**ANTITUMORAL COMPOUNDS**

**CROSS-REFERENCE TO RELATED  
APPLICATIONS**

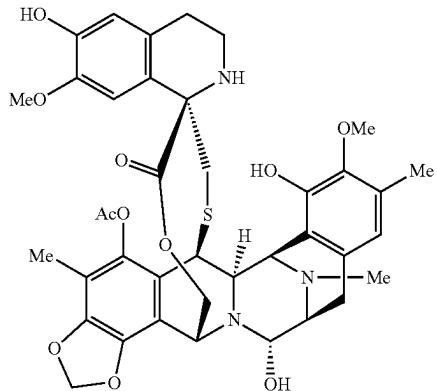

This application is a continuation of U.S. application Ser. No. 17/714,114, filed Apr. 5, 2022, which is a continuation of U.S. application Ser. No. 16/608,617, filed Oct. 25, 2019, which is a U.S. National Phase Application of International Application No. PCT/EP2018/060868, filed Apr. 27, 2018, which claims priority to European Application No. 17382228.9, filed Apr. 27, 2017, and European Application No. 17382497.0, filed Jul. 26, 2017, each of which are hereby incorporated by reference in their entirety.

**FIELD OF THE INVENTION**

The present invention relates to synthetic analogues of the ecteinascidins, particularly of ecteinascidin 736 (ET-736), pharmaceutical compositions containing them, methods for their manufacture and their use as antitumoral agents.

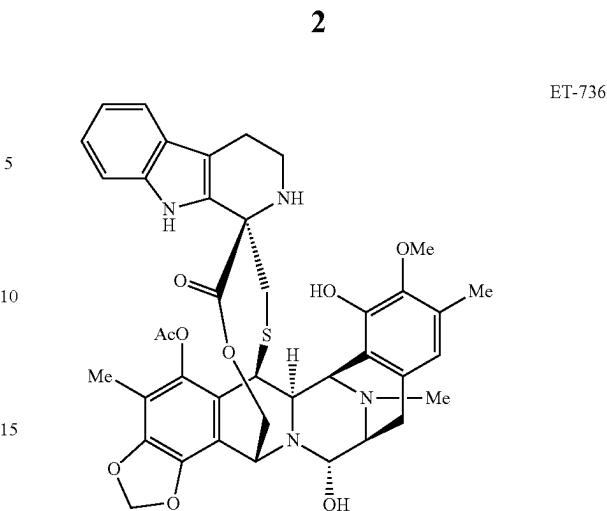

**BACKGROUND OF THE INVENTION**

The ecteinascidins are exceedingly potent antitumor agents isolated from the marine tunicate *Ecteinascidia turbinata*. One of these compounds, ET-743 of formula:

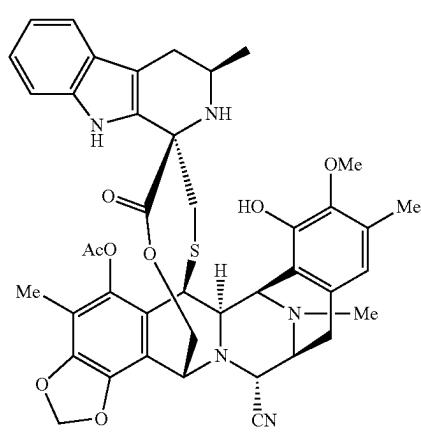

is being employed as an anticancer medicament, under the international nonproprietary name (INN) trabectedin, for the treatment of patients with advanced and metastatic soft tissue sarcoma (STS) after failure of anthracyclines and ifosfamide, or who are unsuited to receive such agents, and for the treatment of relapsed platinum-sensitive ovarian cancer in combination with pegylated liposomal doxorubicin.

Ecteinascidin 736 (ET-736) was first discovered by Rinehart and features a tetrahydro- $\beta$ -carboline unit in place of the tetrahydroisoquinoline unit more usually found in the ecteinascidin compounds isolated from natural sources; See for example Sakai et al., *Proc. Natl. Acad. Sci. USA* 1992, vol. 89, 11456-11460.

