**CROSS-REFERENCE TO RELATED  
APPLICATIONS**

**[0001]** This application claims the benefit under 35 U.S.C. § 119(e) of U.S. Provisional Application No. 63/553,382, filed Feb. 14, 2024, the entire disclosure of which is hereby incorporated herein by reference.

**FIELD**

**[0002]** The present disclosure is directed towards pyrrolidine-2-carboxylic acid derivatives, stereoisomers, and pharmaceutically acceptable salts thereof, pharmaceutical compositions containing said compounds, and the use of said compounds in the treatment of autoimmune disorders including Aicardi-Goutieres Syndrome (AGS), Systemic Lupus Erythematosus (SLE), Lupus Nephritis, Systemic Sclerosis, Sjogren's Syndrome, Inflammatory Myopathies, Hidradenitis Suppurativa, Parkinson's Disease, Rheumatoid Arthritis, Ulcerative Colitis and Crohn's Disease.

**BACKGROUND**

**[0003]** Pattern Recognition Receptors (PRR) are one of the fundamental mechanisms of how the Myeloid cells of the immune system monitor their environment for disturbances to homeostasis. The presence of double stranded DNA in the cytoplasm of eukaryotic cells acts as a danger signal to trigger the host immune response. Cyclic GMP-AMP synthase (cGAS) is a 59 kDa nucleotidyl transferase which acts as a PRR for double stranded DNA (Ablasser et al, cGAS produces a 2'-5'-linked cyclic dinucleotide second messenger that activates STING. *Nature* 498, 380-384; 2013; Wu et al, cyclic GMP-AMP Is an endogenous second messenger in innate immune signaling by cytosolic DNA. *Science* 330 826-830, 2013; Sun et al, cyclic GMP-AMP Synthase Is a cytosolic DNA Sensor that activates the Type 1 Interferon Pathway. *Science* 339, 786-791, 2013). Upon DNA binding, cGAS catalyzes the cyclization of ATP and GTP to form the secondary signaling molecule, 2'3'cGAMP or cGAMP. cGAMP in-turn is a natural ligand for STING (Stimulator of Interferon Genes) which through Tank-binding Kinase 1(TBK1)/Interferon Regulatory Factor 3 (IRF3) induces interferon response factors (IRF) and nuclear factor kappa-light-chain-enhancer of activated B cells (NFkB) driven gene expression.

**[0004]** Deoxyribonuclease (Dnase) deficiencies result in excess DNA and have been linked to aberrant DNA sensing and subsequent increased pathological anti-nuclear antibody titers in human SLE patients (Yasutomo et al., Mutation of DNASE1 in people with systemic lupus erythematosus. *Nature Genetics* 28:313, 2001). This phenomenon has been recapitulated in a mouse model of DNASE deficiency via the three-prime repair exonuclease 1 (TREX1) mutant mouse model. TREX1 acts as part of the SET complex to degrade DNA. The TREX1 model manifests as an autoimmune phenotype with multi-organ inflammation and increased interferon signature gene (ISG) expression similar to SLE. However, if these mice are bred on to a cGAS deficient background, the animals are protected from disease as reported by Gao et al (Gao et al., Activation of cyclic GMP-AMP synthase by self-DNA causes autoimmune dis-

eases. *Proceedings of the National Academy of Sciences* 112:E5699-E5705, 2015). And critically, the authors report anti-dsDNA antibodies are reduced in the cGAS/TREX1 double knockouts, which highlights the role cGAS plays in DNA-driven immune mediated pathology. Similarly, Aicardi-Goutieres syndrome or AGS is a lupus-like autoinflammatory disorder that results from mutations in the DNA exonuclease, TREX1 (Crow et al, Mutations in the gene encoding the 3'-5' DNA exonuclease TREX1 Aicardi-Goutieres syndrome at the AGS1 locus, *Nature Genetics*, 38:917-920, 2006). These observations support a role for the inhibition of cGAS as a therapeutic strategy for treating SLE/Lupus Nephritis and AGS. Additionally, emerging evidence has linked aberrant DNA exposure in the form of cell free DNA with reduced TREX expression in Rheumatoid Arthritis Patients (Luo et al, Age-related self-DNA accumulation may accelerate arthritis in rats and in human rheumatoid arthritis. *Nature Communications*, 20; 14(1):4394, 2023) thereby supporting a role for inhibition of cGAS in Rheumatoid Arthritis. A similar link to aberrant DNA exposure in the form of Neutrophil Extracellular Traps (NETS) has been linked to cGAS in manifestations of Hidradenitis Suppurativa (Byrd et al, Neutrophil extracellular traps, B cells, and type I interferons contribute to immune dysregulation in hidradenitis suppurativa. *Sci Transl Med.*, 508: 2019). Additionally, a recent study by Papinska and colleagues (Papinska et al, Activation of Stimulator of Interferon Genes (STING) and Sjogren Syndrome. *Journal of Dental Research*, 97, 893-900, 2018) demonstrated that activating the cGAS pathway through activation of STING with a STING agonist induced Sjogren syndrome like disease in mice, thus supporting a role for inhibition of the upstream activator of STING as a therapeutic strategy for Sjogren's syndrome.

**[0005]** Similarly, systemic sclerosis has been linked to the cGAS-STING pathway thorough chromosomal instability as evident by the recent work by Paul et al (Paul et al, Centromere defects, chromosome instability, and cGAS-STING activation in systemic sclerosis *Nature Communications*, 13, 7074, 2022). Similarly, a role for the cGAS pathway in driving inflammatory myopathies was demonstrated by the Zhou and colleagues (Zhou et al, Activation of cGAS-STING pathway—A possible cause of myofiber atrophy/necrosis in dermatomyositis and immune-mediated necrotizing myopathy, *Journal of Clinical Laboratory Analysis*, 36, 24631, 2022). Finally, a role for the cGAS pathway was recently demonstrated for Parkinson's disease wherein mouse models highlighted microglial driven inflammation (Ma et al, Microglial cGAS drives Neuroinflammation in the MPTP Mouse Model of Parkinson's Disease, *CNS Neuroscience Therapy*, 29, 2018-2035, 2023). Targeting the cGAS pathway is therefore a possible strategy for the treatment of autoimmune diseases.

