# Map-based graphical user interface for ephemeral social media content

#### Abstract

A social media platform provides a map-based graphical user interface (GUI) with multiple geographically anchored icons that are selectable to trigger playback of respective galleries of ephemeral messages. Each of the plurality of location-based ephemeral galleries comprises media content contributed by multiple different users. The ephemeral galleries are compiled based on geotag data associated with respective ephemeral messages submitted by multiple users to be publicly viewable via the map-based GUI.

Inventors: Amitay; Daniel (New York City, NY), Brody; Jonathan (Marina del Rey, CA),

Johnson; Jeffrey Arthur (Brooklyn, NY), Lin; Andrew (Long Island City, NY), Lin; Walton (New York, NY), Rauser; John (Seattle, WA), Spiegel; Evan (Los

Angeles, CA)

**Applicant: Snap Inc.** (Santa Monica, CA)

Family ID: 1000008762369

Assignee: Snap Inc. (Santa Monica, CA)

Appl. No.: 17/131598

Filed: December 22, 2020

# **Background/Summary**

PRIORITY APPLICATIONS (1) This application is a continuation of U.S. patent application Ser. No. 15/965,361, filed Apr. 27, 2018, which claims the benefit of priority to U.S. Provisional Application Ser. No. 62/491,115, filed Apr. 27, 2017, U.S. Provisional Application Ser. No. 62/552,958, filed Aug. 31, 2017, and U.S. Provisional Application Ser. No. 62/556,134, filed Sep. 8, 2017, all of which are incorporated herein by reference in their entireties.

#### **BACKGROUND**

(1) Social media applications implement computer-mediated technologies allowing for the creating and sharing of content that communicates information, ideas, career interests and other forms of expression via virtual communities and networks. Social media platforms use web-based

technologies, desktop computers and mobile technologies (e.g., smartphones and tablet computers) to create highly interactive platforms through which individuals, communities, and organizations can share, co-create, discuss, and modify user-generated content or pre-made content posted online.

- (2) Mobile electronic devices on which end-user social media applications can be executed typically provide geolocation services that determine the geographic location of the mobile electronic device, by extension indicating the geographic location of the associated user. Social media content posted by users is often geo-tagged based on the geolocation of a mobile electronic device (such as a mobile phone) by use of which the social media content is captured and/or posted to the social media platform. In other embodiments, social media content may explicitly be geotagged by a user using a computer device that does not have activated geolocation services and/or that is not a mobile device (such as a desktop personal computer (PC)).
- (3) This disclosure presents various features and functionalities for social media applications using user geolocation data and/or geo-tagged social media content.

## **Description**

#### BRIEF DESCRIPTION OF THE DRAWINGS

- (1) Some aspects of the disclosure are illustrated in the appended drawings. Note that the appended drawings illustrate example embodiments of the present disclosure and cannot be considered as limiting the scope of the disclosure.
- (2) FIG. **1** is a block diagram showing an example social media platform system for exchanging, posting, and/or consuming social media data (e.g., messages and associated content) over a network.
- (3) FIG. **2** is block diagram illustrating further details regarding a social media platform system, according to example embodiments.
- (4) FIG. **3** is a schematic diagram illustrating data which may be stored in a database of a social media platform system, according to certain example embodiments.
- (5) FIG. **4** is a schematic diagram illustrating a structure of a message, according to some embodiments, generated by a social media client application according to an example embodiment.
- (6) FIG. **5** is a schematic diagram illustrating an example access-limiting process, in terms of which access to content (e.g., an ephemeral message, and associated multimedia payload of data) or a content collection (e.g., an ephemeral message gallery or story) may be time-limited (e.g., made ephemeral).
- (7) FIGS. **6**A and **6**B are respective schematic views of a client device providing a map-based graphical user interface (GUI) for a social media application, according to different respective example embodiments.
- (8) FIGS. 7A-7C are respective schematic views of a client device providing a destination selection interface forming part of a map-based graphical user interface for a social media application, according to some example embodiments.
- (9) FIG. **8** is a schematic view of a social media platform system for providing a map-based graphical user interface for a social media application, according to one example embodiment (10) FIG. **9** is a schematic flow chart illustrating an example embodiment of a method of providing a map-based graphical user interface for a social media application, according to an example embodiment.
- (11) FIG. **10** is a block diagram illustrating a representative software architecture, which may be used in conjunction with various hardware architectures herein described.
- (12) FIG. **11** is a block diagram illustrating components of a machine, according to some example embodiments, able to read instructions from a machine-readable medium (e.g., a machine-readable storage medium) and perform any one or more of the methodologies discussed herein.

(13) The headings provided herein are merely for convenience and do not necessarily affect the scope or meaning of the terms used.

#### INTRODUCTION

- (14) One aspect of the disclosure provides a geographical map-based graphical user interface (GUI) for a social media platform or application, to allow user access via the map-based GUI to ephemeral social media content. Such an interface is also referred to herein as a map GUI. (15) As will be described in greater detail below, ephemeral social media content comprises social media items that are available for viewing via the social media application for only a limited period. For example, an ephemeral message (also referred to herein as a snap) submitted by a user to the social media application may be available for viewing by other users via the map GUI of the social media application for only a predefined period subsequent to submission. In one example embodiment, each ephemeral message or snap has an availability lifetime (also referred to herein as a gallery participation timer) of 24 hours after submission, after which the ephemeral message "disappears" and is no longer available for viewing by other users via the map GUI. Such ephemeral messages typically comprise photographic or video content, which may be submitted with or without augmentations made by the user to the underlying photo or video content. (16) Ephemeral messages submitted by multiple different users may be available on a map forming part of the map GUI based at least in part on respective geo-tag information of the ephemeral messages. In some embodiments, the map GUI may provide location-based access to one or more collections or galleries of ephemeral messages (also known as and referred to herein as a "stories"). In some example embodiments, a plurality of ephemeral messages submitted by different users are included in a common geo-anchored gallery or story based at least in part on respective geotagging information of the plurality of ephemeral messages. Such a location-based gallery or story is in some embodiments represented on the map GUI by a respective gallery icon displayed at a corresponding map location, the gallery icon being selectable by the user to trigger automated sequential display of the plurality of ephemeral messages in the gallery on the user device on which the map GUI is rendered.
- (17) In some embodiments, such a map GUI includes representations of at least approximate respective positions of a user's friends in a social network graph accessed by the social media application, with the social media application enabling the user to explore the world around friends' locations by use of the GUI. Thus, the map GUI can in some embodiments enable the user to explore uploaded social media content (e.g., individual photos or video clips/snaps, or social media galleries such as stories comprising respective collections of photos, messages, or snaps). (18) Various aspects of the disclosure will be described below with reference to specific example embodiments. First, platform architecture and a technical background to implementation of the various embodiments will be described with reference to FIGS. 1-5. Thereafter, specific example embodiments are described with reference to FIGS. 6-9. FIGS. 10-11 finally describe aspects of software and hardware components that are in some instances used in the implementation of the described example embodiments.

#### **DETAILED DESCRIPTION**

- (19) A portion of the disclosure of this patent document contains material that is subject to copyright protection. The copyright owner has no objection to the facsimile reproduction by anyone of the patent document or the patent disclosure, as it appears in the Patent and Trademark Office patent files or records, but otherwise reserves all copyright rights whatsoever. The following notice applies to the software and data as described below and in the drawings that form a part of this document: Copyright 2017 SNAP, INC., All Rights Reserved.
- (20) The description that follows includes systems, methods, devices, techniques, instruction sequences, and computing machine program products that embody illustrative embodiments of the disclosure. In the following description, for the purposes of explanation, numerous specific details are set forth in order to provide an understanding of various embodiments of the inventive subject

matter. It will be evident, however, to those skilled in the art, that embodiments of the inventive subject matter may be practiced without these specific details. In general, well-known instruction instances, protocols, structures, and techniques are not necessarily shown in detail.

- (21) System Architecture and Operating Environment
- (22) FIG. **1** is a block diagram showing an example social media platform system **100** for exchanging data (e.g., social media items or messages and associated content) over a network. In this description, items communicated from one user to one or more other users via a social media application or platform, as well as items uploaded or provided by users to a social media application or platform for availability to or consumption by other users via the social media application or platform, are referred to as messages. Thus, the term "messages" as used herein is not limited to communications from one user to specified recipient users, but includes messages made available for public consumption via the relevant social media platform.
- (23) The social media platform system **100** includes multiple client devices **102**, each of which hosts a number of applications including a social media client application **104**. Each social media client application **104** is communicatively coupled to other instances of the social media client application **104** and a social media application server system **108** via a network **106** (e.g., the Internet).
- (24) Accordingly, each social media client application **104** is able to communicate and exchange data with another social media client application **104** and with the social media application server system **108** via the network **106**. The data exchanged between social media client applications **104**, and between a social media client application **104** and the social media application server system **108**, includes functions (e.g., commands to invoke functions) as well as payload data (e.g., text, audio, video, or other multimedia data).
- (25) The social media application server system **108** provides server-side functionality via the network **106** to a particular social media client application **104**. While certain functions of the social media platform system **100** are described herein as being performed by either a social media client application **104** or by the social media application server system **108**, it will be appreciated that the location of certain functionality either within the social media client application **104** or the social media application server system **108** is a design choice. For example, it may be technically preferable to initially deploy certain technology and functionality within the social media application server system **108**, but to later migrate this technology and functionality to the social media client application **104** where a client device **102** has sufficient processing capacity. (26) The social media application server system **108** supports various services and operations that are provided to the social media client application **104**. Such operations include transmitting data to, receiving data from, and processing data generated by the social media client application **104**. This data may include message content, client device information, geolocation information, media annotation and overlays, message content persistence conditions, social network information, and live event information, as examples. Data exchanges within the social media platform system 100 are invoked and controlled through functions available via user interfaces (UIs) of the social media client application **104**.
- (27) Turning now specifically to the social media application server system **108**, an Application Program Interface (API) server **110** is coupled to, and provides a programmatic interface to, an application server **112**. The application server **112** is communicatively coupled to a database server **118**, which facilitates access to a database **120** in which is stored data associated with messages processed by the application server **112**.
- (28) Dealing specifically with the API server **110**, this server **110** receives and transmits message data (e.g., commands and message payloads) between the client device **102** and the application server **112**. Specifically, the API server **110** provides a set of interfaces (e.g., routines and protocols) that can be called or queried by the social media client application **104** in order to invoke functionality of the application server **112**. The API server **110** exposes various functions supported

