United States Patent	12392136
Kind Code	B2
Date of Patent	August 19, 2025
Inventor(s)	Kiik; Matti et al.

Roofing material

Abstract

A roofing material is provided having an asphalt-coated mat or felt made up of or in combinations of fiberglass, polyester, nylon, cotton, cellulosic fibers or materials, polyethylene, polypropylene, co-polymers, melamine, phenolic, acrylics, polycarbonate, carbon fiber, clay, metallic in woven, non-woven, strands or sheets, styrene compounds, rubber, silk, leather, or wool in a woven, non-woven, or solid form. The surfacing materials can be made up of or in combination minerals, plastic particles or film, metal particles or film, cement particles, clay particles, paints, coatings, glass, ceramics, wood, wood fiber, or composite materials.

Inventors: Kiik; Matti (Richardson, TX), Bryson; Michael L. (Independence, MO), Wilson; Paul G. (Waxahachie, TX), Beerer; Margie A. (Ennie, TX), Leitch; Olan (Bakersfield, CA)

Applicant: BMIC LLC (Dallas, TX)

Family ID: 1000008766797

Assignee: BMIC LLC (Dallas, TX)

Appl. No.: 18/764897

Filed: July 05, 2024

Background/Summary

CROSS REFERENCE TO RELATED APPLICATIONS (1) This application is a continuation of U.S. patent application Ser. No. 18/473,977, filed on Sep. 25, 2023, which is a continuation of U.S. patent application Ser. No. 17/314,788, filed May 7, 2021, which is a continuation of U.S. patent application Ser. No. 16/680,263, filed on Nov. 11, 2019, which is a continuation of U.S. patent application Ser. No. 16/546,464, filed on Aug. 21, 2019, now U.S. Pat. No. 10,995,495, which is a continuation of U.S. patent application Ser. No. 15/811,988, filed on Nov. 14, 2017, now, U.S. Pat. No. 10,415,247, which is a continuation of U.S. patent application Ser. No. 14/606,666, filed on Jan. 27, 2015, now U.S. Pat. No. 9,845,602, which claims priority to U.S. Provisional Application No. 61/931,828, filed on Jan. 27, 2014, the contents of all of which are incorporated herein by reference in their entireties.

FIELD OF THE DISCLOSED SUBJECT MATTER

(1) The disclosed subject matter relates to roofing material, including roofing shingles and roll roofing, having a novel construction.

BACKGROUND

(2) Asphalt shingles and asphalt roll roofing for decades have been limited by building codes mandating compliance with certain industry specifications. For example, the ASTM D3462 specification, "Standard Specification for Asphalt Shingles made from Glass Felt and Surfaced with Mineral Granules," is one such industry standard for asphalt shingles and asphalt roll roofing.

(3) The D3462 specification is quite limited, however, in the acceptable materials and construction parameters for producing roofing material. D3462 requires a fiberglass mat with a minimum weight, asphalt content, mineral surfacing, and mineral fillers mixed in the asphalt with a maximum percentage. For example, the exposed surface material and the headlap surface material must be composed of mineral granules, and the back surface covering material must be composed of a suitable material such as sand, talc, or mica. Additionally, the overall shingle under D3462 has a minimum shingle mass requirement. The entirety of the D3462 specification is hereby incorporated by reference. Flexibility in shingle design and manufacture has thus been somewhat limited.

(4) Recently, however, the International Code Compliance Evaluation Service has approved an alternative shingle specification (ICC-ES AC438). The primary material requirement of ICC-ES AC438 is that shingles contain asphalt. AC438 focuses on shingle performance, rather than materials, and contains a number of shingle performance requirements, including those of the ASTM standards.

(5) There is therefore a need for asphalt shingles constructed of alternative materials other than those required by the D3462 specification. The presently disclosed subject matter satisfies these and other needs.