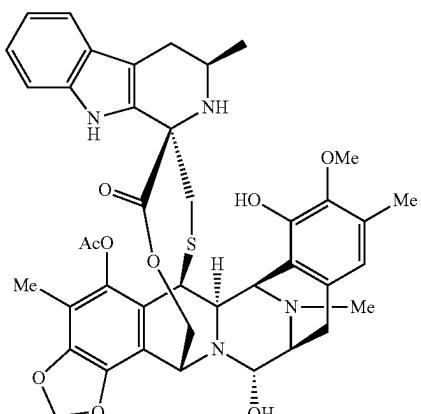

U.S. Pat. No. 5,149,804 describes Ecteinascidin 736 (ET-736), isolated from the Caribbean tunicate *Ecteinascidia turbinata*, and its structure. ET-736 protects mice in vivo at very low concentrations against P388 lymphoma, B16 melanoma, and Lewis lung carcinoma.

WO03014127 describes several synthetic analogues of ET-736 and their cytotoxic activity against tumoral cells. In particular, WO03014127 describes compounds A to D together with their cytotoxic activity against a panel of cancer cell lines.

PM01183 has demonstrated a highly potent in vitro activity against solid and non-solid tumour cell lines as well as a significant in vivo activity in several xenografted human tumor cell lines in mice, such as those for breast, kidney and ovarian cancer. PM01183 exerts its anticancer effects through the covalent modification of guanines in the DNA minor groove that eventually give rise to DNA double-strand break, S-phase arrest and apoptosis in cancer cells.

Despite the positive results obtained in clinical applications in chemotherapy, the search in the field of ecteinascidin compounds is still open to the identification of new compounds with optimal features of activity, selectivity toward the tumour, with a reduced systemic toxicity and/or improved pharmacokinetic properties.

- The terms "pharmaceutically acceptable salt" and "ester" refers to any pharmaceutically acceptable salt or ester which, upon administration to the patient is capable of providing (directly or indirectly) a compound as described herein. However, it will be appreciated that non-pharmaceutically acceptable salts also fall within the scope of the invention since those may be useful in the preparation of pharmaceutically acceptable salts. The preparation of salts can be carried out by methods known in the art.

For instance, pharmaceutically acceptable salts of the compounds provided herein are synthesized from the parent compounds, which contain a basic or acidic moiety, by conventional chemical methods. Generally, such salts are, for example, prepared by reacting the free acid or base of these compounds with a stoichiometric amount of the appropriate base or acid in water or in an organic solvent or in a mixture of both. Generally, nonaqueous media like ether, ethyl acetate, ethanol, 2-propanol or acetonitrile are preferred. Examples of the acid addition salts include mineral acid addition salts such as, for example, hydrochloride, hydrobromide, hydroiodide, sulfate, nitrate, phosphate, and organic acid addition salts such as, for example, acetate, trifluoroacetate, maleate, fumarate, citrate, oxalate, succinate, tartrate, malate, mandelate, methanesulfonate and p-toluenesulfonate. Examples of the alkali addition salts include inorganic salts such as, for example, sodium, potassium, calcium and ammonium salts, and organic alkali salts such as, for example, ethylenediamine, ethanolamine, N,N-dialkylmethanamine, triethanolamine and basic aminoacids salts.

The compounds of the invention may be in crystalline or amorphous form either as free compounds or as solvates (e.g. hydrates) and it is intended that all forms are within the scope of the present invention. Methods of solvation are generally known within the art.

Stereoisomerism about the asymmetric carbons with unspecified stereochemistry is possible, therefore in such cases the asymmetric carbons can have (R) or (S) configuration. All diastereomers generated by a specific configuration of such asymmetric carbons in conjunction with the other asymmetric carbons present in the molecule, and mixtures thereof, are considered within the scope of the present invention. Stereosomerism about the double bond (geometric isomerism) is also possible, therefore in some cases the molecule could exist as (E)-isomer or (Z)-isomer. If the molecule contains several double bonds, each double bond will have its own stereoisomerism, that could be the same or different than the stereoisomerism of the other double bonds of the molecule. Furthermore, compounds referred to herein may exist as atropoisomers. The single stereoisomers including diastereoisomers, geometric isomers and atropoisomers of the compounds referred to herein, and mixtures thereof fall within the scope of the present invention.

In addition, compounds referred to herein may exist in isotopically-labelled forms. All pharmaceutically acceptable salts, esters and isotopically labelled forms of the compounds referred to herein, and mixtures thereof, are considered within the scope of the present invention.

Protected forms of the compounds disclosed herein are considered within the scope of the present invention. Suitable protecting groups are well known for the skilled person in the art. A general review of protecting groups in organic chemistry is provided by Wuts, PGM and Greene TW in Protecting Groups in Organic Synthesis, 4<sup>th</sup> Ed. Wiley-Interscience, and by Kocienski P J in Protecting Groups, 3<sup>rd</sup> Ed. Georg Thieme Verlag. These references provide sections on protecting groups for OH, amino and SH groups. All these references are incorporated by reference in their entirety.

