Robertson; Galen C.

# **Ultrasonic surgical instrument blades**

#### **Abstract**

An ultrasonic surgical instrument including an ultrasonically actuated blade or end effector having a treatment portion. The blade can define a central axis and at least one axis which is transverse to the central axis, wherein the transverse axis can lie within a plane which is perpendicular, or normal, to the longitudinal axis and can define a cross-section of the treatment portion. Such a cross-section can include a central portion and a step extending from the central portion, wherein the central portion can comprise a width, and wherein the step can comprise a cutting edge. In at least one embodiment, the cutting edge can be defined by first and second surfaces which define an angle therebetween. In various embodiments, the position of the cutting edge and/or the angle between the cutting edge surfaces can be selected in order to balance the blade with respect to the transverse axis.

Inventors: Robertson; Galen C. (Apex, NC)

No. 8,591,536, which is a divisional application claiming priority under 35 U.S.C. § 121 from U.S. patent application Ser. No. 11/998,543, filed on Nov. 30, 2007, entitled ULTRASONIC SURGICAL INSTRUMENT BLADES, which issued on Nov. 15, 2011 as U.S. Pat. No. 8,057,498, the entire disclosures of which are incorporated by reference herein.

#### **BACKGROUND**

- (1) Ultrasonic instruments, including both hollow core and solid core instruments, are used for the safe and effective treatment of many medical conditions. Ultrasonic instruments, and particularly solid core ultrasonic instruments, are advantageous because they may be used to cut and/or coagulate organic tissue using energy in the form of mechanical vibrations transmitted to a surgical end effector at ultrasonic frequencies. Ultrasonic vibrations, when transmitted to organic tissue at suitable energy levels and using a suitable end effector, may be used to cut, dissect, elevate or cauterize tissue or to separate muscle tissue off bone. Ultrasonic instruments utilizing solid core technology are particularly advantageous because of the amount of ultrasonic energy that may be transmitted from the ultrasonic transducer, through a waveguide, to the surgical end effector. Such instruments may be used for open procedures or minimally invasive procedures, such as endoscopic or laparoscopic procedures, wherein the end effector is passed through a trocar to reach the surgical site.
- (2) Activating or exciting the end effector (e.g., cutting blade) of such instruments at ultrasonic frequencies induces longitudinal vibratory movement that generates localized heat within adjacent tissue, facilitating both cutting and coagulation. Because of the nature of ultrasonic instruments, a particular ultrasonically actuated end effector may be designed to perform numerous functions, including, for example, cutting and coagulation.
- (3) Ultrasonic vibration is induced in the surgical end effector by electrically exciting a transducer, for example. The transducer may be constructed of one or more piezoelectric or magnetostrictive elements in the instrument hand piece. Vibrations generated by the transducer section are transmitted to the surgical end effector via an ultrasonic waveguide extending from the transducer section to the surgical end effector. The waveguides and end effectors are designed to resonate at the same frequency as the transducer. Therefore, when an end effector is attached to a transducer the overall system frequency is the same frequency as the transducer itself.
- (4) The amplitude of the longitudinal ultrasonic vibration at the tip, d, of the end effector behaves as a simple sinusoid at the resonant frequency as given by:
- (5)  $d = A\sin(t)$
- where:  $\omega$ =the radian frequency which equals  $2\pi$  times the cyclic frequency, f; and A=the zero-to-peak amplitude. The longitudinal excursion is defined as the peak-to-peak (p-t-p) amplitude, which is just twice the amplitude of the sine wave or 2A.
- (6) The shape of an ultrasonic surgical blade or end-effector used in an ultrasonic surgical instrument can define at least four important aspects of the instrument. These are: (1) the visibility of the end-effector and its relative position in the surgical field, (2) the ability of the end-effector to access or approach targeted tissue, (3) the manner in which ultrasonic energy is coupled to tissue for cutting and coagulation, and (4) the manner in which tissue can be manipulated with the ultrasonically inactive end-effector. It would be advantageous to provide an improved ultrasonic surgical instrument blade or end-effector optimizing at least these four aspects of the instrument. (7) However, as features are added to an ultrasonic surgical instrument blade to achieve the abovelisted aspects, the shape of the blade is typically altered which creates asymmetries therein and
- listed aspects, the shape of the blade is typically altered which creates asymmetries therein and causes the blade to become unbalanced, meaning that the blade can have the tendency to vibrate in directions other than the longitudinal direction along the length of the instrument, such as transverse directions. Substantial transverse motion in the blade and/or waveguide may lead to

excess heat generation and/or premature stress failure therein. Long, thin ultrasonic waveguides, such as those used in instruments for minimally invasive surgery, are particularly susceptible to transverse vibrations introduced by imbalances, or asymmetries, in the end effector.

(8) U.S. Pat. No. 6,283,981, which issued on Sep. 4, 2001 and is entitled METHOD OF BALANCING ASYMMETRIC ULTRASONIC SURGICAL BLADES, U.S. Pat. No. 6,309,400, which issued on Oct. 30, 2001 and is entitled CURVED ULTRASONIC BLADE HAVING A TRAPEZOIDAL CROSS SECTION, and U.S. Pat. No. 6,436,115, which issued on Aug. 20, 2002 and is entitled BALANCED ULTRASONIC BLADE INCLUDING A PLURALITY OF BALANCE ASYMMETRIES, the disclosures of which are hereby incorporated by reference

herein, address balancing blades having asymmetries within a treatment portion of the blade by utilizing asymmetries within an adjacent balance portion. While such approaches have proven eminently successful, there are some applications where balancing may be desirable within the

treatment, or functional, portion of a blade.

- (9) Solid core ultrasonic surgical instruments may be divided into two types, single element end effector devices and multiple-element end effector. Single element end effector devices include instruments such as scalpels, and ball coagulators. Single-element end effector instruments have limited ability to apply blade-to-tissue pressure when the tissue is soft and loosely supported. Substantial pressure may be necessary to effectively couple ultrasonic energy to the tissue. This inability to grasp the tissue results in a further inability to fully coapt tissue surfaces while applying ultrasonic energy, leading to less-than-desired hemostasis and tissue joining. The use of multiple-element end effectors such as clamping coagulators includes a mechanism to press tissue against an ultrasonic blade that can overcome these deficiencies.
- (10) Ultrasonic clamp coagulators provide an improved ultrasonic surgical instrument for cutting/coagulating tissue, particularly loose and unsupported tissue, wherein the ultrasonic blade is employed in conjunction with a clamp for applying a compressive or biasing force to the tissue, whereby faster coagulation and cutting of the tissue, with less attenuation of blade motion, are achieved.
- (11) Surgical elevators are instruments used to help facilitate the elevation and removal of soft tissue during surgery. Surgical elevators are generally employed to separate muscle from bone. Cobb or curette type surgical elevators and used in spine surgery, especially to assist in posterior access in removing muscle tissue from bone. To remove muscle tissue from bone using conventional surgical elevators, the surgeon must exert a significant amount of force. This may cause premature fatigue. Also, using significant force on a conventional surgical elevator during this technique may increase the likelihood of error and unwanted tissue damage.
- (12) It would be desirable to provide an ultrasonic instrument comprising a surgical elevator blade to remove soft tissue such as muscle from bone and to perform additional surgical functions as well. Also, because ultrasonic frequencies induce longitudinal vibratory movements and generate localized heat within adjacent tissue it would be desirable to provide a protective material for the surgical elevator of such ultrasonic instrument. The protective material may reduce the possibility of blade breakage when in contact with bone or metal retractors and may decrease thermal spread from the back edge of the blade.

#### **SUMMARY**

(13) In one general aspect, the various embodiments are directed to an ultrasonic surgical instrument that comprises a transducer configured to produce vibrations at a predetermined frequency. The transducer is configured to produce vibrations along a longitudinal axis at a predetermined frequency. An ultrasonic blade extends along the longitudinal axis and is coupled to the transducer. The ultrasonic blade includes a body having a proximal end and a distal end. The distal end is movable relative to the longitudinal axis by the vibrations produced by the transducer. The body includes a treatment region that extends from the proximal end to the distal end. The body includes a substantially flat broad top surface, a bottom surface, and a neck portion protruding

from the proximal end adapted to couple to the transducer.

(14) In at least one form of the invention, an ultrasonic surgical instrument can include an ultrasonically actuated blade or end effector having a treatment portion. In various embodiments, the blade can define a longitudinal axis and at least one axis which is transverse to the longitudinal axis. In at least one such embodiment, the transverse axis can lie within a plane which is perpendicular, or normal, to the longitudinal axis and can define a cross-section of the treatment portion. In various embodiments, such a cross-section can include a central portion and a step, wherein the step can extend from the central portion, wherein the central portion can comprise a width, and wherein the step can comprise a cutting edge. In at least one embodiment, the cutting edge can be defined by first and second surfaces which define an angle therebetween. In various embodiments, the position of the cutting edge and/or the angle between the cutting edge surfaces, for example, can be selected in order to balance the blade with respect to the transverse axis.

### **Description**

#### **FIGURES**

- (1) The novel features of the various embodiments are set forth with particularity in the appended claims. The various embodiments, however, both as to organization and methods of operation, together with further objects and advantages thereof, may best be understood by reference to the following description, taken in conjunction with the accompanying drawings as follows.
- (2) FIG. **1** illustrates one embodiment of an ultrasonic system.
- (3) FIG. 2 illustrates one embodiment of a connection union/joint for an ultrasonic instrument.
- (4) FIG. **3** illustrates an exploded perspective view of one embodiment of a sterile ultrasonic surgical instrument.
- (5) FIGS. 4-7 illustrate one embodiment of an ultrasonic blade, where:
- (6) FIG. 4 is a side view of one embodiment of an ultrasonic blade;
- (7) FIG. **5** is a top view of the ultrasonic blade shown in FIG. **4**;
- (8) FIG. 6 is a cross-sectional view of the ultrasonic blade taken along line 6-6 in FIG. 4; and
- (9) FIG. 7 is a top perspective view of the ultrasonic blade shown in FIG. 4.
- (10) FIGS. **8-11** illustrate one embodiment of an ultrasonic blade, where:
- (11) FIG. **8** is a side view of one embodiment of an ultrasonic blade;
- (12) FIG. **9** is a top view of the ultrasonic blade shown in FIG. **8**;
- (13) FIG. 10 is a cross-sectional view of the ultrasonic blade taken along line 10-10 in FIG. 8; and
- (14) FIG. **11** is a top perspective view of the ultrasonic blade shown in FIG. **8**.
- (15) FIGS. **12-15** illustrate one embodiment of an ultrasonic blade, where:
- (16) FIG. 12 is a side view of one embodiment of an ultrasonic blade;
- (17) FIG. **13** is a top view of the ultrasonic blade shown in FIG. **12**;
- (18) FIG. 14 is a cross-sectional view of the ultrasonic blade taken along line 14-14 in FIG. 12; and
- (19) FIG. **15** is a top perspective view of the ultrasonic blade shown in FIG. **12**.
- (20) FIGS. 16-19 illustrate one embodiment of an ultrasonic blade, where:
- (21) FIG. **16** is a side view of one embodiment of an ultrasonic blade;
- (22) FIG. **17** is a top view of the ultrasonic blade shown in FIG. **16**;
- (23) FIG. **18** is an end-sectional view of the ultrasonic blade taken along line **18-18** in FIG. **16**; and
- (24) FIG. **19** is a top perspective view of the ultrasonic blade shown in FIG. **16**.
- (25) FIG. **20** is a top perspective view of one embodiment of an ultrasonic blade.
- (26) FIG. 21 illustrates a use of one embodiment of the ultrasonic blade shown in FIG. 20.
- (27) FIGS. **22-24** illustrate one embodiment of an ultrasonic blade comprising a protective sheath, where:
- (28) FIG. 22 illustrates a partial cross-sectional view of one embodiment of an ultrasonic blade

- comprising a protective sheath taken along the longitudinal axis;
- (29) FIG. 23 is a bottom view of the ultrasonic blade taken along line 23-23 in FIG. 22; and
- (30) FIG. **24** is a cross-sectional view of the ultrasonic blade and the protective sheath shown in FIG. **22**.
- (31) FIG. **25** illustrates a use of one embodiment of an ultrasonic surgical instrument removing muscle tissue from bone.
- (32) FIG. **26** illustrates a use one embodiment of the ultrasonic surgical blade shown in FIGS. **20**, **21** comprising one embodiment of a protective sheath.
- (33) FIGS. **27-31** illustrate one embodiment of an ultrasonic surgical instrument comprising an end effector, where:
- (34) FIG. **27** is a top perspective view of one embodiment of an ultrasonic surgical instrument;
- (35) FIG. **28** is a cross-sectional view of the ultrasonic surgical instrument shown in FIG. **27** taken along the longitudinal axis of the ultrasonic surgical instrument shown in FIG. **27**;
- (36) FIG. **29** is a bottom view of the ultrasonic surgical instrument taken along lines **29-29** in FIG. **28**:
- (37) FIG. **30** is a cross-sectional view of the ultrasonic surgical instrument taken along lines **30-30** in FIG. **28**; and
- (38) FIG. **31** is cross-sectional view of the ultrasonic surgical instrument taken along lines **31-31** in FIG. **28**.
- (39) FIGS. **32-35** are cross-sectional views of various embodiments of ultrasonic surgical instruments taken along the longitudinal axis.
- (40) FIGS. **36-37** are cross-sectional views of one embodiment of an ultrasonic surgical instrument taken along the longitudinal axis.
- (41) FIGS. **38-39** are cross-sectional views of one embodiment of an ultrasonic surgical instrument taken along the longitudinal axis.
- (42) FIG. **40** is cross-sectional view of one embodiment of an ultrasonic surgical instrument taken along the longitudinal axis.
- (43) FIGS. **41-43** illustrate one embodiment of an ultrasonic system, where:
- (44) FIG. **41** is a side view of one embodiment of the ultrasonic system;
- (45) FIG. **42** is a cross-sectional side view of the ultrasonic system shown in FIG. **41** and a cross-sectional view of various tube assemblies to couple the hand piece housing with an end effector;
- (46) FIG. **43** is a bottom cross-sectional view of the ultrasonic instrument shown in FIG. **41**.
- (47) FIGS. **44-51** illustrate one embodiment of an ultrasonic system, where:
- (48) FIG. **44** is a side view of one embodiment of a ultrasonic instrument with a deployable protective sheath in a stowed or retracted position;
- (49) FIG. **45** is a top view of the ultrasonic instrument with the deployable protective sheath in the stowed or retracted position taken along line **45-45** in FIG. **44**;
- (50) FIG. **46** is a side view of the ultrasonic instrument shown in FIG. **44** with the deployable protective sheath in a deployed position;
- (51) FIG. **47** is a top view of the ultrasonic instrument in the deployed position taken along line **47**-**47** in FIG. **46**;
- (52) FIG. **48** is a more detailed side view of the ultrasonic instrument shown in FIG. **44** with the deployable protective sheath in a stowed or retracted position;
- (53) FIG. **49** is a more detailed top view of the ultrasonic instrument shown in FIG. **45** with the protective sheath in the stowed or retracted position taken along line **49-49** in FIG. **48**;
- (54) FIG. **50** is a more detailed side view of the ultrasonic instrument shown in FIG. **46** with the deployable protective sheath in a deployed position; and
- (55) FIG. **51** is a more detailed top view of the ultrasonic instrument shown in FIG. **47** in the deployed position taken along line **51-51** in FIG. **50**.
- (56) FIGS. 52-55 illustrate one embodiment of an ultrasonic surgical instrument comprising an end