SUMMARY

(6) The purpose and advantages of the disclosed subject matter will be set forth in and are apparent from the description that follows, and will be learned by practice of the disclosed subject matter. Additional advantages of the disclosed subject matter will be realized and attained by the devices particularly pointed out in the written description and claims hereof, as well as from the appended drawings.

(7) To achieve these and other advantages and in accordance with the purpose of the disclosed subject matter, as embodied and broadly described, the disclosed subject matter includes a roofing material using felts or mats of different compositions and alternatives to mineral surfacing materials. This roofing material meets the ICC-ES AC438 standard, including the physical and performance requirements. The disclosed roofing material can be made from lighter-weight and lower-cost materials, and will perform as well or better than existing shingles and roll roofing.

(8) In accordance with another aspect of the disclosed subject matter, a roofing material is provided comprising a mat, comprising top and back surfaces, at least one asphalt layer, disposed on the mat, comprising asphalt and an asphalt filler, an exposed surface covering material disposed on an exposed area of the top surface, and a headlap surface covering material disposed on a headlap area of the top surface, wherein the roofing material satisfies the performance requirements of the AC438 standard, including, wind resistance, fire rating, weather resistance, temperature cycling, wind-driven rain resistance, and breaking strength after weathering.

(9) In further embodiments of the disclosed subject matter, the roofing material mat comprises one or more of fiberglass, polyester, nylon, cotton, cellulosic fibers or materials, polyethylene, polypropylene, co-polymers, melamine, phenolic, acrylics, polycarbonate, carbon fiber, clay, metallic in woven, non-woven, strands or sheets, styrene compounds, rubber, silk, leather, and wool in a woven, non-woven, or solid form.

(10) In further embodiments of the disclosed subject matter, the roofing material exposed surface covering material comprises one or more of minerals, plastic particles or film, metal particles or film, cement particles, clay particles, paints, coatings, glass, ceramics, wood, wood fiber, and composite materials.

(11) In further embodiments of the disclosed subject matter, the roofing material headlap surface

covering material comprises one or more of minerals, plastic particles or film, metal particles or film, cement particles, clay particles, paints, coatings, glass, ceramics, wood, wood fiber, and composite materials.

(12) In further embodiments of the disclosed subject matter, the roofing material back surface covering material comprises one or more of sand, coal slag, and polymer film.

(13) It is to be understood that the foregoing general description and the following detailed description and drawings are only examples and are provided for purpose of illustration and not intended to limit the scope of the disclosed subject matter in any way.

(14) The accompanying drawings, which are incorporated in and constitute part of this specification, are included to illustrate and provide a further understanding of the devices of the disclosed subject matter. Together with the description, the drawings serve to explain the principles of the disclosed subject matter.

Description

BRIEF DESCRIPTION OF THE DRAWINGS

(1) The subject matter of the application will be more readily understood from the following detailed description when read in conjunction with the accompanying drawings, in which:

(2) FIG. 1 is a perspective view of a roofing material in accordance with the present disclosure.

(3) FIG. 2 is a cross-sectional view of a roofing material in accordance with the present disclosure.

DETAILED DESCRIPTION

(4) Reference will now be made in detail to embodiments of the disclosed subject matter, an example of which is illustrated in the accompanying drawings. The disclosed subject matter will be described in conjunction with the detailed description of the system.

(5) In accordance with the disclosed subject matter, the use of different felts to make an asphalt shingle can be made up of or in combinations of: fiberglass, polyester, nylon, cotton, cellulosic fibers or materials, polyethylene, polypropylene, co-polymers, melamine, phenolic, acrylics, polycarbonate, carbon fiber, clay, metallic in woven, non-woven, strands or sheets, styrene compounds, rubber, silk, leather, or wool in a woven, non-woven, or solid form. The surfacing materials can be made up of or in combination minerals, plastic particles or film, metal particles or film, cement particles, clay particles, paints, coatings, glass, ceramics, wood, wood fiber, or composite materials.