An important feature of the above-described compounds is their bioactivity and in particular their cytotoxic activity. In this regard, we have surprisingly found that the compounds of the present invention show an enhanced antitumor activity, as it is shown in Examples 27 and 29 to 40. Compositions Comprising a Compound of Formula I, IA, IB, IC, ID, IE, IF, IG, Ia, IAA, IBA, ICA, IDA, IEA, IfA, IGa, Ib, IAb, IBb, ICb, IDb, IEb, IfB, IGB, Ic, IAc, IBC, IDC, IfC or IGc of the Invention and Uses Thereof

In a further embodiment of the present invention, there is provided a pharmaceutical composition comprising a compound according to the present invention and a pharmaceutically acceptable carrier. Examples of the administration form include without limitation oral, topical, parenteral, sublingual, rectal, vaginal, ocular and intranasal. Parenteral administration includes subcutaneous injections, intravenous, intramuscular, intrasternal injection or infusion techniques. Preferably the compositions are administered parenterally. Pharmaceutical compositions of the invention can be formulated so as to allow a compound according to the present invention to be bioavailable upon administration of the composition to an animal, preferably human. Compositions can take the form of one or more dosage units, where for example, a tablet can be a single dosage unit, and a container of a compound according to the present invention may contain the compound in liquid or in aerosol form and may hold a single or a plurality of dosage units.

The pharmaceutically acceptable carrier or vehicle can be particulate, so that the compositions are, for example, in tablet or powder form. The carrier(s) can be liquid, with the compositions being, for example, an oral syrup or injectable liquid. In addition, the carrier(s) can be gaseous, or liquid so as to provide an aerosol composition useful in, for example inhalatory administration. Powders may also be used for inhalation dosage forms. The term "carrier" refers to a diluent, adjuvant or excipient, with which the compound according to the present invention is administered. Such pharmaceutical carriers can be liquids, such as water and oils including those of petroleum, animal, vegetable or synthetic origin, such as peanut oil, soybean oil, mineral oil, sesame oil and the like. The carriers can be saline, gum acacia, gelatin, starch paste, talc, keratin, colloidal silica, urea, disaccharides, and the like. In addition, auxiliary, stabilizing, thickening, lubricating and coloring agents can be used. In one embodiment, when administered to an animal, the compounds and compositions according to the present invention, and pharmaceutically acceptable carriers are sterile. Water is a preferred carrier when the compounds according to the present invention are administered intravenously. Saline solutions and aqueous dextrose and glycerol solutions can also be employed as liquid carriers, particularly for injectable solutions. Suitable pharmaceutical carriers also include excipients such as starch, glucose, lactose, sucrose, gelatin, malt, rice, flour, chalk, silica gel, sodium stearate, glycerol monostearate, talc, sodium chloride, dried skim milk, glycerol, propylene glycol, water, ethanol and the like. The present compositions, if desired, can also contain minor amounts of wetting or emulsifying agents, or pH buffering agents.

When intended for oral administration, the composition is preferably in solid or liquid form, where semi-solid, semi-liquid, suspension and gel forms are included within the forms considered herein as either solid or liquid.

As a solid composition for oral administration, the composition can be formulated into a powder, granule, compressed tablet, pill, capsule, chewing gum, wafer or the like form. Such a solid composition typically contains one or more inert diluents. In addition, one or more for the following can be present: binders such as carboxymethylcellulose, ethyl cellulose, microcrystalline cellulose, or gelatin; excipients such as starch, lactose or dextrans, disintegrating agents such as alginic acid, sodium alginate, corn starch and the like; lubricants such as magnesium stearate; glidants such as colloidal silicon dioxide; sweetening agent such as sucrose or saccharin; a flavoring agent such as peppermint, methyl salicylate or orange flavoring; and a coloring agent.

When the composition is in the form of a capsule (e.g. a gelatin capsule), it can contain, in addition to materials of the above type, a liquid carrier such as polyethylene glycol, cyclodextrins or a fatty oil.

The composition can be in the form of a liquid, e.g. an elixir, syrup, solution, emulsion or suspension. The liquid can be useful for oral administration or for delivery by injection. When intended for oral administration, a composition can comprise one or more of a sweetening agent, preservatives, dye/colorant and flavor enhancer. In a composition for administration by injection, one or more of a surfactant, preservative, wetting agent, dispersing agent, suspending agent, buffer, stabilizer and isotonic agent can also be included.

