### FIELD OF THE INVENTION

[0002] The present invention relates to novel steroidal C-15 derivatives, to their pharmaceutically acceptable salts, and their use in therapy. The invention further relates to pharmaceutical compositions comprising these compounds as active ingredients and to methods for their preparation.

### BACKGROUND OF THE INVENTION

[0003] 17 $\beta$ -hydroxysteroid dehydrogenases (17 $\beta$ -HSDs), also known as 17-ketosteroid reductases (17-KSR) are NAD (H)- and/or NAPD(H)-dependent alcohol oxidoreductase enzymes which catalyse the last and key step in formation of all estrogens and androgens. More specifically 17 $\beta$ -HSDs catalyse the dehydrogenation (oxidation) of 17-hydroxysteroids into corresponding 17-ketosteroids or hydrogenation (reduction) of inactive 17-ketosteroids into corresponding active 17-hydroxysteroids.

[0004] As both estrogens and androgens have the highest affinity for their receptors in the 17 $\beta$ -hydroxy form, the 17 $\beta$ -HSD/KSRs regulate the biological activity of the sex hormones. At present, 15 human members of 17 $\beta$ -HSDs have been described (type 1-15). Different types of 17 $\beta$ -HSD/KSRs differ in their substrate and cofactor specificities. The 17KSR activities convert low-activity precursors to more potent forms while 17 $\beta$ -HSD activities decrease the potency of estrogens and androgens and consequently may protect tissues from excessive hormone action.

[0005] Each type of 17 $\beta$ -HSD has a selective substrate affinity and a distinctive, although in some cases overlapping, tissue distribution.

[0006] Type 1 17 $\beta$ -hydroxysteroid dehydrogenase (17 $\beta$ -HSD1) is most abundantly expressed in the ovarian granulosa cells of the developing follicles in ovaries and in human placenta, both being estrogen biosynthetic tissues. In addition, 17R-HSD1 is expressed in estrogen target tissues, including breast, endometrium and bone. The human 17R-HSD1 is specific to estrogenic substrates and in vivo catalyzes the reduction of estrone to estradiol.

[0007] Type 2 17 $\beta$ -hydroxysteroid dehydrogenase (17 $\beta$ -HSD2) on the other hand converts estradiol, testosterone and 5a-dihydrotestosterone to their less active forms estrone, androstenedione and 5a-androstanedione, respectively. Due to its wide and abundant expression in number of various estrogen and androgen target tissues, such as uterus, placenta, liver and the gastrointestinal and urinary tracts, it has been suggested that type 2 enzyme protects tissues from excessive steroid actions.

[0008] Estradiol (E2) is about 10 times as potent as estrone (E1) and about 80 times as potent as estratriol (E3) in its estrogenic effect. In contrast to certain other estrogens, estradiol binds well to both estrogen receptors ER $\alpha$  and ER $\beta$ , and thus regulates the expression of a variety of genes.

[0009] Although both 17 $\beta$ -HSD1 and 17 $\beta$ -HSD2 are present in healthy pre-menopausal humans, increased ratio of 17 $\beta$ -HSD1 to 17 $\beta$ -HSD2 in the tumors of postmenopausal patients with hormone-dependent breast cancer has been shown in several studies. 17HSD1 gene amplification and loss of heterozygosity of 17HSD2 allele are potential mechanisms involved to increased reductive estrogen synthesis pathway in breast tumors. Increased ratio of type 1 enzyme to type 2 enzyme results in an increased level of estradiol that then promotes the proliferation of the cancerous tissue via the estrogen receptors (ER). High levels of estrogen thus support certain cancers such as breast cancer and cancer of the uterine lining i.e. endometrial cancer and uterine cancer.

[0010] Similarly it has been suggested that 17 $\beta$ -HSD2 is down-regulated in endometriosis while both aromatase and 17 $\beta$ -HSD1 are expressed or up-regulated in comparison with normal endometrium. This again results in the presence of high concentration of estradiol (E2) which drives the proliferation of the tissue. Similar mechanism has been elucidated in uterine leiomyoma (uterine fibroids) and endometrial hyperplasia.

[0011] Reduction of the endogenous estradiol concentration in affected tissues will result in reduced or impaired proliferation of 17 $\beta$ -estradiol cells in said tissues and may thus be utilized in prevention and treatment of malign and benign estradiol dependent pathologies. Due to the proposed involvement of 17 $\beta$ -estradiol in a number of malign and benign pathologies, inhibitors of 17 $\beta$ -hydroxysteroid dehydrogenases, that can be used to impair endogenous production of estradiol from estrone, can have therapeutic value in the prevention or the treatment of such disorders or diseases are in great demand.