**[0006]** Given the potential role of the cGAS-STING pathway in autoimmune diseases, efforts to develop small molecule cGAS inhibitors have been explored by the scientific community. For example, WO 2019/241787 describes methyl 4-amino-6-(phenylamino)-1,3,5-triazine-2-carboxylates as cGas inhibitors. U.S. Pat. No. 12,043,625 and US Pat. Application Publication No. 2023/0000878 also describe small molecule cGas inhibitors. For example, U.S. Pat. No. 12,043,625 describes pyridine derivatives with C-linked cyclic substitutes as cGAS inhibitors and US Pat. App. Pub. No. 2023/0000878 describes pyridine derivatives

with N-linked cyclic substitutes as cGAS inhibitors (see e.g., Table 23 herein, entries 1-4 for representative example compounds).

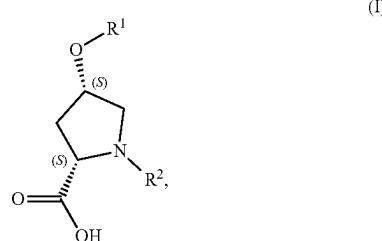

**[0007]** Despite the efforts to develop small molecule cGAS inhibitors, their development has remained challenging. For example, no small molecule cGAS inhibitor has been approved and none have entered late-stage clinical trials. As of Jan. 22, 2025, publicly available information shows that only three cGAS inhibitors have entered phase I clinical trials, which include: a phase 1 study of VENT-03 (EUCT number:2023-507504-31-00) completed October 2024, a phase 1 study for GSK4347859 (NCT06188507) that started Q1 2024 with a completion date projected in 2026, and a phase 1 study of IMSB301 (ISRCTN90049550) initiated in Q2 2024 with a planned completion date in Q2 2025.

**[0008]** Accordingly, there is a long-felt and unmet need for the development of a small molecule cGAS inhibitor as their development may provide and/or broaden treatment options for patients with an autoimmune disorder (e.g., Aicardi-Goutieres Syndrome (AGS), Systemic Lupus Erythematosus (SLE), Lupus Nephritis, Systemic Sclerosis, Sjogren's Syndrome (SjD), Inflammatory Myopathies, Hidradenitis Suppurativa, Parkinson's Disease, Rheumatoid Arthritis, Ulcerative Colitis and Crohn's Disease).

#### BRIEF SUMMARY

**[0009]** Surprisingly, it has been found that compounds of Formula (I) and Formula (II) are potent inhibitors of cGAS with IC<sub>50</sub> values ranging from 0.0003 μM to 0.4631 μM with regards to inhibiting the production of IP-10 in cells stimulated with double-stranded DNA. See e.g., Assay No. 1 described in Table 22. Given the higher order alkynyl groups in compounds of Formula (I) and Formula (II), it was unexpected that these compounds would bind to the cGAS target—let alone inhibit cGAS with the high potency observed (see, e.g., FIGS. 1-3). Moreover, compounds of Formula (IIB) maintain their high potency while also exhibiting increased permeability, hepatocyte stability, and/or bioavailability as compared to representative examples from US Pat. App. Pub. No. 2023/0000878 (see, e.g., Table 23).

and of such compounds, and mixtures thereof, even if such forms are not listed explicitly.

[0083] “Enantiomers” are a pair of stereoisomers that are non-superimposable mirror images of each other. A “racemic” mixture is a 1:1 mixture of a pair of enantiomers. A “scalemic” mixture of enantiomers is mixture of enantiomers at a ratio other than 1:1.

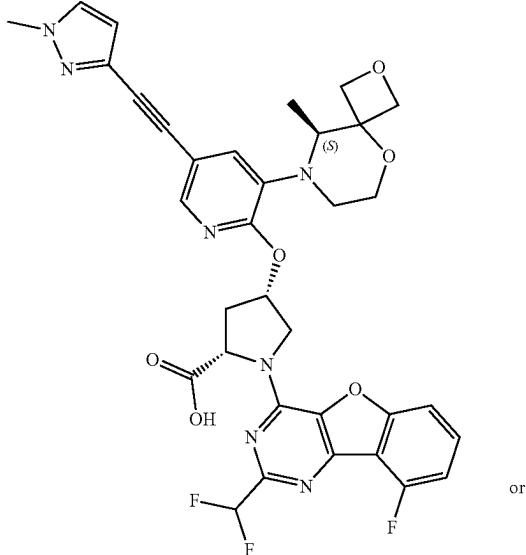

[0084] The term “R” at a stereocenter designates that the stereocenter is purely of the R-configuration as defined in the art; likewise, the term “S” means that the stereocenter is purely of the S-configuration. As used herein, the term “RS” refers to a stereocenter that exists as a mixture of the R- and S-configurations.

[0085] Compounds containing one stereocenter drawn without a stereo bond designation are a mixture of 2 enantiomers. Compounds containing 2 stereocenters both drawn without stereo bond designations are a mixture of 4 diastereomers. Compounds with 2 stereocenters both labeled “RS” and drawn with stereo bond designations are a 2-component mixture with relative stereochemistry as drawn. Unlabeled stereocenters drawn without stereo bond designations are a mixture of the R- and S-configurations. For unlabeled stereocenters drawn with stereo bond designations, the absolute stereochemistry is as depicted.

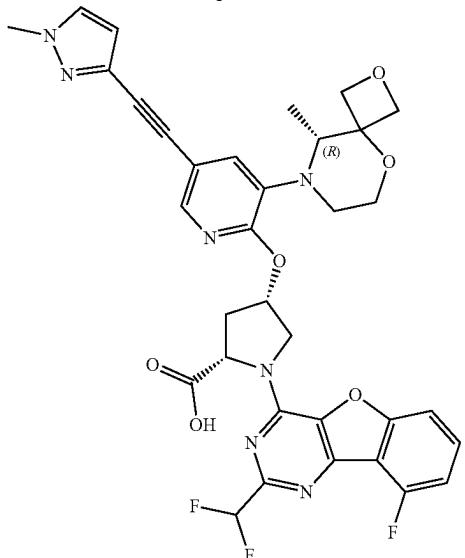

[0086] Certain examples contain chemical structures that are depicted or labelled as an (R\*) or (S\*). When (R\*) or (S\*) is used in the name of a compound or in the chemical representation of the compound, it is intended to convey that the compound is a pure single isomer at that stereocenter; however, absolute configuration of that stereocenter has not been established. Thus, a compound designated as (R) refers to a compound that is a pure single isomer at that stereocenter with an absolute configuration of either (R) or (S), and a compound designated as (S) refers to a compound that is a pure single isomer at that stereocenter with an absolute configuration of either (R) or (S). For example, (2S,4S)-1-(2-(Difluoromethyl)-9-fluorobenzo[3,2-d]pyrimidin-4-yl)-4-((5-((1-methyl-1H-pyrazol-3-yl)ethynyl)-3-((R\*)-9-methyl-2,5-dioxa-8-azaspiro[3.5]nonan-8-yl)pyridin-2-yl)oxy)pyrrolidine-2-carboxylic acid:

refers to a compound that is either:

or

[0087] Unless indicated otherwise, the description or naming of a particular compound in the specification and claims is intended to include both individual enantiomers and mixtures, racemic or otherwise, thereof. The methods for the determination of stereochemistry and the separation of stereoisomers are well-known in the art.