The preferred route of administration is parenteral administration including, but not limited to, intradermal, intramuscular, intraperitoneal, intravenous, subcutaneous, intranasal, epidural, intracerebral, intraventricular, intrathecal, intrav-

vaginal or transdermal. The preferred mode of administration is left to the discretion of the practitioner, and will depend in part upon the site of the medical condition (such as the site of cancer). In a more preferred embodiment, the compounds according to the present invention are administered intravenously. Infusion times of up to 24 hours are preferred to be used, more preferably 1 to 12 hours, with 1 to 6 hours being most preferred. Short infusion times which allow treatment to be carried out without an overnight stay in a hospital are especially desirable. However, infusion may be 12 to 24 hours or even longer if required. Infusion may be carried out at suitable intervals of, for example, 1 to 4 weeks.

The liquid compositions of the invention, whether they are solutions, suspensions or other like form, can also include one or more of the following: sterile diluents such as water for injection, saline solution, preferably physiological saline, Ringer's solution, isotonic sodium chloride, fixed oils such as synthetic mono or diglycerides, polyethylene glycols, glycerin, or other solvents; antibacterial agents such as benzyl alcohol or methyl paraben; and agents for the adjustment of tonicity such as sodium chloride or dextrose. A parenteral composition can be enclosed in an ampoule, a disposable syringe or a multiple-dose vial made of glass, plastic or other material. Physiological saline is a preferred adjuvant.

The amount of the compound according to the present invention that is effective in the treatment of a particular disorder or condition will depend on the nature of the disorder or condition, and can be determined by standard clinical techniques. In addition, *in vitro* or *in vivo* assays can optionally be employed to help identify optimal dosage ranges. The precise dose to be employed in the compositions will also depend on the route of administration, and the seriousness of the disease or disorder, and should be decided according to the judgement of the practitioner and each patient's circumstances.

The compositions comprise an effective amount of a compound of the present invention such that a suitable dosage will be obtained. The correct dosage of the compounds will vary according to the particular formulation, the mode of application, and its particular site, host and the disease being treated, e.g. cancer and, if so, what type of tumor. Other factors like age, body weight, sex, diet, time of administration, rate of excretion, condition of the host, drug combinations, reaction sensitivities and severity of the disease should be taken into account. Administration can be carried out continuously or periodically within the maximum tolerated dose.

Typically, the amount is at least about 0.01% of a compound of the present invention, and may comprise at least 80%, by weight of the composition. When intended for oral administration, this amount can be varied to range from about 0.1% to about 80% by weight of the composition. Preferred oral compositions can comprise from about 4% to about 50% of the compound of the present invention by weight of the composition.

Preferred compositions of the present invention are prepared so that a parenteral dosage unit contains from about 0.01% to about 10% by weight of the compound of the present invention. More preferred parenteral dosage unit contains about 0.5% to about 5% by weight of the compound of the present invention.

For intravenous administration, the composition is suitable for doses from about 0.1 mg/kg to about 250 mg/kg of the animal's body weight, preferably from about 0.1 mg/kg

and about 20 mg/kg of the animal's body weight, and more preferably from about 1 mg/kg to about 10 mg/kg of the animal's body weight.

The compound of the present invention, can be administered by any convenient route, for example by infusion or bolus injection, by absorption through epithelial or mucocutaneous linings.

In specific embodiments, it can be desirable to administer one or more compounds of the present invention, or compositions locally to the area in need of treatment. In one embodiment, administration can be by direct injection at the site (or former site) of a cancer, tumor or neoplastic or pre-neoplastic tissue.

Pulmonary administration can also be employed, e.g. by use of an inhaler or nebulizer, and formulation with an aerosolizing agent, or via perfusion in a fluorocarbon or synthetic pulmonary surfactant. In certain embodiments, the compound of the present invention can be formulated as a suppository, with traditional binders and carriers such as triglycerides.

The present compositions can take the form of solutions, suspensions, emulsions, tablets, pills, pellets, capsules, capsules containing liquids, powders, sustained-release formulations, suppositories, emulsions, aerosols, sprays, suspensions, or any other form suitable for use. Other examples of suitable pharmaceutical carriers are described in "Remington's Pharmaceutical Sciences" by E. W. Martin.