### effector, where:

- (57) FIG. **52** is a top perspective view of one embodiment of an ultrasonic surgical instrument;
- (58) FIG. **53** is a partial cross-sectional view of the ultrasonic surgical instrument shown in FIG. **52** taken along the longitudinal axis of the ultrasonic surgical instrument;
- (59) FIG. **54** is a cross-sectional view of the ultrasonic surgical instrument taken along lines **54-54** shown in FIG. **53**; and
- (60) FIG. **55** is a top view of the ultrasonic surgical instrument.
- (61) FIGS. **56-59** illustrate one embodiment of an ultrasonic blade, where:
- (62) FIG. **56** is a side view of one embodiment of an ultrasonic blade;
- (63) FIG. **57** is a top view of the ultrasonic blade shown in FIG. **56**;
- (64) FIG. 58 is a cross-sectional view of the ultrasonic blade taken along line 58-58 in FIG. 57; and
- (65) FIG. **59** is a top perspective view of the ultrasonic blade shown in FIG. **56**.
- (66) FIG. **60** is a schematic of parameters of a cross-section of a blade which can be used to balance the blade.
- (67) FIG. **60**A is an additional schematic of the cross-section of FIG. **60**
- (68) FIG. **61** is a cross-sectional view of an ultrasonic blade.

- (70) FIG. **63** is a cross-sectional view of an additional ultrasonic blade.
- (71) FIG. **64** is a cross-sectional view of a further ultrasonic blade.

#### DESCRIPTION

- (72) Before explaining the various embodiments in detail, it should be noted that the embodiments are not limited in its application or use to the details of construction and arrangement of parts illustrated in the accompanying drawings and description. The illustrative embodiments may be implemented or incorporated in other embodiments, variations and modifications, and may be practiced or carried out in various ways. For example, the surgical instruments and blade configurations disclosed below are illustrative only and not meant to limit the scope or application thereof. Furthermore, unless otherwise indicated, the terms and expressions employed herein have been chosen for the purpose of describing the illustrative embodiments for the convenience of the reader and are not to limit the scope thereof.
- (73) The various embodiments relate, in general, to ultrasonic surgical blades for use in surgical instruments and, more particularly, to an ultrasonic surgical blade with improved elevator, cutting and coagulation features and to an ultrasonic blade comprising a protective sheath on a portion thereof. The various embodiments relate, in general, to ultrasonic surgical blades and instruments for improved bone and tissue removal, aspiration, and coagulation features. A blade according to various embodiments is of particular benefit, among others, in orthopedic procedures wherein it is desirable to remove cortical bone and/or tissue while controlling bleeding for removing muscle tissue from bone, due to its cutting and coagulation characteristics. The blade, however, may be useful for general soft tissue cutting and coagulation. The blade may be straight or curved, and useful for either open or laparoscopic applications. A blade according to various embodiments may be useful in spine surgery, especially to assist in posterior access in removing muscle from bone. A blade according to the various embodiments may reduce the user force required to remove muscle from bone and, in one embodiment, may be useful to simultaneously hemostatically seal or cauterize the tissue. Reducing the force to operate the surgical instrument may reduce user fatigue, improve precision and reduce unwanted tissue damage. A variety of different blade configurations are disclosed which may be useful for both open and laparoscopic applications.
- (74) Examples of ultrasonic surgical instruments are disclosed in U.S. Pat. Nos. 5,322,055 and 5,954,736 and in combination with ultrasonic blades and surgical instruments disclosed in U.S. Pat. Nos. 6,309,400 B2, 6,278,218 B1, 6,283,981 B1, and 6,325,811 B1, for example, are incorporated herein by reference in their entirety. Also incorporated by reference in its entirety is commonly-owned, co-pending U.S. patent application Ser. No. 11/726,625, entitled ULTRASONIC

SURGICAL INSTRUMENTS, filed on Mar. 22, 2007, now U.S. Pat. No. 8,911,460. Some of these references disclose ultrasonic surgical instrument design and blade designs where a longitudinal node of the blade is excited. Because of asymmetry or asymmetries, these blades exhibit transverse and/or torsional motion where the characteristic "wavelength" of this non-longitudinal motion is less than that of the general longitudinal motion of the blade and its extender portion. Therefore, the wave shape of the non-longitudinal motion will present nodal positions of transverse/torsional motion along the tissue effector while the net motion of the active blade along its tissue effector is non-zero (i.e. will have at least longitudinal motion along the length extending from its distal end, an antinode of longitudinal motion, to the first nodal position of longitudinal motion that is proximal to the tissue effector portion). Certain exemplary embodiments will now be described to provide an overall understanding of the principles of the structure, function, manufacture, and use of the devices and methods disclosed herein. One or more examples of these embodiments are illustrated in the accompanying drawings. Those of ordinary skill in the art will understand that the devices and methods specifically described herein and illustrated in the accompanying drawings are non-limiting exemplary embodiments and that the scope of the various embodiments is defined solely by the claims. The features illustrated or described in connection with one exemplary embodiment may be combined with the features of other embodiments. Such modifications and variations are intended to be included within the scope of the claims.

- (75) FIG. 1 illustrates one embodiment of an ultrasonic system 10. One embodiment of the ultrasonic system 10 comprises an ultrasonic signal generator 12 coupled to an ultrasonic transducer 14, a hand piece assembly 60 comprising a hand piece housing 16, and an end effector 50. The ultrasonic transducer 14, which is known as a "Langevin stack", generally includes a transduction portion 18, a first resonator or end-bell 20, and a second resonator or fore-bell 22, and ancillary components. The ultrasonic transducer 14 is preferably an integral number of one-half system wavelengths (nλ/2) in length as will be described in more detail later. An acoustic assembly 24 includes the ultrasonic transducer 14, a mount 26, a velocity transformer 28, and a surface 30. (76) It will be appreciated that the terms "proximal" and "distal" are used herein with reference to a clinician gripping the hand piece assembly 60. Thus, the end effector 50 is distal with respect to the more proximal hand piece assembly 60. It will be further appreciated that, for convenience and clarity, spatial terms such as "top" and "bottom" also are used herein with respect to the clinician gripping the hand piece assembly 60. However, surgical instruments are used in many orientations and positions, and these terms are not intended to be limiting and absolute. (77) The distal end of the end-bell 20 is connected to the proximal end of the transduction portion
- **18**, and the proximal end of the fore-bell **22** is connected to the distal end of the transduction portion **18**. The fore-bell **22** and the end-bell **20** have a length determined by a number of variables, including the thickness of the transduction portion **18**, the density and modulus of elasticity of the material used to manufacture the end-bell **20** and the fore-bell **22**, and the resonant frequency of the ultrasonic transducer **14**. The fore-bell **22** may be tapered inwardly from its proximal end to its distal end to amplify the ultrasonic vibration amplitude as the velocity transformer **28**, or alternately may have no amplification. A suitable vibrational frequency range may be about 20 Hz to 120 kHz and a well-suited vibrational frequency range may be about 30-70 kHz and one example operational vibrational frequency may be approximately 55.5 kHz.
- (78) Piezoelectric elements **32** may be fabricated from any suitable material, such as, for example, lead zirconate-titanate, lead meta-niobate, lead titanate, or other piezoelectric crystal material. Each of positive electrodes **34**, negative electrodes **36**, and the piezoelectric elements **32** has a bore extending through the center. The positive and negative electrodes **34** and **36** are electrically coupled to wires **38** and **40**, respectively. The wires **38** and **40** are encased within a cable **42** and electrically connectable to the ultrasonic signal generator **12** of the ultrasonic system **10**. (79) The ultrasonic transducer **14** of the acoustic assembly **24** converts the electrical signal from

the ultrasonic signal generator 12 into mechanical energy that results in primarily longitudinal

vibratory motion of the ultrasonic transducer **24** and the end effector **50** at ultrasonic frequencies. A suitable generator is available as model number GEN01, from Ethicon Endo-Surgery, Inc., Cincinnati, Ohio. When the acoustic assembly **24** is energized, a vibratory motion standing wave is generated through the acoustic assembly **24**. The amplitude of the vibratory motion at any point along the acoustic assembly **24** may depend upon the location along the acoustic assembly **24** at which the vibratory motion is measured. A minimum or zero crossing in the vibratory motion standing wave is generally referred to as a node (i.e., where motion is usually minimal), and an absolute value maximum or peak in the standing wave is generally referred to as an anti-node (i.e., where motion is usually maximal). The distance between an anti-node and its nearest node is one-quarter wavelength ( $\lambda$ /4).

- (80) The wires **38** and **40** transmit an electrical signal from the ultrasonic signal generator **12** to the positive electrodes **34** and the negative electrodes **36**. The piezoelectric elements **32** are energized by the electrical signal supplied from the ultrasonic signal generator **12** in response to a foot switch **44** to produce an acoustic standing wave in the acoustic assembly **24**. The electrical signal causes disturbances in the piezoelectric elements **32** in the form of repeated small displacements resulting in large compression forces within the material. The repeated small displacements cause the piezoelectric elements **32** to expand and contract in a continuous manner along the axis of the voltage gradient, producing longitudinal waves of ultrasonic energy. The ultrasonic energy is transmitted through the acoustic assembly **24** to the end effector **50** via a an ultrasonic transmission waveguide **104**.
- (81) In order for the acoustic assembly **24** to deliver energy to the end effector **50**, all components of the acoustic assembly **24** must be acoustically coupled to the end effector **50**. The distal end of the ultrasonic transducer **14** may be acoustically coupled at the surface **30** to the proximal end of the ultrasonic transmission waveguide **104** by a threaded connection such as a stud **48**.
- (82) The components of the acoustic assembly **24** are preferably acoustically tuned such that the length of any assembly is an integral number of one-half wavelengths ( $n\lambda/2$ ), where the wavelength  $\lambda$  is the wavelength of a pre-selected or operating longitudinal vibration drive frequency fa of the acoustic assembly **24**, and where n is any positive integer. It is also contemplated that the acoustic assembly **24** may incorporate any suitable arrangement of acoustic elements.
- (83) The ultrasonic end effector  $\bf 50$  may have a length substantially equal to an integral multiple of one-half system wavelengths ( $\lambda$ /2). A distal end  $\bf 52$  of the ultrasonic end effector  $\bf 50$  may be disposed near an antinode in order to provide the maximum longitudinal excursion of the distal end. When the transducer assembly is energized, the distal end  $\bf 52$  of the ultrasonic end effector  $\bf 50$  may be configured to move in the range of, for example, approximately 10 to 500 microns peak-to-peak, and preferably in the range of about 30 to 150 microns at a predetermined vibrational frequency.
- (84) The ultrasonic end effector 50 may be coupled to the ultrasonic transmission waveguide 104. The ultrasonic end effector 50 and the ultrasonic transmission guide 104 as illustrated are formed as a single unit construction from a material suitable for transmission of ultrasonic energy such as, for example, Ti6Al4V (an alloy of Titanium including Aluminum and Vanadium), Aluminum, Stainless Steel, or other known materials. Alternately, the ultrasonic end effector 50 may be separable (and of differing composition) from the ultrasonic transmission waveguide 104, and coupled by, for example, a stud, weld, glue, quick connect, or other suitable known methods. The ultrasonic transmission waveguide 104 may have a length substantially equal to an integral number of one-half system wavelengths ( $\lambda/2$ ), for example. The ultrasonic transmission waveguide 104 may be preferably fabricated from a solid core shaft constructed out of material that propagates ultrasonic energy efficiently, such as titanium alloy (i.e., Ti-6Al-4V) or an aluminum alloy, for example.
- (85) The ultrasonic transmission waveguide **104** comprises a longitudinally projecting attachment post **54** at a proximal end to couple to the surface **30** of the ultrasonic transmission waveguide **104**

by a threaded connection such as the stud **48**. In the embodiment illustrated in FIG. **1**, the ultrasonic transmission waveguide **104** comprises a plurality of stabilizing silicone rings or compliant supports **56** positioned at a plurality of nodes. The silicone rings **56** dampen undesirable vibration and isolate the ultrasonic energy from a removable sheath **58** assuring the flow of ultrasonic energy in a longitudinal direction to the distal end **52** of the end effector **50** with maximum efficiency.