- by the application server 112, including account registration; login functionality; the sending of messages, via the application server 112, from a particular social media client application 104 to another social media client application 104; the sending of media files (e.g., images or video) from a social media client application 104 to the social media server application 114, and for possible access by another social media client application 104; the setting of a collection of media data (e.g., a story or gallery); the retrieval of a list of friends of a user of a client device 102; the retrieval of such collections; the retrieval of messages and content; the adding and deletion of friends to a social graph; the location of friends within a social graph; and opening an application event (e.g., relating to the social media client application 104).
- (29) The application server **112** hosts a number of applications and subsystems, including a social media server application **114**, an image processing system **116**, and a social network system **122**. The social media server application **114** implements a number of message processing technologies and functions particularly related to the aggregation and other processing of content (e.g., textual and multimedia content) included in messages received from multiple instances of the social media client application **104**. As will be described in further detail, the text and media content from multiple sources may be aggregated into collections of content (e.g., called stories or galleries). These collections are then made available, by the social media server application **114**, to the social media client application **104**. Other processor and memory intensive processing of data may also be performed server-side by the social media server application **114**, in view of the hardware requirements for such processing.
- (30) The application server **112** also includes an image processing system **116** that is dedicated to performing various image processing operations, typically with respect to images or video received within the payload of a message at the social media server application **114**.
- (31) The social network system 122 supports various social networking functions and services, and makes these functions and services available to the social media server application 114. To this end, the social network system 122 maintains and accesses an entity graph 304 (FIG. 3) within the database 120. Examples of functions and services supported by the social network system 122 include the identification of other users of the social media platform system 100 with whom a particular user has relationships or is "following," and also the identification of other attributes and interests of a particular user. In some embodiments, the social network system 122 includes an identification of other users whose location is available for viewing by a particular user via a map-based GUI displayable on a client device 102 using the corresponding social media client application 104.
- (32) The application server **112** is communicatively coupled to a database server **118**, which facilitates access to a database **120** in which is stored data associated with messages processed by the social media server application **114**.
- (33) FIG. **2** is block diagram illustrating further details regarding the social media platform system **100**, according to example embodiments. Specifically, the social media platform system **100** is shown to comprise the social media client application **104** and the application server **112**, which in turn embody a number of subsystems, namely an ephemeral timer system **202**, a collection management system **204** (also referred to as a gallery management system), and an annotation system **206**.
- (34) The ephemeral timer system **202** is responsible for enforcing the temporary access to content permitted by the social media client application **104** and the social media server application **114**. To this end, the ephemeral timer system **202** incorporates a number of timers that, based on duration and display parameters associated with a message, or collection/gallery of messages (e.g., an INSTAGRAM of SNAPCHAT story), selectively display and enable access to messages and associated content via the social media client application **104**. Further details regarding the operation of the ephemeral timer system **202** are provided below.
- (35) The collection management system **204** is responsible for managing collections of media (e.g.,

collections of text, image video and audio data). In some examples, a collection of content (e.g., messages, including images, video, text, and audio) may be organized into an "event gallery" or an "event story." Such a collection may be made available for a specified time period, such as the duration of an event to which the content relates, or at expiry of a last message or snap in the gallery. For example, content relating to a music concert may be made available as a "story" for the duration of that music concert. The collection management system **204** may also be responsible for publishing an icon that provides notification of the existence of a particular collection to the user interface of the social media client application **104**. As will be described in greater detail with reference to the specific example embodiments that follow, the collection management system **204** may also be responsible for compiling and managing multiple location-based social media galleries based at least in part on geo-tag data of social media items or messages uploaded to the social media platform by multiple users. Other types of collections or galleries that may be provided by the collection management system **204** include: a "place story" that collects ephemeral messages having geo-tag data indicating a location within a predefined associated geographical area; and an ad-hoc story or spike story that is dynamically surfaced on a map GUI as described herein based on underlying location-based social media activity, e.g., based on geo-temporal volume or anomality/unusualness of social media items submitted by users for public consumption (e.g., for inclusion in a "live story" or "our story").

- (36) The collection management system **204** furthermore includes a curation interface **208** that allows a human operator (e.g., a collection manager) to manage and curate a particular collection of content. For example, the curation interface **208** enables an event organizer to curate a collection of content relating to a specific event (e.g., delete inappropriate content or redundant messages). Instead, or in addition, the collection management system **204** employs machine vision (or image recognition technology), geo-tag data, and/or content rules to automatically compile and/or curate a content collection. In certain embodiments, compensation may be paid to a user for inclusion of user generated content into a collection. In such cases, the curation interface **208** operates to automatically make payments to such users for the use of their content.
- (37) The annotation system **206** provides various functions that enable a user to annotate or otherwise augment, modify, or edit media content associated with a message. For example, the annotation system **206** provides functions related to the generation and publishing of media overlays for messages processed by the social media platform system **100**. The annotation system 206 operatively supplies a media overlay (e.g., a SNAPCHAT filter) to the social media client application **104** based on a geolocation of the client device **102**. In another example, the annotation system **206** operatively supplies a media overlay to the social media client application **104** based on other information, such as, social network information of the user of the client device 102. A media overlay may include audio and visual content and visual effects. Examples of audio and visual content include pictures, texts, logos, animations, and sound effects. An example of a visual effect includes color overlaying. The audio and visual content or the visual effects can be applied to a media content item (e.g., a photo) at the client device 102. For example, the media overlay includes text that can be overlaid on top of a photograph generated or taken by the client device **102**. In another example, the media overlay includes an identification of a location overlay (e.g., Venice beach), a name of a live event, or a name of a merchant overlay (e.g., Beach Coffee House). In another example, the annotation system **206** uses the geolocation of the client device **102** to identify a media overlay that includes the name of a merchant at the geolocation of the client device **102**. The media overlay may include other indicia associated with the merchant. The media overlays may be stored in the database **120** and accessed through the database server **118**. (38) In one example embodiment, the annotation system **206** provides a user-based publication platform that enables users to select a geolocation on a map and upload content associated with the selected geolocation. The user may also specify circumstances under which a particular media overlay should be offered to other users. The annotation system **206** generates a media overlay that

includes the uploaded content and associates the uploaded content with the selected geolocation. (39) In another example embodiment, the annotation system **206** provides a merchant-based publication platform that enables merchants to select a particular media overlay associated with a geolocation via a bidding process. For example, the annotation system **206** associates the media overlay of a highest bidding merchant with a corresponding geolocation for a predefined amount of time

- (40) FIG. **3** is a schematic diagram **300** illustrating data which may be stored in the database **120** of the social media application server system **108**, according to certain example embodiments. While the content of the database **120** is shown to comprise a number of tables, it will be appreciated that the data could be stored in other types of data structures (e.g., as an object-oriented database). (41) The database **120** includes message data stored within a message table **314**. An entity table **302** stores entity data, including an entity graph **304**. Entities for which records are maintained within the entity table **302** may include individuals, corporate entities, organizations, objects, places, events, and the like. Regardless of type, any entity regarding which the social media application server system **108** stores data may be a recognized entity. Each entity is provided with a unique identifier, as well as an entity type identifier (not shown).
- (42) The entity graph **304** furthermore stores information regarding relationships and associations between entities. Such relationships may be social, professional (e.g., work at a common corporation or organization) interested-based or activity-based, merely for example.
- (43) The database **120** also stores annotation data, including in the example form of filters, in an annotation table 312. Filters for which data is stored within the annotation table 312 are associated with and applied to videos (for which data is stored in a video table 310) and/or images (for which data is stored in an image table **308**). Filters, in one example, are overlays that are displayed as overlaid on an image or video during presentation to a recipient user. Filters may be of various types, including user-selected filters from a gallery of filters presented to a sending user by the social media client application **104** when the sending user is composing a message. Other types of filters include geolocation filters (also known as geo-filters), which may be presented to a sending user based on geographic location. For example, geolocation filters specific to a neighborhood or special location may be presented within a user interface by the social media client application **104**, based on geolocation information determined by a Global Positioning System (GPS) unit of the client device **102**. Another type of filter is a data filter, which may be selectively presented to a sending user by the social media client application **104**, based on other inputs or information gathered by the client device **102** during the message creation process. Examples of data filters include a current temperature at a specific location, a current speed at which a sending user is traveling, battery life for a client device **102**, or the current time.
- (44) Other annotation data that may be stored within the image table **308** is so-called "lens" data. A "lens" may be a real-time special effect and sound that may be added to an image or a video.
- (45) Yet further annotation data that may be stored within the annotation table **312** is user generated annotations or augmentations provided by the user to overlay an underlying photographic image or video. Such augmentation/annotations can include, for example, text annotations and drawing annotations or augmentations provided by the user, e.g., via a client device touchscreen.
- (46) As mentioned above, the video table **310** stores video data which, in one embodiment, is associated with messages for which records are maintained within the message table **314**. Similarly, the image table **308** stores image data associated with messages for which message data is stored in the entity table **302**. The entity table **302** may associate various annotations from the annotation table **312** with various images and videos stored in the image table **308** and the video table **310**.
- (47) A story table **306** stores data regarding collections of messages and associated image, video, or audio data, which are compiled into a collection (e.g., a SNAPCHAT story or a gallery). The creation of a particular collection may be initiated by a particular user (e.g., each user for which a record is maintained in the entity table **302**). A user may create a "personal story" in the form of a

collection of content that has been created and sent/broadcast by that user. To this end, the user interface of the social media client application **104** may include an icon that is user selectable to enable a sending user to add specific content to his or her personal story. In the context of this description, such messages and stories/galleries are understood to be for private consumption, being limited for viewing via the social media application to particular users identified by the submitting user or to users who are members of a social network of the submitting user. This is to be contrasted with social media items provided for public or non-private consumption via the social media application, not being limited to a user-specific or user-specified subset of all users of the social media application. An example of a publicly viewable collection or gallery is a "live story" or "Our Story."

- (48) As mentioned, a collection may also constitute a "live story," which is a collection of content from multiple users that is created manually, automatically, or using a combination of manual and automatic techniques. For example, a "live story" may constitute a curated stream of usersubmitted content from various locations and events. Users, whose client devices have location services enabled and are at a common location event at a particular time, may, for example, be presented with an option, via a user interface of the social media client application 104, to contribute content to a particular live story. The live story may be identified to the user by the social media client application **104**, based on his or her location. The end result is a "live story" told from a community perspective. In accordance with some example embodiments of this disclosure, a submitting user can submit social media items or messages to a non-specific common live story. Such content is accessible to other users via a map-based graphical user interface, with such social media items or messages being accessible via the map GUI based on a respective location indicated by corresponding geo-tag data, either by forming part of a location-based gallery or story, or by using location-based search mechanisms forming part of the map GUI. (49) A further type of content collection is known as a "location story," which enables a user whose client device **102** is located within a specific geographic location (e.g., on a college or university campus) to contribute to a particular collection. In some embodiments, a contribution to a location story may require a second degree of authentication to verify that the end user belongs to a specific organization or other entity (e.g., is a student on the university campus). In some embodiments of the this disclosure, messages uploaded to a live story or our story generally, without the user specifying a particular location story in which the message is to be included, can automatically or semi-automatically be included in a location story based at least in part on geo-tag data of the message.
- (50) A map tile table **320** stores multiple map tiles that can be used for presenting a map in a map viewport of a map GUI, according to some embodiments of this disclosure. In a particular example embodiment, each map view is composed of 9 or 16 map tiles stitched together. A plurality of sets of map tiles may be maintained for different map zoom levels. In some example embodiments, a superset of map tiles is maintained server-side, being forwarded to a requesting client device **102** for composing a map representation of specific requested areas.
- (51) User location table **326** stores current or most recent user location data for multiple users of the social media application. The user location data may be based on location data received from respective client devices **102** associated with the respective users. Such user location data is, in some example embodiments, used to display, in a map GUI, respective locations of a plurality of users who form part of the social network of the requesting user and/or who have provided permission for the requesting user to view their location. Each such user may be represented on a map forming part of the map GUI by a respective user icon or bitmoji.
- (52) FIG. **4** is a schematic diagram illustrating a structure of a social media item or message **400**, according to some in some embodiments, generated by one instance of the social media client application **104** for communication to a further instance of the social media client application **104** or to the social media server application **114**. The content of a particular message **400** is used to