The pharmaceutical compositions can be prepared using methodology well known in the pharmaceutical art. For example, a composition intended to be administered by injection can be prepared by combining a compound of the present invention with water, or other physiologically suitable diluent, such as phosphate buffered saline, so as to form a solution. A surfactant can be added to facilitate the formation of a homogeneous solution or suspension.

Evaluation of Cytotoxic Activity Using the SBR and the MTT Colorimetric Assays

A colorimetric assay, using sulforhodamine B (SRB) reaction has been adapted to provide a quantitative measurement of cell growth and viability (following the technique described by Skehan et al. *J. Natl. Cancer Inst.* 1990, 82, 1107-1112). Another colorimetric assay based on 3-(4, 5-Dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide (MTT) reduction to a purple formazan has been also used to assess the antiproliferative activity (following the technique described by Mosmann et al. *J. Immunol. Meth.* 1983, 65, 55-63).

These forms of assays employ 96-well cell culture micro-plates following the standards of the American National Standards Institute and the Society for Laboratory Automation and Screening (ANSI SLAS 1-2004 (R2012) Oct. 12, 2011. All the cell lines used in this study were obtained from the American Type Culture Collection (ATCC) and derive from different types of human cancer.

A549, HT29, MDA-MB-231 and PSN1 cells were maintained in Dulbecco's Modified Eagle Medium (DMEM) while PC-3 and 22Rv1 cells were maintained in Roswell Park Memorial Institute Medium (RPMI). All cell lines were supplemented with 10% Fetal Bovine Serum (FBS), 2 mM L-glutamine, 100 U/mL penicillin, and 100 U/mL streptomycin at 37° C., 5% CO<sub>2</sub> and 98% humidity. For the experiments, cells were harvested from subconfluent cultures using trypsinization and resuspended in fresh medium before counting and plating.

A549, HT29, MDA-MB-231 and PSN1 cells were seeded in 96 well microtiter plates, at 5000 cells per well in aliquots

of 150 μL, and allowed to attach to the plate surface for 18 hours (overnight) in drug free medium. After that, one control (untreated) plate of each cell line was fixed (as described below) and used for time zero reference value.

40 Culture plates were then treated with test compounds (50 μL aliquots of 4× stock solutions in complete culture medium plus 4% DMSO) using ten ½ serial dilutions (concentrations ranging from 10 to 0.003 μg/mL) and triplicate cultures (1% final concentration in DMSO). After 72 hours treatment, the 45 antitumor effect was measured by using the SRB methodology: Briefly, cells were washed twice with PBS, fixed for 15 min in 1% glutaraldehyde solution at room temperature, rinsed twice in PBS, and stained in 0.4% SRB solution for 30 min at room temperature. Cells were then rinsed several times with 1% acetic acid solution and air-dried at room temperature. SRB was then extracted in 10 mM trizma base solution and the absorbance measured in an automated spectrophotometric plate reader at 490 nm.

50 An appropriate number of PC-3 and 22Rv1 cells, to reach a final cell density in the assay ranging from 5,000 to 15,000 cells per well depending on the cell line, were seeded in 96-well plates and allowed to stand in culture medium for 24 h at 37° C. under 5% CO<sub>2</sub> and 98% humidity. Then, 55 compounds or DMSO in culture medium were added to reach a final volume of 200 μL and the intended compound concentration in a range covering ten serial ½ dilutions starting from 0.1 μg/mL in 1% (v/v) DMSO. At this point a set of "time zero control plates" treated with 1% (v/v) DMSO were processed with MTT as described below. The 60 rest of the plates were incubated during 72 h under the aforementioned environmental conditions. Afterwards 50

$\mu\text{L}$  of a 1 mg/mL MTT solution in culture medium were added to the wells and incubated for 6-8 hours at 37° C. to allow formazan crystals generation. Culture medium was then removed and 100  $\mu\text{L}$  of neat DMSO added to each well to dissolve the formazan product into a coloured solution whose absorbance at 540 nm was finally measured in a PolarStar Omega microplate multilabel reader (BMG Labtech, Ortenberg, Germany).

Effects on cell growth and survival were estimated by applying the NCI algorithm (Boyd M R and Paull K D. Drug Dev. Res. 1995, 34, 91-104). The values obtained in triplicate cultures were fitted by nonlinear regression to a four-parameters logistic curve by nonlinear regression analysis. Three reference parameters were calculated (according to the aforementioned NCI algorithm) by automatic interpola-

tion of the curves obtained by such fitting:  $\text{GI}_{50}$ =compound concentration that produces 50% cell growth inhibition, as compared to control cultures;  $\text{TGI}$ =total cell growth inhibition (cytostatic effect), as compared to control cultures, and  $\text{LC}_{50}$ =compound concentration that produces 50% net cell killing cytotoxic effect.