(6) The various embodiments of the disclosed subject matter, described in detail below, are constructed with one common raw material, asphalt. Other materials, however, can vary. For example, the felt that is the base of an asphalt shingle can be a polypropylene woven material coated on the top and back surface with an asphaltic compound containing finely ground mineral stabilizer. The back of the shingle can be coated with a crushed waste cement product that keeps the shingles from sticking together in the bundle before being applied to the roof. On the top portion of the single the exposure area of the shingle can be covered with a colored crushed brick material and the non-exposure area of the shingle can be covered with a mineral surfacing material such as limestone.

(7) In further embodiments of the disclosed subject matter, the felt can be a fiberglass non-woven mat coated on both the top and bottom surface with the filled asphalt coating. The back surface and the non-exposure area of the top of the shingles can be covered with a crushed expanded clay material. The exposed portion of the shingle can be covered with a ceramic coated aluminum flake material.

(8) In further embodiments of the disclosed subject matter the felt can be made with a combination of fiberglass and aluminum strands and can be coated on both top and back surfaces with a filled asphalt coating. The back surface may be covered with a mineral surfacing material. The top of the

shingle's exposed surface may be coated with a reduced size colored ceramic coated mineral surfacing granule mixed with a antimicrobial polypropylene granule. The non-exposed portion of the top side of the shingle may be covered with a mineral surfacing material.

(9) In further embodiments of the disclosed subject matter the felt can be made with a fiberglass and can be coated on both top and back surfaces with a filled asphalt coating. The back side of the felt can be covered with a polyethylene film. The top surface can be coated with a filled asphalt coating. In some embodiments, the back surface covering material can be omitted. The top of the shingle's surface can be covered with a crushed waste concrete and the exposure can be painted.

(10) Solely for the purpose of illustration, FIG. 1 depicts an embodiment of a roofing shingle in accordance with the present disclosure. Particularly, and as illustrated, the roofing shingle **20** can comprise a headlap section **21** and a buttlap (or exposed) section **22**. The headlap section **21** is the portion of the shingle that is covered by an overlaid shingle after installation. The buttlap section is the portion of the shingle that is exposed after installation. In FIG. 1, the dashed line indicates the demarcation between these two sections.

(11) FIG. 2 depicts an embodiment of a roofing material **200** in accordance with the present disclosure. The roofing material **200** can comprise a mat or felt **206**, an asphalt filled coating **208**, which can be disposed on top of the mat **206**, a second asphalt filled coating **212**, which can be disposed beneath the mat **206**. A layer of top surface material **210** can be disposed over the first asphalt filled coating **208**. A layer of back surface material **214** can be disposed over the second asphalt filled coating **212**. The top surface layer **210** can be subdivided into headlap and buttlap sections as depicted in FIG. 1. The headlap and buttlap sections of the top surface layer **210** can be comprised of the same or different materials, as described in more detail below. Optionally, a layer of color coating **211** (e.g., paint) can be disposed on top of the top surface layer **210**.

(12) The examples herein are not intended to limit the scope of the disclosed subject matter. It will be understood that the configuration depicted in FIG. 1, known as a “no cut-out” or strip shingle, is just one of many well-known asphalt-based roofing products, such as three-tab shingles, laminated or architectural shingles, hip and ridge shingles, and roll roofing. These and other such products are all compatible with the disclosed subject matter. Similarly, the configuration depicted in FIG. 2 is an exemplary layout, but not intended to be limiting or exhaustive. A variety of well-known roofing material configurations can be used with the disclosed subject matter.

(13) Although some of the materials described herein are previously known for use in shingles, such as in the D3462 specification, the combinations as described herein are unique and offer improvements over known combinations. For example, many of the materials used in embodiments of the disclosed subject matter are lower-cost and/or lighter-weight than existing materials, and therefore offer previously unrealized advantages such as lower costs of production and shipping, improved ease of manufacture and installation and/or improved performance.