(86) As shown in FIG. 1, the removable sheath 58 is coupled to the distal end of the handpiece

- assembly **60**. The sheath **58** generally includes an adapter or nose cone **62** and an elongated tubular member **64**. The tubular member **64** is attached to the adapter **62** and has an opening extending longitudinally therethrough. The sheath **58** may be threaded or snapped onto the distal end of the housing **16**. The ultrasonic transmission waveguide **104** extends through the opening of the tubular member **64** and the silicone rings **56** isolate the ultrasonic transmission waveguide **104** therein. (87) The adapter **62** of the sheath **58** is preferably constructed from Ultem®, and the tubular member **64** is fabricated from stainless steel. Alternatively, the ultrasonic transmission waveguide **104** may have polymeric material surrounding it to isolate it from outside contact. (88) The distal end of the ultrasonic transmission waveguide **104** may be coupled to the proximal end of the end effector **50** by an internal threaded connection, preferably at or near an antinode. It is contemplated that the end effector **50** may be attached to the ultrasonic transmission waveguide **104** by any suitable means, such as a welded joint or the like. Although the end effector **50** may be detachable from the ultrasonic transmission waveguide **104**, it is also contemplated that the end effector **50** and the ultrasonic transmission waveguide **104** may be formed as a single unitary piece. (89) FIG. 2 illustrates one embodiment of a connection union/joint **70** for an ultrasonic instrument. The connection union/joint **70** may be formed between the attachment post **54** of the ultrasonic transmission waveguide **104** and the surface **30** of the velocity transformer **28** at the distal end of the acoustic assembly **24**. The proximal end of the attachment post **54** comprises a female threaded substantially cylindrical recess **66** to receive a portion of the threaded stud **48** therein. The distal end of the velocity transformer 28 also may comprise a female threaded substantially cylindrical recess **68** to receive a portion of the threaded stud **40**. The recesses **66**, **68** are substantially circumferentially and longitudinally aligned.
- (90) FIG. **3** illustrates an exploded perspective view of one embodiment of a sterile ultrasonic surgical instrument **100**. The ultrasonic surgical instrument **100** may be employed with the above-described ultrasonic system **10**. However, as described herein, those of ordinary skill in the art will understand that the various embodiments of the ultrasonic surgical instruments disclosed herein as well as any equivalent structures thereof could conceivably be effectively used in connection with other known ultrasonic surgical instruments without departing from the scope thereof. Thus, the protection afforded to the various ultrasonic surgical blade embodiments disclosed herein should not be limited to use only in connection with the exemplary ultrasonic surgical instrument described above.
- (91) The ultrasonic surgical instrument 100 may be sterilized by methods known in the art such as, for example, gamma radiation sterilization, Ethelyne Oxide processes, autoclaving, soaking in sterilization liquid, or other known processes. In the illustrated embodiment, an ultrasonic transmission assembly 102 includes an ultrasonic end effector, the generally designated ultrasonic end effector 50, and the ultrasonic transmission waveguide 104. The ultrasonic end effector 50 and the ultrasonic transmission waveguide 104 are illustrated as a single unit construction from a material suitable for transmission of ultrasonic energy such as, for example, 700 Titanium including Aluminum and Vanadium), Aluminum, Stainless Steel, or other known materials. Alternately, the ultrasonic end effector 50 may be separable (and of differing composition) from the ultrasonic transmission waveguide 104, and coupled by, for example, a stud, weld, glue, quick connect, or other known methods. The ultrasonic transmission waveguide 104 may have a length substantially equal to an integral number of one-half system wavelengths (100).

- for example. The ultrasonic transmission waveguide **104** may be preferably fabricated from a solid core shaft constructed out of material that propagates ultrasonic energy efficiently, such as titanium alloy (i.e., Ti-6Al-4V) or an aluminum alloy, for example.
- (92) In the embodiment illustrated in FIG. **3**, the ultrasonic transmission waveguide **104** is positioned in an outer sheath **106** by a mounting O-ring **108** and a sealing ring **110**. One or more additional dampers or support members (not shown) also may be included along the ultrasonic transmission waveguide **104**. The ultrasonic transmission waveguide **104** is affixed to the outer sheath **106** by a mounting pin **112** that passes through mounting holes **114** in the outer sheath **106** and a mounting slot **116** in the ultrasonic transmission waveguide **104**.
- (93) FIGS. **4-19** illustrate various embodiments of ultrasonic blades, which may be considered different embodiments of the end effector **50** and are generally well-suited for cutting, coagulating, and reshaping tissue. In various embodiments, the ultrasonic blades may be configured as ultrasonic surgical elevator blades that are well-suited for separating muscle from bone, for example. The ultrasonic blades may be employed in the above-described ultrasonic surgical instruments 10, 100. Embodiments of the ultrasonic blades may be suitable in spine surgery, and more particularly, to assist in posterior access in removing muscle tissue from bone and coagulating the tissue. Accordingly, the ultrasonic blades may be employed to simultaneously reshape or remove muscle tissue from bone and to hemostatically seal the tissue as it is removed from the bone. The ultrasonic energy assists the cutting action of the ultrasonic blade and reduces the force required by a surgeon during an operation and thereby reduces surgeon fatigue, improves precision, and reduces unwanted tissue damage. The embodiments, however, are not limited in this context. Those skilled in the art will appreciate that although the various embodiments of the ultrasonic blades are well-suited for cutting, coagulating, and reshaping tissue, e.g., to separate muscle tissue from bone, these ultrasonic blades are multifunctional and may be employed in multiple numerous applications.
- (94) FIGS. **4-7** illustrate one embodiment of an ultrasonic blade **120**. The ultrasonic blade **120** is generally well-suited for cutting, coagulating, and reshaping tissue. In one embodiment the ultrasonic blade **120** may be configured as an ultrasonic surgical elevator blade generally well-suited to separate muscle tissue from bone. Nevertheless, the ultrasonic blade **120** may be employed in various other therapeutic procedures. FIG. **4** is a side view of the ultrasonic blade **120**. FIG. **5** is a top view of the ultrasonic blade **120**. FIG. **6** is a cross-sectional view of the ultrasonic blade **120** taken along line **6-6** in FIG. **4**. FIG. **7** is a top perspective view of the ultrasonic blade **120**.
- (95) In the embodiment illustrated in FIGS. 4-7, the ultrasonic blade 120 comprises a blade body 122 having a generally flat top surface 124 that is substantially arcuate about a first axis 121 and a smooth generally round bottom surface 126 that is substantially arcuate about a second axis 123. As shown in the cross-sectional view of FIG. 6, the top surface 124 is generally flat and the bottom surface 126 is substantially arcuate with respect to a third axis 125. The blade body 122 extends along a longitudinal central axis 127. The blade body 122 may comprise a substantially elongated treatment region, generally designated as 128, and a neck or transition portion 130 that protrudes from a proximal end 132 of the treatment region 128. The neck portion 130 may be attached to the ultrasonic transmission waveguide 104 by a stud, weld, glue, quick connect, or other known attachment methods, for example. In alternative embodiments, the ultrasonic blade 120 and the ultrasonic transmission waveguide 104 may be formed as a single unitary body. In either configuration, the ultrasonic transmission waveguide 104 amplifies the mechanical vibrations transmitted to the ultrasonic blade 120 as is well known in the art. The ultrasonic blade 120 is adapted to couple to the ultrasonic surgical instrument 100, which may be employed with the above-described ultrasonic surgical instruments 10, 100.
- (96) The ultrasonic blade **120** comprises a treatment region **128** to effect tissue, such as, for example, cut, coagulate, reshape, scrape, and remove tissue. The treatment region **128** comprises

the top surface **124** which is substantially arcuate about the first axis **121** and the smooth bottom surface **126** which is substantially arcuate about the second axis **123**. As shown in the crosssectional view in FIG. 6, the treatment region 128 the top surface 124 is generally flat and the bottom surface **126** is substantially arcuate about the third axis **125**. A distal end **134** of the treatment region **128** also comprises a substantially flat tip with a cutting edge **136**. The blade **120** and the distal cutting edge **136** define a broad top surface **124** for effecting tissue. The bottom surface **126** may be a surface for bone contact and atraumatic use along the bone region configured to prevent the cutting edge **136** from cutting into bone tissue. Due to its arcuate shape the bottom surface **126** may be employed to coagulate tissue. The top surface **124** of the blade **120** has a width "W" that is substantially greater than a thickness "T" of the blade **120**. Additional cutting edges **138** may be positioned laterally along both sides of the treatment region **128**. In one embodiment, the cutting edges **138** extend from the proximal end **132** to the distal end **134** of the treatment region 128. In one example, the flat tip cutting edge 136 or the lateral cutting edges 138 of the ultrasonic blade **120** are suitable to remove muscle tissue from bone while the smooth generally round substantially arcuate bottom surface 126 acts as an atraumatic surface that glides against the bone.

- (97) The ultrasonic blade **120** may be fabricated from a material suitable for transmission of ultrasonic energy such as, for example, Ti6Al4V (an alloy of Titanium including Aluminum and Vanadium), Aluminum, Stainless Steel, or other known materials.
- (98) FIGS. **8-11** illustrate one embodiment of an ultrasonic blade **150**. The ultrasonic blade **150** is generally well-suited for cutting, coagulating, and reshaping tissue. In one embodiment the ultrasonic blade **150** may be configured as an ultrasonic surgical elevator blade generally well-suited to separate muscle tissue from bone. Nevertheless, the ultrasonic blade **150** may be employed in various other therapeutic procedures. FIG. **8** is a side view of the ultrasonic blade **150**. FIG. **9** is a top view of the ultrasonic blade **150**. FIG. **10** is a cross-sectional view of the ultrasonic blade **150** taken along line **10-10** in FIG. **8**. FIG. **11** is a top perspective view of the ultrasonic blade **150**.
- (99) In the embodiment illustrated in FIGS. **8-11**, the ultrasonic blade **150** comprises a blade body **152** having a generally flat planar top surface **154** and a smooth substantially arcuate bottom surface **156**. The top and bottom surfaces **154**, **56** extend along the longitudinal central axis **127**. As shown in the cross-sectional view of FIG. **10**, the top surface **154** is generally flat and planar and the bottom surface **156** is substantially arcuate about axis **129**. The blade body **152** may comprise a substantially elongated treatment region, generally designated as **158**, and a neck or transition portion **160** that protrudes from a proximal end **132** of the treatment region **158**. The neck portion **160** may be attached to the ultrasonic transmission waveguide **104** by a stud, weld, glue, quick connect, or other known attachment methods, for example. In alternative embodiments, the ultrasonic blade **150** and the waveguide **104** may be formed as a single unitary body. In either configuration, the ultrasonic transmission waveguide **104** amplifies the mechanical vibrations transmitted to the ultrasonic blade **150** as is well known in the art. The ultrasonic blade **150** is adapted to couple to the ultrasonic surgical instrument **100**, which may be coupled to abovedescribed ultrasonic system **10**. In one embodiment, the ultrasonic blade **150** and the ultrasonic transmission waveguide **104** may be formed as a single unitary body.
- (100) The ultrasonic blade **150** comprises the substantially straight planar treatment region **158** to effect tissue. The treatment region **158** comprises the generally flat planar top surface **154** and the smooth substantially arcuate bottom surface **156**. The bottom surface **156** comprises a smooth atraumatic surface **162** that is substantially arcuate about axis **131** at a distal end **134** of the treatment region **158** for bone contact and atraumatic use along the bone region. The distal end **134** of the treatment region **158** also comprises a substantially flat tip with a distal cutting edge **166**. The atraumatic surface **162** is configured to prevent the distal cutting edge **166** from cutting into bone tissue. The atraumatic surface **162** extends from the bottom surface **156** to the top surface **154**

and is intended to contact and slidingly engage the bone as the cutting edge **166** removes muscle tissue from the bone without cutting into bone tissue. A cutting edge **168** is positioned laterally along one side of the treatment region **158**. The blade **150** and the distal cutting edge **166** define a broad top surface **154** for effecting tissue. The broad top surface **154** of the blade **150** has a width "W" that is substantially greater than a thickness "T". In one embodiment, the cutting edge 168 extends from the proximal end 132 to the distal end 134 of the treatment region 158. The blade 150 also comprises a dull, smooth, or curved lateral coagulating edge **164** positioned laterally along the side of the treatment region **158** opposite the lateral cutting edge **168**. In one embodiment, the coagulating edge **164** extends from the proximal end **132** to the distal end **134** of the treatment region **158**. The coagulating edge **164** may be used for different tissue effects other than coagulation, for example. In one example, the flat tip distal cutting edge **166** or the lateral cutting edge **168** of the ultrasonic blade **150** is suitable to remove muscle tissue from bone while the atraumatic surface **162** glides against the bone. The clinician may select either one of the cutting edges **166**, **168** or the atraumatic surface **162** for different tissue effects. The ultrasonic blade **150** may be fabricated from a material suitable for transmission of ultrasonic energy as previously described with respect to the ultrasonic blade **120**.

(101) FIGS. **12-15** illustrate one embodiment of an ultrasonic blade **180**. The ultrasonic blade **180** is generally well-suited for cutting, coagulating, and reshaping tissue. In one embodiment the ultrasonic blade **180** may be configured as an ultrasonic surgical elevator blade generally well-suited to separate muscle tissue from bone. Nevertheless, the ultrasonic blade **180** may be employed in various other therapeutic procedures. FIG. **12** is a side view of the ultrasonic blade **180**. FIG. **13** is a top view of the ultrasonic blade **180** taken along line **14-14** in FIG. **12**. FIG. **15** is a top perspective view of the ultrasonic blade **180**.

(102) In the embodiment illustrated in FIGS. 12-15, the ultrasonic blade 180 comprises a blade body 182 having a generally flat planar top surface 184 and a generally flat planar bottom surface 186. The top and bottom surfaces 184, 186 are substantially parallel and extend along the longitudinal central axis 127. The blade body 182 may comprise a substantially elongated treatment region, generally designated as 188, and a neck or transition portion 190 that protrudes from a proximal end 132 of the treatment region 188. The neck portion 190 may be attached to the ultrasonic transmission waveguide 104 by a stud, weld, glue, quick connect, or other known attachment methods, for example. In alternative embodiments, the ultrasonic blade 180 and the ultrasonic transmission waveguide 104 may be formed as a single unitary body. In either configuration, the ultrasonic transmission waveguide 104 amplifies the mechanical vibrations transmitted to the ultrasonic blade 180 as is well known in the art. Accordingly, the ultrasonic blade 180 is adapted to couple to the ultrasonic surgical instrument 100, which may be employed with the above-described ultrasonic surgical instruments 100, which may be employed in the above-described ultrasonic system 10. In one embodiment, the ultrasonic blade 180 and the ultrasonic transmission waveguide 104 may be formed as a single unitary body.

(103) The ultrasonic blade **180** comprises the substantially flat planar treatment region **188** to effect tissue. The treatment region **188** comprises the generally flat planar top surface **184** and the generally flat planar bottom surface **186**. A notch **192** (hook shaped in the illustrated embodiment) is defined at the distal end **134** of the treatment region **188**. The notch **192** extends inwardly into the blade body **182**. The notch **192** comprises a cutting edge **194**. A first straight lateral cutting edge **196** is positioned on the distal end **134** of the treatment region **188**. A second straight lateral cutting edge **198** is positioned laterally along the along the side of the treatment region **188** between the notch **192** and the proximal end **132**. A dull, smooth, or curved coagulating edge **200** is positioned laterally along the side of the treatment region **188** opposite the lateral cutting edge **198**. The dull, smooth, or curved coagulating edge **200** is substantially arcuate about axis **135**. The blade **180** and the lateral cutting edge **198** define a broad top surface **184**. The broad top surface **184** of

the blade **184** has a width "W" that is substantially greater than a thickness "T". In one embodiment, the curved edge **200** extends from the proximal end **132** to the distal end **134** of the treatment region **188**. The coagulating edge **200** may be used different tissue effects other than coagulation, for example. In one example, the cutting edges **194**, **196**, **198** of the ultrasonic blade **180** may be employed to remove muscle tissue from bone while the coagulating edge **200** may be used for coagulation. The notch cutting edge **194** assists in cutting tissue. For example, the notch cutting edge **194** allows for faster tissue cutting in avascular tissue or may aid in entering joint capsules. The ultrasonic blade **180** may be fabricated from a material suitable for transmission of ultrasonic energy as previously described with respect to the ultrasonic blade **120**. (104) FIGS. **16-19** illustrate one embodiment of an ultrasonic blade **210**. The ultrasonic blade **210** is generally well-suited for cutting, coagulating, and reshaping tissue. In one embodiment the ultrasonic blade **210** may be configured as an ultrasonic surgical elevator blade generally wellsuited to separate muscle tissue from bone. Nevertheless, the ultrasonic blade **210** may be employed in various other therapeutic procedures. FIG. **16** is a side view of the ultrasonic blade 210. FIG. 17 is a top view of the ultrasonic blade 210. FIG. 18 is an end-sectional view of the ultrasonic blade **210** taken along line **18-18** in FIG. **16**. FIG. **19** is a top perspective view of the ultrasonic blade 210.