[0012] Some small-molecule inhibitors of 17 $\beta$ -HSD1 enzyme have been identified and reviewed in Poirier D. (2003) Curr Med Chem 10: 453-77 and Poirier D. (2010) Expert Opin. Ther. Patents 20(9): 1123-1145. Further, small molecule inhibitors of 17 $\beta$ -HSD's have been disclosed in WO 2001/42181, WO 2003/022835, WO 2003/033487, WO 2004/046111, WO 2004/060488, WO 2004/110459, WO 2005/032527, and WO 2005/084295.

[0013] WO2004/085457 discloses steroidal compounds capable of inhibiting 17 $\beta$ -hydroxysteroid dehydrogenase. WO2006/003012 discloses 2-substituted D-homo-estriene derivatives suitable for the treatment of estrogen-dependent diseases that can be influenced by the inhibition of the 17 $\beta$ -hydroxysteroid dehydrogenase type 1. Similarly WO2006/003013 presents 2-substituted estratrienones usable for preventing and treating estrogen-dependent diseases influenced by inhibiting 17 $\beta$ -hydroxysteroid dehydrogenase type 1.

[0014] 15-substituted estradiol analogues acting as locally active estrogens are presented in WO2004/085345. WO2006/027347 discloses 15b-substituted estradiol derivatives having selective estrogenic activity for the treatment or prevention of estrogen receptor-related diseases and physiological conditions. Further, WO2005/047303 discloses 3,15 substituted estrone derivatives capable of inhibiting the 17 $\beta$ -hydroxysteroid dehydrogenase type 1.

[0015] International application WO2008/034796 relates to estratrien triazoles suitable for use in treatment and prevention of steroid hormone dependent diseases or disorders requiring the inhibition of a 17 $\beta$ -hydroxysteroid dehydrogenases such as 17 $\beta$ -HSD type 1, type 2 or type 3 enzyme. Inhibitors of 17 $\beta$ -HSD type 3 enzyme have been disclosed in WO99/46279.

[0016] International applications WO2014/207309, WO2014/207310 and WO2014/207311 relate to estrone C-15 thiazole derivatives, estrone C-17 ketimine C-15 thiazole derivatives and estradiol C-15 thiazole derivatives, respectively, as well as their use in therapy.

**[0466]** Compounds of this invention are also useful in the form of acid or base addition salts, hydrates, or solvates thereof.