#### Example 28. MTD and MTMD Determination

Female CD-1 or Athymic Nude-Fox1 nu/nu mice (Envigo) were utilized for all experiments. Animals (N=10/cage) were housed in individually ventilated cages (Sealsafe Plus®, Techniplast S.P.A.), on a 12-hour light-dark cycle at 21-23° C. and 40-60% humidity. Mice were allowed free access to irradiated standard rodent diet (Tecklad 2914C) and sterilized water. Animals were acclimated for five days prior to being individually tattoo-identified. Animal protocols were reviewed and approved according to the regional Institutional Animal Care and Use Committees.

Mice were randomly allocated into experimental groups and intravenously administered, once for the MTD (Maximum Tolerated Dose) determination or one administration a week during three consecutive weeks, for the MTMD (Maximum Tolerated Multiple Dose) determination study. The animals were administered with white formulation or with compound dissolved in the experimental formulation at different concentrations. The volume administered was always mL/kg. Once administered, animals were monitored for clinical signs of systemic toxicity, changes in body weight and mortality up to 14 days after the administration.

\*European Collection of Cell Cultures

HT1080 cells were maintained in vitro at 37° C. with 5% CO<sub>2</sub> in Minimum Essential Medium Eagle (MEME) (Sigma-Aldrich, Co). Each animal was orthotopically implanted into gastrocnemius muscle by an intramuscular injection using a 26G needle and a 1 cc syringe at 4-6 weeks of age, with 10×10<sup>6</sup> HT1080 cells, suspended in serum free medium, without antibiotics.

MDA-MB-231 cells were maintained in vitro at 37° C. with 5% CO<sub>2</sub> in Dulbecco's Modified Eagle's Medium (Sigma-Aldrich, Co). Culture cells were passaged every 3 to 5 days upon reaching confluence. Each animal was subcutaneously implanted (on the right flank using 26G needle and a 1 cc syringe) at 4-6 weeks of age with 7.5×10<sup>6</sup> MDA-MB-231 cells suspended in 0.05 mL of a solution consisting of 50% Matrigel® (Corning Incorporated Life Sciences) and 50% medium without serum or antibiotics.

H460 cells were maintained in vitro at 37° C. with 5% CO<sub>2</sub> in Dulbecco's Modified Eagle's Medium (Sigma-Aldrich, Co). Culture cells were passaged every 3 to 5 days

upon reaching confluence. Each animal was subcutaneously implanted (on the right flank using 26G needle and a 1 cc syringe) at 4-6 weeks of age with 5×10<sup>6</sup> H460 cells suspended in 0.05 mL of a solution consisting of 50% Matrigel® (Corning Incorporated Life Sciences) and 50% medium without serum or antibiotics.

A2780 cells were maintained in vitro at 37° C. with 5% CO<sub>2</sub> in RPMI-1640 (Sigma-Aldrich, Co). Culture cells were passaged every 3 to 5 days upon reaching confluence. Each animal was subcutaneously implanted (on the right flank using 26G needle and a 1 cc syringe) at 4-6 weeks of age with 10×10<sup>6</sup> A2780 cells suspended in 0.05 mL of a solution consisting of 50% Matrigel® (Corning Incorporated Life Sciences) and 50% medium without serum or antibiotics.

HGC27 cells were maintained in vitro at 37° C. with 5% CO<sub>2</sub> in Iscove's Modified Dulbecco's Medium (Sigma Aldrich, Co). Culture cells were passage every 3 to 5 days on reaching confluence. Each animal was subcutaneously implanted (on the right flank using 26G needle and a 1 cc

syringe) at 4-6 weeks of age with  $5 \times 10^6$  HGC-27 cells suspended in 0.05 mL of a solution consisting of 50% Matrigel® (Corning Incorporated Life Sciences), 50% medium without serum or antibiotics.

H526 cells were maintained in vitro at 37° C. with 5% CO<sub>2</sub> in RPMI-1640 Medium (Sigma-Aldrich, Co). H526 cells were grown as a suspension and maintained by addition of fresh medium, as the cell density increases, every 2 to 3 days. Every week, culture was reestablished by centrifugation of the suspension with subsequent resuspension in fresh medium at a concentration of  $1 \times 10^5$  cell/mL. Each animal was subcutaneously implanted (on the right flank using 26G needle and a 1 cc syringe) at 4-6 weeks of age with  $5 \times 10^6$  H526 cells suspended in 0.05 mL of a solution consisting of 50% Matrigel® (Corning Incorporated Life Sciences) and 50% medium without serum or antibiotics.