- populate the message table **314** stored within the database **120**, accessible by the social media server application **114**. Similarly, the content of a message **400** is stored in memory as "in-transit" or "in-flight" data of the client device **102** or the application server **112**. The message **400** is shown to include the following components:
- (53) A message identifier **402**: a unique identifier that identifies the message **400**.
- (54) A message text payload **404**: text, to be generated by a user via a user interface of the client device **102** and included in the message **400**.
- (55) A message image payload **406**: image data, captured by a camera component of a client device **102** or retrieved from memory of a client device **102** and included in the message **400**.
- (56) A message video payload **408**: video data, captured by a camera component or retrieved from a memory component of the client device **102** and included in the message **400**.
- (57) A message audio payload **410**: audio data, captured by a microphone or retrieved from the memory component of the client device **102** and included in the new message **400**.
- (58) A message annotations **412**: annotation data (e.g., filters, stickers or other enhancements) that represents annotations to be applied to message image payload **406**, message video payload **408**, or message audio payload **410** of the message **400**.
- (59) A display duration parameter **414**: parameter value indicating, in seconds, the amount of time for which content of the message (e.g., the message image payload **406**, message video payload **408**, message audio payload **410**) is to be presented or made accessible to a user via the social media client application **104**. The display duration parameter **414** is also referred to herein as a display duration timer.
- (60) A message geolocation parameter **416**: geolocation data or geo-tag data (e.g., latitudinal and longitudinal coordinates) associated with the content payload of the message. Multiple message geolocation parameter **416** values may be included in the payload, with each of these parameter values being associated with content items included in the content (e.g., a specific image into within the message image payload **406** or a specific video in the message video payload **408**).
- (61) A message story identifier **418**: identifier values identifying one or more content collections (e.g., "stories") with which a particular content item in the message image payload **406** of the message **400** is associated. For example, multiple images within the message image payload **406** may each be associated with multiple content collections using identifier values.
- (62) A message tag **420**: each message **400** may be tagged with multiple tags, each of which is indicative of the subject matter of content included in the message payload. For example, where a particular image included in the message image payload **406** depicts an animal (e.g., a lion), a tag value may be included within the message tag **420** that is indicative of the relevant animal. Tag values may be generated manually, based on user input, or may be automatically generated using, for example, image recognition.
- (63) A message sender identifier **422**: an identifier (e.g., a messaging system identifier, email address, or device identifier) indicative of a user of the client device **102** on which the message **400** was generated and from which the message **400** was sent
- (64) A message receiver identifier **424**: an identifier (e.g., a messaging system identifier, email address, or device identifier) indicative of a user of the client device **102** to which the message **400** is addressed.
- (65) The contents (e.g., values) of the various components of message **400** may be pointers to locations in tables within which content data values are stored. For example, an image value in the message image payload **406** may be a pointer to (or address of) a location within an image table **308**. Similarly, values within the message video payload **408** may point to data stored within a video table **310**, values stored within the message annotations **412** may point to data stored in an annotation table **312**, values stored within the message story identifier **418** may point to data stored in a story table **306**, and values stored within the message sender identifier **422** and the message receiver identifier **424** may point to user records stored within an entity table **302**.

- (66) FIG. **5** is a schematic diagram illustrating an access-limiting process **500**, in terms of which access to content (e.g., an ephemeral message **502**, and associated multimedia payload of data) or a content collection (e.g., an ephemeral message story **504**) may be time-limited (e.g., made ephemeral).
- (67) An ephemeral message **502** is shown to be associated with a display duration parameter **506**, the value of which determines an amount of time that the ephemeral message **502** will be displayed to a receiving user of the ephemeral message **502** by the social media client application **104**. In one embodiment, where the social media client application **104** is a SNAPCHAT application client, an ephemeral message **502** is viewable by a receiving user for up to a maximum of 10 seconds, depending on the amount of time that the sending user specifies using the display duration parameter **506**. In some embodiments, the system automatically attaches a default display duration parameter **506** to photographic or still-image messages (e.g., having a default display duration of **5s**). The display duration parameter **506** of video-based messages may automatically correspond to the duration of the underlying video, with an automatically enforced upper limit. Thus, in an example embodiment in which an upper limit of 10 seconds is enforced, a seven second video message will have a display duration parameter of seven seconds.
- (68) The display duration parameter **506** and the message receiver identifier **424** are shown to be inputs to a message timer **512**, which is responsible for determining the amount of time that the ephemeral message **502** is shown to a particular receiving user identified by the message receiver identifier **424**. In particular, the ephemeral message **502** will only be shown to the relevant receiving user for a time period determined by the value of the display duration parameter **506**. The message timer **512** is shown to provide output to a more generalized ephemeral timer system **202**, which is responsible for the overall timing of display of content (e.g., an ephemeral message **502**) to a receiving user.
- (69) The ephemeral message **502** is shown in FIG. **5** to be included within a social media gallery in the form of an ephemeral message story **504** (e.g., a personal SNAPCHAT story or an event story). The ephemeral message story **504** has a story duration parameter **508**, a value of which determines a time-duration for which the ephemeral message story **504** is made available and is accessible to users of the social media platform system **100**. The story duration parameter **508**, for example, may be the duration of a music concert, where the ephemeral message story **504** is a collection of content pertaining to that concert. Alternatively, a user (either the owning user or a curator user) may specify the value for the story duration parameter **508** when performing the setup and creation of the ephemeral message story **504**. In some embodiments, the story duration parameter **508** is determined based at least in part on the respective story participation parameters **510** (or lifetimes) for one or more of the ephemeral messages **502** forming part of the particular story **504**. In one example embodiment, the story duration parameter **508** corresponds to a story participation parameter **510** or lifetime of the last-posted one of the ephemeral messages **502** in the relevant ephemeral message story **504**. In such case, the story **504** expires (e.g., by becoming unavailable for viewing via the social media platform) when the last-posted message 502 therein expires (e.g., when a story participation parameter **510** or timer of the last message **502** expires).
- (70) As alluded to above, each ephemeral message **502** within the ephemeral message story **504** has an associated story participation parameter **510** (also referred to herein as a gallery participation parameter or a gallery participation timer), a value of which determines the duration of time for which the ephemeral message **502** will be accessible within the context of the ephemeral message story **504**. Accordingly, a particular ephemeral message **502** may "expire" and become inaccessible within the context of the ephemeral message story **504**, prior to the ephemeral message story **504** itself expiring in terms of the story duration parameter **508**. The story duration parameter **508**, story participation parameter **510**, and message receiver identifier **424** each provide input to a story timer **514**, which operationally determines, firstly, whether a particular ephemeral message **502** of the ephemeral message story **504** will be displayed to a particular receiving user and, if so, for how

long. Note that the ephemeral message story **504** is also aware of the identity of the particular receiving user as a result of the message receiver identifier **424**.

- (71) Accordingly, the story timer **514** in some embodiments operationally controls the overall lifespan of an associated ephemeral message story **504**, as well as an individual ephemeral message **502** included in the ephemeral message story **504**. In one embodiment, each and every ephemeral message **502** within the ephemeral message story **504** remains viewable and accessible for a time-period specified by the story duration parameter **508**. In a further embodiment, a certain ephemeral message **502** may expire, within the context of ephemeral message story **504**, based on a story participation parameter **510**. Note that a respective display duration parameter **506** may still determine the duration of time for which a particular ephemeral message **502** is displayed to a receiving user upon replay of the message **502**, even within the context of the ephemeral message story **504**. Accordingly, the display duration parameter **506** determines the duration of time that a particular ephemeral message **502** is displayed to a receiving user, regardless of whether the receiving user is viewing that ephemeral message **502** inside or outside the context of an ephemeral message story **504**.
- (72) The ephemeral timer system **202** may furthermore operationally remove a particular ephemeral message **502** from the ephemeral message story **504** based on a determination that it has exceeded an associated story participation parameter **510**. For example, when a sending user has established a story participation parameter **510** of 24 hours from posting, the ephemeral timer system **202** will remove the relevant ephemeral message **502** from the ephemeral message story **504** after the specified 24 hours. The ephemeral timer system **202** also operates to remove an ephemeral message story **504** either when the story participation parameter **510** for each and every ephemeral message 502 within the ephemeral message story 504 has expired, or when the ephemeral message story **504** itself has expired in terms of the story duration parameter **508**. Note that in this disclosure, at least some ephemeral messages 502 may be submitted by the user to the social media application for general or public viewing via the map GUI, without being included by the user any particular event gallery and without being included in any location-based gallery represented by a respective gallery icon on the map GUI. In some embodiments, such messages **502** also have respective story participation parameters **510** for which the messages **502** are accessible via the map GUI as part of a collective Live Story or Our Story, as described with reference to specific example embodiments below. In a particular example embodiment, each ephemeral message **502** thus submitted for public or non-private view has a default gallery timer parameter or story participation parameter **510** of 24 hours. Such ephemeral messages **502** are thus viewable via the map GUI for only 24 hours after submission.
- (73) In certain use cases, a creator of a particular ephemeral message story **504** may specify an indefinite story duration parameter **508**. In this case, the expiration of the story participation parameter **510** for the last remaining ephemeral message **502** within the ephemeral message story **504** will determine when the ephemeral message story **504** itself expires. In this case, a new ephemeral message **502**, added to the ephemeral message story **504**, with a new story participation parameter **510**, effectively extends the life of an ephemeral message story **504** to equal the value of the story participation parameter **510**.
- (74) Responsive to the ephemeral timer system **202** determining that an ephemeral message story **504** has expired (e.g., is no longer accessible), the ephemeral timer system **202** communicates with the social media platform system **100** (and, for example, specifically the social media client application **104**) to cause an indicium (e.g., an icon) associated with the relevant ephemeral message story **504** to no longer be displayed within a user interface of the social media client application **104**. Similarly, when the ephemeral timer system **202** determines that the story participation parameter **510** for a particular ephemeral message **502** has expired, the ephemeral timer system **202** causes the social media client application **104** to no longer display an indicium (e.g., an icon or textual identification) associated with the ephemeral message **502**.

- (75) Example Embodiments of Map GUI Functionality
- (76) First, various aspects and features of the disclosure will be described conceptually with respect to specific example embodiments discussed with reference to and illustrated in FIGS. **6** and **7**.
- (77) Basic Map GUI Architecture
- (78) FIG. **6**A shows an example embodiment of a map-based graphical user interface, further referred to as a map GUI **612**, displayed on a user device in the example form of a mobile phone **102**. In this example embodiment, the map GUI **612** is generated on a display in the form of a touchscreen **606** capable of receiving haptic input. The map GUI **612** includes a map **618** showing an aerial or satellite representation of a particular geographical area. The map 618 is displayed within a map viewport **621** which, in this example embodiment, uses the full available area of the touchscreen **606**. In other example embodiments, the map viewport **621** may be a bounded panel or window within a larger display screen. The map GUI **612** further comprises a plurality of userselectable graphical user interface elements displayed at specific respective geographic locations on the map. Each such geo-anchored GUI element is, in this example embodiment, represented by a respective indicium or icon overlaid on the map **618**. The different types of icons and their respective functionalities will be described in greater detail below. As will also be described briefly, the map GUI **612** may further include one or more informational overlays rendered over the underlying geographical map **618**, the informational overlay in this example embodiment including a heatmap **625** representative of the geographical distribution of underlying social media activity on the social media platform provided by the relevant social media application. In this example embodiment, the social media platform to which the social media client application 104 executing on the mobile phone **102** provides access is SnapChat<sup>™</sup> provided by Snap Inc.
- (79) As mentioned, the map GUI **612** includes a number of different user-selectable icons or UI elements that indicate different geographically-based content or information. In this example embodiment, the map GUI **612** includes a plurality of different gallery icons also referred to in this description as story icons. Each story icon corresponds in location on the map **618** to a respective location-based social media gallery; in this example embodiment, the icons correspond to a location-based story of ephemeral messages in the example form of so-called snaps, as discussed elsewhere herein. Each of these stories that are represented by a respective story icon on the map **618** consists of a respective set of snaps (respectively comprising augmented or unaugmented photographic or video content) that are grouped together based at least in part on respective geo-tag data associated with respective snaps.
- (80) In the example embodiment of FIG. **6**A, the map GUI **612** includes two different types of gallery icons for two different respective types of location-based social media galleries: place icons **631** for place galleries/stories and spike icons **633** for spike galleries/stories that are dynamically surfaced on the map GUI **612** based on one or more metrics of underlying social media activity relating to the submission of social media items/snaps to the social media platform with geo-tag data indicating the respectively associated geographical areas. Note that these different types of galleries are represented by different types of icons **631**, **633**. The differences between these different types of galleries and the corresponding visually distinct gallery icons **631**, **633** is discussed later herein. The map GUI **612** in this example embodiment further includes friend icons in the example form of bitmojis **640** that are displayed on the map GUI **612** based on the current or last known geographic location of respective friends of the user associated with the client device **102**.
- (81) Message and/or Story Ephemerality
- (82) In this example embodiment, the social media items that are selectively playable by selection of the corresponding story icons **631**, **633** in the map GUI **612** are ephemeral social media items or messages. As described previously, ephemeral content is social media content (e.g., augmented and/or unaugmented video clips, pictures, and/or other messages) that is available for viewing by social media users via the map GUI **612** for only a predetermined limited period, also referred to

herein as a respective gallery participation parameter or timer. After expiry of a respective gallery participation parameter or timer for any ephemeral message or snap uploaded by a particular user, that ephemeral message or snap is no longer available for viewing by other users via the map GUI **612** generated on their respective client devices **102**. Current examples of such ephemeral social media content include the respective snaps or messages included in so-called Stories in the SNAPCHAT or the INSTAGRAM social media applications.