#### General Preparation Methods

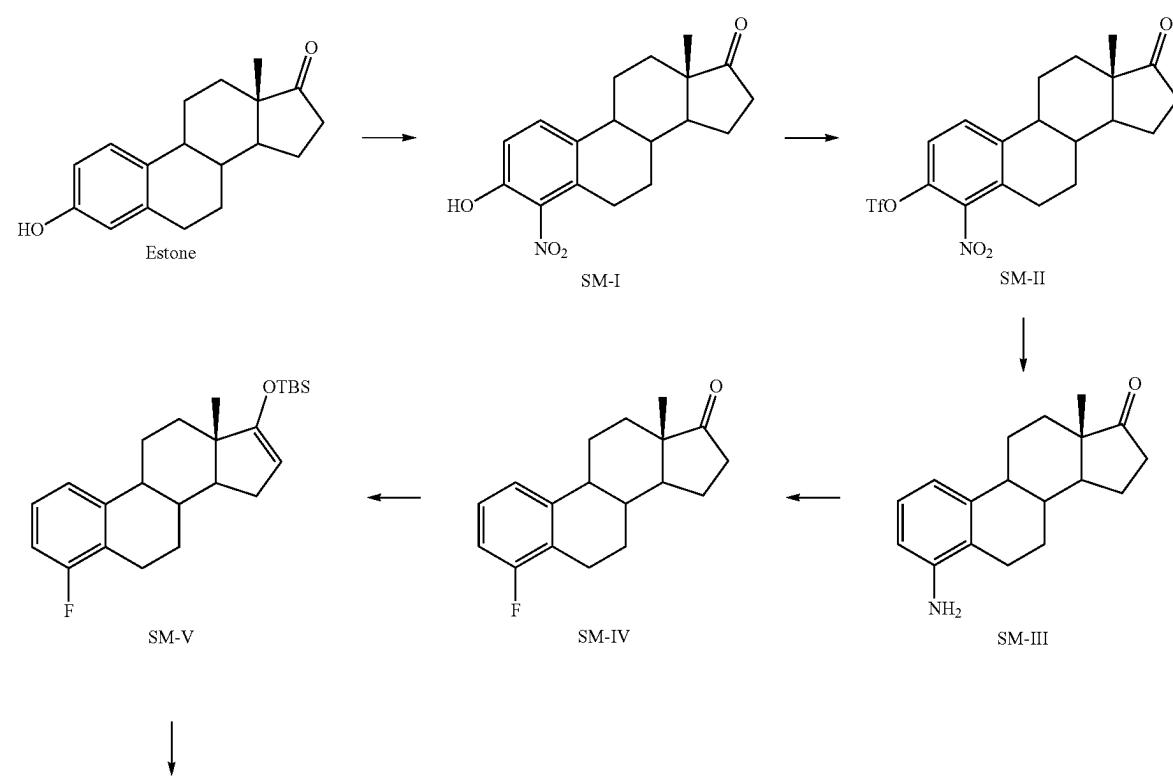

**[0467]** Compounds of the present invention may be prepared by methods known in the art.

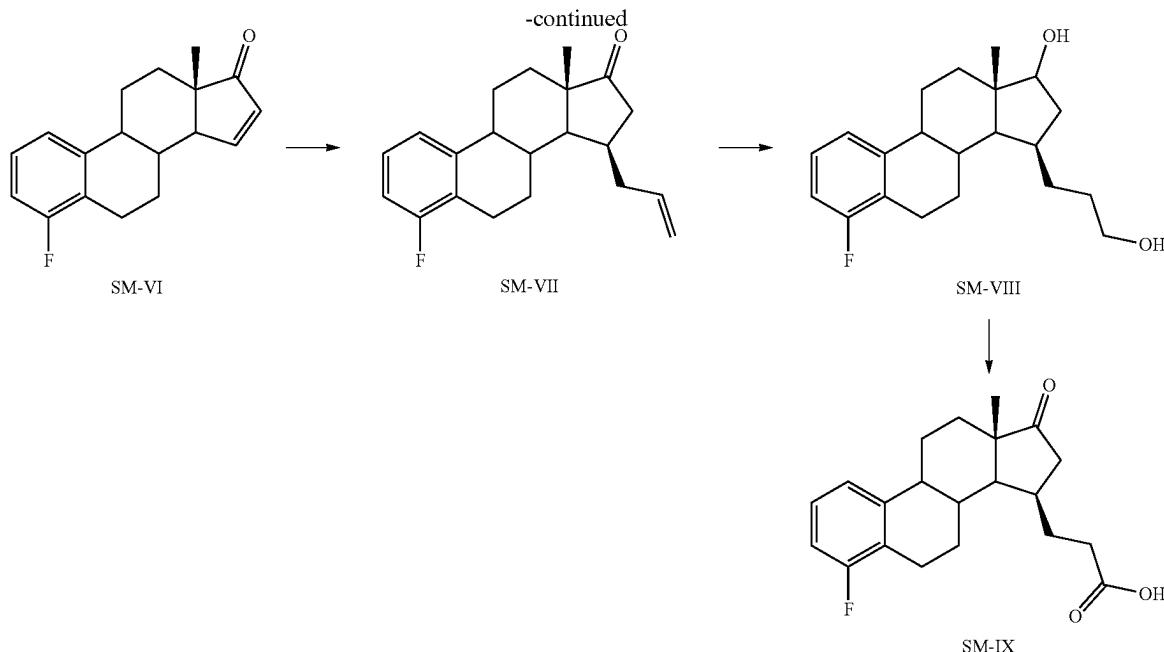

**[0468]** The following examples illustrate the preparation of compounds of formula (I).

#### Preparation of Synthesis Starting Materials and Precursors

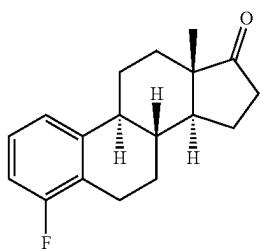

##### Preparation of the starting material Acid IX

**[0469]** Compound SM-IX was synthesized from Estrone (Scheme 1.). Methods of Horwitz et al (*J. Med. Chem.*, 1986, 29 (5), 692-698) yielded amine SM-III which was fluorinated using conditions of Labrie et al. WO 2008124922. The fluoride SM-IV was converted to enone SM-VI by silylation/oxidation method of Kobayashi et al (*Tetrahedron*, 71(35), 5918-5924; 2015). The allylation, hydroboration and oxidation of SM-VI to SM-IX was performed as in patents WO2005/047303 and WO2006/125800.

## Compound SM-IV

**[0470]** A solution of Compound SM-III (11.00 g, 40.8 mmol, 100 mol-%) in dichloromethane (430 mL) was added to neat boron trifluoride diethyl etherate (7.9 mL, 64.20 mmol, 157 mol-%) while stirring at -15° C. under nitrogen (approx 10-15 mins addition time). The reaction mixture was stirred for 15 min. at -15° C. before a solution of tert-butyl nitrite (5.9 mL, 49.80 mmol, 122 mol-%) in dichloromethane (50 mL) was added to it dropwise over a period of 10 min. The reaction mixture was stirred for another 15 min. at -15° C., and afterwards at 0-5° C. for 30 min.

