Background/Summary

CROSS-REFERENCE TO RELATED APPLICATION [0001] This application is a continuation of U.S. application Ser. No. 17/135,605, filed on Dec. 28, 2020, which claims priority to and the benefit of Korean Patent Application No. 10-2020-0069098, filed on Jun. 8, 2020, in the Korean Intellectual Property Office, the entire contents of both of which are incorporated herein by reference.

BACKGROUND

1. Field

[0002] One or more aspects of embodiments of the present disclosure relate to an organometallic compound and an organic light-emitting device including the same.

2. Description of Related Art

[0003] Organic light-emitting devices (OLEDs) are self-emission devices that, as compared with related devices, have wide viewing angles, high contrast ratios, short response times, and excellent characteristics in terms of luminance, driving voltage, and/or response speed, and produce full-color images.

[0004] OLEDs may include a first electrode located on a substrate, and a hole transport region, an emission layer, an electron transport region, and a second electrode sequentially stacked on the first electrode. Holes provided from the first electrode may move toward the emission layer through the hole transport region, and electrons provided from the second electrode may move toward the emission layer through the electron transport region. Carriers, such as holes and electrons, recombine in the emission layer to produce excitons. These excitons transition from an excited state to a ground state to thereby generate light.

[0194] In one embodiment, the organometallic compound may be selected from Compounds 1 to 10:

##STR00042## ##STR00043##

[0195] The organometallic compound includes a ligand including a boron-containing group represented by *—B(Ar.sub.1)(Ar.sub.2) in (attached to) the nitrogen atom of carbazole, so that the binding between the ligand and the metal (M) may be strengthened, and accordingly, the energy level of a triplet metal centered state (.sup.3MC state) may increase, thereby increasing the stability of the organometallic compound. Furthermore, the presence ratio of the triplet metal-to-ligand charge transfer state (.sup.3MLCT state) of the organometallic compound may increase. Such an increase may be explained as follows. Because the probability of transitioning the organometallic compound from the .sup.3MLCT state to the .sup.3MC state, which is a non-luminescence state, decreases at an excited state, the stability of the organometallic compound may be increased at the excited state. Thus, the possibility of transitioning the organometallic compound to the dissociation path may accordingly decrease, thereby increasing the stability of the organometallic compound. However, the mechanism is not limited thereto. Therefore, an organic light-emitting device including the organometallic compound may have improved effects in terms of luminescence efficiency and lifespan.

[0196] Furthermore, because the organometallic compound includes a boron-containing group represented by *—B(Ar.sub.1)(Ar.sub.2) in (attached to) the nitrogen atom of the carbazole, the presence ratio at the .sup.3MLCT state may accordingly increase. Accordingly, an organic light-emitting device including the organometallic compound may exhibit improvements in terms of quantum yield and luminescence efficiency.

[0197] In the organometallic compound according to an embodiment, ring CY.sub.1 may be coordinated to the centered metal through a carbon atom of a carbene. Because the bond strength between carbon and the centered metal is stronger than that between nitrogen and the centered metal, the organometallic compound may be more optically and/or electrically stable, thereby exhibiting a light-emitting device having a long lifespan.

[0198] Furthermore, the organometallic compound according to an embodiment may have an asymmetric molecular structure. When the organometallic compound has an asymmetric molecular structure, a lowest unoccupied molecular orbital (LUMO) energy level of the organometallic compound may be relatively high, so that the luminescence wavelength shifts to a short wavelength

to emit blue light with high purity.

[0199] Regarding Compounds 1, 3, 4, and 8 and Compounds C1 and C2 according to an embodiment, the presence ratio at the .sup.3MLCT state, energy at the .sup.3MC state, and bond dissociation energy (BDE) between Pt and the pyridine ring of the ligand were evaluated using the DFT method of the Gaussian program structurally optimized at the B3LYP/6-31G(d,p) level, and the results are shown in Table 1.

EXAMPLES

Example 1

[0492] As an anode, a glass substrate with 15 Ω CM^{sup.2} (1,200 Å) ITO formed thereon, which was manufactured by Corning Inc., was cut to a size of 50 mm×50 mm×0.7 mm, and the glass substrate was sonicated by using isopropyl alcohol and pure water for 5 minutes each, and then ultraviolet (UV) light was irradiated for 30 minutes thereto and ozone was exposed thereto for cleaning. Then, the resultant glass substrate was loaded onto a vacuum deposition apparatus.

[0493] 2-TNATA was vacuum-deposited on the ITO anode formed on the glass substrate to form a hole injection layer having a thickness of 600 Å, and then, 4,4'-bis[N-(1-naphthyl)-N-phenyl aminobiphenyl (hereinafter, NPB) was vacuum-deposited on the hole injection layer to form a hole transport layer having a thickness of 300 Å.

[0494] 3,3-di(9H-carbazol-9-yl)biphenyl (mCBP) as a host and Compound 1 as a dopant were co-deposited (at a weight ratio of 90:10) on the hole transport layer to form an emission layer having a thickness of 300 Å.

[0495] Diphenyl(4-(triphenylsilyl)phenyl)-phosphine oxide (TSPO1) was vacuum-deposited on the emission layer to form a hole blocking layer having a thickness of 50 Å. Next, Alq₃^{sub.3} was deposited on the hole blocking layer to form an electron transport layer having a thickness of 300 Å, LiF (which is a halogenated alkali metal) was deposited on the electron transport layer to form an electron injection layer having a thickness of 10 Å, and A_{sub.1} was vacuum-deposited on the electron injection layer to form a cathode having a thickness of 3,000 Å, so as to form a LiF/A_{sub.1} electrode, thereby completing the manufacture of an organic light-emitting device.

Examples 2 to 4

[0496] Organic light-emitting devices were manufactured in substantially the same manner as in Example 1, except that Compounds shown in Table 3 were respectively used instead of Compound 1 as a dopant in forming an emission layer.

Comparative Examples 1 and 2

[0497] Organic light-emitting devices were manufactured in substantially the same manner as in Example 1, except that Compounds C1 and C2 were respectively used instead of Compound 1 as a dopant in forming an emission layer.

[0498] Regarding the organic light-emitting devices manufactured according to Examples 1 to 4

and Comparative Examples 1 and 2, the driving voltage, luminance, luminescence efficiency, and maximum luminescence wavelength were measured using a voltammeter (Keithley SMU 236) and a luminance meter (PR650), and the lifespan (T.sub.90), which is the time taken for luminance to reduce to 90% of the initial light-emitting device, was measured. The results are shown in Table 3.

[0499] As shown in Table 3, it was confirmed that the organic light-emitting devices of Examples 1 to 4 using, as dopants, the compounds according to the embodiments of the present disclosure each exhibited a low driving voltage, a high efficiency, a high color purity, and/or a long lifespan, as compared with the organic light-emitting devices of Comparative Examples 1 and 2.

[0500] That is, it was confirmed that, when the compounds according to the present disclosure are used in an organic light-emitting device, the organic light-emitting device may have excellent effects in terms of driving voltage, efficiency, color purity, and/or lifespan.

[0501] According to the one or more embodiments, an organic light-emitting device including the organometallic compound of the present embodiments may have a low driving voltage, high efficiency, and may easily control the luminescence wavelength, thereby exhibiting high color purity.