(105) In the embodiment illustrated in FIGS. **16-19**, the ultrasonic blade **210** comprises a blade body **212** having a generally flat planar top surface **214** and a generally flat planar bottom surface **216**. The top and bottom surfaces **212**, **214** are substantially parallel and extend along the longitudinal central axis **127**. The blade body **212** may comprise a substantially elongated treatment region, generally designated as 218, and a neck or transition portion 220 that protrudes from a proximal end 132 of the treatment region 218. The neck portion 220 may be attached to the ultrasonic transmission waveguide **104** by a stud, weld, glue, quick connect, or other known attachment methods, for example. In alternative embodiments, the ultrasonic blade **210** and the waveguide **104** may be formed as a single unitary body. In either configuration, the ultrasonic transmission waveguide 104 amplifies the mechanical vibrations transmitted to the ultrasonic blade **210** as is well known in the art. Accordingly, the ultrasonic blade **210** is adapted to couple to the ultrasonic transmission waveguide **104** of the surgical instrument **100**, which may be employed with the above-described ultrasonic system 10. In one embodiment, the ultrasonic blade 210 and the ultrasonic transmission waveguide **104** may be formed as a single unitary body. (106) The ultrasonic blade **210** comprises the substantially flat planar treatment region **218** to effect tissue. The treatment region **218** comprises the generally flat planar top surface **214** and the generally flat planar bottom surface **216**. A first atraumatic flat edge **222** may be positioned on the tip at the distal end **134** of the ultrasonic blade **210** for bone contact and atraumatic use along the bone region as well as to characterize the blade **210**. The blade **210** and the distal atraumatic edge **222** define a broad top surface **214** for effecting tissue. The top surface **214** of the blade **210** has a width "W" that is substantially greater than a thickness "T" of the blade **210**. The flat atraumatic edge **222** at the tip of the distal end **134** of the ultrasonic blade **210** may be normal to the longitudinal central axis 127 of the ultrasonic blade 210 and may be employed for benchmarking measurements of the displacement of the distal end **134**, for example. This may be employed to make measurements and to characterize the ultrasonic blade **210**. A smooth atraumatic surface **228** that is substantially arcuate about axis **135** may be provided at the distal end **134** for bone contact and atraumatic use along the bone region. Cutting edges **224**, **226** may be disposed laterally along both sides of the treatment region **218**. The ultrasonic blade **210** may be fabricated from a material suitable for transmission of ultrasonic energy as previously described with respect to the ultrasonic blade **120**.

(107) FIG. **20** is a top perspective view of one embodiment of an ultrasonic blade **230**. The ultrasonic blade **230** is generally well-suited for cutting, coagulating, and reshaping tissue. In one embodiment the ultrasonic blade **230** may be configured as an ultrasonic surgical elevator blade

generally well-suited to separate muscle tissue from bone. Nevertheless, the ultrasonic blade 230 may be employed in various other therapeutic procedures. The ultrasonic blade 230 has a blade body 232 that has a generally flat planar tapered top surface portion 234, a generally flat planar bottom surface 238 (FIG. 21), and an offset edge portion 236 with a cutting edge 239 well-suited for dissecting tissue against bone. The ultrasonic blade 230 may be fabricated from a material suitable for transmission of ultrasonic energy as previously described with respect to the ultrasonic blade 120. The blade body 232 may comprise a substantially elongated treatment region, generally designated as 240, and a neck or transition portion 242 that protrudes from a proximal end 132 of the treatment region 240. The neck portion 242 may be attached to the ultrasonic transmission waveguide 104 by a stud, weld, glue, quick connect, or other known attachment methods, for example. In alternative embodiments, the ultrasonic blade 230 and the waveguide 104 may be formed as a single unitary body. In either configuration, the ultrasonic transmission waveguide 104 amplifies the mechanical vibrations transmitted to the ultrasonic blade 230 as is well known in the art. Accordingly, the ultrasonic blade 230 is adapted to couple to the ultrasonic surgical instrument 100, which may be employed with the above-described ultrasonic system 10.

- (108) FIG. **21** illustrates a use of one embodiment of the ultrasonic blade **230** shown in FIG. **20**. The ultrasonic blade **230** comprises the generally planar treatment region **240** with a generally flat planar top surface **234**, a generally flat planar bottom surface **238**, and an offset edge portion **236** with a cutting edge **239**. The cutting edge **239** is suitable to dissect muscle tissue **244** from a bone **246**.
- (109) The ultrasonic blades **120**, **150**, **180**, **210**, **230** described above each have a length "L" that is substantially equal to an integral multiple of one-half system wavelengths ( $\lambda$ /2). The distal end **134** of the ultrasonic blades **120**, **150**, **180**, **210**, **230** may be disposed near an antinode in order to provide the maximum longitudinal excursion of the distal end **134**. When the transducer assembly is energized, the distal end **134** of the ultrasonic blade **120**, **150**, **180**, **210**, **230** may be configured to move in the range of, for example, approximately 10 to 500 microns peak-to-peak, and preferably in the range of about 30 to 150 microns at a predetermined vibrational frequency range. As previously discussed, a suitable vibrational frequency range may be about 20 Hz to 120 kHz and a well-suited vibrational frequency may be approximately 55.5 kHz.
- (110) Other embodiments may comprise multiple end effectors **50** attached distally to a common ultrasonic transmission waveguide **104**. The end effectors **50** may provide a variety of tissue effects that are similar to those discussed above with respect to the ultrasonic blades **120**, **150**, **180**, **210**, **230**. As discussed above, the ultrasonic blades **120**, **150**, **180**, **210**, **230** may be separable (and of differing composition) from the waveguide **104**, and coupled by, for example, a stud, weld, glue, quick connect, or other known methods. A quick connect coupling may provide lower cost and ease of use of multiple ultrasonic blades **120**, **150**, **180**, **210**, **230** in one procedure.
- (111) As described above, an end effector or blade of an ultrasonic surgical instrument can be vibrated along a longitudinal axis to treat tissue, for example. In various circumstances, such instruments can be preferably configured such that they do not vibrate in any other direction, such as axes which are transverse to the longitudinal axis, for example. Such transverse vibration may make the surgical instrument inefficient and may require additional power to operate the surgical instrument, for example. In at least one circumstance, such transverse vibration may be created and/or amplified by an imbalanced asymmetrical configuration of the blade. In various embodiments of the present invention, an end effector or blade of an ultrasonic surgical instrument can be configured such that such transverse vibration is reduced or eliminated. For example, in at least one embodiment, the blade can include an asymmetrical configuration which can be balanced with respect to at least one axis which is transverse to the longitudinal vibrational axis of the surgical instrument, as described in greater detail below.
- (112) In various embodiments, referring to FIGS. 56-59, an ultrasonic surgical instrument blade,

such as blade **680**, for example, can include blade body **682** having a generally flat top surface, or side, **684** and a generally flat bottom surface, or side, **686**. Although surfaces, or sides, **684** and **686** can be generally flat or planar, they can comprise any suitable configuration including curved and/or curvilinear configurations, for example. The top and bottom surfaces **684**, **686** can be substantially parallel and can extend along the longitudinal or central axis **127**. The blade body **682** may comprise a substantially elongated treatment region, generally designated as **688**, and a neck or transition portion **690** that protrudes from a proximal end **632** of the treatment region **688**. The neck portion **690** may be attached to the ultrasonic transmission waveguide **104** (FIG. **1**) by a stud, weld, glue, quick connect, or other known attachment methods, for example. In alternative embodiments, the ultrasonic blade **680** and the ultrasonic transmission waveguide **104** may be formed as a single unitary body. In either configuration, the ultrasonic transmission waveguide **104** can amplify the mechanical vibrations transmitted to the ultrasonic blade **680** as is well known in the art.

(113) In various embodiments, blade **680** can include a notch **692** (hook shaped in the illustrated embodiment) which is defined at the distal end **634** of the treatment region **688**. The notch **692** can extend inwardly into the blade body **682**, as illustrated in FIGS. **57** and **59**, wherein the notch **692** can comprise a cutting edge **694** configured to incise tissue, for example. In various embodiments, referring to FIG. 58, the blade 680 can further include cutting edge 696 which can also be configured to incise tissue, for example. In at least one embodiment, the cross-section of blade **680**, again referring to FIG. 58, can be configured such that blade 680 is balanced, or at least substantially balanced, with respect to axis 669. In various embodiments, the cross-section can be defined by a plane, such as plane **673**, for example, wherein plane **673** can be perpendicular to longitudinal axis **127** and wherein axis **669** can lie within the plane **673**. In at least one embodiment, the cross-section of blade **680** can include a body, or central, portion **675** and a cutting, or step, portion **679**, extending from central portion **675**. In various embodiments, axis **669** may be referred to as a centerline of the blade, or a portion of the blade, although such use is not intended to communicate that the blade, or a portion of the blade, is necessarily symmetrical. Often, such a reference can be used to refer to an axis, or datum, which is utilized to determine or measure whether a symmetrical and/or asymmetrical blade, or a portion of a blade, is balanced with respect thereto.

(114) In various embodiments, referring to the cross-section of blade **680** illustrated in FIG. **60**, the sides of central portion **675** can be defined by surfaces **684** and **686**, for example, wherein surfaces **684** and **686** can define a width (w) therebetween. Although the width of central portion **675** is substantially constant in the illustrated exemplary embodiment, the width of central portion **675** can have any suitable configuration, including configurations which comprise identical, or at least substantially identical, portions on the opposite sides of transverse axis **669**, for example. In at least one such embodiment, central portion **675** can include a first mass M.sub.B1 positioned on a first side of transverse axis **669** and a second mass M.sub.B2 positioned on a second side of said transverse axis, wherein M.sub.B, can be equal, or at least substantially equal, to M.sub.B2. In various embodiments, again referring to FIG. **60**, M.sub.B1 can comprise the area defined by h and w/2 and, similarly, M.sub.B2 can comprise the area defined by l.sub.2 and w/2. In at least one embodiment, l.sub.1 can equal, or at least substantially equal, l.sub.2. In various alternative embodiments, however, M.sub.B1 may not be equal to M.sub.B2. In at least one such embodiment, l.sub.1 may not equal l.sub.2. In various embodiments, though, the mass of blade **680** may be balanced in another manner as described in greater detail below.

(115) In various embodiments, referring to FIG. **60**, step portion **679** of the cross-section can comprise first surface **681** and second surface **683**, wherein cutting edge **696** can be positioned intermediate first surface **681** and second surface **683**. In at least one embodiment, step portion **679** can include, similar to the above, a first mass M.sub.S1, defined by A.sub.1, positioned on the first side of axis **669** and a second mass M.sub.S2, defined by A.sub.2, positioned on the opposite, or

```
second, side of axis 669, wherein M.sub.S1 can be equal, or at least substantially equal, to
M.sub.S2. In at least one such embodiment, step portion 679 can include a center of gravity 685,
wherein center of gravity 685 can be positioned along transverse axis 669. Although various
embodiments having a symmetrical step portion 679 are possible, step portion 679 can include an
asymmetric configuration with respect to transverse axis 669. In at least one such embodiment,
cutting edge 696 may not lie along, or be co-planar with, axis 669 wherein, as a result, blade 680
can include a cutting edge which is positioned closer to one of sides 684 and 686 without creating a
mass imbalance with respect to axis 669. In at least one embodiment, referring to FIG. 60, cutting
edge 696 can be positioned a distance x with respect to second side 686, for example, such that
blade 680 is balanced as described in greater detail below. Owing to the closer proximity of the
cutting edge with respect to one side of the blade, the cutting edge may be more visible to the
surgeon thereby facilitating the proper use of the surgical instrument.
(116) In various embodiments, further to the above, M.sub.S1 may not be equal to M.sub.S2. In at
least one such embodiment, though, the masses of central portion 675 and step portion 679, for
example, can be arranged such that the mass of blade 680 is still balanced with respect to transverse
axis 669, for example. More particularly, M.sub.S1, M.sub.S2, M.sub.B1, and M.sub.B2 can be
selected such that M.sub.B1+M.sub.S1 is equal, or at least substantially equal, to
M.sub.B2+M.sub.S2. In such embodiments, as a result, the total mass of blade 680 on the first side
of axis 669 can be equal, or at least substantially equal, to the total mass of blade 680 on the second
side of axis 669. Furthermore, in various embodiments, the mass of blade 680 can be arranged such
that the moment of force and the moment of inertia of masses M.sub.S1, M.sub.S2, M.sub.B1, and
M.sub.B2 are balanced as well. Generally, the moment of force of a mass is proportional to the
product of the mass and the distance between the center of gravity of the mass and a datum, or axis.
Also, generally, the moment of inertia of a mass is proportional to the product of the mass and the
square of the distance between the center of gravity of the mass and a datum, or axis. Referring to
the illustrated embodiment of FIG. 60, masses M.sub.S1, M.sub.S2, M.sub.B1, and M.sub.B2 can
be positioned so as to balance, or at least substantially balance, the moment of force and the
moment of inertia of blade 680 with respect to transverse axis 669, for example.
(117) In various embodiments, again referring to FIG. 60, step portion 679, as described above, can
include first and second surfaces and a cutting edge 696 positioned therebetween. In at least one
embodiment, step portion 679 can further include an edge height, s, which can define the distance
between cutting edge 696 and first portion 697 of step portion 679. More particularly, in at least
one embodiment, step portion 679 can include first portion 697 and cutting portion 699 which are
separated by datum 695, wherein edge height s can define the distance between the top of first
portion 697, i.e., cutting edge 696, and datum 695. Stated another way, referring to FIG. 60A, edge
height s can be defined as the distance between the top of a right triangle defined by area A.sub.4
and the top of a right triangle defined by the combined areas of A.sub.1 and A.sub.3. In at least one
embodiment, further to the above, A.sub.1 can equal A.sub.2, and A.sub.2 can equal
A.sub.3+A.sub.4. In various embodiments where second surface 683 is parallel to axis 669, the
edge height s can equal the length of second surface 683. In various other embodiments where
second surface 683 is not parallel to axis 669, the edge height s can equal the length of the
projection of second surface 683 onto axis 669. In various embodiments, cutting edge 696 can lie
in a first plane 693, datum 695 can lie in a second plane which is parallel to the first plane, and
wherein the step height s can define the distance between the first and second planes.
(118) In various embodiments, first surface 681 and second surface 683 can be arranged such that
an angle \alpha, or edge angle, is defined therebetween wherein the edge angle can be any suitable angle
such as approximately 35 degrees or approximately 65 degrees, for example. During various
experimental uses of such surgical blades, it was observed that surgical blades having smaller edge
angles, i.e., angles closer to zero degrees, transected tissue faster than surgical blades having larger
edge angles, i.e., angles closer to 90 degrees. It was also observed, though, that such blades were to
```

able to seal, or produce hemostasis within, the edges of the tissue as the tissue was being transected regardless of the edge angle selected. Such a result was deemed to be surprising and, advantageously, it is believed that the edge angle of the blades disclosed herein can be selected to facilitate a desired cutting rate without affecting the hemostasis of the tissue. Furthermore, it was also determined by the experimental uses of such surgical blades that a relationship for producing hemostasis within porcine tissue can comprise:

 $(119) 1.26 - 0.0102^* a - 1.14^* h + 8.14w$ 

wherein a represents the longitudinal amplitude of the blade, wherein w represents the width of the blade, similar to the above, and wherein h represents the height of the blade. In various embodiments, this relationship for producing hemostasis can be equated to zero, values for two of variables a, h, and w can be selected or input into the relationship, and the relationship can then be utilized to determine a value for the third variable. In at least one circumstance, this relationship was used to determine a suitable range of widths for the blade, w, which can be between approximately 0.040" and approximately 0.070", depending on the level of hemostasis required from a particular blade. A width of approximately 0.060" was selected for one actual example. (120) In at least one embodiment, second surface **683** of step portion **679** can be parallel, or at least substantially parallel, to first side **684** and/or second side **686** of central portion **675**. In various embodiments, first surface **681** can lie within a plane which is transverse to second surface **683** and first side **684**, for example. Although portions of the exemplary embodiment of step portion **679** in FIG. **60** are illustrated as right triangles having straight sides, step portion **679** can include any suitable configuration which is balanced, or at least substantially balanced, with respect to transverse axis **669**, for example. In at least one embodiment, such balancing can be achieved by positioning the center of gravity of the step portion along the centerline of the blade. In various embodiments, a blade, such as blade **680**, for example, can be balanced such that the relationship of:

(121) 
$$\frac{x^2}{2*\tan} + \frac{(w-x)}{2}(\frac{x}{\tan} - S) - (\frac{w}{2})^2 \frac{1}{\tan}$$
 or, correspondingly: (1)  $\left[\frac{x^2}{2}*(\tan)^{-1} + \frac{(w-x)}{2}(x*(\tan)^{-1} - S) - (\frac{w}{2})^2(\tan)^{-1}\right]$   $\frac{x^2}{2}*(\tan)^{-1} + \frac{(w-x)}{2}(x*(\tan)^{-1} - S) - (\frac{w}{2})^2(\tan)^{-1}$ 

is equal to, or at least substantially equal to, zero, wherein w is the width of the body portion of the blade, such as central portion **675**, for example, wherein  $\alpha$  is the edge angle defined between the first and second surfaces of the step portion, such as surfaces **681** and **683**, for example, wherein s is the edge height of the step portion which can be defined as outlined above, and wherein x is the distance between a side of the body portion, such as second side **686**, and the cutting edge of the step portion, such as cutting edge **696**, for example.

(122) In various embodiments, suitable values for variables w, s, and a can be selected and relationship (1) can be manipulated to determine a value for variable x. In at least one such embodiment, relationship (1) is equated to zero and the selected values for variables w, s, and a are substituted into relationship (1) to determine the value for variable x. In such circumstances, variable x is dependent upon the selection of the values for w, s, and  $\alpha$ . If a blade, such as blade **680**, for example, is constructed in accordance with the selected values of w, s, and  $\alpha$  and the determined value for x, then blade **680** will be balanced, or at least substantially balanced, with respect to transverse axis **669**, for example. As outlined above, the values for variables w, s, and  $\alpha$  can be selected for various reasons. For example, the value for variable w, i.e., the width of the body portion of the blade, can be selected such that the blade can fit through an endoscope, for example. In various embodiments, the value for variables s and a, i.e., the height and edge angle of step portion **679**, can be selected to improve or optimize the manufacturability of the blade. In addition to or in lieu of the above, the values for variable w, s, and/or  $\alpha$  can be selected to optimize the cutting performance of the blade, for example.

(123) Although relationship (1) may be utilized to set variable x as a dependent variable,

relationship (1) may be utilized to set at least one of the other above-described variables as a dependent variable. In at least one such embodiment, for example, relationship (1) can be equated to zero and selected values for variables w, s, and x can be substituted into relationship (1) to determine a value for variable  $\alpha$ . Similarly, relationship (1) can be equated to zero and selected values for variables w, a, and x can be substituted into relationship (1) to determine a value for variable s, for example. A similar approach can be undertaken to determine a value for variable w. Further to the above, in various embodiments, an ultrasonic surgical blade can be configured such that, for any given values of s and w, the relationship of:

$$(124) A * x^{2} * (\tan )^{-1} + B * x * (\tan )^{-1} + C * (\tan )^{-1} + D * x + E$$
 (2)

$$A * x^{2} * (\tan )^{-1} + B * x * (\tan )^{-1} + C * (\tan )^{-1} + D * x + E$$

is equal, or at least substantially equal, to zero, wherein A, B, C, D, and E are constants. In various alternative embodiments, an ultrasonic surgical blade can be configured such that, for any given values of s and  $\alpha$ , the relationship of:

(125) 
$$A * x^2 + B * x + C * x * w + D * w + E * w^2 + F$$
 (3)

is equal, or at least substantially equal, to zero, wherein A, B, C, D, E, and F are constants. In various further embodiments, an ultrasonic surgical blade can be configured such that, for any given values of w and  $\alpha$ , the relationship of:

(126) 
$$A * x^2 + B * x + C * x * s + D * s + E$$
 (4)

is equal, or at least substantially equal, to zero, wherein A, B, C, D, and E are constants. (127) In various embodiments, the above-described approaches for balancing an ultrasonic surgical blade can be utilized to balance, or at least substantially balance, various alternative surgical blades as outlined in greater detail below. In at least one embodiment, owing to the relationship between mass and kinetic energy, the energy imparted by such blades can also be balanced. More specifically, if the mass of a blade is balanced with respect to a datum or centerline of a blade, the kinetic energy produced by the blade, when it is motivated, will also be balanced with respect to the datum or centerline. In such circumstances, as a result, the surgical blade can be configured to deliver a uniform energy profile to the targeted tissue, for example. In various embodiments, a balanced, or at least substantially balanced, blade can provide a uniform, or at least substantially uniform, pressure profile to the targeted tissue. In at least one embodiment, a blade can be considered to be substantially balanced if the mass on the first side of the cross-section centerline is within approximately 10 percent of the mass on the second side of the centerline. In such embodiments, although the blade is not mass balanced, any transverse vibrations produced by the unbalanced blade may not substantially affect the performance of the blade. In at least one embodiment, a blade can be considered substantially balanced if the cutting edge, such as cutting edge **696**, for example, is positioned within approximately 10 percent of the calculated distance for x, for example. Further to the above, although methods of balancing the mass of a blade with respect to one axis have been described herein, such methods can be utilized to balance the mass of a blade with respect to two or more axes.

(128) In at least one embodiment, referring to FIG. **61**, blade **780** can include a central portion **775** having first side **784** and second side **786**. Blade **780** can further include two step portions **779** which, in various embodiments, can be positioned on opposite sides of central portion **775**. In such embodiments, as a result, blade **780** can comprise two cutting edges **796** which can be configured to transect tissue, for example. In various embodiments, further to the above, each step portion **779** can be balanced with respect to axis **769**, wherein axis **769** can be transverse to longitudinal axis **127**. In various alternative embodiments, although not illustrated, step portions **779** can be arranged such that, although each step portion **779** may be imbalanced with respect to axis **769**, step portions **779** can balance, or offset, one another. In at least one additional embodiment, referring to FIG. **62**, blade **880** can include central portion **875** and two step portions **879** wherein, similar to the above,

portions **875** and **879** can be balanced with respect to transverse axis **869**. In at least one further embodiment, referring to FIG. **63**, blade **980** can include a central portion **975** having first side **984** and second side **986**. Blade **980** can further include two step portions **979** wherein, similar to the above, portions **975** and **979** can be balanced with respect to transverse axis **969**. In at least one more embodiment, referring to FIG. **64**, blade **1080** can include central portion **1075** and two step portions **1079** wherein portions **1075** and **1079** can be balanced with respect to transverse axis **1069**.

(129) FIGS. **22-24** illustrate one embodiment of an ultrasonic blade **250** comprising a protective sheath **252**. The ultrasonic blade **250** is generally well-suited for cutting, coagulating, and reshaping tissue. The protective sheath **252** is generally well suited for glidingly engaging the surface of the bone to prevent damage to the bone and the ultrasonic blade **250** while the ultrasonic blade **250** removes muscle tissue from the bone and to dissipate thermal energy generated by the ultrasonic blade **250**. FIG. **22** illustrates a partial cross-sectional view of one embodiment of an ultrasonic blade 250 comprising a protective sheath 252 taken along the longitudinal axis. FIG. 23 is a bottom view of the ultrasonic blade **250** taken along line **23-23**. FIG. **24** is a cross-sectional view of the ultrasonic blade **250** and the protective sheath **252**. The ultrasonic blade **250** comprises a body **254** having a substantially planar top surface **256** a generally rounded cutting edge **258** and an atraumatic surface **259** for bone contact and atraumatic use along the bone region configured to prevent the cutting edge **136** from cutting into bone tissue. In one embodiment the cutting edge **258** may be configured as an ultrasonic surgical elevator blade generally well-suited to separate muscle tissue from bone. A lateral cutting edge **264** suitable for dissecting tissue is positioned on one side of the body **254** and an atraumatic edge **266** suitable to coagulate tissue may be positioned laterally along an opposite side of the body **254**. The body also comprises a generally flat planar bottom surface **268** adjacent to the protective sheath **252**. An air gap **262** may separate the bottom surface **268** from the protective sheath **252** for cooling purposes, for example. The protective sheath **252** comprises a substantially arcuate lateral bottom surface **260** with a flat portion in the center thereof. (130) FIG. **25** illustrates a use of one embodiment of an ultrasonic surgical instrument **270** removing muscle tissue **244** from bone **246**. The ultrasonic surgical instrument **270** comprises the ultrasonic blade **250** described above. The ultrasonic blade **250** comprises the atraumatic bone protective sheath 252. As used herein, atraumatic means designed to avoid injury. In one embodiment, the atraumatic bone protective sheath 252 extends longitudinally below the ultrasonic blade **250** to the handpiece housing of the ultrasonic surgical instrument **270** to act between the bottom surface of the ultrasonic blade **268** and the bone **246** to avoid injuring the bone **246** while coagulating, reshaping, or removing muscle tissue **244** from the bone **246** as described above. The air gap **262** provides a path for irrigation fluid to pass between the bottom surface **268** of the ultrasonic blade **250** and the protective sheath **252** to dissipate thermal energy generated by the ultrasonic blade **250** while cutting. In one embodiment, the protective sheath **252** may be rigidly and fixedly attached or mounted to the bottom surface **268** of the ultrasonic blade **250** in any suitable manner to reduce design complexity and cost. In other embodiments, the protective sheath 252 may be fixedly mounted to other substantially rigid portions of the ultrasonic surgical instrument **270**. In alternative embodiments, the protective sheath **252** may be user deployable (e.g., retractable).

(131) The protective sheath **252** reduces thermal heating effects that may result from the ultrasonic blade **250** contacting the bone **246**. The process of removing the muscle tissue **244** from the bone **246** during posterior spine access may be a lengthy procedure. Accordingly, there is a concern that the high temperatures may build and cause breakage of the ultrasonic blade **250**, spread of excessive lateral thermal heating, damage to the bone **246**, damage to the muscle **244**, and/or damage to nerve tissue. Accordingly, the bottom surface **268** of the ultrasonic blade **250** is shielded or protected by the protective sheath **252** and can rest against the surface of the bone **246** while the active portion or the cutting edge **258** of the ultrasonic blade **250** applies energy to the muscle

tissue **244**, resulting in good surgical technique of dissecting muscle tissue from bone (e.g., the spine). This protective sheath **252** also shields the ultrasonic blade **250** from contacting metal retractors and thus minimizes the risk of breaking the blade **250**. Reducing the risk of breaking the ultrasonic blade **250** reduces instrument exchange during a surgical procedure because there is less concern for retracting instruments to avoid breaking the ultrasonic blade **250**. In addition, the protective sheath **252** may enable more directed energy between the blade and a clamp arm (not shown).