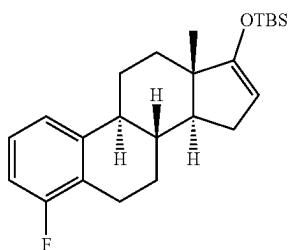

**[0471]** The solution was added to n-pentane (2.25 L) on order to give a beige precipitate. The liquors were decanted away and the residue was washed with more n-pentane (400 mL). The beige solid (12.00 g) was dried in vacuo at room temperature overnight.

**[0472]** The crude material was purified by flash column chromatography using n-hexanes and ethyl acetate (10-30%) as solvent system. The desired product was isolated as a cream solid. The yield of Compound SM-IV was 70% (7.82 g).

[0473]  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ )  $\delta$  ppm 0.91 (s, 3H,  $-\text{CH}_3$ ), 1.34-1.70 (m, 6H), 1.93-1.99 (m, 1H), 2.04-2.21

(m, 3H), 2.27-2.46 (m, 2H), 2.48-2.56 (m, 1H), 2.66-2.77 (m, 1H), 2.95-3.03 (m, 1H), 6.84-6.90 (m, 1H, —ArH), 7.06-7.16 (m, 2H, 2x-ArH).

### Compound SM-V

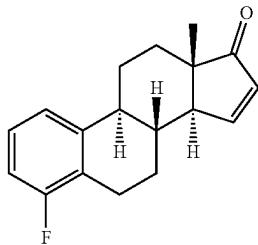

[0474] tert-Butyldimethylsilyl triflate (7.1 mL, 31.10 mmol, 110 mol-%) was added dropwise, over a period of 20 min., to a stirred solution of Compound SM-IV (7.70 g, 28.27 mmol, 100 mol-%) and triethylamine (6.0 mL, 42.72 mmol, 151 mol-%) in dichloromethane (75 mL) at room temperature under nitrogen. The reaction mixture was stirred at room temperature for 2 h.

**[0475]** The reaction mixture was diluted with dichloromethane (95 mL) and it was washed with a saturated aqueous solution of sodium bicarbonate ( $2 \times 70$  mL) and brine (70 mL). The organic layer was dried over sodium sulfate, filtered and concentrated under reduced pressure in order to afford the desired Example as a cream solid. The yield of Compound SM-V was quantitative (11.42 g). This Example was used in the next reaction without further purification.

**[0476]**  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ )  $\delta$  ppm 0.14-0.19 (m, 6H, 2x- $\text{CH}_3$ ), 0.86 (s, 3H,  $-\text{CH}_3$ ), 0.94 (s, 9H, 3x- $\text{CH}_3$ ), 1.21-1.62 (m, 5H), 1.78-2.06 (m, 3H), 2.08-2.16 (m, 1H),

Compound SM-VI

[0477] A mixture of Compound SM-V (11.42 g, 28.27 mmol, 100 mol-%) and palladium acetate (0.63 g, 2.83 mmol, 10 mol-%) in dimethylsulfoxide (75 mL) and dichloromethane (50 mL) was stirred at 35° C. under an oxygen atmosphere (balloon) for 16 h. After that time, starting material was still present by tlc. So, more palladium acetate (126 mg, 0.56 mmol, 2 mol-%) was added to the mixture and it was stirred for another 7 h at 35° C. After that time, TLC showed the reaction had reached completion.

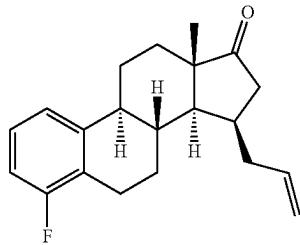

[0478] The reaction mixture was cooled to room temperature and it was poured into a saturated aqueous solution of sodium bicarbonate (300 mL). The mixture was extracted with ethyl acetate (400 mL). The organic layer was washed with water (300 mL) and brine (200 mL) and it was dried over sodium sulfate, filtered and concentrated under reduced pressure in order to afford an orange/brown solid.

[0479] The crude material was purified by flash column chromatography using n-hexanes and ethyl acetate (0-30%) as solvent system. The desired product was isolated as a pinkish/white solid and it was dried in the vacuum oven. The yield of Compound SM-VI was 72% (5.50 g).

ture was stirred for 20 min. at room temperature and it was cooled to -70° C. Allyl magnesium bromide (41.5 mL, 41.48 mmol, 350 mol-%) was then added dropwise, keeping the temperature under -70° C. Chlorotrimethylsilane (5.3 mL, 41.48 mmol, 350 mol-%) was added dropwise to the reaction mixture, keeping the temperature at -70° C., followed by the addition of a solution of Compound SM-VI (3.20 g, 11.85 mmol, 350 mol-%) in anhydrous tetrahydrofuran (60 mL), which was added dropwise keeping the temperature below -65° C. The reaction mixture was allowed to warm slowly to room temperature whilst stirring overnight.