Example Shingles

(14) Specific exemplary embodiments of the disclosed subject matter are provided in the tables below. The data provided in these tables are based on construction of a 36 inch by 12 inch no cut-out shingle with a 5-inch exposure, such as depicted in FIG. 1. A “square” containing 80 shingles is made up of 240 square feet of shingles and covers 100 square feet of roof at the recommended exposure. The term “wt./100 sq. ft.” represents the weight of the material per 100 square feet of shingle. The term “Wt./Sq.” represents the weight of the material per square. As a benchmark, an exemplary prior-art shingle constructed according to the D3462 specification is also provided.

(15) Although the examples are provided for a no cut-out shingle for simplicity, the scope of the invention is not limited to any specific shingle configuration or other roof covering product. Moreover, the values given below are not intended to be limiting or exclusive. A person of ordinary skill in the art would understand that weights and compositions of certain materials can be varied or adjusted without a substantial change in shingle performance or quality.

(16) TABLE-US-00001 TABLE 1 Prior Art Shingle (D3462) Mat (felt) Material non-woven

fiberglass wt./100 sq. ft. 1.35 lbs. (min.) Wt./Sq. 3.24 lbs. Asphalt wt./100 sq. ft. 15.00 lbs. (min.) Wt./Sq. 36.00 lbs. Asphalt Filler Material limestone Filler Percentage 70% (max.) Back Surface covering material Material n/a wt./100 sq. ft. no requirement Wt./Sq. 0.00 lbs. Total lbs./Sq. 150.51 lbs.

(25) TABLE-US-00010 TABLE 10 Example 9 Mat (felt) Material non-woven fiberglass wt./100 sq. ft. 1.55 lbs. Wt./Sq. 3.72 lbs. Asphalt wt./100 sq. ft. 10.50 lbs. Wt./Sq. 25.20 lbs. Asphalt Filler Material limestone Filler Percentage 65% Wt./Sq. 46.80 lbs. Exposed Surface Covering Material Material aluminum flakes wt./100 sq. ft. 3.00 lbs. Wt./Sq. 3.00 lbs. Headlap surface covering material Material polymer film wt./100 sq. ft. 1.50 lbs. Wt./Sq. 2.10 lbs. Back Surface covering material Material polymer film wt./100 sq. ft. 1.50 lbs. Wt./Sq. 3.60 lbs. Total lbs./Sq. 84.42 lbs.

(26) TABLE-US-00011 TABLE 11 Example 10 Mat (felt) Material non-woven fiberglass wt./100 sq. ft. 1.55 lbs. Wt./Sq. 3.72 lbs. Asphalt wt./100 sq. ft. 7.50 lbs. Wt./Sq. 18.00 lbs. Asphalt Filler Material limestone Filler Percentage 60% Wt./Sq. 27.00 lbs. Exposed Surface Covering Material Material textured & painted polymer film wt./100 sq. ft. 3.50 lbs. Wt./Sq. 3.50 lbs. Headlap surface covering material Material polymer film wt./100 sq. ft. 1.50 lbs. Wt./Sq. 2.10 lbs. Back Surface covering material Material polymer film wt./100 sq. ft. 1.50 lbs. Wt./Sq. 3.60 lbs. Total lbs./Sq. 57.92 lbs.

(27) All of the above examples have a lighter total weight than the prior art D3462 shingle (57.92 to 166.85 pounds per square compared to 195.24). This is a result of the lighter-weight materials used in their construction.