(83) Instead, or in addition, to management of ephemerality on a per-snap level using respective gallery participation timers, availability of the ephemeral messages by the map GUI 612 can in some instances be managed collectively (e.g., on a per-story level). In such instances, each story or gallery can have a respective story duration parameter 508 (e.g., being based on a corresponding story timer **514**—see FIG. **5**), at the expiry of which availability of the corresponding story for viewing via map GUI **612** is terminated. In some embodiments, the story duration parameter **508** is calculated based on the story participation parameter **510** of one of the ephemeral messages included in the relevant story. For example, a story may, in some embodiments, expire when a last uploaded item within the story expires, responsive to which the corresponding story icon 631/633 is no longer displayed on the map GUI **612**. In one example embodiment, the map GUI **612** may include one or more event icons (e.g., similar in appearance to the place icons **631** of FIG. **6**A) corresponding to respective event stories, with the story duration parameter **508** of the event story being set to expire a predetermined period of time from a start or conclusion of the underlying event. At expiry of the story duration parameter **508**, the corresponding gallery icon is removed from the map GUI 612, irrespective of individual timers associated with respective snaps included in the event story.

(84) Story Playback

- (85) The user can select any one of the gallery icons **631**, **633** by haptic contact with the touchscreen **606** at the onscreen location of the selected gallery icon **631/633**. Responsive to such selection, automated sequential playback of the corresponding set of ephemeral messages or snaps in the selected story is performed by the client device **102** on the touchscreen **606**. Such automated sequential reproduction of the selected story consists of: displaying on the touchscreen 606 the content or media payload of a first one of the ephemeral messages for a corresponding display duration (e.g., a default value of five seconds for photo-based messages and a maximum value of 10 seconds for video-based snaps), which, in this example embodiment, temporarily replaces the map GUI **612** on the touchscreen **606** with a full-screen replay of the relevant snap; at expiry of the display duration, ceasing display of the content of the first of ephemeral message, and then displaying the content of the next snap/message for its respective display duration; and thus progressing in sequence through all of the ephemeral messages in the selected story until all of the snaps in the story have been replayed or until the user selectively dismisses the playback sequence. (86) In some embodiments, not all of the snaps in a particular story/gallery are necessarily included in the replay sequence. For example, if there are many overlapping snaps (e.g., snaps showing substantially identical content), some of those snaps are automatically skipped to keep a continuous narrative and not repeat some sections of an event commonly captured by the different snaps. Instead, or in addition, the social media server application **114** can, in some embodiments, be programmed to automatically identify and curate overlapping or contemporaneous snaps based on timestamp information associated with respective snaps.
- (87) In this example embodiment, the snaps automatically collected together in a replayable spike story or place story are arranged automatically to be played back in chronological order based on respective timestamps (i.e., being played in sequence from oldest to newest or earliest posted to most recently posted). A benefit of such chronological playback is that viewing of the story provides a user with sequentially arranged views of events transpiring at the relevant location. In some instances, however, a human curator may choose to rearrange snaps out of chronological order (for example, to improve the narrative flow of the story). In other embodiments, the snaps

- may be played in reverse chronological order, from newest to oldest.
- (88) It can thus be seen that the example map GUI **612** includes multiple location-based gallery icons in the example form of story icons **631**, **633** that are user-selectable to trigger playback of respective collections of ephemeral social media items, in this example embodiment being respective ephemeral stories consisting of respective sets of ephemeral messages (also referred to in this description as snaps). In this example embodiment, each of the plurality of location-based stories represented by the respective story icons **631**, **633** may comprise media content contributed by multiple different users.
- (89) Our Story and Publication of Ephemeral Messages to Our Story
- (90) The respective ephemeral stories are, in this example embodiment, compiled from ephemeral messages submitted by multiple users based at least in part on geo-tagging of the respective snaps. Note that the ephemeral messages made available for viewing via the map GUI **612** are, in this example embodiment, not limited to content provided by other users who are members of an inapplication social network of the user on whose client device **102** the map GUI **612** is generated. Instead, the social media content to which the map GUI **612** allows access is, in this example embodiment, provided by snaps uploaded or submitted by any user to be publicly accessible via the map GUI **612**.
- (91) One aspect of the example map GUI **612** provides for the functionality for users to submit social media content that is publicly viewable via the map GUI **612**. Turning briefly to FIG. **7**, therein is shown an example embodiment of a destination selection interface **707** forming part of the map GUI **612** to provide a mechanism that provides the user with a selectable option to make a snap publicly viewable via the map GUI **612** upon capturing of the snap.
- (92) In this example embodiment, snaps can be captured via the map GUI **612** while the map viewport **621** is displayed (as seen in FIG. **6**A) by operation of a camera soft button **650** (FIG. **6**A) forming part of the map GUI **612**. After capturing of photo or video content by operation of the camera soft button **650**, the captured media content is displayed on the touchscreen **606** (FIG. 7) together with the destination selection interface **707**. In this example embodiment, the user can select one or both destination options identified in FIG. 7 as "My Story" and "Our Story," represented in FIG. 7 by respective radio buttons **714**, **721**. By selecting the Our Story radio button **721** and thereafter selecting a "Send" soft button **728**, the snap is submitted over the network **106** to the application server **112** with an indication that the snap is available for non-private publication via the map GUI **612**. If the snap is not so marked by the user (if, for example, only the My Story radio button **714** is selected), then the snap is not available for inclusion in any of the stories associated with the story icons **631**, **633** and is not available for inclusion in search results of a location-based search via the map GUI **612**, as described later herein. Snaps included only in the My Story gallery are available only to friends of the user (e.g., members of the uploading user's social network). The My Story gallery is a per user location-agnostic gallery of ephemeral messages available to friend users only, and is thus a non-public/private gallery. (93) In other example embodiments described herein, the superset of ephemeral messages made
- available by multiple users for public viewing via the map GUI **612** is alternatively referred to as the "Live Story" or simply as a "Live" gallery. For the purposes of the description of example embodiments herein, Live and Our Story are thus to be read as being synonymous. In the present example embodiment, the compilation and/or surfacing of gallery icons **631**, **633**, and the rendering of the heatmap **625** are based exclusively on publicly available social media content provided by snaps uploaded to Our Story. Calculation of metrics or attributes of social media activity upon which one or more aspects of the map GUI **612** are based (e.g., an unusualness or anomality metric indicating geo-temporal unusualness or anomality of social media activity within respective geographical areas) is, in this example embodiment, likewise based exclusively on snaps uploaded to Our Story.
- (94) Visual Distinctions Between Story Icons for Different Story Types

- (95) Returning now to the visual distinctions or differences between the different types of gallery icons **631**, **633**, it will be noted that each gallery icon **631**/**633** in this example embodiment comprises a circular graphical user interface element bearing a thumbnail image provided by the one of the snaps contained in the respective story. Each place icon **631**, however, also includes an associated label **635** bearing a text indication of the associated place. In this example embodiment, the geographical labels **635** indicate the respective place stories surfaced in the geographic window presently displayed in the example map **618** as being the Rockefeller Center, Bryant Park, and the Empire State Building, respectively.
- (96) In other example embodiments, the visual distinctions between different types of story icons may be provided in a different manner. FIG. **6**B, for example, shows another example embodiment of a map GUI **612** that is analogous to the example embodiment of FIG. **6**A, with a major difference being that the visual distinction between place icons **631** and spike icons **633** is provided at least in part by differently shaped thumbnail images. In the example of FIG. **6**B, the thumbnails of the place icons **631** are rectangular, while the thumbnails of the spike icons **633** are circular. (97) The respective thumbnail images that are used for the spike icons **633** are, in the example embodiments of FIGS. **6**A and **6**B, automatically selected by the social media server application **114**. In this instance, the thumbnail image for a spike icon **633** is automatically selected based on the posting time of the respective snaps forming part of the corresponding spike story (in this case being selected as a most recently posted snap in the relevant story). In other embodiments, automatic selection of the thumbnail image to be used in the spike icon 633 can be based on selecting the earliest posted ephemeral message/snap that is still available for viewing as part of the spike story. The thumbnail images for the place icons **631** (or for other curated stories, such as event stories) can, in some embodiments, likewise be selected automatically. In this embodiment, however, the thumbnail images for the place icons **631** can be selected from the snaps included in the corresponding story/gallery by a human operator via a content management interface forming part of the social media server application **114**. Absent such an explicit designation of a particular snap to be used for the thumbnail image, thumbnail selection may refer to an automatic default selection as described previously.
- (98) Differences Between Different Story Types
- (99) Place Stories
- (100) Returning to FIG. **6**A, the differences between the different types of social media galleries or stories accessible via respective story icons **631**, **633** on the map GUI **612** will now be briefly discussed.
- (101) Place stories, represented by respective place icons **631**, are social media galleries for defined locations or places, typically being places that consistently have relatively large activity volumes (e.g. Times Square, Universal Studios, etc.). Note that, in this example embodiment, not all defined places are by default surfaced in the map GUI **612** by respective place icons **631**. Instead, the geo-anchored place stories are surfaced based on the amount of activity (e.g., the raw number of uploaded snaps) captured within a defined geographic area associated with the relevant place, as indicated by associated geo-tag data. This ensures that places that regularly or always attract relatively large volumes of snaps are identified as such on the map **618**.
- (102) Defined places for which place icons **631** may be surfaced in the map GUI **612** are, in this example embodiment, manually created by one or more human operators using a server-side gallery management system or content management system (CMS) provided by the social media server application **114**. In this example embodiment, each defined place has: (a) an associated operator-defined polygon marking its geographical boundaries that specifies a particular geographical area for the place story; (b) a thumbnail location or icon location that specifies the onmap position at which the place icon **631** for a gallery or story associated with that place is displayed in the map **618**. Typically, the icon location lies within the associated polygon; and (c) a name by which the place is identified. In the example embodiment of FIG. **6**A, this is the name that

is displayed on the associated label **635** of the place icon **631**.