[0088] Reference to a compound herein stands for a reference to any one of: (a) the actually recited form of such compound, and (b) any of the forms of such compound in the medium in which the compound is being considered when named. For example, reference herein to a compound such as R—COOH, encompasses reference to any one of: for example, R—COOH(s), R—COOH(sol), and R—COO-(sol). In this example, R—COOH(s) refers to the solid compound, as it could be for example in a tablet or some other solid pharmaceutical composition or preparation; R—COOH(sol) refers to the undissociated form of the compound in a solvent; and R—COO-(sol) refers to the

dissociated form of the compound in a solvent, such as the dissociated form of the compound in an aqueous environment, whether such dissociated form derives from R—COOH, from a salt thereof, or from any other entity that yields R—COO— upon dissociation in the medium being considered. In another example, an expression such as “exposing an entity to compound of formula R—COOH” refers to the exposure of such entity to the form, or forms, of the compound R—COOH that exists, or exist, in the medium in which such exposure takes place. In still another example, an expression such as “reacting an entity with a compound of formula R—COOH” refers to the reacting of (a) such entity in the chemically relevant form, or forms, of such entity that exists, or exist, in the medium in which such reacting takes place, with (b) the chemically relevant form, or forms, of the compound R—COOH that exists, or exist, in the medium in which such reacting takes place. In this regard, if such entity is for example in an aqueous environment, it is understood that the compound R—COOH is in such same medium, and therefore the entity is being exposed to species such as R—COOH (aq) and/or R—COO-(aq), where the subscript “(aq)” stands for “aqueous” according to its conventional meaning in chemistry and biochemistry. A carboxylic acid functional group has been chosen in these nomenclature examples; this choice is not intended, however, as a limitation but it is merely an illustration. It is understood that analogous examples can be provided in terms of other functional groups, including but not limited to hydroxyl, basic nitrogen members, such as those in amines, and any other group that interacts or transforms according to known manners in the medium that contains the compound. Such interactions and transformations include, but are not limited to, dissociation, association, tautomerism, solvolysis, including hydrolysis, solvation, including hydration, protonation, and deprotonation. No further examples in this regard are provided herein because these interactions and transformations in a given medium are known by any one of ordinary skill in the art.

[0089] Any formula given herein is also intended to represent unlabeled forms as well as isotopically labeled forms of the compounds. Isotopically labeled compounds have structures depicted by the formulas given herein except that one or more atoms are replaced by an atom having a selected atomic mass or mass number in an enriched form. Examples of isotopes that can be incorporated into compounds of the present disclosure in a form that exceeds natural abundances include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorous, fluorine, chlorine, and iodine, such as <sup>2</sup>H (or chemical symbol D), <sup>3</sup>H (or chemical symbol T), <sup>11</sup>C, <sup>13</sup>C, <sup>14</sup>C, <sup>15</sup>N, <sup>18</sup>O, <sup>17</sup>O, <sup>31</sup>P, <sup>32</sup>P, <sup>35</sup>S, <sup>18</sup>F, <sup>36</sup>Cl, and <sup>125</sup>I, respectively. Such isotopically labelled compounds are useful in metabolic studies (preferably with <sup>14</sup>C), reaction kinetic studies (with, for example <sup>2</sup>H or <sup>3</sup>H), detection or imaging techniques [such as positron emission tomography (PET) or single-photon emission computed tomography (SPECT)] including drug or substrate tissue distribution assays, or in radioactive treatment of patients. In particular, an <sup>18</sup>F or <sup>11</sup>C labeled compound may be particularly preferred for PET or SPECT studies. Further, substitution with heavier isotopes such as deuterium (i.e., <sup>2</sup>H, or D) may afford certain therapeutic advantages resulting from greater metabolic stability, for example increased in vivo half-life or reduced dosage requirements. Isotopically labeled compounds of this present disclosure can generally be prepared

by carrying out the procedures disclosed in the schemes or in the examples and preparations described below by substituting a readily available isotopically labeled reagent for a non-isotopically labeled reagent.

[0090] When referring to any formula given herein, the selection of a particular moiety from a list of possible species for a specified variable is not intended to define the same choice of the species for such variable appearing elsewhere. In other words, where a variable appears more than once, the choice of the species from a specified list is independent of the choice of the species for the same variable elsewhere in the formula, unless stated otherwise.

[0091] The term “zwitterion” refers to a molecule having a net formal charge of zero, but negative and positive formal charges on individual atoms within its structure. The charged atoms are joined by one or more covalent bonds. In some embodiments, described herein are compounds of Formula (I) or Formula (II) that can exist in zwitterionic form.

[0093] When referring to any formula given herein, the selection of a particular moiety from a list of possible species for a specified variable is not intended to define the same choice of the species for the variable appearing elsewhere. In other words, where a variable appears more than once, the choice of the species from a specified list is independent of the choice of the species for the same variable elsewhere in the formula, unless stated otherwise.

[0094] The nomenclature “ $C_i-C_j$ ” or “ $C_{i,j}$ ” with  $j > i$ , when applied herein to a class of substituents, is meant to refer to embodiments of this present disclosure for which each and every one of the number of carbon members, from i to j including i and j, is independently realized. By way of example, the term  $C_1-C_3$  refers independently to embodiments that have one carbon member ( $C_1$ ), embodiments that have two carbon members ( $C_2$ ), and embodiments that have three carbon members ( $C_3$ ).

[0095] A “pharmaceutically acceptable salt” is intended to mean a salt of an acid or base of a compound represented by Formula (I) or a compound of Formula (II) (including compounds of Formulas (IIA), (IIB), (IIC), (IIC'), and (IID)) that is non-toxic, biologically tolerable, or otherwise biologically suitable for administration to the subject. #### Methods of Treatment

[0253] Another aspect of the present disclosure includes methods of treating disease, disorder, or condition that can be treated by the inhibition of cGAS. An embodiment of the present disclosure is a method of treating a subject suffering from or diagnosed with a disease, disorder, or condition mediated by cGAS activity, comprising administering to a subject in need of such treatment a therapeutically effective amount of at least one compound selected from compounds of Formula (I) or Formula (II); and pharmaceutically acceptable salts, and stereoisomers thereof, to a subject in need thereof.