(28) Furthermore, roofing material of the disclosed subject matter conform to the AC438 standard, which includes some of the physical requirements of the D3462 specification such as dimensions and pliability, but replaces several of the D3462's physical requirements with performance requirements. The performance requirements of the AC438 standard include, for example: wind resistance, which are a minimum of either ASTM D 7158 Class D or, alternatively, ASTM D 3161 Class A; fire rating of at least ASTM E 108 or UL790, Class C; weather resistance, after testing of which, according to ASTM G 155, the weathered specimens show no visual signs of surfacing material loss, cracks, erosion or exposed felt substrate; temperature cycling, after testing of which the specimens do not show signs of tearing or cracking of the filled asphalt coating that exposes the reinforcing felt of the shingle, or separation greater than ¼ inch (6.4 mm) at the joints between the specimens, and there are no signs of tearing of the shingle at the fastener locations or pull-through of the fasteners, and no portion of the asphalt-coated reinforcing felt breaks or separates from the specimens; wind-driven rain resistance, which is tested according to Florida Building Code Test Protocol TAS-100, after which any test specimen which exhibits water infiltration through the sheathing is considered as failing the wind-driven rain test, and any test specimen which has the prepared roof covering or any portion thereof "blow off," tear or blow upward without reseating during the test is considered as failing the wind driven rain test; and breaking strength after weathering, according to which the average breaking strength of weathered specimens is not less than 80 percent of the average breaking strength of unweathered specimens. A more detailed description of the AC438 requirements are found in the AC438 specification, which is hereby incorporated by reference in its entirety.

(29) While the disclosed subject matter is described herein in terms of certain preferred and

exemplary embodiments, those skilled in the art will recognize that various modifications and improvements can be made to the disclosed subject matter without departing from the scope thereof. Moreover, although individual features of one embodiment of the disclosed subject matter can be discussed herein or shown in the drawings of the one embodiment and not in other embodiments, it should be apparent that individual features of one embodiment can be combined with one or more features of another embodiment or features from a plurality of embodiments.

(30) In addition to the various embodiments depicted and claimed, the disclosed subject matter is also directed to other embodiments having other possible combinations of the features disclosed and claimed herein. As such, the particular features presented herein can be combined with each other in other manners within the scope of the disclosed subject matter such that the disclosed subject matter includes any suitable combination of the features disclosed herein. Thus, the foregoing description of specific embodiments of the disclosed subject matter has been presented for purposes of illustration and description. It is not intended to be exhaustive or to limit the disclosed subject matter to those embodiments disclosed.

(31) It will be apparent to those skilled in the art that various modifications and variations can be made in the system and method of the disclosed subject matter without departing from the spirit or scope of the disclosed subject matter. Thus, it is intended that the disclosed subject matter include modifications and variations that are within the scope of the appended claims and their equivalents.

Claims

1. A roofing material, comprising: a mat at least one asphalt layer, wherein the asphalt layer is disposed on the mat, wherein the asphalt layer comprises an asphalt and an asphalt filler, wherein the wt./100 sq. ft. of the asphalt is approximately 10.50 lbs.; an exposed surface covering material, wherein the exposed surface consists essentially of grade 18 mineral granules, disposed on the exposed surface, wherein the wt./100 sq. ft. of the exposed surface covering material is approximately 18.00 lbs.; and a headlap surface covering material, wherein the headlap surface covering material consists essentially of grade 18 mineral granules, disposed on the headlap surface, wherein the wt./100 sq. ft. of the headlap surface covering material is approximately 18.00 lbs, and a back surface covering material, wherein the back surface covering material consists essentially of sand.
2. The roofing material of claim 1, wherein the mat consists essentially of non-woven fiberglass, wherein the mat comprises a top and a back surfaces, wherein the top surface comprises an exposed surface and a headlap surface, wherein the wt./100 sq. ft. of the mat is approximately 1.55 lbs.
3. The roofing material of claim 1, wherein the mat consists essentially of spunglass polypropylene, wherein the mat comprises a top and a back surfaces, wherein the top surface comprises an exposed surface and a headlap surface, wherein the wt./100 sq. ft. of the mat is approximately 1.0 lbs.
4. The roofing material of claim 1, wherein the roofing material is an asphalt shingle.
5. The roofing material of claim 1, wherein the roofing material is roll roofing.
6. A roofing material, comprising: a mat wherein the mat consists essentially of non-woven fiberglass, wherein the mat comprises a top and a back surfaces, wherein the top surface comprises an exposed surface and a headlap surface, wherein the wt./100 sq. ft. of the mat is approximately 1.55 lbs.; at least one asphalt layer, wherein the asphalt layer is disposed on the mat, wherein the asphalt layer comprises an asphalt and an asphalt filler, wherein the wt./100 sq. ft. of the asphalt is approximately 10.50 lbs.; an exposed surface covering material, wherein the exposed surface consists essentially of aluminum flakes, disposed on the exposed surface, wherein the wt./100 sq. ft. of the exposed surface covering material is approximately 3.00 lbs.; and a headlap surface covering material, wherein the headlap surface covering material consists essentially of fine mineral surfacing, disposed on the headlap surface, wherein the wt./100 sq. ft. of the headlap surface covering material is approximately 12.00 lbs, and a back surface covering material, wherein