- (103) In other embodiments, such places and associated place stories are automatically identified by historical snap volume. In some such embodiments, the defined places and their associated stories/galleries are created and curated automatically by server-side procedures.
- (104) In some instances, each place story includes all of the snaps having geo-tag information indicating a geographic location lying within the associated polygon. Selection of a particular place icon **631** (e.g., by clicking in a desktop application or by tapping on the touchscreen **606** in the example embodiment of FIG. **6**A) in such cases plays all the snaps from within the corresponding polygon. In this example embodiment, the CMS provides functionality to operators or administrators to curate the collection of snaps associated with any operator-selected defined place (i.e., a particular geographical area defined by the corresponding polygon). The operator or one or more automated procedures can thus, for example, delete individual snaps from the place story, or can select individual snaps for inclusion in the place story.
- (105) When playing snaps responsive to selection of a place icon **631**, the name of the place appears onscreen together with the replayed content or payload of the respective snaps. As mentioned, in this example embodiment, the snap represented by a corresponding thumbnail within the relevant place icon **631** is played first, then the rest in time order.
- (106) Spike Stories
- (107) The unlabeled circular spike icons **633** are automatically surfaced for geographical areas of unusually high activity, with the respective associated spike stories or ad hoc galleries including unexpired snaps within the associated geographical area. In the example embodiment of FIG. **6**A, all ad hoc galleries associated with spike icons **633** are unmoderated, so that selecting a spike icon **633** triggers automated sequential replay of all of the snaps within a geographical area associated with the spike icon **633**. In a particular example embodiment, the geographical area associated with the spike icon **633** includes all geographical points located within predefined radius of the on-map location of the selected spike icon **633**.
- (108) Thus, clicking or tapping on the spike icon **633** plays all the snaps in that cluster, showing the snap in the thumbnail first and then the rest of the snaps in time order. Note, again, that the snaps clustered under the common spike icon **633** are, in this example, uploaded by multiple different respective social media users to our story, and are uncurated by moderators. In other embodiments, the stories collected under such spike thumbnails may be curated.
- (109) Automated selection of spike icons **633** (and therefore of the associated social media gallery, collection, or story) for surfacing in the map GUI **612** is, in this example embodiment, based at least in part on calculation of respective anomality or unusualness metric values for different geographical areas, as discussed elsewhere herein. Thus, a level of unusualness or anomality of user activity in a particular geo-temporal space would, in such instances, increase the likelihood of a particular spike story being surfaced on the map by display of a corresponding spike icon **633**. Instead, or in addition, human curators can also mark specific spike stories or clusters as "interesting," thereby boosting the interestingness or anomality score of the respective spike. (110) Note that, in the example embodiment described with reference to FIG. **6**A, different social media activity attributes or metrics are used for surfacing of the place icons **631** and the spike icons **633**, respectively. As discussed, spike icons **633** are, in this example embodiment, surfaced based on anomality metric values, while place icons **631** are surfaced based on raw snap volume. In other embodiments, surfacing of the place icons **631** may also be based at least in part on associated anomality values. Note that in some embodiments, various aspects of social media surfacing as described herein (including heatmap calculation and generation, story surfacing, etc.) are based on attributes other than anomality. For example, the heatmap 625 and story surfacing are, in one embodiment, based on raw activity levels.
- (111) Other Types of Stories or Ephemeral Social Media Galleries
- (112) Other embodiments can instead, or in addition, provide for social media gallery types

different from the place stories and the spike stories described with reference to FIGS. **6**A and **6**B. Each such different type of gathering may be represented on the map **618** by a visually distinct type of icon or other user interface element.

- (113) One example embodiment provides for event galleries pertaining to particular events occurring at a specific location. Such events can include, for example, concerts, festivals, sports events, or the like. These event galleries are, in one embodiment, created and curated by human operators using the gallery management system of the social media server application 114. (114) Some embodiments provide for surfacing on the map 618 story icons or thumbnails with respect to non-public snaps, e.g., snaps or stories that are access-restricted based at least in part on a social network information. For example, individual stories uploaded by friend users may, in some embodiments, be represented on the map 618 by a respective icon on the thumbnail. For example, the My Story of friend users may, in some embodiments, be directly accessible via the map 618. Such story icons are, in some embodiments, indicated by a respective friend icon or bitmoji 640 located on the map 618 corresponding to the location at which the corresponding story was generated. In other embodiments, each such user story icon may be indicated on the map 618 by a circular thumbnail analogous to the previously described example story icons 631, 633 of FIG. 6A.
- (115) Snap Submission to User-Selected Location-Based Stories
- (116) Another feature of the disclosure enables users to submit publicly viewable snaps designated for inclusion in any and all Live stories or ephemeral galleries that might be happening at locations where the user is eligible to post, e.g., being geographically proximate to the current location of the user as indicated by the associated user device **102**. In this manner, the user can specify snaps for inclusion in place stories, event stories, or other location-based ephemeral social media galleries as discussed above.
- (117) FIGS. 7B and 7C show an example embodiment of a destination selection interface **707** that provides a mechanism for such a destination selection alternative to the example embodiment previously described with reference to FIG. 7A. The destination selection interface **707** in FIG. 7B is displayed on the client device **102** responsive to the user initiating a snap submission flow (e.g. by capturing a snap).
- (118) The destination selection interface **707** of FIG. 7B is similar to the example embodiment of FIG. **7A**, in that two different user-selectable user interface elements in the form of respective radio buttons **714**, **721** are presented for posting a snap to snap to a user-specific My Story (radio button **714**) or to a publicly viewable Our Story (radio button **721**). A distinction between the user interfaces **707** of FIGS. **7A**-7B is that the Our Story cell of FIG. 7B automatically expands upon selection of button **721** to show subtitles of local place stories and/or event stories to which the snap could be submitted based on device location or the geo-tag of the associated snap. (119) FIG. **7**C shows additional options presented as a result of selecting the Our Story radio button **721**, which opens up a list showing the respective local stories for which the snap is eligible. In this example embodiment, all suboptions are selected by default via respective radio buttons **750**. In other embodiments, separate selection of individual suboptions may be required. If the user chooses to submit the snap with all of the options selected, that snap is automatically associated with each of the selected suboptions as well as with being made available for geographically based viewing as part of Our Story, separate from any curated location based place or event gallery/story, as described above.
- (120) The user can deselect any particular suboptions by clicking or tapping on the corresponding default-selected radio button **750**, as shown in FIG. **7**C, in which the lowermost one of the suboptions has been deselected. If all suboptions are deselected, the snap is not posted to any curated location-based story, but is posted only to Our Story to be publicly viewable via the map GUI **612**, as described elsewhere herein.
- (121) Heatmap Considerations

- (122) As shown in FIG. **6**A, the social media application map GUI **612**, in this example embodiment, includes a heat map layer overlaid on the geographical map **618**, thus providing the heatmap **625** that indicates geographical distribution of one or more attributes of user activity within the social media application. As discussed previously, the heatmap **625** indicates user activity levels with respect to posting geo-tagged content that is publicly viewable (e.g., Live Stories/Our Story). Instead, or in addition, the heatmap **625** can, in some embodiments, be based on snaps that are available for viewing by the particular user on whose client device **102** the map GUI **612** is displayed, in which case the heatmap **625** may differ from person to person depending on who gave the viewer permission to see their snaps.
- (123) In this example embodiment, the map **618** is color-coded, with warmer colors corresponding to higher levels of unusualness, as indicated by higher anomality metric values. Thus, in the map **618** illustrated in FIG. **6**A, the red areas of the heatmap **625** indicate those geographic areas with snap clusters corresponding to the highest anomality metric values. Again, different metrics or attributes for generation of the heatmap **625** may be used in other embodiments (for example, being based on snap density (e.g., raw snap volume per unit area of the map **618**)).
- (124) In some embodiments, the map GUI **612** displays information pertaining to the heatmap **625** differently at different magnification levels. For example, calculation of anomality metrics and consequent rendering of the heatmap **625** based thereon is, in some embodiments, performed separately for each of a plurality of zoom levels. In addition, different sets of spike icons **633** may be surfaced at different magnification levels. In one example embodiment, the heatmap **625** may be displayed at a first zoom level without individual spike icons **633** surfaced in the map GUI **612**, while multiple gallery or story icons **631**, **633** are automatically surfaced responsive to user-controlled zooming in on a particular portion of the map **618** shown at the first zoom level. (125) Anomality Metric Calculation
- (126) Some features of the map GUI **612**, in this example embodiment, provide for calculating, with respect to social media content, an anomality metric that quantifies geospatial anomality or unusualness of the social media content, and for surfacing the social media content in the map GUI **612** based on respective values for the anomality metric. In this example embodiment, respective collections of snaps associated with different geographical locations are ranked based at least in part on corresponding anomality metric values, and a predetermined number of the connections are automatically selected based on their anomality rankings for surfacing on the map GUI **612** with respective spike icons **633**. Instead, or in addition, all spike stories with an anomality metric value higher than a predefined threshold value can automatically be surfaced by the display of a corresponding spike icon **633**. As described elsewhere herein, the calculation and display of heatmap information is, in some embodiments, based at least in part on anomality metric calculation.
- (127) Anomality metrics may, in some embodiments, be counted for individual social media items. In this example embodiment, however, anomality metrics are calculated for collective user behavior. In particular, anomality metrics are calculated for multiple snaps (in this example being respective geo-tagged social media submissions) based on comparison between geo-temporal distribution of the multiple snaps compared to historic geo-temporal social media behavior in or around the relevant geographic location.
- (128) Note that the calculation of the anomality metric is, in this example embodiment, time sensitive. Thus, the same volume of snaps in a particular location may be identified as being anomalous at one time of the day but not at another time. For example, a certain level of social media activity (here, posting of snaps to Our Story) at the Empire State Building would be flagged as above-threshold anomalous at 4 AM in the morning, but would not be thus identified as anomalous during daytime.
- (129) An aspect of the disclosure provides for determining one or more geo-temporal attributes of social media activity by a process comprising, for each of multiple social media postings,

representing the posting as having a distribution in time and/or in space. In some embodiments, representing respective postings as having a geotemporal distribution comprises treating respective social media items as a probability cloud having, for example, a Gaussian distribution. Instead, or in addition, the method may comprise generating or extrapolating a historical model or historical representation of social media activity based at least in part on a resampling procedure executed with respect to a multiplicity of historical geo-tagged social media items. In one example embodiment, the resampling procedure comprises a bootstrapping operation.

(130) In some embodiments, the representation of social media postings as having respective distributions in time and/or space is performed as part of an operation to represent a geo-temporal reference profile or model for historical social media activity for a particular geographical area. Instead, or in addition, the representation of social media postings as having respective distributions in time and/or space may be performed as part of a procedure to represent recent or near-live social media activity in the particular geographical area. In such cases, the geo-temporal reference profile and the representation of the recent or near-live social media activity may be used in combination to identify within the geographic area one or more regions of interesting or anomalous social media activity, e.g., by calculating geographical distribution of a quantified anomality metric based on differences between the geo-temporal reference profile and the corresponding representation of recent or near-live social media activity.

(131) Dynamic Variation of Icon Size

- (132) Turning briefly to FIG. **6**B, it will be seen that the map GUI **612** illustrated therein provides an example embodiment of an aspect of the disclosure that provides for automated variation in one or more visual attributes of user interface elements associated with respective social media content based at least in part on a quantified attribute of underlying social media activity. In particular, example embodiment of FIG. **6**B provides for dynamic variation in the on-screen size of respective spike icons **633** based on respective anomality metric values for the corresponding clusters all spike galleries. On-screen sizes of the respective spike icons **633** thus indicate a level of unusualness or anomality of the underlying social media activity. Worded differently, the size of a spike icon **633** represents how unusual it is for there to be the relevant amount of activity in that spot, with a larger spike icon **633** indicating a greater level of unusualness.
- (133) Instead, or in addition, a visual attribute (such as its on-screen size) of the place icons **631** may likewise be variable based on a corresponding anomality value. In the example embodiment of FIG. **6**B, however, the on-screen size of the place icons **631** is variable based on snap volume, with a greater number of snaps included in any place story corresponding to a larger on-screen size of the associated place icon **631**. Thus, it is intuitively intelligible from the example screenshot shown in FIG. **6**B that the Universal Studios story has a greater number of snaps than the Venice Boardwalk story.