[0254] In treatment methods according to the present disclosure, a therapeutically effective amount of at least one active agent according to the present disclosure is administered to a subject suffering from or diagnosed as having such a disease, disorder, or condition. A “therapeutically effective amount” means an amount or dose sufficient to generally bring about the desired therapeutic or prophylactic benefit in subjects in need of such treatment for the designated disease, disorder, or condition. Effective amounts or doses of the active agents of the present disclosure may be ascertained by routine methods such as modeling, dose escalation studies or clinical trials, and by taking into consideration routine factors, e.g., the mode or route of administration or drug delivery, the pharmacokinetics of the agent, the severity and course of the disease, disorder, or condition, the subject's previous or ongoing therapy, the subject's health status and response to drugs, and the judgment of the treating physician. For a 70-kg human, an illustrative range for a suitable dosage amount is from about 1 to 1000 mg/day in single or multiple dosage units (e.g., BID, TID, QID or as required by modality).

[0255] Once improvement of the subject's disease, disorder, or condition has occurred, the dose may be adjusted for preventive or maintenance treatment. For example, the dosage or the frequency of administration, or both, may be reduced as a function of the symptoms, to a level at which the desired therapeutic or prophylactic effect is maintained. Of course, if symptoms have been alleviated to an appropriate level, treatment may cease. Subjects may, however, require intermittent treatment on a long-term basis upon any recurrence of symptoms.

[0256] In addition, the compounds of the present disclosure are envisaged for use alone, in combination with one or more of other compounds of this present disclosure, or in combination with additional active ingredients in the treatment of the conditions discussed below. The additional active ingredients may be co-administered separately with at least one compound of the present disclosure, with active agents of the present disclosure or included with such an agent in a pharmaceutical composition according to the present disclosure. In an illustrative embodiment, additional active ingredients are those that are known or discovered to be effective in the treatment of conditions, disorders, or diseases associated with the cGAS modulation, such as another cGAS inhibitor or a compound active against another target associated with the particular condition, disorder, or disease. The combination may serve to increase efficacy (e.g., by including in the combination a compound potentiating the potency or effectiveness of an agent according to the present disclosure), decrease one or more side effects, or decrease the required dose of the active agent according to the present disclosure.

[0257] When referring to inhibiting the target, an “effective amount” means an amount sufficient to affect cGAS inhibition.

[0258] In a further embodiment, the present disclosure is directed to a method of treating a subject suffering from or diagnosed with a disease, disorder, or condition associated with cGAS inhibition, comprising administering to the subject in need of such treatment a therapeutically effective amount of the active agent. In some embodiments, the active agent is a compound of the present disclosure, such as a compound of Formula (I) or a compound of Formula (II) (including compounds of Formulas (IIA), (IIB), (IIC), (IIC'), and (IID)), or a pharmaceutically acceptable salt and/or stereoisomer thereof. In some embodiments, the disease, disorder, or condition associated with cGAS inhibition is selected from autoimmune disorders including Aicardi-Goutieres Syndrome (AGS), Systemic Lupus Erythematosus (SLE), Lupus Nephritis, Scleroderma, Sjogren's Syndrome, Inflammatory Myopathies, Hidradenitis Supperativa (HS), Parkinson's Disease, Rheumatoid Arthritis, Ulcerative Colitis and Crohn's Disease.

[0259] The compounds of Formula (I) or compounds of Formula (II) (including compounds of Formulas (IIA), (IIB), (IIC), (IIC'), and (IID)) are useful in methods for treating, ameliorating and/or preventing a disease, a condition or a disorder that is affected by the inhibition of cGAS. Such methods comprise administering to a subject, including an animal, a mammal, and a human in need of such treatment, amelioration and/or prevention, a therapeutically effective amount of a compound of Formula (I) or a compound of Formula (II) (including compounds of Formulas (IIA), (IIB), (IIC), (IIC'), and (IID)), or a pharmaceutically acceptable salt thereof.

### Pharmaceutical Compositions

[0260] An additional embodiment of the present disclosure is a pharmaceutical composition comprising:

[0261] (A) therapeutically effective amount of at least one compound selected from compounds of Formula (I) or compounds of Formula (II) (including compounds of Formulas (IIA), (IIB), (IIC), (IIC'), and (ID)); and pharmaceutically acceptable salts, and stereoisomers of compounds of Formula (I) or compounds of Formula (II) (including compounds of Formulas (IIA), (IIB), (IIC), (IIC'), and (ID));

[0262] and (B) at least one pharmaceutically acceptable excipient.

[0263] An additional embodiment of the present disclosure is a pharmaceutical composition comprising a therapeutically effective amount of at least one compound in Table 1, as well as and pharmaceutically acceptable salts, and stereoisomers of compounds of Table 1, and at least one pharmaceutically acceptable excipient.

[0264] The active agents of the present disclosure are envisaged for use, alone or in combination with one or more additional active ingredients, to formulate pharmaceutical compositions of the present disclosure. A pharmaceutical composition of the present disclosure comprises a therapeutically effective amount of at least one active agent in accordance with the present disclosure.

[0265] Pharmaceutically acceptable excipients commonly used in pharmaceutical compositions are substances that are non-toxic, biologically tolerable, and otherwise biologically suitable for administration to a subject, such as an inert substance, added to a pharmacological composition or otherwise used as a vehicle, carrier, or diluent to facilitate administration of an agent and that is compatible therewith. Examples of such excipients include calcium carbonate, calcium phosphate, various sugars and types of starch, cellulose derivatives, gelatin, vegetable oils, and polyethylene glycols.

[0266] Delivery forms of the pharmaceutical compositions containing one or more dosage units of the active agents may be prepared using pharmaceutically acceptable excipients and compounding techniques known or that become available to those of ordinary skill in the art. The compositions may be administered in the inventive methods by a suitable route of delivery, e.g., oral, parenteral, rectal, topical, or ocular routes, or by inhalation.