(132) The protective sheath **252** may be formed of any suitable polymeric material and may be formed on or attached to the ultrasonic blade **250** using a variety of techniques. Generally, the protective sheath **252** may be formed of any material suitable to shield the ultrasonic blade **250** from contacting bone or metal objects while cutting and minimizing the risk that of breaking the ultrasonic blade **250**. In addition, the protective sheath **252** may be formed of a material and may be attached to the ultrasonic blade **250** in a manner that is suitable to decrease the thermal energy created by the ultrasonic blade 250 to spread from the bottom surface 268 thereof. In one embodiment, the protective sheath 252 may be formed by coating the bottom surface 268 of the ultrasonic blade **250** with a polymeric material. The protective sheath **252** may be formed of a variety of high temperature lubricious polymers. For example, the protective sheath 252 may be formed of any number of fluorinated polymers such as Tetrafluoroethylene or Polytetrafluoroethylene, such as Teflon® by DuPont. In another embodiment, the protective sheath 252 may be formed as separate rigid polymeric component permanently attached (e.g., affixed, mounted) to the bottom surface **268** of the ultrasonic blade **250**. The protective sheath **252** may be attached to the bottom surface **268** of the ultrasonic blade **250** with physical snaps, adhesives, and/or insert/molding. In yet another embodiment, the protective sheath 252 may be formed as a separate rigid polymeric component mounted to a rigid portion of the ultrasonic instrument 270 and shield the bottom surface **268** of the ultrasonic blade **250** without physically contacting the bottom surface **268** of the ultrasonic blade **250**. This provides the air gap **262** between the bottom surface **268** of the ultrasonic blade **250** and the separate rigid polymeric protective sheath **252**. The air gap 262 enables irrigation fluid to travel between the protective sheath 252 and the bottom surface 268 of the ultrasonic blade **250** to assist in cooling the blade. In one embodiment, irrigation may be provided within the protective sheath to assist in cooling the ultrasonic blade **250** from ultrasonically induced thermal effects. For example, in one embodiment a protective sheath may be configured to act as an irrigation conduit along the bottom surface of the ultrasonic blade to provide directed irrigation for surgical regions as well as providing a cooling effect to the ultrasonic blade during use (FIGS. **52-55**). In various other embodiments, the protective sheath **252** may be user deployable and/or retractable by the user. Thus the user may deploy the protective sheath **252** to shield the bottom surface 268 of the ultrasonic blade 150 from the bone 246 or may retract the protective sheath 252 when desired to enable back-cutting. In other embodiments, the protective sheath **252** may be configured to assist in the mechanical dissection or removal of the muscle tissue **244** from the bone **246**. For example, the protective sheath **252** may be configured in the shape and style to accommodate a conventional curette or cobb blade with sharp cutting edges **258**, **264**. The sheath also may be employed as a fulcrum along the bottom surface **268** of the ultrasonic blade **250** while still enabling distal and lateral tissue effects by exposing the cutting edge **258** of the ultrasonic blade **250**.

(133) FIG. **26** illustrates a use of one embodiment of the ultrasonic surgical blade **230** shown in FIGS. **20**, **21** comprising one embodiment of a protective sheath **272**. The protective sheath **272** is positioned adjacent to the bottom surface **238** of the ultrasonic surgical blade **230**. The protective sheath **272** protects the bone **246** as the cutting edge **239** dissects the muscle tissue **244** from the bone **246**. An air gap **274** between the protective sheath **272** and the bottom surface **238** of the ultrasonic blade **230** provides a path for irrigation fluid to pass therebetween to dissipate thermal energy generated by the ultrasonic blade **230** while cutting. The protective sheath **272** may be

formed of any polymeric material as previously discussed with respect to FIGS. **22-25**. (134) FIGS. **27-31** illustrate one embodiment of an ultrasonic surgical instrument **280** comprising an end effector **304**. FIG. **27** is a top perspective view of one embodiment of the ultrasonic surgical instrument **280**. FIG. **28** is a cross-sectional view of the ultrasonic surgical instrument **280** shown in FIG. **27** taken along the longitudinal axis of the ultrasonic surgical instrument **280**. FIG. **29** is a bottom view of the ultrasonic surgical instrument 280 taken along lines 29-29. FIG. 30 is a crosssectional view of the ultrasonic surgical instrument 280 taken along lines 30-30. FIG. 31 is crosssectional view of the ultrasonic surgical instrument 280 taken along lines 31-31. With reference now to FIGS. 27-31, the ultrasonic surgical instrument 280 comprises an outer tubular member or outer tube **282** that extends from the handpiece assembly **456** (FIGS. **41-44**). The outer tube **282** has a substantially circular cross-section and a longitudinal opening or aperture **302** to receive an inner tubular member or inner tube **312**. The outer tube **282** has a substantially circular crosssection and may be fabricated from stainless steel. It will be recognized that the outer tube **282** may be constructed from any suitable material and may have any suitable cross-sectional shape. Located at the distal end of the ultrasonic surgical instrument 280 is an end effector 304 for performing various tasks, such as, for example, grasping tissue, cutting tissue and the like. It is contemplated

(135) The end effector **304** comprises a non-vibrating clamp arm assembly **284**, an ultrasonic blade **286**, and a protective sheath **288**. The clamp arm assembly **284** comprises a tissue pad **300**. The non-vibrating clamp arm assembly **284** is to grip tissue or compress tissue against the ultrasonic blade **286**, for example.

that the end effector **304** may be formed in any suitable configuration.

- (136) The ultrasonic blade **286** is generally well-suited for cutting, coagulating, and reshaping tissue. In one embodiment the ultrasonic blade **286** may be configured as an ultrasonic surgical elevator blade generally well-suited to separate muscle tissue from bone. Nevertheless, the ultrasonic blade **286** may be employed in various other therapeutic procedures. The ultrasonic blade **286** comprises a cutting edge **324** at a distal portion and in other embodiments may comprise one or more lateral cutting edges and/or lateral atraumatic dull, smooth or curved edges. The ultrasonic blade **286** comprises a bottom surface **322** adjacent to the protective sheath **288** such that the protective sheath **288** shields the bottom surface **322** from contacting other surfaces. The ultrasonic blade **286** may be coupled to the ultrasonic transmission waveguide **104** or may be formed as a unitary piece therewith. The ultrasonic instrument **280** may be employed with the ultrasonic system **10**.
- (137) The protective sheath **288** is generally well suited for glidingly engaging the surface of the bone to prevent damage to the bone while the ultrasonic blade **286** removes muscle tissue from bone and to dissipate thermal energy generated by the ultrasonic blade **286** while cutting. In the embodiment, the protective sheath **288** may be fixedly coupled to the ultrasonic blade **286** or to the outer tube **282** and is not user deployable. An air gap **320** between the bottom surface **322** of the ultrasonic blade **286** and the protective sheath **288** provides a path for irrigation fluid to pass therebetween to dissipate thermal energy generated by the ultrasonic blade **286**. The protective sheath **288** comprises the proximal partially circumferentially extending portion **310** that overlaps and fixedly engages the outer tube **282**. As previously discussed, the proximal partially circumferentially extending portion **310** comprises multiple projections **318** to engage apertures **316** formed in the outer tube **282**. In one embodiment, the protective sheath **288** may be fixedly attached to the outer sheath **282** by way of the multiple projections **318** engaging the apertures **316** formed in the outer tube **282**. As shown in FIG. **30**, the protective sheath **288** comprises a curved substantially arcuate bottom surface **314** to slidingly engage bone. The curved bottom surface **314** comprises a convex portion **315** at a distal end and a concave portion **317** at a proximal end. The protective sheath 288 may be formed of any polymeric material as previously discussed with respect to FIGS. 22-25.
- (138) The end effector **304** is illustrated in a clamp open position. The clamp arm assembly **284** is

preferably pivotally mounted to the distal end of the outer tube **282** at pivot points **290**A, B such that the clamp arm assembly **284** can rotate in the direction shown by arrows **294**, **298**. The clamp arm assembly **284** preferably includes clamp arms **306**A, B and corresponding pivot pins **291**A, B on either side to engage the pivot points **290**A, B. The distal end of the inner tube **312** comprises fingers or flanges **313**A and **313**B (not shown) that extend therefrom. The fingers **313**A, B have corresponding openings **313**A and **313**B (not shown) to receive posts **315**A and **315**B (not shown) of the clamp arms **306**A, B. When the inner tube **312** is moved axially, the fingers **313**A, B move axially forwardly or rearwardly and engage the corresponding posts **315**A, B of the clamp arms **306**A, B to open and close the clamp arm assembly **284**. For example, when the inner tube **312** moves axially rearwardly or is retracted towards the proximal end in the direction indicated by arrow **292**, the clamp arm assembly **284** opens in the direction indicated by arrow **294**. When the inner tube **312** moves axially or is advanced towards to the distal end in the direction indicated by arrow **296** the clamp arm assembly **284** closes in the direction indicated by arrow **298**. The outer tube **282** remains fixed and the apertures **316** are configured to receive the projecting members **318** from the partially circumferentially extending portion **310** of the protective sheath **288**. The proximal partially circumferentially extending portion 310 of the protective sheath 288 is thus fixedly mounted to the outer tube **282**. In one embodiment, the proximal partially circumferentially extending portion **310** of the protective sheath **288** may be formed of similar materials as the protective sheath **288** or may be formed of other substantially rigid materials.

(139) The clamp arm **306** includes the tissue pad **300** attached thereto for squeezing tissue between the ultrasonic blade **286** and the clamp arm assembly **300**. The tissue pad **300** is preferably formed of a polymeric or other compliant material and engages the ultrasonic blade **286** when the clamp arm **306** is in its closed position. Preferably, the tissue pad **300** is formed of a material having a low coefficient of friction but which has substantial rigidity to provide tissue-grasping capability, such as, for example, TEFLON, a trademark name of E. I. Du Pont de Nemours and Company for the polymer polytetraflouroethylene (PTFE). The tissue pad **300** may be mounted to the clamp arm **300** by an adhesive, or preferably by a mechanical fastening arrangement. Serrations **308** are formed in the clamping surfaces of the tissue pad **300** and extend perpendicular to the axis of the ultrasonic blade **286** to allow tissue to be grasped, manipulated, coagulated and cut without slipping between the clamp arm **306** and the ultrasonic blade **286**.

(140) FIGS. 32-35 are cross-sectional views of various embodiments of ultrasonic surgical instruments 350, 352, 354, 356 taken along the longitudinal axis. The ultrasonic surgical instruments 350, 352, 354, 356 comprise respective fixedly attached protective sheaths 358, 364, 370, 376. As previously discussed, fixedly attached means that the protective sheaths are not deployable and remain in the position shown in FIGS. 32-35 during use of the instruments 350, 352. As shown in FIGS. 32-35, the ultrasonic surgical instrument 350, 352, 354, 356 each comprise the outer tube 282 that extends from a handpiece assembly (e.g., the handpiece assembly 60 shown in FIG. 1). The outer tube 282 has a substantially circular cross-section and a longitudinal opening or aperture 302 to receive the inner tube 312. Located at the distal end of the ultrasonic surgical instrument 350 is an end effector 304 for performing various tasks, such as, for example, grasping tissue, cutting tissue and the like. It is contemplated that the end effector 304 may be formed in any suitable configuration. The ultrasonic surgical instrument 350, 352, 354, 356 may be employed with the ultrasonic system 10.

(141) The end effector **304** comprises the non-vibrating clamp arm assembly **284**, an ultrasonic blade **286**, and a protective sheath **354**. The clamp arm assembly **284** is preferably pivotally attached to the distal end of the outer tube **282** at the pivot point **290**. The clamp arm assembly **284** comprises a tissue pad **300**. As previously discussed, the ultrasonic blade **286** may be coupled to the ultrasonic transmission waveguide **104** or may be formed as a unitary piece therewith and may be actuated by the ultrasonic system **10**.

(142) The protective sheaths 358, 364, 370, 376 are generally well suited for glidingly engaging the

surface of the bone to prevent damage to the bone while the ultrasonic blade **286** removes muscle tissue from the bone and to dissipate thermal energy generated by the ultrasonic blade **286** while cutting. The protective sheaths **358**, **364**, **370**, **376** may be fixedly coupled to the ultrasonic blade **286** or to the outer tube **282** and are not user deployable. An air gap **320** between the bottom surface **322** of the ultrasonic blade **286** and the fixed protective sheaths **358**, **364**, **370**, **376** provides a space for irrigation fluid to pass therebetween to dissipate thermal energy generated by the ultrasonic blade **286** while cutting. In the embodiments illustrated in FIGS. **32-35**, the fixedly mounted protective sheaths 358, 364, 370, 376 each comprise the proximal partially circumferentially extending portion **310** that overlaps and fixedly engages the outer tube **282**. As previously discussed, the proximal partially circumferentially extending portion **310** comprises multiple projections **318** to engage the apertures **316** formed in the outer tube **282** and thus the protective sheaths **358**, **364**, **370**, **376** are fixedly secured within the outer tube **282**. The alternative embodiments, the fixed protective sheaths **358**, **364**, **370**, **376** may be attached to an inner tube positioned within the outer tube **282**. The fixed protective sheaths **358**, **364**, **370**, **376** each comprise a distal portion comprising respective tapered bodies 384, 388, 392, 398 that extend longitudinally beyond the distal portion of the ultrasonic blade 286 to protect the distal cutting edge **324** of the ultrasonic blade **286**. In other embodiments, the tapered bodies **384**, **388**, **392**, **398** may extend laterally to protect longitudinal portions of the ultrasonic blade **286**. The fixed protective sheaths **358**, **364**, **370**, **376** each comprise respective substantially planar sheet portions **359**, **365**, **371**, **377** extending longitudinally between the distal tapered bodies **384**, **388**, **392**, **398** and the proximal partially circumferentially extending portion 310 to shield the bottom surface 322 of the ultrasonic blade **286**. The protective sheaths **358**, **364**, **370**, **376** may be formed of any polymeric material as previously discussed with respect to FIGS. **22-25**.