(134) Search Functionalities

- (135) In addition to viewing clustered stories by selection of the story icons **631**, **633**, the user can access snaps by use of one or more search functionalities provided by the map GUI **612**. In this example embodiment, the map GUI **612** provides two separate search mechanisms, namely a search box **665** (FIG. **6**A) and a location-based search by clicking or tapping at a target location on the map **618**.
- (136) Responsive to entry of a text search query in the search box **665**, search results are, in this example embodiment, displayed in a search box drop-down in which individual cells correspond to individual snaps, stories, places, and/or users returned in the search. When the user clicks on a selected cell in the search box drop-down, the map GUI **612** in this example automatically navigates with a fly-over to the point on the map, after which the selected story or spike cluster starts playing, or a friend bubble pops up, as the case may be. In some embodiments, at least some aspects of the text-based query are limited to the geographical area currently displayed in the map viewport **621**. Instead, or in addition, some aspects of the text-based query may be location-

agnostic, returning search results from any location.

(137) As an alternative to entering a text-based search query, the user can initiate a location-based search by clicking or tapping on a particular location on the map viewport **621**, responsive to which a search is conducted for social media items within a predefined radius from the click or tap location. In this example embodiment, such a location-based search does not return a list of graphical user interface elements that are selectable to play respective items, but instead automatically triggers automated sequential replay returned as a result of the search. Thus, clicking or tapping on a non-thumbnail place on the map **618** will radiate out a search around the tap location. Such a location-based search can have a predefined search radius from the tap location. If any snaps are found, they are automatically played back in sequence, as described before. If there are no snaps in that area, the search bounces back to show no results found.

(138) In embodiments in which the map GUI **612** is displayed on a touchscreen **606** (as is the case in the example embodiments of FIGS. **6**A and **6**B), a geo-temporal search is triggered by haptic contact at a particular location within the map **618**, with the search being geographically centered on the location of the haptic contact. An input interval indicated by the time period for which the haptic contact is maintained with the touchscreen automatically determines the preceding time period with respect to which the search is carried out. In such a case, for example, a tap on the screen triggers a geo-temporal search for material within the default time period, while a press and hold automatically triggers a geo-temporal search for material within an extended time period which is longer than the default time period. Instead, or in addition, the search radius may be variable based on the length of the input interval, with longer input intervals (i.e., a longer hold period) corresponding to a larger search radius.

(139) Overview of Map GUI Functionality

(140) In use, the map GUI **612** thus surfaces different types of location-based stories, which the user can view from the map **618**. In the example embodiment of FIGS. **6**A and **6**B, the user can access, via the map GUI **612**, snaps posted to Our Story from anywhere in the world. This can be achieved by navigating to different geographical areas displayed within the map viewport **621**. In particular, the displayed geographical area can be changed by zooming in or zooming out and by moving the focus area of the map viewport **621**. In the example embodiments of FIGS. **6**A and **6**B, in which the map GUI **612** is provided on a touchscreen **606**, zooming in and zooming out can be achieved by haptic gestures in the form of a pinch-out or a pinch-in haptic input. Movement of the map **618** within the map viewport **621**, so as to change the displayed geographical area, is achieved by a haptic dragging gesture at any point on the map **618**.

(141) In this example embodiment, the map **618** is not selectively rotatable by the user, having a fixed default orientation relative to the touchscreen **606**. In other embodiments, the map **618** may have a fixed orientation relative to the Earth. In some embodiments, the map **618** is selectively rotatable, e.g., with all map content rotating around a fixed anchor.

(142) As discussed at length above, in any particular map viewport **621**, the displayed information can include: the color-coded heatmap **625**, visually displaying the geographical distribution of snap uploading activity within a preceding window (for example the default snap lifetime, which in this example is 24 hours), allowing the user readily to identify places with more activity or less activity. This enables the user to more effectively target location-based searches via the map GUI **612**. In some embodiments, the color-coded heatmap **625** is shown only at a highest level of magnification. In this example embodiment, however, the map **618** is rendered at all zoom levels. thumbnail icons **631**, **633** for surfaced content forming part of ephemeral galleries or Stories. As described previously, these include, in this example embodiment, place icons **631** for geo-anchored stories associated with particular labeled locations, and spike icons **633** for location-based stories surfaced based on anomalous levels of geo-spatial activity. friend bitmojis **640** of friend users most frequently contacted by the user who is logged into the social media client application **104** executing on the client device **102** and by which the map GUI **612** is generated.

- (143) In some embodiments, no spike icons **633** are shown at some levels of magnification. In a particular example embodiment, no spike icons **633** are shown at the original zoom level at which the map GUI **612** loads by default. In such an example, only the heatmap **625**, friend bitmojis **640**, and a number of place icons **631** are displayed on the map **618** at the original zoom level. As the user zooms in, spike icons **633** are surfaced, representing respective clusters of activity. (144) It will be appreciated that different icons **631**, **633** are surfaced at different zoom levels. In this example embodiment, the map GUI **612** displays no more than a predefined maximum number of place icons **631** and no more than a predefined maximum number of spike icons **633** in any particular view. For example, at any zoom level, the top three place stories (ranked by snap volume) are surfaced by displaying respective place icons **631** in the map viewport **621**. Likewise, at any zoom level, the top three spike stories (ranked by anomality or unusualness metric value) are surfaced by displaying respective spike icons **633** in the map viewport **621**. (145) In addition to viewing stories surfaced in the map **618** by respective story icons **631**, **633**, the user can use one or more of the search functionalities described above to access any snap uploaded to Our Story and whose gallery participation timer or availability lifetime has not yet expired. (146) It will be appreciated that the map GUI **612** is dynamic, in that the information displayed therein changes dynamically with time. New snaps may continually be uploaded to Our Story, while the underlying social media items upon which surfacing of the story icons **631**, **633** and generation of the heatmap **625** is based may further continually change due to the expiration of the availability of snaps. In this example embodiment, however, the information displayed in the map viewport **621** is not dynamically updated during display of any particular geographical area.
- 112. (147) A benefit of the map GUI 612 as described with the example embodiments is that it provides for user-friendly and intuitive interaction with geographically distributed social media content. The provision of different types of social media galleries (e.g., represented respectively by spike icons 633 and place icons 631) provides a system that automatically surfaces the most relevant content for user-selection in such a manner that the very large number of individual social media items that may be available via a social media platform is reduced in complexity and allows selection of targeted content in which the user might be interested.

Instead, changing of the focus of the map viewport **621** is associated with receiving updated

information with respect to the story icons **631**, **633** and heatmap **625** from the application server

- (148) Example System
- (149) FIG. **8** shows an example embodiment of a social media platform system **800** configured to provide a map-based graphical user interface for a social media application, such as the map GUI **612** described with reference to FIGS. **1-7**. In some embodiments, the system **800** and its associated components can be provided server-side, for example by the social media application server system **108** (FIG. **1**). In such instances, the respective components of the system **800** can be provided by execution of the social media server application **114** on the application server **112**. In other embodiments, one or more components of the system **800** are provided client-side, for example by execution of the social media client application **104** executing on a respective client device **102** (FIG. **1**). In yet further embodiments, the system **800** is provided collaboratively server-side and client-side, the application server **112** and client device **102** in communication therewith being configured to provide the respective system components by execution of the social media client application **104** on the client device **102** and by execution of the social media server application **114** on the application server **112**.
- (150) The system **800** includes a map engine **808** to generate the map GUI **612**, including the location-based social media information displayed fire the map GUI **612**. Thus, the map engine **808** is configured to generate or to facilitate generation of the map **618** (FIGS. **6**A-**6**B) in the map viewport **621** of the client device **102**. To this end, the map engine **808** can be configured to surface and cause display of particular story icons **631**, **633**, to identify and cause display of respective

friend bitmojis **640**, to generate heatmap information and display or cause display of a heatmap **625** overlaid on the map **618**, and to perform operations that provide other related functionalities of the map GUI **612** described with reference to FIGS. **1-7**.

- (151) The system **800** further includes a replay mechanism **816** configured to cause automated sequential replay of the content of a set of social media items or snaps on the client device 102. The replay mechanism **816** can thus call sequential display of all of the snaps in a selected place story or spike story, as described previously herein. In some embodiments, the replay mechanism may provide for transmission of the set of snaps to the client device 102 responsive to selection of a corresponding story icon **631/633**. In some such embodiments, information automatically transmitted by the application server **112** to the client device **102** upon initial rendering of a map view in the map GUI **612** can include a first few (e.g., 2 or 3) snaps for each of the story icons **631**, **633** surfaced in the map viewport **621**. Upon selection of a particular story icon **631/633**, the first few snaps in the story are immediately available for replay, with the subsequent snaps in the story being pulled from the application server **112** during presentation of the first few snaps. (152) The system **800** also includes a gallery management system **824**. In this example embodiment, the gallery management system **824** is provided by the collection management system **204** (FIG. 2) as previously described. The gallery management system **824** is configured for the automated and/or semi-automated compilation of the respective social media galleries or stories as previously described. This may include duration or moderation of respective stories by use of a server-side curation interface **208** provided by the gallery management system **824**. (153) Example Method
- (154) FIG. **9** is a schematic flow chart illustrating a high-level view of a method **900** of providing a map-based GUI for a social media application, according to an example embodiment. The method **900** is in this example embodiment executed by a system **800** as described with reference to FIG. **8**, using the system architecture and environment described with reference to FIGS. **1-5**. Moreover, the example method **900** in this example embodiment provides the various map-based functionalities described with reference to FIGS. **6** and **7**, and the various operations that provide the respective functionalities described with reference to the example map GUI **612** of FIGS. **6** and **7** are to be read as forming part of the method **900**, even though all of the different operations previously described are, for avoidance of repetition, not repeated in the high-level overview of the method **900** described below.
- (155) In operation **901**, location-based social media galleries are compiled by identifying the respective set of snaps that are included in each of multiple stories or galleries viewable via the map GUI **612**. Note that in this description the superset of snaps or social media items that are publicly viewable via the map GUI **612** (e.g., all of the snaps uploaded to Our Story) is used as an overarching gallery, with operations performed by the gallery management system **824** (such as managing respective gallery participation timers for the multiple snaps) in some instances being performed also for snaps that are not included in any story replayable by user-selection of a corresponding story icon **631/633**.
- (156) Compilation of stories, at operation **901**, in some instances comprises fully automated inclusion in a respective story of all publicly viewable snaps having geo-tag data indicating a location corresponding to a defined geographic area associated with the story. In an example embodiment of FIG. **6**A, spike stories or clusters are compiled in a fully automatic procedure. In other instances, story compilation can be semi-automated, in that the set of snaps associated with a particular story is directed by a human operator. In such instances, the gallery management system **824** can generate a set of candidate messages or snaps based at least in part on the geo-tag data of the respective snaps. An operator administrator can then curate the story based on the set of candidate snaps (for example, by deleting unsuitable, low-quality, offensive, and/or redundant snaps).
- (157) At operation **903**, the system **800** receives a request for map display via the map GUI **612**.

Thus, for example, an initial loading of the social media client application **104** on the user device **102** in some embodiments automatically requests map information for a geographical area centered on the user's current location at a default magnification level. Likewise, when the user changes the geographical area to be displayed in the map viewport **621** (e.g., by changing the magnification level and/or by changing the centerpoint of the map **618**), a request for a corresponding map information is issued.