[0267] The preparation may be in the form of tablets, capsules, sachets, dragees, powders, granules, lozenges, powders for reconstitution, liquid preparations, or suppositories. The compositions may be formulated for any one of a plurality of administration routes, such as intravenous infusion, topical administration, or oral administration. Preferably, the compositions may be formulated for oral administration.

[0268] For oral administration, the active agents of the present disclosure can be provided in the form of tablets or capsules, or as a solution, emulsion, or suspension. To prepare the oral compositions, the active agents may be formulated to yield a dosage of, e.g., for a 70-kg human, an illustrative range for a suitable dosage amount is from about 1 to 1000 mg/day in single or multiple dosage units.

[0269] Oral tablets may include the active ingredient(s) mixed with compatible pharmaceutically acceptable excipients such as diluents, disintegrating agents, binding agents, lubricating agents, sweetening agents, flavoring agents, col-

oring agents and preservative agents. Suitable inert fillers include sodium and calcium carbonate, sodium and calcium phosphate, lactose, starch, sugar, glucose, methyl cellulose, magnesium stearate, mannitol, sorbitol, and the like. Exemplary liquid oral excipients include ethanol, glycerol, water, and the like. Starch, polyvinyl-pyrrolidone (PVP), sodium starch glycolate, microcrystalline cellulose, and alginic acid are exemplary disintegrating agents. Binding agents may include starch and gelatin. The lubricating agent, if present, may be magnesium stearate, stearic acid or talc. If desired, the tablets may be coated with a material such as glyceryl monostearate or glyceryl distearate to delay absorption in the gastrointestinal tract or may be coated with an enteric coating.

[0270] Capsules for oral administration include hard and soft gelatin or (hydroxypropyl)methyl cellulose capsules. To prepare hard gelatin capsules, active ingredient(s) may be mixed with a solid, semi-solid, or liquid diluent. Liquids for oral administration may be in the form of suspensions, solutions, emulsions, or syrups or may be lyophilized or presented as a dry product for reconstitution with water or other suitable vehicle before use. Such liquid compositions may optionally contain: pharmaceutically-acceptable excipients such as suspending agents (for example, sorbitol, methyl cellulose, sodium alginate, gelatin, hydroxyethylcellulose, carboxymethylcellulose, aluminum stearate gel and the like); non-aqueous vehicles, e.g., oil (for example, almond oil or fractionated coconut oil), propylene glycol, ethyl alcohol, or water; preservatives (for example, methyl or propyl p-hydroxybenzoate or sorbic acid); wetting agents such as lecithin; and, if desired, flavoring or coloring agents.

[0271] The active agents of this present disclosure may also be administered by non-oral routes. For example, compositions may be formulated for rectal administration as a suppository, enema, or foam. For parenteral use, including intravenous, intramuscular, intraperitoneal, or subcutaneous routes, the agents of the present disclosure may be provided in sterile aqueous solutions or suspensions, buffered to an appropriate pH and isotonicity or in parenterally acceptable oil. Suitable aqueous vehicles include Ringer's solution and isotonic sodium chloride. Such forms may be presented in unit-dose form such as ampules or disposable injection devices, in multi-dose forms such as vials from which the appropriate dose may be withdrawn, or in a solid form or pre-concentrate that can be used to prepare an injectable formulation. Illustrative infusion doses range from about 1 to 1000 µg/kg/minute of agent admixed with a pharmaceutical carrier over a period ranging from several minutes to several days.

[0272] For topical administration, the agents may be mixed with a pharmaceutical carrier at a concentration of about 0.01% to about 20% of drug to vehicle, preferably 0.1% to 10%. Another mode of administering the agents of the present disclosure may utilize a patch formulation to affect transdermal delivery.

[0273] Active agents may alternatively be administered in methods of this present disclosure by inhalation, via the nasal or oral routes, e.g., in a spray formulation also containing a suitable carrier.

### Methods of Making

[0274] Exemplary compounds useful in methods of the present disclosure will now be described by reference to the illustrative synthetic schemes for their general preparation

below and the specific examples that follow. Artisans will recognize that, to obtain the various compounds herein, starting materials may be suitably selected so that the ultimately desired substituents will be carried through the reaction scheme with or without protection as appropriate to yield the desired product. Alternatively, it may be necessary or desirable to employ, in the place of the ultimately desired substituent, a suitable group that may be carried through the reaction scheme and replaced as appropriate with the desired substituent. Unless otherwise specified, the variables are as defined above in reference to Formula (I) or a compound of

Formula (II) (including compounds of Formulas (IIA), (IIB), (IIC), (IIC'), and (IID)). Reactions may be performed between the melting point and the reflux temperature of the solvent, and preferably between 0° C., and the reflux temperature of the solvent. Reactions may be heated employing conventional heating or microwave heating. Reactions may also be conducted in sealed pressure vessels above the normal reflux temperature of the solvent.

**[0299]** Compounds of Formula (I) or compounds of Formula (II) (including compounds of Formulas (IIA), (IIB), (IIC), (IIC'), and (IID)) may be converted to their corresponding salts using methods known to one of ordinary skill in the art. For example, an amine of Formula (I) or Formula (II) is treated with trifluoroacetic acid, HCl, or citric acid in a solvent such as Et<sub>2</sub>O, CH<sub>2</sub>Cl<sub>2</sub>, THF, MeOH, chloroform, or isopropanol to provide the corresponding salt form. Alternately, trifluoroacetic acid or formic acid salts are obtained as a result of reverse phase HPLC purification conditions. Crystalline forms of pharmaceutically acceptable salts of compounds of Formula (I) or compounds of Formula (II) (including compounds of Formulas (IIA), (IIB), (IIC), (IIC'), and (IID)) may be obtained in crystalline form by recrystallization from polar solvents (including mixtures of polar solvents and aqueous mixtures of polar solvents) or from non-polar solvents (including mixtures of non-polar solvents).

**[0300]** Where the compounds according to this present disclosure have at least one chiral center, they may accordingly exist as enantiomers. Where the compounds possess two or more chiral centers, they may additionally exist as diastereomers. It is to be understood that all such isomers and mixtures thereof are encompassed within the scope of the present disclosure.

**[0301]** Compounds prepared according to the schemes described above may be obtained as single forms, such as single enantiomers, by form-specific synthesis, or by resolution. Compounds prepared according to the schemes above may alternately be obtained as mixtures of various forms, such as racemic (1:1) or non-racemic (not 1:1) mixtures. Where racemic and non-racemic mixtures of enantiomers are obtained, single enantiomers may be isolated using conventional separation methods known to one of ordinary skill in the art, such as chiral chromatography, recrystallization, diastereomeric salt formation, derivatization into diastereomeric adducts, biotransformation, or enzymatic transformation. Where regioisomeric or diastereomeric mixtures are obtained, as applicable, single isomers may be separated using conventional methods such as chromatography or crystallization.