Compound SM-VIII

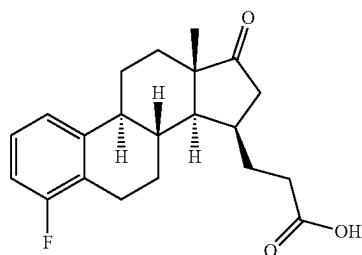

[0485] A dry, nitrogen flushed, flask was charged with Compound SM-VII (2.85 g, 9.13 mmol, 100 mol-%) and anhydrous tetrahydrofuran (70 mL). A 1 M solution of borane THE complex (18.3 mL, 18.30 mmol, 200 mol-%) was added dropwise to the previous solution. The resulting reaction mixture was heated until it was gently refluxing and it was stirred for 1 h. After that time, the reaction mixture was cooled in an ice-bath to -5° C. and a 3M aqueous solution of sodium hydroxide (28 mL) was added to it very cautiously. After the addition was complete and the effervescence ceased, hydrogen peroxide 30% (28 mL) was added and the mixture was gently refluxed for 2 h.

[0486] The reaction mixture was cooled to room temperature and was extracted with ethyl acetate (3x70 mL). The combined extracts were washed with water (2x50 mL) and brine (50 mL), dried over sodium sulfate, filtered and concentrated under reduced pressure in order to afford the desired Example. The yield of Compound SM-VIII was quantitative (3.09 g).

[0487]  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ )  $\delta$  ppm 0.82 (s, 3H, —CH<sub>3</sub>), 1.13-1.64 (m, 9H), 1.81-1.88 (m, 1H), 1.91-2.06

**[0488]** Periodic acid (5.15 g, 22.60 mmol, 500 mol-%) and chromium trioxide (23 mg, 0.23 mmol, 5.0 mol-%) were dissolved in a mixture of acetonitrile (36 mL) and water (12 mL). The solution was cooled to 0° C. in an ice/salt bath. A slurry of Compound SM-VIII (1.5 g, 4.52 mmol, 100 mol-%) in acetonitrile (30 mL) was added to the previous solution over a period of 40 min. whilst maintaining the temperature at or below 0° C. The reaction mixture was stirred for 1 h at 0° C., then the mixture was slowly warmed to room temperature and it was stirred for a further 3.5 h.

#### Preparation of the Starting Material Acid SM-XV

**[0493]** C-3 Fluoro SM-XV was synthesized from Estrone (Scheme 2.) via the Compound SM-X, which may be synthesized as disclosed in Messinger et al. Mol Cell Endocrinol. 2009 (301) 216-224. The detailed synthesis of compound X starting from estrone has been described in WO2008065100, WO2005/047303 and WO2006/125800. The acid SM-X was methylated by heating in methanol in the presence of sulphuric acid followed by triflation. Bisbutylytin derivative SM-XIII was prepared from the corresponding triflate SM-XII followed by fluorination to XIV in 75% yield, (ref. WO 2010059943 and Furuya et al, JACS

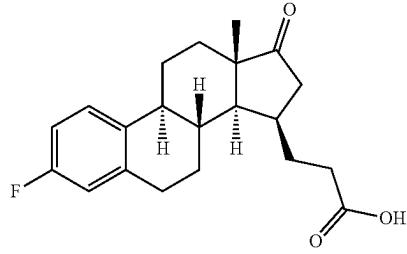

2009, 13 (15), 1662). Several estrone deoxyfluorination methods are available (Labrie, Fernand et al PCT Int. Appl., 9946279, 16 Sep. 1999; Labrie, Fernand et al PCT Int. Appl., 2004089971, 21 Oct. 2004).

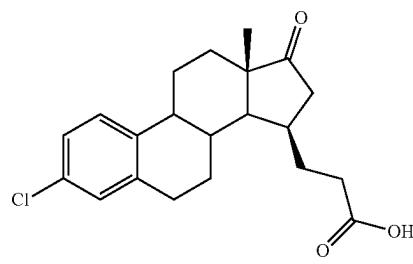

**[0494]** To a screw-cap sealed tube was added Compound SM-XII (10.0 g, 20.47 mmol, 100 mol-%) and 1,4-dioxane (120 mL). Bistributyltin (230.7 mL, 40.99 mmol, 200 mol-%) and LiCl (4.2 g, 102.3 mmol, 500 mol-%) were added to reaction mixture. The reaction mixture was degassed with argon gas for 10 min then added Pd(PPh<sub>3</sub>)<sub>4</sub> (1.41 g, 1.22 mmol, 6 mol-%) to it. The tube was sealed under nitrogen and the mixture was stirred and heated at 100° C. in a preheated oil bath for 4 hours. The reaction progress was monitored by TLC and LC-MS. The mixture was cooled to room temperature and quenched with water (100 mL), extracted with ethyl acetate (2×200 mL), then filtered through celite, washing well with ethyl acetate. The solvents were concentrated under reduced pressure to leave brown viscous oil. The crude was purified by flash chromatography

Inhibition of 17 $\beta$ -Hydroxysteroid Dehydrogenase Type 1 Enzyme

[0868] 17 $\beta$ -HSD1 production and isolation: Recombinant baculovirus was generated by the “Bac to Bac Expression System” (Invitrogen). Recombinant bacmid was transfected to Sd9 insect cells using “Cellfектin Reagent” (Invitrogen). 60 h later cells were harvested; the microsomal fraction was isolated as described by Puranen, T. J., Poutanen, M. H., Peltoketo, H. E., Vihko, P. T. and Vihko, R. K. (1994) Site-directed mutagenesis of the putative active site of human 17  $\beta$ -hydroxysteroid dehydrogenase type 1. Biochem. J. 304: 289-293. Aliquots were stored frozen until determination of enzymatic activity.