- (158) Responsive to the request for map display information, the map engine **808** in an automated operation identifies, at operation **907**, the particular social media galleries that are to be surfaced in the requested map view by displaying respective story icons **631**, **633** on the map **618**. In this example embodiment, as described previously, a number of spike stories are identified for surfacing based on previously calculated respective anomality metric values, and a number of place stories are identified for surfacing based on snap volume.
- (159) At operation **911**, the map engine **808** causes display in the map GUI **612** of respective story icons **631**, **633** for each gallery or story identified for surfacing. In this example embodiment, the application server **112** communicates to the client device **102** gallery information in the form of respective story manifests that provide information necessary for displaying the respective story icons **631**, **633**. For example, the application server **112** can provide, for each of the surface stories, a location of the corresponding story icon **631/633**, an indicator of the type of story icon (e.g., whether it is a place icon **631** or a spike icon **633**), a name or label of the story (if any), a thumbnail image for inclusion in the respective story icon **631/633**, and a list of snaps forming part of the corresponding story. In some embodiments, as discussed previously, such gallery information may include the payload of a first few of the snaps, to enable immediate commencement of story playback responsive to user selection. Based on the gallery information thus received, the client device **102** generates the requested map view in the map GUI **612**, in some instances including display of a plurality of place icons **631** and a plurality of spike icons **633** at different respective locations on the map **618**.
- (160) At operation **913**, user input is received via the map GUI **612** indicating a request for playback of a particular story by selection of the corresponding story icon **631/633**. In response to such a request, automated sequential playback of the story corresponding to the selected story icon **631/633** is performed, at operation **917**. As described previously, such automated sequential playback comprises displaying the payload of each of the plurality of snaps in the selected story in sequence, with each of the snaps being displayed for no more than predefined display duration. In some embodiments, the user can skip a remainder of the playback of any particular snap, e.g., by tapping on the touchscreen **606** for the end of the corresponding display duration.
- (161) Machine and Software Architecture
- (162) These systems, system components, methods, applications and so forth described in conjunction with FIGS. **1-9** are implemented in some embodiments in the context of a machine and an associated software architecture. The sections below describe representative software architecture(s) and machine (e.g., hardware) architecture that are suitable for use with the disclosed embodiments.
- (163) Software architectures are used in conjunction with hardware architectures to create devices and machines configured for particular purposes. For example, a particular hardware architecture coupled with a particular software architecture will create a mobile device, such as a mobile phone, tablet device, or so forth. A slightly different hardware and software architecture may yield a smart device for use in the "Internet of Things," while yet another combination produces a server computer for use within a cloud computing architecture. The software and hardware architectures presented here are example architectures for implementing the disclosure, are is not exhaustive as to possible architectures that can be employed for implementing the disclosure.
- (164) Software Architecture
- (165) FIG. 10 is a block diagram illustrating an example software architecture 1006, which may be

used in conjunction with various hardware architectures herein described. FIG. 10 is a non-limiting example of a software architecture and it will be appreciated that many other architectures may be implemented to facilitate the functionality described herein. The software architecture 1006 may execute on hardware such as machine 1100 of FIG. 11 that includes, among other things, processors 1104, memory 1114, and input/output (I/O) components 1118. A representative hardware layer 1052 is illustrated and can represent, for example, the machine 1100 of FIG. 11. The representative hardware layer 1052 includes a processing unit 1054 having associated executable instructions 1004. Executable instructions 1004 represent the executable instructions of the software architecture 1006, including implementation of the methods, components and so forth described herein. The hardware layer 1052 also includes memory and/or storage modules 1056, which also have executable instructions 1004. The hardware layer 1052 may also comprise other hardware 1058.

(166) In the example architecture of FIG. **10**, the software architecture **1006** may be conceptualized as a stack of layers where each layer provides particular functionality. For example, the software architecture **1006** may include layers such as an operating system **1002**, libraries **1020**, applications **1016**, frameworks/middleware **1018** and a presentation layer **1014**. Operationally, the applications **1016** and/or other components within the layers may invoke API calls **1008** through the software stack and receive a response **1012** to the API calls **1008**. The layers illustrated are representative in nature and not all software architectures have all layers. For example, some mobile or special purpose operating systems may not provide a frameworks/middleware **1018**, while others may provide such a layer. Other software architectures may include additional or different layers. (167) The operating system **1002** may manage hardware resources and provide common services. The operating system **1002** may include, for example, a kernel **1022**, services **1024**, and drivers **1026**. The kernel **1022** may act as an abstraction layer between the hardware and the other software layers. For example, the kernel **1022** may be responsible for memory management, processor management (e.g., scheduling), component management, networking, security settings, and so on. The services **1024** may provide other common services for the other software layers. The drivers **1026** are responsible for controlling or interfacing with the underlying hardware. For instance, the drivers 1026 include display drivers, camera drivers, Bluetooth® drivers, flash memory drivers, serial communication drivers (e.g., Universal Serial Bus (USB) drivers), Wi-Fi® drivers, audio drivers, power management drivers, and so forth depending on the hardware configuration. (168) The libraries **1020** provide a common infrastructure that is used by the applications **1016** and/or other components and/or layers. The libraries **1020** provide functionality that allows other software components to perform tasks in an easier fashion than to interface directly with the underlying operating system **1002** functionality (e.g., kernel **1022**, services **1024** and/or drivers **1026**). The libraries **1020** may include system libraries **1044** (e.g., C standard library) that may provide functions such as memory allocation functions, string manipulation functions, mathematical functions, and the like. In addition, the libraries 1020 may include API libraries 1046 such as media libraries (e.g., libraries to support presentation and manipulation of various media format such as MPREG4, H.264, MP3, AAC, AMR, JPG, PNG), graphics libraries (e.g., an OpenGL framework that may be used to render 2D and 3D in a graphic content on a display), database libraries (e.g., SQLite that may provide various relational database functions), web libraries (e.g., WebKit that may provide web browsing functionality), and the like. The libraries **1020** may also include a wide variety of other libraries **1048** to provide many other APIs to the applications **1016** and other software components/modules. (169) The frameworks/middleware 1018 (also sometimes referred to as middleware) provide a

higher-level common infrastructure that may be used by the applications **1016** and/or other software components/modules. For example, the frameworks/middleware **1018** may provide various graphic user interface (GUI) functions, high-level resource management, high-level location services, and so forth. The frameworks/middleware **1018** may provide a broad spectrum of

other APIs that may be utilized by the applications **1016** and/or other software components/modules, some of which may be specific to a particular operating system **1002** or platform.

- (170) The applications **1016** include built-in applications **1038** and/or third-party applications **1040**. Examples of representative built-in applications **1038** may include, but are not limited to, a contacts application, a browser application, a book reader application, a location application, a media application, a messaging application, and/or a game application. Third-party applications **1040** may include an application developed using the ANDROID<sup>TM</sup> or IOS<sup>TM</sup> software development kit (SDK) by an entity other than the vendor of the particular platform, and may be mobile software running on a mobile operating system such as IOS<sup>TM</sup>, ANDROID<sup>TM</sup>, WINDOWS® Phone, or other mobile operating systems. The third-party applications **1040** may invoke the API calls **1008** provided by the mobile operating system (such as operating system **1002**) to facilitate functionality described herein.
- (171) The applications **1016** may use built in operating system functions (e.g., kernel **1022**, services **1024**, and/or drivers **1026**), libraries **1020**, and frameworks/middleware **1018** to create user interfaces to interact with users of the system. Alternatively, or additionally, in some systems interactions with a user may occur through a presentation layer, such as presentation layer **1014**. In these systems, the application/component "logic" can be separated from the aspects of the application/component that interact with a user.
- (172) Hardware Architecture
- (173) FIG. **11** is a block diagram illustrating components of a machine **1100**, according to some example embodiments, able to read instructions from a machine-readable medium (e.g., a machinereadable storage medium) and perform any one or more of the methodologies discussed herein. Specifically, FIG. **11** shows a diagrammatic representation of the machine **1100** in the example form of a computer system, within which instructions **1110** (e.g., software, a program, an application, an applet, an app, or other executable code) for causing the machine **1100** to perform any one or more of the methodologies discussed herein may be executed. As such, the instructions **1110** may be used to implement modules or components described herein. The instructions **1110** transform the general, non-programmed machine **1100** into a particular machine **1100** programmed to carry out the described and illustrated functions in the manner described. In alternative embodiments, the machine **1100** operates as a standalone device or may be coupled (e.g., networked) to other machines. In a networked deployment, the machine 1100 may operate in the capacity of a server machine or a client machine in a server-client network environment, or as a peer machine in a peer-to-peer (or distributed) network environment. The machine **1100** may comprise, but not be limited to, a server computer, a client computer, a PC, a tablet computer, a laptop computer, a netbook, a set-top box (STB), a personal digital assistant (PDA), an entertainment media system, a cellular telephone, a smart phone, a mobile device, a wearable device (e.g., a smart watch), a smart home device (e.g., a smart appliance), other smart devices, a web appliance, a network router, a network switch, a network bridge, or any machine capable of executing the instructions **1110**, sequentially or otherwise, that specify actions to be taken by machine **1100**. Further, while only a single machine **1100** is illustrated, the term "machine" shall also be taken to include a collection of machines that individually or jointly execute the instructions **1110** to perform any one or more of the methodologies discussed herein.
- (174) The machine **1100** may include processors **1104** (e.g., an array of processors **1008-1012**, memory memory/storage **1106**, and I/O components **1118**, which may be configured to communicate with each other such as via a bus **1102**. The memory/storage **1106** may include a memory **1114**, such as a main memory, or other memory storage, and a storage unit **1116**, both accessible to the processors **1104** such as via the bus **1102**. The storage unit **1116** and memory **1114** store the instructions **1110** embodying any one or more of the methodologies or functions described herein. The instructions **1110** may also reside, completely or partially, within the memory **1114**,

within the storage unit **1116**, within at least one of the processors **1104** (e.g., within the processor's cache memory), or any suitable combination thereof, during execution thereof by the machine **1100**. Accordingly, the memory **1114**, the storage unit **1116**, and the memory of processors **1104** are examples of machine-readable media.

(175) The I/O components **1118** may include a wide variety of components to receive input, provide output, produce output, transmit information, exchange information, capture measurements, and so on. The specific I/O components 1118 that are included in a particular machine **1100** will depend on the type of machine. For example, portable machines such as mobile phones will likely include a touch input device or other such input mechanisms, while a headless server machine will likely not include such a touch input device. It will be appreciated that the I/O components **1118** may include many other components that are not shown in FIG. **11**. The I/O components **1118** are grouped according to functionality merely for simplifying the following discussion and the grouping is in no way limiting. In various example embodiments, the I/O components **1118** may include output components **1126** and input components **1128**. The output components 1126 may include visual components (e.g., a display such as a plasma display panel (PDP), a light emitting diode (LED) display, a liquid crystal display (LCD), a projector, or a cathode ray tube (CRT)), acoustic components (e.g., speakers), haptic components (e.g., a vibratory motor, resistance mechanisms), other signal generators, and so forth. The input components 1128 may include alphanumeric input components (e.g., a keyboard, a touch screen configured to receive alphanumeric input, a photo-optical keyboard, or other alphanumeric input components), point based input components (e.g., a mouse, a touchpad, a trackball, a joystick, a motion sensor, or other pointing instrument), tactile input components (e.g., a physical button, a touch screen that provides location and/or force of touches or touch gestures, or other tactile input components), audio input components (e.g., a microphone), and the like.