H82 cells were maintained in vitro at 37° C. with 5% CO<sub>2</sub> in RPMI-1640 Medium (Sigma-Aldrich, Co). H82 cells were grown as a suspension and maintained by addition of fresh medium, as the cell density increases, every 2 to 3 days. Every week, culture was reestablished by centrifugation of the suspension with subsequent resuspension in fresh medium at a concentration of  $1 \times 10^5$  cell/ml. Animals were subcutaneously implanted (on the right flank using 26G needle and a 1 cc syringe) at 4-6 weeks of age with  $5 \times 10^6$  H82 cells, suspended in 0.05 mL of a solution consisting of 50% Matrigel® (Corning Incorporated Life Sciences) and 50% medium without serum or antibiotics.

PC3 cells were maintained in vitro at 37° C. with 5% CO<sub>2</sub> in RPMI-1640 Medium (Sigma-Aldrich, Co). Culture cells were passaged every 3 to 5 days upon reaching confluence. Each female athymic mice was subcutaneously implanted (on the right flank using a 26G needle and a 1 cc syringe) at 4-6 weeks of age with  $3 \times 10^6$  PC3 cells suspended in 0.05 mL of a solution consisting of 50% Matrigel® Matrix (Corning Incorporated Life Sciences) and 50% medium without serum or antibiotics. In this model, instead of male, female animals were used because PC-3 growth is not hormone dependant.

DU-145 cells were maintained in vitro at 37° C. with 5% CO<sub>2</sub> in RPMI-1640 Medium (Sigma-Aldrich, Co). Culture cells were passaged every 3 to 5 days upon reaching confluence. Each male athymic mice was subcutaneously implanted (on the right flank using a 26G needle and a 1 cc syringe) at 4-6 weeks of age with  $5 \times 10^6$  DU-145 cells suspended in 0.05 mL of a solution consisting of 50% Matrigel® Matrix (Corning Incorporated Life Sciences) and 50% medium without serum or antibiotics. 22Rv1 cells were maintained in vitro at 37° C. with 5% CO<sub>2</sub> in RPMI-1640 Medium (Sigma-Aldrich, Co). Culture cells were passage every 3 to 5 days upon reaching confluence. Each male athymic mice was subcutaneously implanted (on the right flank using 26G needle and a 1 cc syringe) at 4-6 weeks of age with  $5 \times 10^6$  22Rv1 cells suspended in 0.05 mL of a solution consisting of 50% Matrigel® Matrix (Corning Incorporated Life Sciences) and 50% medium without serum or antibiotics.

Treatment tolerability was assessed by monitoring body weight evolution, clinical signs of systemic toxicity, as well as evidences of local damage in the injection site.

In xenograft studies with HT1080 cell line:

Total diameter (tumor+leg) measurements were determined by using digital caliper (Fowler Sylvac, S235PAT). This total diameter and animal body weights were measured 2-3 times per week starting from the first day of treatment (day 0).

**182**

When total diameter reached a length of about 7.0-8.0 mm, mice were randomly allocated into the treatments and control groups (N=8-10/group) based on body weight and tumor measurements by using NewLab Oncology Software (version 2.25.06.00).

Comparison of the median total diameter (tumor+leg) in the treatment groups to the median total diameter (tumor+leg) in the control group was used for evaluation of the antitumoral efficacy.

Animals were euthanized when their total leg diameter reached ca. 18 mm.

In Xenograft Studies with Other Cell Lines:

Tumor volume was calculated using the equation (a·b<sup>2</sup>)/2, where a: length (longest diameter) and b: width (shortest diameter) were measured in mm by using digital caliper (Fowler Sylvac, S235PAT). Tumor dimensions and body weights were recorded 2-3 times per week starting from the first day of treatment.

When tumors reached ca. 150-250 mm<sup>3</sup>, tumor bearing animals (N=8-10/group) were randomly allocated into the treatment groups, based on body weight and tumor measurements by using NewLab Oncology Software (version 2.25.06.00).

Comparison between median tumor volume of treated groups and control group was used for evaluation of the antitumoral efficacy.