## EXAMPLES

**[0302]** The following Examples are set forth to aid in the understanding of the present disclosure and are not intended and should not be construed to limit in any way the present disclosure set forth in the claims which follow thereafter.

**[0303]** Unless otherwise indicated in the examples, all temperature is expressed in Centigrade (° C.). All reactions were conducted under an inert atmosphere at ambient temperature unless otherwise noted. Unless otherwise specified, reaction solutions were stirred at room temperature under a N<sub>2(g)</sub> or Ar<sub>(g)</sub> atmosphere. Reagents employed without syn-

thetic details are commercially available or made according to known methods, for example according to literature procedures. When solutions were “concentrated to dryness”, they were concentrated using a rotary evaporator under reduced pressure; when solutions were dried, they were typically dried over a drying agent such as MgSO<sub>4</sub> or Na<sub>2</sub>SO<sub>4</sub>. Where a synthesis product is listed as having been isolated as a residue, it will be understood by those skilled in the art that the term “residue” does not limit the physical state in which the product was isolated and may include, for example, a solid, an oil, a foam, a gum, a syrup, and the like.

**[0304]** In obtaining the compounds described in the examples below and the corresponding analytical data, the following experimental and analytical protocols were followed unless otherwise indicated.

**[0305]** Mass spectra: Unless otherwise noted, mass spectra were obtained on a mass spectrometer, such as Agilent series 1100 MSD using electrospray ionization (ESI) in positive mode unless otherwise indicated. Calculated mass corresponds to the exact mass.

**[0306]** Preparative HPLC: The compounds described in the examples may also be purified via preparative reverse-phase HPLC (e.g., Table 3). A typical HPLC chromatographic separation ranges from about 10 to about 20 minutes. Suitable solvent gradients and conditions for purification may be determined by one having skill in the art. Unless otherwise specified, where reverse-phase HPLC is used to purify a compound described in one of the examples below, the solvent used is a gradient of 10% to 80% acetonitrile in water, wherein the acetonitrile and water both contain 0.16% of either TFA or formic acid, or the acetonitrile and water have been adjusted to pH 10 with ammonium hydroxide. The following column abbreviations are also used throughout the examples.

The nuclear magnetic resonance (NMR) spectral characteristics refer to chemical shifts ( $\delta$ ) are expressed in parts per million (ppm). Tetramethylsilane (TMS) was used as internal reference in DMSO-d<sub>6</sub> solutions, and residual CH<sub>3</sub>OH peak or TMS was used as internal reference in CD<sub>3</sub>OD solutions. Coupling constants ( $J$ ) are reported in hertz (Hz). The nature of the shifts as to multiplicity is reported as s (singlet), d

## Biological Data

## 1A. Potency Data for Example Compounds

**[0476]** THP1, an immortalized human monocyte cell line, was engineered to contain two inducible reporters, namely SEAP and Luciferase (Lucia) under promotors responsive to NF- $\kappa$ B and IRF, respectively, to create the THP1-Dual (Invivogen) cell line. In Assay No. 1, stimulation of the cells was accomplished with double-stranded DNA, such as VACV-70/LyoVec (Invivogen), which activates the cGAS pathway to initiate downstream signaling and expression of the reporter genes. In Assay No. 2, stimulation of the cells was accomplished by induction of mtDNA release with ABT-737 and Q-VD-OPH (Sigma), which activates the cGAS pathway to initiate downstream signaling and expression of the reporter genes. Cells were maintained in suspension in culture medium consisting of the following: RPMI 1640 with GlutaMAX, 10% Heat Inactivated Fetal Bovine Serum, 100U/mL Pen/Strep, 100  $\mu$ g/mL Normocin, 10  $\mu$ g/mL Blasticidin, and 100  $\mu$ g/mL Zeocin. Cells were treated with compounds diluted to a final concentration of 0.2% DMSO for 1 hour prior to addition of DNA. Cells were stimulated with VACV-70/LyoVec to a final concentration of 5  $\mu$ g/mL or ABT-737/Q-VD-OPH to a final concentration of 10 uM for 18-21 hours in 37° C./5% CO<sub>2</sub> incubator. Supernatants were collected and luciferase detection was performed using Quanti Luc reagents (Invivogen). Luciferase signal was measured using a Pherastar instrument (BMG Labtech) using MARS software.

### 1B. Discussion of Potency Data and Modeling

[0477] As shown in Table 22, compounds of Formula (I) and Formula (II) are potent inhibitors of cGAS with IC<sub>50</sub> values ranging from 0.0003 μM to 0.4631 μM as measured in Assay No. 1 and values ranging from 0.0004 μM to 0.6981 μM as measured in Assay No. 2. These assays measure cGAS-inhibition in THP1-Dual cells stimulated with either

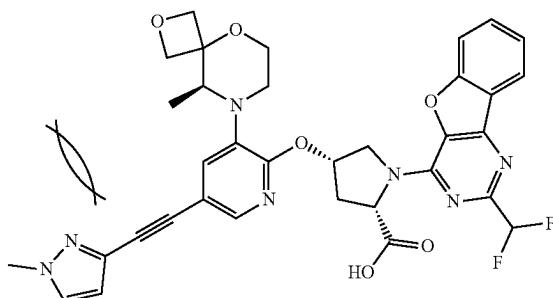

double-stranded DNA (Assay No. 1) or mtDNA release with ABT-737 and Q-VD-OPH (Assay No. 2).

[0478] The high potency of the compounds described herein is surprising in view of the sterically hindered binding pocket in the target. This steric hinderance is illustrated by FIG. 1, which shows the cGAS-DNA bound structure from W. Xie, et al., “Human cGAS catalytic domain has an additional DNA-binding interface that enhances enzymatic activity and liquid-phase condensation,” Proc. Natl. Acad. Sci. U.S.A. 116 (24) 11946-11955, <https://doi.org/10.1073/pnas.1905013116> (2019). As can be seen, the activation loop in the cGAS-DNA bound structure (amino acids 210-220) appears to restrict the space available for a small molecule compound to interact with cGAS-DNA bound structure. This view is supported by modeling Example 1.11 from US 2023/000078 with the cGAS-DNA bound structure, which is shown in FIG. 2. There, Ex. 1.11 (structure reproduced below) is in an energetically minimized structure in water, then inserted in cGAS receptor using substructural overlay with a literature structure from US 2022/0073532 (e.g., FIG. 4 in US 2022/0073532). As shown in FIG. 2, the terminal alkynyl group attached to the pyridine ring appears to abut the activation loop without causing structural alteration of the target.