- (143) As shown in FIG. **32**, the fixed protective sheath **358** comprises the tapered body **360** at a distal end that extends longitudinally beyond the distal end of the ultrasonic blade **286**. The tapered body **360** comprises a substantially planar top surface **362** and a substantially planar bottom surface **382** that taper from a proximate end to a blunt distal end **384**.
- (144) As shown in FIG. **33**, the fixed protective sheath **364** comprises the tapered body **366** at a distal end that extends longitudinally beyond the distal end of the ultrasonic blade **286**. The tapered body **366** comprises a substantially planar top surface **368** and a substantially planar bottom surface **386** that taper from a proximate end to a blunt distal end **388**. The substantially planar top and bottom surfaces **368**, **386** have corresponding radiused contoured surfaces that meet the blunt surface **388**.
- (145) As shown in FIG. **34**, the fixed protective sheath **370** comprises the tapered body **378** at a distal end that extends longitudinally beyond the distal end of the ultrasonic blade **286**. The tapered body **378** comprises a curved top surface **374** and a curved bottom surface **390** that taper from a proximate end to a sharp distal end **392**.
- (146) As shown in FIG. **35**, the fixed protective sheath **376** comprises the tapered body **378** at a distal end that extends longitudinally beyond the distal end of the ultrasonic blade **286**. The tapered body **378** comprises a substantially planar top surface **396** and a substantially curved bottom surface **394** that taper from a proximate end to a sharp distal end **398**.
- (147) FIGS. **36-37** are cross-sectional views of one embodiment of an ultrasonic surgical instrument **400** taken along the longitudinal axis. The ultrasonic surgical instrument **400** may be employed with the ultrasonic system **10**. The ultrasonic surgical instrument **400** comprises a deployable protective sheath **402**. In one embodiment, the deployable protective sheath **402** may be deployed by a user during a surgical procedure. Deployable means that the deployable protective sheath **402** may be advanced to a distal end in the direction indicated by arrow **404** to be put into use and may be retracted to a proximate end in the direction indicated by arrow **406** when it is to be taken out of use. The deployable protective sheath **402** comprises a distal portion **401** that substantially shields the bottom surface **322** of the ultrasonic blade **286** when it is deployed. The

deployable protective sheath **402** comprises a proximate portion **403** that extends to the handpiece assembly (e.g., the handpiece assembly **60** shown in FIG. **1**) where it is coupled to a protective sheath deploying and retracting mechanism. The distal portion **401** may be formed slightly thicker then the proximal portion **403**. The deployable protective sheath **402** may be formed of any polymeric material as previously discussed with respect to FIGS. 22-25. In one embodiment, the proximal portion 403 may be formed of the same material as the distal portion 401 of the deployable protective sheath **402**. In other embodiments, the proximal portion **403** may be formed of a different more durable material than the distal portion **401** of the deployable protective sheath **402** to withstand repeated deployments and retractions. For example, the proximal portion **403** may be formed of metal or other durable material to withstand the moderate forces required to hold the deployable protective sheath **402** in place during deployment, retraction, and use. (148) The ultrasonic surgical instrument **400** comprises the outer tube **282** that extends from the handpiece assembly **456**. The outer tube **282** has a substantially circular cross-section and a longitudinal opening or aperture **302** to receive the inner tube **312**. Located at the distal end of the ultrasonic surgical instrument **350** is an end effector **304** for performing various tasks, such as, for example, grasping tissue, cutting tissue and the like. It is contemplated that the end effector 304 may be formed in any suitable configuration. The end effector **304** comprises the non-vibrating clamp arm assembly **284**, an ultrasonic blade **286**, and the deployable protective sheath **402**. The clamp arm assembly **284** is preferably pivotally attached to the distal end of the outer tube **282** at the pivot point **290**. The clamp arm assembly **284** comprises a tissue pad **300**. As previously discussed, the ultrasonic blade 286 may be coupled to the ultrasonic transmission waveguide 104 or may be formed as a unitary piece therewith.

(149) When the deployable protective sheath **402** is advanced in the direction indicated by arrow **404**, it is generally well suited for glidingly engaging the surface of the bone to prevent damage to the bone while the ultrasonic blade **286** removes muscle tissue from the bone and to dissipate thermal energy generated by the ultrasonic blade **286** while cutting. The deployable protective sheath **402** also is well suited to shield the bottom surface of the blade **322** from contact with other objects. The deployable protective sheath **402** may be retracted in the direction indicated by arrow **406** when it is not needed. When the deployable protective sheath **402** is deployed, the air gap **320** between the bottom surface **322** of the ultrasonic blade **286** and the protective sheath **402** provides a space for irrigation fluid to pass therebetween to dissipate thermal energy generated by the ultrasonic blade **286** while cutting. In one embodiment, the deployable protective sheath **402** may retract within the inner tube **312**.

(150) FIGS. **38-39** are cross-sectional views of one embodiment of an ultrasonic surgical instrument **410** taken along the longitudinal axis. The ultrasonic surgical instrument **410** comprises a deployable protective sheath **412**. In one embodiment, the deployable protective sheath **412** may be deployed by a user during a surgical procedure. Deployable means that the deployable protective sheath 412 may be advanced to a distal end in the direction indicated by arrow 404 to be put in use and may be retracted to a proximate end in the direction indicated by arrow **406** to be put out of use. The deployable protective sheath **402** comprises a distal portion **407** that substantially covers the bottom surface **418** of the ultrasonic blade **414** when it is deployed. The deployable protective sheath **412** comprises a proximate portion **405** that extends to a handpiece assembly (e.g., the handpiece assembly **60** shown in FIG. **1**) where it is coupled to a protective sheath deploying and retracting mechanism. The distal portion **407** may be formed slightly thicker then the proximal portion **405**. The distal portion comprises a vertically extending projection **420** to protect the cutting edge **416** of the ultrasonic blade **414**. The projection **420** is adapted to engage and compress the bottom surface of the ultrasonic blade **414** when it is retracted. The deployable protective sheath 402 may be formed of any polymeric material as previously discussed with respect to FIGS. **22-25**. In one embodiment, the proximal portion **405** may be formed of the same material as the distal portion **407** of the deployable protective sheath **412**. In other embodiments,

the proximal portion **405** may be formed of a different more durable material than the distal portion **407** of the deployable protective sheath **412** to withstand repeated deployments and retractions. For example, the proximal portion **405** of the deployable protective sheath **412** may be formed of metal or other durable material to withstand the moderate forces required to hold the deployable protective sheath **412** in place during deployment, retraction, and use.

- (151) The ultrasonic surgical instrument **410** comprises the outer tube **282** that extends from the handpiece assembly **456**. The outer tube **282** has a substantially circular cross-section and a longitudinal opening or aperture **302** to receive the inner tube **312**. Located at the distal end of the ultrasonic surgical instrument **350** is an end effector **304** for performing various tasks, such as, for example, grasping tissue, cutting tissue and the like. It is contemplated that the end effector **304** may be formed in any suitable configuration. The end effector **304** comprises the non-vibrating clamp arm assembly **284**, an ultrasonic blade **414** with a distal chisel-shaped cutting edge **416**, and the deployable protective sheath **412**. The clamp arm assembly **284** is preferably pivotally attached to the distal end of the outer tube **282** at the pivot point **290**. The clamp arm assembly **284** comprises a tissue pad **300**. As previously discussed, the ultrasonic blade **286** may be coupled to the ultrasonic transmission waveguide **104** or may be formed as a unitary piece therewith. (152) When the deployable protective sheath **412** is advanced in the direction indicated by arrow **404**, it is generally well suited for gliding along the surface of the bone to prevent damage to the bone while the ultrasonic blade **414** removes muscle tissue from the bone. The deployable protective sheath **412** may be retracted in the direction indicated by arrow **406** when it is not needed. When the deployable protective sheath **412** is deployed, the air gap **320** between the bottom surface **418** of the ultrasonic blade **414** and the protective deployable sheath **412** provides a space for irrigation fluid to pass therebetween. The protective deployable sheath **412** retracts inside the inner tube **312**.
- (153) FIG. **40** is cross-sectional view of one embodiment of an ultrasonic surgical instrument **430** taken along the longitudinal axis. The ultrasonic surgical instrument **430** may be employed with the ultrasonic system **10**. The ultrasonic surgical instrument **430** comprises a fixedly attached protective sheath **432**. As previously discussed, fixedly attached means that the protective sheath is not deployable and remains in the position shown in FIG. **40** for the usable life of the instrument **430**. As shown in FIG. **40**, the ultrasonic surgical instrument **430** comprises the outer tube **282** that extends from the handpiece assembly **456**. The outer tube **282** has a substantially circular cross-section and a longitudinal opening or aperture **302** to receive the inner tube **312**. Located at the distal end of the ultrasonic surgical instrument **350** is an end effector **304** for performing various tasks, such as, for example, grasping tissue, cutting tissue and the like. It is contemplated that the end effector **304** may be formed in any suitable configuration.
- (154) The end effector **304** comprises the non-vibrating clamp arm assembly **284**, an ultrasonic blade **286**, and a protective sheath **432**. The clamp arm assembly **284** is preferably pivotally attached to the distal end of the outer tube **282** at the pivot points **290**A, B. The clamp arm assembly **284** comprises a tissue pad **300**. As previously discussed, the ultrasonic blade **286** may be coupled to the ultrasonic transmission waveguide **104** or may be formed as a unitary piece therewith.
- (155) The protective sheath **432** is generally well suited for glidingly engaging the surface of the bone to prevent damage to the bone while the ultrasonic blade **286** removes muscle tissue from the bone and to dissipate thermal energy generated by the ultrasonic blade **286** while cutting. The protective sheath **432** is also well suited to shield the bottom surface **322** of the blade **286**. The protective sheath **432** may be fixedly coupled to the ultrasonic blade **286** or to the outer tube **282** by way of projections **318** (FIGS. **27-31**) and apertures **316** and is not user deployable. An air gap **320** between the bottom surface **322** of the ultrasonic blade **286** and the fixed protective sheath **432** provides a space for irrigation fluid to pass therebetween to dissipate thermal energy generated by the ultrasonic blade **286** while cutting. The fixed protective sheath **432** comprises the proximal

partially circumferentially extending portion 310 that overlaps and fixedly engages the outer tube 282. As previously discussed, the proximal partially circumferentially extending portion 310 comprises the multiple projections 318 to engage the apertures 316 formed in the outer tube 282. The fixed protective sheath 432 is attached to the outer tube 282. The fixed protective sheath 432 comprises discrete projections or bumps 434 formed on a top surface 436 thereof. There may be one or multiple bumps 434 formed on the top surface 436 of the protective sheath 432. The bumps 434 decrease the contact surface area between the ultrasonic blade 286 and the protective sheath 432, which may occur during a procedure when the protective sheath is used as a fulcrum. This may reduce the heat or thermal energy generated by the ultrasonic blade 286 and the load on the ultrasonic blade 286. The protective sheath 432 may be formed of any polymeric material as previously discussed with respect to FIGS. 22-25.

- (156) FIGS. **41-43** illustrate one embodiment of an ultrasonic system **400**. FIG. **41** is a side view of the ultrasonic system **400**. One embodiment of the ultrasonic system **400** comprises the ultrasonic signal generator 12 coupled to the ultrasonic transducer 14, a hand piece housing 452, and an end effector **304** (shown in FIG. **27**) forming an ultrasonic instrument **456**. The ultrasonic instrument **456** comprises a curved lever member **454** coupled to the protective sheath **402** to move the protective sheath **402** axially. The ultrasonic instrument **456** also comprises a slideable member **458**B coupled to the inner tube **312**. The slideable member **458**B moves axially within a slot that defines walls **460**B formed in the hand piece housing **452** to actuate the end effector **304**. (157) FIG. **42** is a cross-sectional side view of the ultrasonic system **456** shown in FIG. **41** and a cross-sectional view of various tube assemblies to couple the hand piece housing **452** with an end effector. As shown in FIG. **42**, the curved lever member **454** is pivotally mounted to the hand piece housing **452** at pivot point **462** such that it can rotate in the direction indicated by arrows **463**A, B. Link members **464**A and **464**B (not shown) are pivotally coupled at a proximate end to pivot points **466**A and **466**B (not shown) and at a distal end to pivot points **468**A and **468**B (not shown). When the curved lever member **454** is rotated about the pivot point **462** in the direction indicated by arrow **463**A the sheath **402** moves axially in the direction indicated by arrow **465**A in its deployed position. When the curved lever member **454** is moved in the direction indicated by arrow **463**B the sheath **402** moves axially in the direction indicated by arrow **465**B n its retracted position. (158) FIG. **43** is a bottom cross-sectional view of the ultrasonic instrument **456** shown in FIG. **41**. As shown in FIG. **43**, the slideable members **458**A, B are held in a locked position by respective springs **472**A, B which engage and compress the slideable members **458**A, B against an interior portion of the hand piece housing 452. The interior portion of the hand piece housing 452 comprises rows of serrated edges **474**A, B formed along inner portions of the walls **460**A, B defined by the slot. Notched members **480**A, B are mounted to flanges formed on the slideable members **458**A, B and are configured to engage the respective serrated edges **474**A, B formed in the respective walls **460**A, B. Bodies **470**A, B are formed integrally with the inner tube **312** or are attached to thereto. When a force is applied in the direction indicated by arrows 476, B against the respective springs **472**A, B, the slideable members **458**A, B can be moved axially as indicated by arrows **478**A, B. Thus the inner tube **312** moves axially to actuate the clamp arm assembly **284** of the end effector **304**.
- (159) In alternative embodiments, the ultrasonic instrument **456** may be adapted and configured such that the curved lever member **454** is coupled to the inner tube **312** and the slideable members **458**A, B are coupled to the protective sheath **402**. Accordingly, rotating the curved lever member **454** moves the inner tube **312** axially to actuate the end effector **304**. And the slideable members **458**A, B can be used to axially deploy and retract the protective sheath **402**.
- (160) FIGS. **44-51** illustrate one embodiment of an ultrasonic system **500**. FIG. **44** is a side view of the ultrasonic instrument **506** with the deployable protective sheath **402** in a stowed or retracted position. FIG. **45** is a top view of the ultrasonic instrument **506** with the deployable protective sheath **402** in the stowed or retracted position taken along line **45-45** in FIG. **44**. FIG. **46** is a side

view of the ultrasonic instrument **506** with the deployable protective sheath **402** in a deployed position. FIG. **47** is a top view of the ultrasonic instrument **506** in the deployed position taken along line **47-47** in FIG. **46**.