Animals were euthanized when their tumors reached ca. 2000 mm<sup>3</sup> and/or severe necrosis was seen.

Treatments producing >20% lethality and/or 20% net body weight loss were considered toxic.

Tables and figures summarize the data obtained from complete experimental groups, i.e. those groups keeping the initial number of animals, n=8-10. However, once the first animal is sacrificed due to a tumor length >18 mm or a tumor size >2000 mm<sup>3</sup>, the experimental group will be considered incomplete. Therefore, data generated subsequently to the sacrifice day and onwards will not be presented (i.e. neither in tables nor in the figures).

**Example 29. In Vivo Studies to Determine the Effect of 4-S and 12-S in Several Xenograft Models**

4-S, 12-S and compound C were provided in the form of freeze-dried vials of lyophilized product. Each vial was reconstituted with water for infusion to a concentration of 0.5 mg/mL. Further dilutions were made with 5% dextrose solution for injection to the dosing formulation concentration. The administered doses of 4-S, 12-S and compound C were 1.25 mg/kg, 0.25 mg/kg and 3.0 mg/kg, respectively.

Placebo was provided in the form of lyophilised cake containing 100 mg Sucrose+Potassium dihydrogen phosphate 6.8 mg+Phosphoric acid q.s. pH 3.8-4.5 which was reconstituted with water for infusion.

In these experiments, 4-S, 12-S and Compound C, as well as placebo, were intravenously administered once per week for 3 consecutive weeks, on Days 0, 7 and 14, whenever it was possible.

**Example 29a. In Vivo Studies to Determine the Effect of 4-S and 12-S in Human Fibrosarcoma Xenografts**

The aim of this study was to compare the antitumoral activity of 4-S and 12-S with the antitumoral activity of compound C by using a xenograft model of human sarcoma.

**Example 30. In Vivo Studies to Determine the Effect of 4-R in Several Xenograft Models**

4-R was provided in the form of freeze dried vials. 4-R cake was reconstituted with water for infusion to a concentration of 0.5 mg/mL. The 4-R stock solution was further diluted in 5% dextrose solution for injection to the dosing formulation concentration. The 4-R administered dose was 0.30 mg/kg.

Compound D was provided in the form of drug substance vials. Each vial was reconstituted first by total dissolution in DMSO and then adding Kolliphor ELP (BASF)/ethanol absolute (1:1, v/v) to a concentration of 0.8 mg/mL. Further dilutions were made with a lactate buffer solution (pH=4.0) to the dosing formulation concentration. The Compound D administered dose was 0.5 mg/kg.

PM01183 was provided in the form of vials of lyophilized product. Each vial was reconstituted with water for infusion to a concentration of 0.2 mg/mL. Further dilutions were made with 5% glucose or 0.9% sodium chloride solution for injection to the dosing formulation concentrations. The administered dose was 0.18 mg/kg.

Placebo was provided in the form of lyophilised cake containing 100 mg Sucrose+Potassium dihydrogen phosphate 6.8 mg+Phosphoric acid q.s. pH 3.8-4.5 which was reconstituted with water for infusion.

In these experiments, 4-R, Compound D and PM01183, as well as placebo, were intravenously administered once per week for 3 consecutive weeks, on Days 0, 7 and 14, whenever it was possible.

Example 35. In Vivo Studies to Determine the Effect of 47-R in Several Xenograft Models

Compound 47-R was provided in the form of freeze-dried vials of lyophilized product. Each vial was reconstituted with sterile water for injection to a concentration of 0.5 mg/mL. Further dilutions were made with 5% dextrose solution for injection to the dosing formulation concentration. 47-R administered dose was 0.1 mg/Kg.

Compound D was provided in the form of powder drug substance. Each vial was reconstituted first by total dissolution in DMSO (Fisher) and then adding Kolliphor ELP (Basf)/ethanol absolute (Merk) (1:1, v/v) to a concentration of 0.8 mg/mL. Further dilutions were made with a lactate buffer solution (pH=4.0) to the dosing formulation concentration. Compound D administered dose was 0.5 mg/Kg.

Placebo was provided in the form of vials of lyophilised product. Each vial (sucrose 200 mg+potassium dihydrogen phosphate 13.6 mg+phosphoric acid q.s. pH 3.8-4.5) was reconstituted with sterile water for injection (2 mL). Further dilutions were made with 5% dextrose solution for injection.

In these experiments, 47-R and compound D, as well as placebo, were intravenously administered on a weekly schedule at a volume of 10 mL/Kg.