Ex 1.11 from US 2023/000078

[0479] On the other hand, compounds of Formula (II) as described herein, would have been expected to be too large to bind within the binding pocket in the cGAS-DNA bound structure—let alone exhibit the high potencies summarized in Table 22. To illustrate this point, Example 36 was modeled with the cGAS-DNA bound structure as shown in FIG. 3. There, Example 36 is in an energetically minimized conformation in water, then inserted in cGAS receptor using substructural overlay with a literature structure from US 2022/0073532 (e.g., FIG. 4 from US 2022/0073532). As can be seen in FIG. 3, there is clear steric clashing between the higher order heteroaryl alkynyl group of Example 36 and the activation loop in the cGAS-DNA bound structure. Accordingly, compounds of Formula (II), such as Example 36, would appear too large to bind within the sterically constrained binding pocket of the cGAS-DNA bound structure (see below).

Ex. 36: A representative Compound of Formula (I)

**[0480]** The larger R<sup>2</sup> groups shown in the US 2023/000078 examples do not change that compounds of formula (II) have unexpectedly high potency in view of the sterically hindered binding pocket in the cGAS target. While US 2023/000078 shows that the lower order alkynyl R<sup>2</sup> group can be replaced with a larger group such as the heteroaryl group in Example 4.01 (see entry 4 in Table 23), as a whole, it shows that compounds with smaller R<sup>2</sup> groups (e.g., R<sup>2</sup> is chloro, fluoro, cyclopropyl, C<sub>1-3</sub>alkyl, C<sub>2-5</sub>alkynyl, —S-methyl, or —CN) have increased potency over larger R<sup>2</sup> groups. This trend is apparent from analysis of the THP1 cell assay data of other examples in US 2023/0000878 as compared to representative example 4.01. For instance, examples such as 1.09, 1.11, 1.12, 1.13, 1.34, 2.03, 2.04, 6.01, 6.02, 9.01, 3.15, 3.19, 3.22, 3.24, 3.26, 3.27, 3.28, 3.29, 4.03, 5.01 differ from Ex. 4.01 at the R<sup>2</sup> position and have either methyl, monofluoromethyl, difluoromethyl or trifluoromethyl at R<sup>1</sup>. Exemplified compounds that have smaller R<sup>2</sup> groups (F, Cl, -ethynyl, 1-propynyl, and —SMe as in examples 1.09, 1.11, 1.12, 1.13, 1.34, 2.03, 2.04, 6.01, 6.02, 9.01) all exhibit cellular potency of less than 40 nM. On the other hand, exemplified compounds with aryl R<sup>2</sup> groups, have cellular potency that span a larger activity range of up to 712 nM, with several of such aryl R<sup>2</sup> examples having weaker IC<sub>50</sub> values of >40 nM (e.g., examples 3.15, 3.19, 3.22, 3.24, 3.26, 3.27, 3.28, 3.29, 4.03, 5.01). Moreover, Ex. 3.29 in US 2023/0000878 possesses one of the larger R<sup>2</sup> groups in the examples (R<sup>2</sup> is pyridine substituted with —O-tetrahydropyran) and it is one of the weakest potency compounds (712 nM).

#### 2A. Comparative Data Analysis

**[0481]** Table 23 describes potency data and pharmacological properties for Example Compound Nos. 44, 96, 98, 99, 107, and 108 in the instant disclosure and representative compounds from US 2023/0000878. The data for both groups of compounds was collected using identical procedures, and therefore, can be used for comparison purposes.

#### Permeability Assay

**[0482]** The in vitro permeability of test compounds is determined using Madin-Darby canine kidney (MDCK)

cells to provide a measure of intestinal absorption. MDCK cells are seeded onto Millipore Multiscreen Transwell plates and cultured for 4 days. To initiate the permeability studies test compound is added to either the apical or basolateral side of a confluent MDCK monolayer and permeability in the apical to basolateral (A-B) and basolateral to apical (B-A) direction is measured by monitoring the appearance of the test compound on the opposite side of the membrane using LCMS/MS. The permeability coefficient for each test compound (Papp) is derived from the rate of permeation across the cell monolayer.

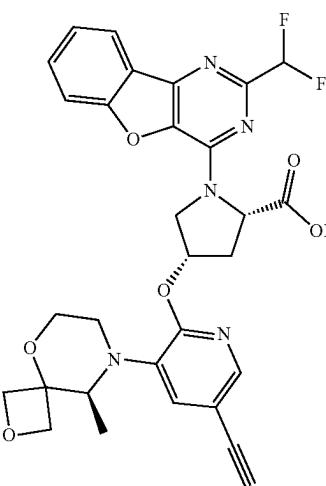

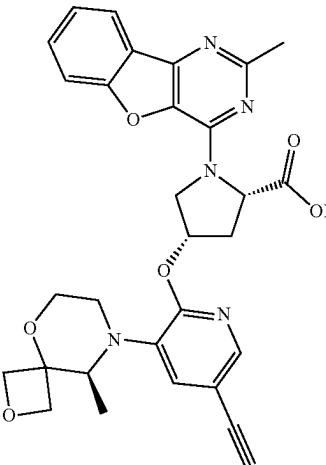

#### Stability Assays

**[0483]** The in vitro stability of test compounds is determined in hepatocytes isolated from cynomolgus monkeys to provide a measure of metabolic stability. Cryopreserved hepatocytes are thawed and incubated with test compound (typically 1 μM) for up to 4 hours. The reaction is terminated by addition of organic solvent and samples are centrifuged prior to LC-MS/MS analysis. The in vitro intrinsic clearance (Clint) is calculated using the slope of the log-linear regression from the percentage parent compound remaining versus time relationship.

