second outer surfaces; and a second portion comprising asymmetric first and

second sections separated by an imaginary split line, wherein the first section comprises a first facet extending from the first outer surface and a third facet extending from the first facet, the second section comprises a second facet extending from the second outer surface, the second and third facets converge at a tip to define a cutting edge, wherein the housing comprises a cap structure and a guard structure, a shaving plane is defined between the cap structure and the guard structure, the blade assembly further comprises a blade support member to which the razor blade substrate is coupled, wherein a shoulder is positioned between the first facet and the third facet, wherein the portion of the shoulder positioned between the first facet and the third facet on the other side of the shaving plane when viewed in relation to the point at which the first facet and a first outer surface meet by a distance less than about 0.2 mm from the shaving plane.

2. The razor cartridge of claim 1, wherein the second section further comprises a second facet extending from the second outer surface of the first portion, the end facet of the second section comprises a fourth facet.

3. The razor cartridge of claim 1, wherein the end facet of the second section is located closer to the split line than the first facet and the end facet of the first section.

4. The razor cartridge of claim 1, wherein the first and second outer surfaces of the first portion of the substrate are generally parallel to one another and the split line passes through the tip and is generally parallel to the first and second outer surfaces of the first portion.

5. The razor cartridge of claim 1, wherein the first and second sections of the second portion define asymmetric first and second sections.

6. The razor cartridge of claim 1, wherein the first facet extends directly from the first outer surface of the first portion.

7. The cartridge of claim 1, further comprising first and second clips mounted to the housing and engaging opposing ends of the shoulder of the substrate defining the razor blade to secure the razor blade within the housing.

8. A razor cartridge comprising: a housing; a blade assembly mounted to the housing, the blade assembly comprising at least one razor blade defined by a substrate comprising: a first portion comprising first and second outer surfaces; and a second portion comprising asymmetric first and second sections separated by an imaginary split line, wherein the first section comprises a first facet extending from the first outer surface and a third facet extending from the first facet, the second section comprises a second facet extending from the second outer surface, the second and third facets converge at a tip to define a cutting edge, wherein the housing comprises a cap structure and a guard structure, a shaving plane is defined between the cap structure and the guard structure, the blade assembly further comprises a blade support member to which the razor blade substrate is coupled, wherein a shoulder is positioned between the first facet and the third facet, wherein the portion of the shoulder positioned between the first facet and the third facet on the other side of the shaving plane when viewed in relation to the point at which the first facet and a first outer surface meet by a distance less than about 0.5 mm below the shaving plane.

9. The razor cartridge of claim 8, wherein the second section further comprises a second facet extending from the second outer surface of the first portion, the end facet of the second section comprises a fourth facet.

10. The razor cartridge of claim 8, wherein the end facet of the second section is located closer to the split line than the first facet and the end facet of the first section.

11. The razor cartridge of claim 8, wherein the first and second outer surfaces of the first portion of the substrate are generally parallel to one another and the split line passes through the tip and is generally parallel to the first and second outer surfaces of the first portion.

12. The razor cartridge of claim 8, wherein the first and second sections of the second portion define asymmetric first and second sections.

13. The razor cartridge of claim 8, wherein the first facet extends directly from the first outer surface of the first portion.

**14.** The cartridge of claim 8, further comprising first and second clips mounted to the housing and engaging opposing ends of the shoulder of the substrate defining the razor blade to secure the razor blade within the housing.