[0869] Assay—Inhibition of recombinant human 17 $\beta$ -HSD1: Recombinant protein (1  $\mu\text{g}/\text{ml}$ ) was incubated in 20 mM KH<sub>2</sub>PO<sub>4</sub> pH 7.4 with 30 nM estrone (including 800 000 cpm/ml of  $^3\text{H}$ -estrone) and 1 mM NADPH for 30 min at RT, in the presence of the potential inhibitor at concentrations 1  $\mu\text{M}$  or 0.1  $\mu\text{M}$ . Inhibitor stock solutions were prepared in DMSO. Final concentration of DMSO was adjusted to 1% in all samples. The enzyme reaction was stopped by addition of 10% trichloroacetic acid (final concentration). Samples were centrifuged in a microtiter plate at 4000 rpm for 10 min. Supernatants were applied to reverse phase HPLC on a Waters Symmetry C18 column, equipped with a Waters Sentry Guard column. Isocratic HPLC runs were performed at RT at a flow rate of 1 ml/min in

acetonitrile:water 48:52 as running solvent. Radioactivity was monitored in the eluate by a Scintillation Analyzer. Total radioactivity for estrone and estradiol were determined in each sample and percent conversion of estrone to estradiol was calculated according to the following formula:

$$\% \text{ conversion} = 100 \times \frac{\frac{[(\text{cpm estradiol in sample with inhibitor}) / (\text{cpm estrone in sample with inhibitor}) + (\text{cpm estradiol in sample with inhibitor})]}{[(\text{cpm estradiol in sample without inhibitor}) / (\text{cpm estrone in sample without inhibitor}) + (\text{cpm estradiol in sample without inhibitor})]}]}{[(\text{cpm estradiol in sample with inhibitor}) / (\text{cpm estrone in sample with inhibitor}) + (\text{cpm estradiol in sample with inhibitor})]}.$$

Percent inhibition was calculated flowingly: % inhibition =  $100 - \% \text{ conversion}$

[0870] The values % inhibition were determined for exemplified compounds and the results are summarized in Table 2.

Inhibition of the 17 $\beta$ -Hydroxysteroid Dehydrogenase Type 2 Enzyme

[0871] 17 $\beta$ -HSD2 production and isolation: Similarly to 17 $\beta$ -HSD1 the Recombinant baculovirus was generated by the “Bac to Bac Expression System” (Invitrogen). Recombinant bacmid was transfected to Sd9 insect cells using “Cellfectin Reagent” (Invitrogen). 60 h later cells were harvested and supernatant were fractionated by the following protocol:

[0872] cells were dissolved into 40 ml of A-buffer (40 mM TRIS, pH 8.0, 20% glycerol, 20  $\mu\text{M}$  NAD, 0.4 mM PMSF, 150 mM NaCl, 0.5% dodecyl- $\beta$ -maltoside+ protease inhibitor cocktail)

[0873] cells were sonicated

[0874] lysate was incubated on ice for 15 min

[0875] lysate was centrifuged 5000 rpm 15 min, +4° C.

[0876] centrifugation of the supernatant 180 000 g 30 min, +4° C.

[0877] pellet was dissolved into 8 ml of A-buffer

[0878] not resuspended material was removed by centrifugation 5000 rpm 15 min, +4° C.

[0879] the clear supernatant was divided into 100  $\mu\text{l}$  aliquots and were stored frozen until determination of enzymatic activity.

[0880] The amount of 17 $\beta$ -HSD2 was analysed by immunoblotting and total protein concentration of each extract batch was determined.