(161) With reference to FIGS. **44-47**, one embodiment of the ultrasonic instrument **500** is coupled to an ultrasonic signal generator **12** and comprises an ultrasonic transducer **14**, a hand piece housing **502**, and an end effector **504** forming an ultrasonic instrument **506**. The ultrasonic instrument **506** comprises a slideable member **508** coupled to the deployable protective sheath **402** in any suitable manner as previously discussed. The slideable member 508 moves axially within a slot **510** formed in the hand piece housing **502** to actuate or deploy/retract the deployable protective sheath **402**. The slideable member **508** is shown in the deployable protective sheath **402** retracted or stowed position. When the slideable member **508** moves axially in the direction indicated by arrow **514** the deployable protective sheath **402** also moves axially in the same direction to its retracted or stowed position. When the slideable member **508** moves axially in the direction indicated by arrow **516** the deployable protective sheath **402** also moves axially in the same direction to its deployed position. Once deployed, the deployable protective sheath 402 may be locked in place with any suitable locking mechanism. An air gap **518** provides a path for irrigation fluid to cool the ultrasonic blade **512** while cutting. The end effector **504** comprises an ultrasonic blade **512** coupled to the ultrasonic transducer **14** by the ultrasonic transmission waveguide **104** as previously discussed. The fixed outer tube **282** (or sheath) shields the surgeon and the patient from unintended contact with the ultrasonic blade **512** and the ultrasonic transmission waveguide **104**. (162) FIG. **48** is a more detailed side view of the ultrasonic instrument **506** with the deployable protective sheath **402** in a stowed or retracted position. FIG. **49** is a more detailed top view of the ultrasonic instrument **506** with the protective sheath **402** in the stowed or retracted position taken along line **49-49** in FIG. **48**. FIG. **50** is a more detailed side view of the ultrasonic instrument **506** with the deployable protective sheath **402** in a deployed position. FIG. **51** is a more detailed top view of the ultrasonic instrument **506** in the deployed position taken along line **51-51** in FIG. **50**. (163) With reference to FIGS. **44-51**, the deployable protective sheath **402** is user deployable by moving the slideable member 508 in the direction indicated by arrow 516. The distal end of the deployable protective sheath 402 may be formed of any polymeric material as previously discussed with respect to FIGS. **22-25**. The proximal end of the deployable protective sheath **402** may be formed of metal or other durable material to withstand the moderate forces required to hold the deployable protective sheath **402** in place during deployment, retraction, and use. (164) FIG. **50** shows the deployable protective sheath **402** in the deployed position in a substantially relaxed state as indicated by the air gap **518** between the deployable protective sheath **402** and the ultrasonic blade **512**. Thus, in a stress free state, the deployable protective sheath **402** does not contact the ultrasonic blade **512**. When the deployable protective sheath **402** is used as a fulcrum, however, it may contact the ultrasonic blade **512** for some period of time. However, when the pressure is released on the ultrasonic instrument **500**, the deployable protective sheath **402** is sufficiently resilient to return to its initial position, thus restoring the air gap 518 between the protective sheath **412** and the ultrasonic blade **512**. If needed, a separate spring may be added to the deployable protective sheath **402** to ensure that it no longer contacts the ultrasonic blade **512** once the pressure is released. In the illustrated embodiment, the deployable protective sheath **402** is shown to be smaller than the outline of the ultrasonic blade **512**. This enables the user to cut tissue with the distal tip and both edges of the ultrasonic blade **512** when the deployable protective sheath **402** is deployed. In alternate embodiments, the deployable protective sheath **402** may also cover some or all of the three edges of the ultrasonic blade **512**. (165) FIGS. **52-55** illustrate one embodiment of an ultrasonic surgical instrument **550** comprising

an end effector **552**. The ultrasonic surgical instrument may be employed with the ultrasonic system **10**. FIG. **52** is a top perspective view of one embodiment of the ultrasonic surgical

instrument **550**. FIG. **53** is a partial cross-sectional view of the ultrasonic surgical instrument **550** 

shown in FIG. **52** taken along the longitudinal axis of the ultrasonic surgical instrument **550**. FIG. **54** is a cross-sectional view of the ultrasonic surgical instrument **550** taken along lines **54-54** shown in FIG. **53**. FIG. **55** is a top view of the ultrasonic surgical instrument **550**.

(166) With reference now to FIGS. **52-55**, the ultrasonic surgical instrument **550** comprises an outer member or outer tube **282** that extends from the handpiece assembly **60** or **456** (FIG. **1** or FIGS. **41-44**). The outer tube **282** has a substantially circular cross-section and a longitudinal opening or aperture 302 to receive an inner member or an inner tube 312. The outer tube 282 has a substantially circular cross-section and may be fabricated from stainless steel. It will be recognized that the outer tube **282** may be constructed from any suitable material and may have any suitable cross-sectional shape. Located at the distal end of the ultrasonic surgical instrument **550** is an end effector **552** for performing various tasks, such as, for example, grasping tissue, cutting tissue and the like. It is contemplated that the end effector **304** may be formed in any suitable configuration. (167) The end effector **552** comprises a non-vibrating clamp arm assembly **284**, an ultrasonic blade **286**, and a protective sheath **554**. The end effector **552** is illustrated in a clamp open position and operates in a manner discussed above. The clamp arm assembly **284** comprises a tissue pad **300**. The non-vibrating clamp arm assembly **284** is to grip tissue or compress tissue against the ultrasonic blade **286**, for example. The protective sheath **552** defines a chamber **556** in fluid communication with irrigation channels or tubes **558**A, B to receive irrigation fluid from the irrigation channels **558**A, B. The irrigation channels **558**A, B couple to conventional irrigation devices by way of ports **560**A, B (not shown) at the proximate end of the ultrasonic instrument **550**. The irrigation channels **558**A, B deliver irrigation fluid to the chamber **556** to dissipate thermal energy generated by the ultrasonic blade **286** while cutting and carrying away pieces cut bone and tissue. Irrigation may be controlled manually by way of a control button on the handpiece or automatically wherein each time the ultrasonic instrument **550** is powered on a irrigation fluid release cam may be activated to release the irrigation fluid.

(168) The ultrasonic blade **286** is generally well-suited for cutting, coagulating, and reshaping tissue. In one embodiment the ultrasonic blade **286** may be configured as an ultrasonic surgical elevator blade generally well-suited to separate muscle tissue from bone. Nevertheless, the ultrasonic blade **286** may be employed in various other therapeutic procedures. The ultrasonic blade **286** comprises a cutting edge **324** at a distal portion and may comprise cutting edges extending longitudinally along the sides of the ultrasonic blade **286**. The ultrasonic blade **286** comprises a bottom surface **322** adjacent to the protective sheath **554**. The ultrasonic blade **286** may be coupled to the ultrasonic transmission waveguide **104** or may be formed as a unitary piece therewith.

(169) The protective sheath 554 is generally well suited for glidingly engaging the surface of the bone to prevent damage to the bone while the ultrasonic blade 286 removes muscle tissue from the bone and to dissipate thermal energy generated by the ultrasonic blade 286 while cutting. The protective sheath 554 may be fixedly coupled to the ultrasonic instrument 550 or may be user deployable. In the illustrated embodiment, the protective sheath 550 is fixedly mounted to the outer tube 282 as previously discussed. The protective sheath 288 comprises the proximal partially circumferentially extending portion 310 that overlaps and fixedly engages the outer tube 282. As previously discussed, the proximal partially circumferentially extending portion 310 comprises multiple projections to engage the apertures 316 formed in the outer tube 282. When fixedly attached, the protective sheath 554 may be attached to the outer tube 282. When the protective sheath 554 is deployed, it may be attached to an inner tube received within the inner tube 312 that is slidingly engaged to a deployment mechanism on the handpiece portion of the ultrasonic instrument 550 as previously discussed. The protective sheath 554 comprises a bottom surface 560 to slidingly engage bone. The protective sheath 554 may be formed of any polymeric material as previously discussed with respect to FIGS. 22-25.

(170) The devices disclosed herein can be designed to be disposed of after a single use, or they can

be designed to be used multiple times. In either case, however, the device can be reconditioned for reuse after at least one use. Reconditioning can include any combination of the steps of disassembly of the device, followed by cleaning or replacement of particular pieces, and subsequent reassembly. In particular, the device can be disassembled, and any number of the particular pieces or parts of the device can be selectively replaced or removed in any combination. Upon cleaning and/or replacement of particular parts, the device can be reassembled for subsequent use either at a reconditioning facility, or by a surgical team immediately prior to a surgical procedure. Those skilled in the art will appreciate that reconditioning of a device can utilize a variety of techniques for disassembly, cleaning/replacement, and reassembly. Use of such techniques, and the resulting reconditioned device, are all within the scope of the present application.

- (171) Preferably, the various embodiments described herein will be processed before surgery. First, a new or used instrument is obtained and if necessary cleaned. The instrument can then be sterilized. In one sterilization technique, the instrument is placed in a closed and sealed container, such as a plastic or TYVEK bag. The container and instrument are then placed in a field of radiation that can penetrate the container, such as gamma radiation, x-rays, or high-energy electrons. The radiation kills bacteria on the instrument and in the container. The sterilized instrument can then be stored in the sterile container. The sealed container keeps the instrument sterile until it is opened in the medical facility.
- (172) It is preferred that the device is sterilized. This can be done by any number of ways known to those skilled in the art including beta or gamma radiation, ethylene oxide, steam.
- (173) Although various embodiments have been described herein, many modifications and variations to those embodiments may be implemented. For example, different types of end effectors may be employed. Also, where materials are disclosed for certain components, other materials may be used. The foregoing description and following claims are intended to cover all such modification and variations.
- (174) Any patent, publication, or other disclosure material, in whole or in part, that is said to be incorporated by reference herein is incorporated herein only to the extent that the incorporated materials does not conflict with existing definitions, statements, or other disclosure material set forth in this disclosure. As such, and to the extent necessary, the disclosure as explicitly set forth herein supersedes any conflicting material incorporated herein by reference. Any material, or portion thereof, that is said to be incorporated by reference herein, but which conflicts with existing definitions, statements, or other disclosure material set forth herein will only be incorporated to the extent that no conflict arises between that incorporated material and the existing disclosure material.

## **Claims**

1. An ultrasonic surgical system, comprising: a housing assembly; a shaft assembly extending from the housing assembly, wherein the shaft assembly comprises: an outer tube; and an inner tube movable relative to the outer tube; an ultrasonic waveguide extending through the shaft assembly; an end effector, comprising: an ultrasonic blade extending from the ultrasonic waveguide; and a clamp arm moveable relative to the ultrasonic blade between an open position and a closed position, wherein the clamp arm is movable based on movement of the inner tube relative to the outer tube; and a protective sheath configured to shield a portion of the ultrasonic blade, wherein the protective sheath is moveable between a retracted position and a deployed position; wherein the housing assembly comprises: a housing; a lever operably coupled to the housing and the protective sheath, wherein the protective sheath is movable between the retracted position and the deployed position based on movement of the lever relative to the housing; and an actuator operably coupled to the inner tube, wherein the actuator is moveable between a first position and a second position,

and wherein the clamp arm is configured to move toward the closed position based on movement of the actuator toward the second position.

- 2. The ultrasonic surgical system of claim 1, wherein the housing assembly defines a slot, and wherein the actuator is movable within the slot.
- 3. The ultrasonic surgical system of claim 1, wherein the housing comprises serrated edges, wherein the actuator comprises a notched member, and wherein the actuator is prevented from moving between the first position and the second position based on the notched member engaging the serrated edges.
- 4. The ultrasonic surgical system of claim 3, wherein the housing assembly further comprises a spring configured to bias the notched member into engagement with the serrated edges.
- 5. The ultrasonic surgical system of claim 1, wherein the housing assembly further comprises a link pivotably coupled to the lever and the protective sheath.
- 6. The ultrasonic surgical system of claim 1, wherein the protective sheath is configured to move toward the retracted position based on movement of the lever toward the housing.
- 7. The ultrasonic surgical system of claim 1, wherein the actuator is slidable between the first position and the second position.
- 8. An ultrasonic surgical system, comprising: a housing assembly; a shaft assembly extending from the housing assembly, wherein the shaft assembly comprises: an outer tube; and an inner tube movable relative to the outer tube; an ultrasonic waveguide extending through the shaft assembly; an end effector, comprising: an ultrasonic blade extending from the ultrasonic waveguide; and a clamp arm pivotable relative to the ultrasonic blade between an open position and a closed position, wherein the clamp arm is movable based on movement of the inner tube relative to the outer tube; and wherein the housing assembly comprises: a housing, defining: a first slot on a first lateral side thereof; and a second slot of a second lateral side thereof; a first actuator operably coupled to the inner tube, wherein the first actuator is axially moveable through the first slot; and a second actuator operably coupled to the inner tube, wherein the second actuator is axially moveable through the second slot, and wherein the clamp arm is configured to move between the open position and the closed position based on cooperative movement of the first actuator and the second actuator through the first slot and the second slot, respectively.
- 9. The ultrasonic surgical system of claim 8, wherein each of the first actuator and the second actuator are moveable between a locked configuration and an unlocked configuration.
- 10. The ultrasonic surgical system of claim 9, wherein the inner tube defines a longitudinal axis, and wherein the first actuator and the second actuator are moveable toward their respective unlocked configurations based on movement of the first actuator and the second actuator toward the longitudinal axis.
- 11. The ultrasonic surgical system of claim 10, wherein the housing assembly further comprises: a first spring configured to bias the first actuator toward a first locked configuration; and a second spring configured to bias the second actuator toward a second locked configuration.
- 12. The ultrasonic surgical system of claim 11, wherein the housing comprises: first serrated edges, wherein the first actuator comprises a first member, and wherein the first member is configured to engage the first serrated edges based on the first actuator being in the first locked configuration; and second serrated edges, wherein the second actuator comprises a second member, and wherein the second member is configured to engage the second serrated edges based on the second actuator being in the second locked configuration.
- 13. The ultrasonic surgical system of claim 8, further comprising a protective sheath configured to shield a portion of the ultrasonic blade, wherein the protective sheath is moveable between a retracted position and a deployed position.
- 14. The ultrasonic surgical system of claim 13, wherein the housing assembly further comprises a lever operably coupled to the housing and the protective sheath, and wherein the protective sheath is movable between the retracted position and the deployed position based on pivotable movement

of the lever relative to the housing.

- 15. An ultrasonic surgical system, comprising: a housing assembly; a shaft assembly extending from the housing assembly, wherein the shaft assembly comprises: an outer tube; and an inner tube movable relative to the outer tube, wherein the inner tube defines a longitudinal axis; an ultrasonic waveguide extending through the shaft assembly; an end effector, comprising: an ultrasonic blade extending from the ultrasonic waveguide; and a clamp arm moveable relative to the ultrasonic blade between an open position and a closed position, wherein the clamp arm is movable based on movement of the inner tube relative to the outer tube; and a protective sheath configured to shield a portion of the ultrasonic blade, wherein the protective sheath is moveable between a retracted position and a deployed position; wherein the housing assembly comprises: a housing; a lever operably pivotably to the housing, wherein pivotable movement of the lever is configured to effect a first action of the ultrasonic surgical system; and a actuator, wherein axial movement of the actuator along the longitudinal axis is configured to effect a second action of the ultrasonic surgical system, and wherein the actuator is prevented from effecting the second action of the ultrasonic surgical system absent a force being applied to the actuator in a direction toward the longitudinal axis.
- 16. The ultrasonic surgical system of claim 15, wherein: the housing comprises serrated edges; the actuator comprises a member; and engagement of the member with the serrated edges prevents the actuator from axially moving along the longitudinal axis between a first position and a second position.
- 17. The ultrasonic surgical system of claim 16, wherein the housing assembly further comprises a spring configured to bias the member into engagement with the serrated edges absent the force. 18. The ultrasonic surgical system of claim 15, wherein: the first action of the ultrasonic surgical system comprises moving the protective sheath between the retracted position and the deployed position; and the second action of the ultrasonic surgical system comprises moving the clamp arm between the open position and the closed position.
- 19. The ultrasonic surgical system of claim 15, wherein: the first action of the ultrasonic surgical system comprises moving the clamp arm between the open position and the closed position; and the second action of the ultrasonic surgical system comprises moving the protective sheath between the retracted position and the deployed position.