#### Bioavailability Assay

**[0484]** The objective of this study is to determine the pharmacokinetic (PK) profile and oral bioavailability (F) of the test compound following intravenous (0.5 mg/kg) and oral (2.5 mg/kg) administrations to male Cynomolgus monkeys. Test compounds for both IV and oral administration are formulated in 20% HP-beta-cyclodextrin at 1.25 mg/mL. All study groups consist of three naïve male Cynomolgus monkeys with a weight ranging from 2 to 5 kg. Animals are fasted overnight prior to dose administration and up to four hours after dosing. Serial venous blood samples (approximately 0.5 mL) are taken at time points up to 24 hours after dosing from each animal. Blood samples are transferred into blood collection tubes containing EDTA as the anti-coagulant and tubes are immediately placed on wet ice until centrifugation for plasma. After centrifugation, plasma is separated and 0.5M ammonium formate buffer is added and tubes are stored at approximately -20° C. LC-MS/MS analysis is used to determine the concentration of test compounds in plasma and non-compartmental analysis is performed on the plasma concentration-time data. Oral bioavailability is calculated as a percentage by comparing the areas under the plasma concentration-time curve after IV and oral administration. Table 23. ## 2B. Discussion of Example Compounds and Representative Compounds from US 2023/0000878

[0485] Compounds from US 2023/0000878: US 2023/0000878 describes pyridine derivatives with N-linked cyclic substitutes as cGAS inhibitors (see e.g., Formula (I) below and Table 23 herein, entries 1-4). US 2023/0000878 further states that the R<sup>2</sup> group, which is attached to the pyridine

ring, can be a C<sub>2-5</sub>alkynyl group in addition to other small groups (e.g., hydrogen, halogen, cyclopropyl, C<sub>1-3</sub>alkyl, —S-methyl, and CN). US 2023/0000878 at page 2, paragraph [0023]. The "Terms and Definitions" section further states that the term "C<sub>2-5</sub>alkynyl" means branched and unbranched alkynyl groups with 2 to 5 carbons provided they have at least one triple bond. Id. at page 22, paragraph

[0150]. The example section shows that R<sup>2</sup> can be a terminal alkyne (—C≡C—H) or a methyl alkyne (—C≡C—Me), which is illustrated by representative examples Nos. 1.11, 2.03, and 6.02 (see entries 1-3 of Table 23). No other alkynyl R<sup>2</sup> groups are exemplified in US 2023/0000878.

Formula (I) from US 2023/0000878

[0486] Alternatively, US 2023/0000878 states that R<sup>2</sup> can be a cyclic group selected from the group consisting of a phenyl and a five- to six-membered heteroaryl comprising 1, 2, 3, or 4 heteroatoms selected from N, S and O. US 2023/0000878 at paragraph [0024]. This cyclic group is substituted by one or two R<sup>10</sup> groups, which are further described in paragraph [0089] of US 2023/0000878. A representative example (Ex. 4.01) where R<sup>2</sup> is a heteroaryl group is shown in entry 4 of Table 23.

[0487] Compounds of Formula II: The instant compounds are structurally differentiated from those in US 2023/0000878 at least because they have a higher order alkynyl group attached to the pyridine ring. Despite the increased sterics of this functionality, the compounds of Formula (II) are potent inhibitors of cGAS with IC<sub>50</sub> values ranging from 0.0003 μM to 0.4631 μM (see, e.g., Assay No. 1 in Table 22). For all the reasons described above, this potency was unexpected in view of the sterically constrained cGAS binding pocket (see FIGS. 1-3).

[0488] Comparison Data: Moreover, certain compounds of Formula (IIB) maintain their high potency while also exhibiting increased permeability, hepatocyte stability, and/or bioavailability as compared to representative example compounds from US 2023/0000878 (see Table 23). Regarding permeability, Examples 1.11, 2.03, 4.01 and 6.02 from US 2023/0000878 exhibit permeability values of 1.91×10<sup>-6</sup> cm/s, 3.33×10<sup>-6</sup> cm/s, 2.17×10<sup>-6</sup> cm/s and 2.5×10<sup>-6</sup> cm/s, respectively. See entries 1-4 in Table 23. The representative Examples 44, 96, 98, 99, 107, and 108 from the instant disclosure exhibit generally higher permeability values of 5.51×10<sup>-6</sup> cm/s, 3.33×10<sup>-6</sup> cm/s, 2.9×10<sup>-6</sup> cm/s, 6.54×10<sup>-6</sup> cm/s, 5.59×10<sup>-6</sup> cm/s, and 5.64×10<sup>-6</sup> cm/s, respectively. See Table 23, entries 5-10.

[0489] Certain compounds of Formula (IIB) have increased stability as compared to the representative compounds from US 2023/0000878. For example, as shown in entries 1-4 of Table 23, representative examples 1.11, 2.03,

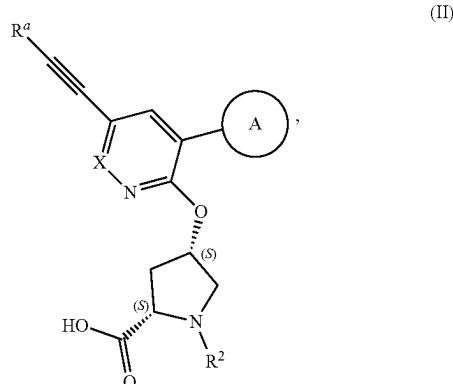

4.01 and 6.02 from US 2023/0000878 exhibit stability values of 21.5 μL/min/million cells, 16.6 μL/min/million cells, 27.9 μL/min/million cells, and 10.6 μL/min/million cells, respectively. Examples 44, 96, 99, and 107 from the instant disclosure, however, have increased stability values of 5.27 μL/min/million cells, 3.65 μL/min/million cells, 7.92 μL/min/million cells, and 8.15 μL/min/million cells, respectively. See Table 23, entries 5-6 and 8-9.

[0490] Additionally, representative compounds Formula (IIB) have increased bioavailability as compared to the representative compounds 1.11 and 4.01 from US 2023/0000878. Those compounds, for example, have bioavailability values of 6% and 1%, respectively. See entries 1 and 4 of Table 23. In contrast, Examples 44, 107, and 108 from the instant disclosures have increased bioavailability values ranging from 21% to 34%. See entries 5 and 9-10 of Table 23.

[0491] In sum, it has been surprisingly found that compounds described herein (e.g., compounds of Formula (II)) are potent inhibitors of cGAS with IC<sub>50</sub> values ranging from 0.0003 μM to 0.4631 μM with regards to inhibiting the production of IP-10 in cells stimulated with double-stranded DNA. See e.g., Assay No. 1 described in Table 22. Moreover, certain compounds of Formula (IIB) maintain their high potency while also exhibiting increased permeability, hepatocyte stability, and/or bioavailability as compared to representative examples from US 2023/0000878 (see, e.g., Table 23).