[0881] Assay—Inhibition of recombinant human 17 $\beta$ -HSD2: Recombinant protein (4  $\mu\text{g}/\text{ml}$ ) was incubated in 20 mM KH<sub>2</sub>PO<sub>4</sub> pH 8.5 with 50 nM estradiol (including 800 000 cpm/ml of  $^3\text{H}$ -estradiol) and 1 mM NADH for 30 min at RT, in the presence of the potential inhibitor at concentrations 1  $\mu\text{M}$  or 0.1  $\mu\text{M}$ . Inhibitor stock solutions were prepared in DMSO. Final concentration of DMSO was adjusted to 1% in all samples. The enzyme reaction was stopped by addition of 10% trichloroacetic acid (final concentration). Samples were centrifuged in a microtiter plate at 4000 rpm for 10 min. Supernatants were applied to reverse phase HPLC on a Waters Symmetry C18 column, equipped with a Waters Sentry Guard column. Isocratic HPLC runs were performed at RT at a flow rate of 1 ml/min in acetonitrile:water 48:52 as running solvent. Radioactivity

was monitored in the eluate by a Scintillation Analyzer. Total radioactivity for estrone and estradiol were determined in each sample and percent conversion of estradiol to estrone was calculated according to the following formula:

$$\% \text{ conversion} = 100 \times \frac{\{(cpm \text{ estrone in sample with inhibitor}) / [(cpm \text{ estradiol in sample with inhibitor}) + (cpm \text{ estrone in sample with inhibitor})]\}}{\{(cpm \text{ estrone in sample without inhibitor}) / [(cpm \text{ estradiol in sample without inhibitor}) + (cpm \text{ estrone in sample without inhibitor})]\}}$$

Percent inhibition was calculated flowingly: % inhibition =  $100 - \% \text{ conversion}$

**[0882]** The values % inhibition were determined for exemplified compounds and the results are summarized in Table 2.

#### Inhibition of the Estrone to Estradiol Conversion in a Rabbit Tissue Homogenate

**[0883]** The assay is based on an enzymatic reaction where HSD1 enzyme that is expressed in rabbit placenta tissue converts its natural substance estrone (E1) to estradiol (E2) in the presence of a co-factor β-NADPH.

**[0884]** Homogenization of rabbit placenta tissue: Weight a piece of the frozen tissue into a Precellys ck28 bead tube. Add buffer solution (20 mM KH2PO4 with 1 mM EDTA, pH 7,4) in 1:2 ratio (e.g. 300 mg of tissue:600 µl reaction buffer solution). Insert the bead tubes to homogenizer and homogenize 2×30 s. 6000 rpm. Centrifugated 5 min., 2600 rpm at +4° C. and collect supernatant. Aliquots of homogenate are stored in -80° C.

**[0885]** Assay—Inhibition of E1 to E2 conversion in rabbit placenta tissue: The reaction takes place in a buffer solution (20 mM KH2PO4 with 1 mM EDTA, pH 7,4), including appropriate amount of rabbit placenta homogenate, co-factor (1 mM β-NADPH), Substrate (30 nM [<sup>3</sup>H]-estrone), labelled substrate as tracer (5 nM [<sup>3</sup>H]-estrone). During a 30-minute incubation part of the estrone is converted to estradiol. The reaction is stopped by lowering the pH to 1 with 10% trichloro acetic acid (TCA). The substrate and conversion products are analyzed by HPLC and a Scintillation counter analyzer. Total radioactivity for estrone and estradiol were determined in each sample and percent conversion of estrone to estradiol was calculated according to the following formula:

$$\% \text{ conversion} = 100 \times \frac{\{(cpm \text{ estradiol in sample with inhibitor}) / [(cpm \text{ estrone in sample with inhibitor}) + (cpm \text{ estradiol in sample with inhibitor})]\}}{\{(cpm \text{ estradiol in sample without inhibitor}) / [(cpm \text{ estrone in sample without inhibitor}) + (cpm \text{ estradiol in sample without inhibitor})]\}}$$

Percent inhibition was calculated flowingly: % inhibition =  $100 - \% \text{ conversion}$ .

The values % inhibition were determined for exemplified compounds and the results are summarized in Table 2.

#### Metabolic Stability Assay

**[0886]** The in vitro metabolic stability of the compounds of the invention was determined for exemplified compounds using human hepatocyte incubations. Study compounds were incubated 0, 10, 20, 40 and 60 min at 37° C. Samples were collected at all time points and compounds were detected by LC-MS/MS analysis. The percent compound remaining is calculated by comparing the peak area of the parent compound at each time point to time zero. In vitro metabolic stability was determined as half life (T<sub>1/2</sub>), which was determined by regression analysis of the percent parent disappearance vs. time curve. The results are summarized in Table 2.

Compounds of the present invention may be administered in a single daily dose, or the total daily dosage may be administered in divided doses of two, three or four times daily.

**[0891]** "An effective amount" refers to an amount of a compound that confers a therapeutic effect on the treated subject. The therapeutic effect may be objective (i.e. measurable by some test or marker) or subjective (i.e. subject gives an indication of or feels an effect). Such treatment need not necessarily completely ameliorate the condition of disease. Further, such treatment or prevention can be used in conjunction with other traditional treatments for reducing the condition known to those skilled in the art.