the back surface covering material consists essentially of fine coal slag.

7. A roofing material, comprising: a mat wherein the mat consists essentially of non-woven fiberglass, wherein the mat comprises a top and a back surfaces, wherein the top surface comprises an exposed surface and a headlap surface, wherein the wt./100 sq. ft. of the mat is approximately 1.55 lbs.; at least one asphalt layer, wherein the asphalt layer is disposed on the mat, wherein the asphalt layer comprises an asphalt and an asphalt filler, wherein the wt./100 sq. ft. of the asphalt is approximately **15.00** lbs.; an exposed surface covering material, a headlap surface covering material, a back surface covering material, wherein the back surface covering material consists essentially of sand.

8. The roofing material of claim 7, wherein the exposed surface consists essentially of plastic granules, disposed on the exposed surface, wherein the wt./100 sq. ft. of the exposed surface covering material is approximately 10.00 lbs.; and wherein the headlap surface covering material consists essentially of plastic granules, disposed on the headlap surface, and wherein the wt./100 sq. ft. of the headlap surface covering material is approximately 10.00 lbs.

9. The roofing material of claim 8, wherein the exposed surface consists essentially of plastic and mineral granule blend, disposed on the exposed surface, wherein the wt./100 sq. ft. of the exposed surface covering material is approximately 20.00 lbs.; and wherein the headlap surface covering material consists essentially of plastic and mineral granule blend, disposed on the headlap surface, wherein the wt./100 sq. ft. of the headlap surface covering material is approximately 20.00 lbs.

10. The roofing material of claim 7, wherein the roofing material is an asphalt shingle.

11. The roofing material of claim 7, wherein the roofing material is roll roofing.

12. A roofing material, comprising: a mat wherein the mat consists essentially of non-woven fiberglass, wherein the mat comprises a top and a back surfaces, wherein the top surface comprises an exposed surface and a headlap surface, wherein the wt./100 sq. ft. of the mat is approximately 1.05 lbs.; at least one asphalt layer, wherein the asphalt layer is disposed on the mat, wherein the asphalt layer comprises an asphalt and an asphalt filler, wherein the wt./100 sq. ft. of the asphalt is approximately 10.50 lbs.; an exposed surface covering material, wherein the exposed surface consists essentially of grade 18 mineral granules, disposed on the exposed surface, wherein the wt./100 sq. ft. of the exposed surface covering material is approximately 18.00 lbs.; and a headlap surface covering material, wherein the headlap surface covering material consists essentially of expanded clay granules, disposed on the headlap surface, wherein the wt./100 sq. ft. of the headlap surface covering material is approximately 12.00 lbs, and a back surface covering material, wherein the back surface covering material consists essentially of fine coal slag.

13. The roofing material of claim 12, wherein the roofing material is an asphalt shingle.

14. The roofing material of claim 12, wherein the roofing material is roll roofing.