**[0892]** Compounds of the invention are most preferably used alone or in combination i.e. administered simultaneously, separately or sequentially with other active ingredients, e.g. pharmaceutically active compounds or biologic products. The amounts of the compound(s) of the invention, particularly a compound of Formula (I), (Ia) or (Ib), or pharmaceutically acceptable salts thereof, and the other active ingredient(s) and the relative timings of administration will be selected in order to achieve the desired combined therapeutic effect. Compounds of the invention may be administered by various routes, for example, parenteral, subcutaneous, intravenous, intraarticular, intrathecal, intramuscular, intraperitoneal, topical, and by intradermal injections, and via transdermal, rectal, buccal, oromucosal, nasal, ocular routes and via inhalation and via implant.

**[0893]** Compounds may be formulated into a suitable composition; suitable administration forms include, for example, solutions, dispersions, suspensions, powders, capsules, tablets, pills, controlled release capsules, controlled release tablets and controlled release pills. **[0894]** Skilled artisans possess the knowledge and skill in the art to enable them to select suitable pharmaceutically acceptable excipients in appropriate amounts for use in the invention. In addition, there are a number of resources that are available to the skilled artisan which describe pharmaceutically acceptable excipients and may be useful in selecting suitable pharmaceutically acceptable excipients.

**[0895]** Suitable pharmaceutically acceptable excipients include but are not limited to the following types of excipients: diluents (for example starches, mannitol), fillers (for example lactose, microcrystalline cellulose or calcium hydrogen phosphate), binders (for example pre-gelatised corn starch, polyvinylpyrrolidone or methylcellulose), additives (for example magnesium stearate, talc, silica), disintegrants (for example potato starch), lubricants (for example sodium lauryl sulphate), glidants (for example fumed silica, talc, magnesium carbonate), granulating agents (for example water, ethanol), coating agents (for example hydroxypropyl methylcellulose, gelatin, waxes, shellac, plastics, plant fibers), wetting agents (for example sorbitan monopalmitate, poloxamer 407), solvents (for example water), co-solvents

(for example ethanol, propylene glycol), suspending agents (for example sorbitol, cellulose derivatives, edible hydrogenated fats), emulsifiers (for example lecithin or acacia), sweeteners (for example sucrose), flavoring agents (for example cherry, lime), flavor masking agents (for example vanilla, citrus), coloring agents (for example titanium oxide), anti-caking agents (for example silicon dioxide), humectants (for example glycerine, sorbitol), chelating agents (for example EDTA salts, histidine, aspartic acid), plasticizers (for example tributyl citrate, diethyl phthalate), viscosity increasing agents (for example methylcellulose), antioxidants (for example (ascorbic acid, cysteine), preservatives (for example methyl or propyl p-hydroxybenzoates, sorbic acid or ascorbic acid), stabilizers (for example polysorbate 20 & 80, poloxamer 407), surfactants (for example polyethylene glycol, polysorbate 80), and buffering agents (for example sodium and potassium phosphates, citrate, acetate, carbonate or glycine buffers depending on the targeted pH-range). The skilled artisan will appreciate that certain pharmaceutically acceptable excipients may serve more than one function and may serve alternative functions depending on how much of the excipient is present in the composition and what other ingredients are present in the composition.

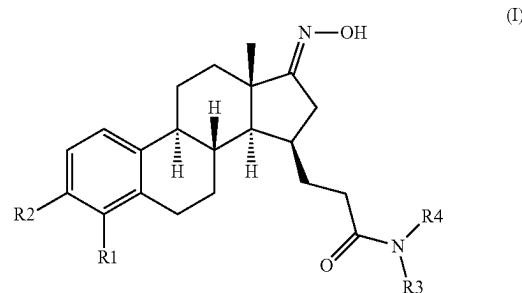

**[0896]** The pharmaceutical compositions of the invention are prepared using techniques and methods known to those skilled in the art. Among useful preservative agents are benzyl alcohol, chlorbutanol, benzalkonium chloride and possibly parabens. The pharmaceutical composition according to the present invention may be provided in concentrated form or in form of a powder to be reconstituted on demand. In such cases formulations of powder for solution for injection/infusion excipients mentioned above may be used. In case of lyophilizing, certain cryoprotectants are preferred, including polymers (povidones, polyethylene glycol, dextran), sugars (sucrose, glu-

ose, lactose), amino acids (glycine, arginine, glutamic acid) and albumin. If solution for reconstitution is added to the packaging, it may consist e.g., of pure water for injection or sodium chloride solution or dextrose or glucose solutions.

**[0897]** Furthermore, compounds of formula (I) can be used as synthesis intermediates for the preparation of other compounds, in particular of other pharmaceutically active ingredients, which are obtainable from compounds of formula (I), for example by introduction of substituents or modification of functional groups.

**[0898]** It will be obvious to a person skilled in the art that, as the technology advances, the inventive concept can be implemented in various ways. The invention and its embodiments are not limited to the examples described above but may vary within the scope of the claims.