(176) In further example embodiments, the I/O components **1118** may include biometric components 1130, motion components 1134, environmental environment components 1136, or position components **1138** among a wide array of other components. For example, the biometric components 1130 may include components to detect expressions (e.g., hand expressions, facial expressions, vocal expressions, body gestures, or eye tracking), measure biosignals (e.g., blood pressure, heart rate, body temperature, perspiration, or brain waves), identify a person (e.g., voice identification, retinal identification, facial identification, fingerprint identification, or electroencephalogram based identification), and the like. The motion components 1134 may include acceleration sensor components (e.g., accelerometer), gravitation sensor components, rotation sensor components (e.g., gyroscope), and so forth. The environment components 1136 may include, for example, illumination sensor components (e.g., photometer), temperature sensor components (e.g., one or more thermometer that detect ambient temperature), humidity sensor components, pressure sensor components (e.g., barometer), acoustic sensor components (e.g., one or more microphones that detect background noise), proximity sensor components (e.g., infrared sensors that detect nearby objects), gas sensors (e.g., gas detection sensors to detection concentrations of hazardous gases for safety or to measure pollutants in the atmosphere), or other components that may provide indications, measurements, or signals corresponding to a surrounding physical environment. The position components **1138** may include location sensor components (e.g., a GPS receiver component), altitude sensor components (e.g., altimeters or barometers that detect air pressure from which altitude may be derived), orientation sensor components (e.g., magnetometers), and the like.

(177) Communication may be implemented using a wide variety of technologies. The I/O components **1118** may include communication components **1140** operable to couple the machine **1100** to a network **1132** or devices **1120** via coupling **1122** and coupling **1124**, respectively. For example, the communication components **1140** may include a network interface component or other suitable device to interface with the network **1132**. In further examples, communication

components **1140** may include wired communication components, wireless communication components, cellular communication components, Near Field Communication (NFC) components, Bluetooth® components (e.g., Bluetooth® Low Energy), Wi-Fi® components, and other communication components to provide communication via other modalities. The devices **1120** may be another machine or any of a wide variety of peripheral devices (e.g., a peripheral device coupled via a USB).

(178) Moreover, the communication components **1140** may detect identifiers or include components operable to detect identifiers. For example, the communication components **1140** may include Radio Frequency Identification (RFID) tag reader components, NFC smart tag detection components, optical reader components (e.g., an optical sensor to detect one-dimensional bar codes such as Universal Product Code (UPC) bar code, multi-dimensional bar codes such as Quick Response (QR) code, Aztec code, Data Matrix, Dataglyph, MaxiCode, PDF417, Ultra Code, UCC RSS-2D bar code, and other optical codes), or acoustic detection components (e.g., microphones to identify tagged audio signals). In addition, a variety of information may be derived via the communication components **1140**, such as, location via Internet Protocol (IP) geo-location, location via Wi-Fi® signal triangulation, location via detecting a NFC beacon signal that may indicate a particular location, and so forth.

## Glossary

- (179) "CARRIER SIGNAL" in this context refers to any intangible medium that is capable of storing, encoding, or carrying instructions for execution by the machine, and includes digital or analog communications signals or other intangible media to facilitate communication of such instructions. Instructions may be transmitted or received over the network using a transmission medium via a network interface device and using any one of a number of well-known transfer protocols.
- (180) "CLIENT DEVICE" in this context refers to any machine that interfaces to a communications network to obtain resources from one or more server systems or other client devices. A client device may be, but is not limited to, a mobile phone, desktop computer, laptop, portable digital assistant (PDA), smart phone, tablet, ultra book, netbook, laptop, multi-processor system, microprocessor-based or programmable consumer electronics, game console, set-top box, or any other communication device that a user may use to access a network.
- (181) "COMMUNICATIONS NETWORK" in this context refers to one or more portions of a network that may be an ad hoc network, an intranet, an extranet, a virtual private network (VPN), a local area network (LAN), a wireless LAN (WLAN), a wide area network (WAN), a wireless WAN (WWAN), a metropolitan area network (MAN), the Internet, a portion of the Internet, a portion of the Public Switched Telephone Network (PSTN), a plain old telephone service (POTS) network, a cellular telephone network, a wireless network, a Wi-Fi® network, another type of network, or a combination of two or more such networks. For example, a network or a portion of a network may include a wireless or cellular network and the coupling may be a Code Division Multiple Access (CDMA) connection, a Global System for Mobile communications (GSM) connection, or other type of cellular or wireless coupling. In this example, the coupling may implement any of a variety of types of data transfer technology, such as Single Carrier Radio Transmission Technology (1×RTT), Evolution-Data Optimized (EVDO) technology, General Packet Radio Service (GPRS) technology, Enhanced Data rates for GSM Evolution (EDGE) technology, third Generation Partnership Project (3GPP) including 3G, fourth generation wireless (4G) networks, Universal Mobile Telecommunications System (UMTS), High Speed Packet Access (HSPA), Worldwide Interoperability for Microwave Access (WiMAX), Long Term Evolution (LTE) standard, others defined by various standard setting organizations, other long range protocols, or other data transfer technology.
- (182) "EPHEMERAL MESSAGE" in this context refers to a message that is accessible for a timelimited duration. An ephemeral message may be a text, an image, a video, and the like. The access

time for the ephemeral message may be set by the message sender. Alternatively, the access time may be a default setting or a setting specified by the recipient. Regardless of the setting technique, the message is transitory. "Snaps" as referenced in the description are ephemeral messages. (183) "MACHINE-READABLE MEDIUM" in this context refers to a component, device, or other tangible media able to store instructions and data temporarily or permanently and may include, but is not be limited to, random-access memory (RAM), read-only memory (ROM), buffer memory, flash memory, optical media, magnetic media, cache memory, other types of storage (e.g., Erasable Programmable Read-Only Memory (EEPROM)) and/or any suitable combination thereof. The term "machine-readable medium" should be taken to include a single medium or multiple media (e.g., a centralized or distributed database, or associated caches and servers) able to store instructions. The term "machine-readable medium" shall also be taken to include any medium, or combination of multiple media, that is capable of storing instructions (e.g., code) for execution by a machine, such that the instructions, when executed by one or more processors of the machine, cause the machine to perform any one or more of the methodologies described herein. Accordingly, a "machinereadable medium" refers to a single storage apparatus or device, as well as "cloud-based" storage systems or storage networks that include multiple storage apparatus or devices. The term "machinereadable medium" excludes signals per se.

(184) "COMPONENT" in this context refers to a device, physical entity, or logic having boundaries defined by function or subroutine calls, branch points, application program interfaces (APIs), or other technologies that provide for the partitioning or modularization of particular processing or control functions. Components may be combined via their interfaces with other components to carry out a machine process. A component may be a packaged functional hardware unit designed for use with other components and a part of a program that usually performs a particular function of related functions. Components may constitute either software components (e.g., code embodied on a machine-readable medium) or hardware components. A "hardware component" is a tangible unit capable of performing certain operations and may be configured or arranged in a certain physical manner. In various example embodiments, one or more computer systems (e.g., a standalone computer system, a client computer system, or a server computer system) or one or more hardware components of a computer system (e.g., a processor or a group of processors) may be configured by software (e.g., an application or application portion) as a hardware component that operates to perform certain operations as described herein. A hardware component may also be implemented mechanically, electronically, or any suitable combination thereof. For example, a hardware component may include dedicated circuitry or logic that is permanently configured to perform certain operations. A hardware component may be a specialpurpose processor, such as a Field-Programmable Gate Array (FPGA) or an Application Specific Integrated Circuit (ASIC). A hardware component may also include programmable logic or circuitry that is temporarily configured by software to perform certain operations. For example, a hardware component may include software executed by a general-purpose processor or other programmable processor. Once configured by such software, hardware components become specific machines (or specific components of a machine) uniquely tailored to perform the configured functions and are no longer general-purpose processors. It will be appreciated that the decision to implement a hardware component mechanically, in dedicated and permanently configured circuitry, or in temporarily configured circuitry (e.g., configured by software) may be driven by cost and time considerations. Accordingly, the phrase "hardware component" (or "hardware-implemented component") should be understood to encompass a tangible entity, be that an entity that is physically constructed, permanently configured (e.g., hardwired), or temporarily configured (e.g., programmed) to operate in a certain manner or to perform certain operations described herein. Considering embodiments in which hardware components are temporarily configured (e.g., programmed), each of the hardware components need not be configured or instantiated at any one instance in time. For example, where a hardware component comprises a

general-purpose processor configured by software to become a special-purpose processor, the general-purpose processor may be configured as respectively different special-purpose processors (e.g., comprising different hardware components) at different times. Software accordingly configures a particular processor or processors, for example, to constitute a particular hardware component at one instance of time and to constitute a different hardware component at a different instance of time. Hardware components can provide information to, and receive information from, other hardware components. Accordingly, the described hardware components may be regarded as being communicatively coupled. Where multiple hardware components exist contemporaneously, communications may be achieved through signal transmission (e.g., over appropriate circuits and buses) between or among two or more of the hardware components. In embodiments in which multiple hardware components are configured or instantiated at different times, communications between such hardware components may be achieved, for example, through the storage and retrieval of information in memory structures to which the multiple hardware components have access. For example, one hardware component may perform an operation and store the output of that operation in a memory device to which it is communicatively coupled. A further hardware component may then, at a later time, access the memory device to retrieve and process the stored output. Hardware components may also initiate communications with input or output devices, and can operate on a resource (e.g., a collection of information). The various operations of example methods described herein may be performed, at least partially, by one or more processors that are temporarily configured (e.g., by software) or permanently configured to perform the relevant operations. Whether temporarily or permanently configured, such processors may constitute processor-implemented components that operate to perform one or more operations or functions described herein. As used herein, "processor-implemented component" refers to a hardware component implemented using one or more processors. Similarly, the methods described herein may be at least partially processor-implemented, with a particular processor or processors being an example of hardware. For example, at least some of the operations of a method may be performed by one or more processors or processor-implemented components. Moreover, the one or more processors may also operate to support performance of the relevant operations in a "cloud computing" environment or as a "software as a service" (SaaS). For example, at least some of the operations may be performed by a group of computers (as examples of machines including processors), with these operations being accessible via a network (e.g., the Internet) and via one or more appropriate interfaces (e.g., an Application Program Interface (API)). The performance of certain of the operations may be distributed among the processors, not only residing within a single machine, but deployed across a number of machines. In some example embodiments, the processors or processor-implemented components may be located in a single geographic location (e.g., within a home environment, an office environment, or a server farm). In other example embodiments, the processors or processor-implemented components may be distributed across a number of geographic locations.

(185) "PROCESSOR" in this context refers to any circuit or virtual circuit (a physical circuit emulated by logic executing on an actual processor) that manipulates data values according to control signals (e.g., "commands," "op codes," "machine code," etc.) and which produces corresponding output signals that are applied to operate a machine. A processor may, for example, be a Central Processing Unit (CPU), a Reduced Instruction Set Computing (RISC) processor, a Complex Instruction Set Computing (CISC) processor, a Graphics Processing Unit (GPU), a Digital Signal Processor (DSP), an Application Specific Integrated Circuit (ASIC), a Radio-Frequency Integrated Circuit (RFIC) or any combination thereof. A processor may further be a multi-core processor having two or more independent processors (sometimes referred to as "cores") that may execute instructions contemporaneously.

(186) "TIMESTAMP" in this context refers to a sequence of characters or encoded information identifying when a certain event occurred, for example giving date and time of day, sometimes

accurate to a small fraction of a second.

(187) Language

(188) Throughout this specification, plural instances may implement components, operations, or structures described as a single instance. Although individual operations of one or more methods are illustrated and described as separate operations, one or more of the individual operations may be performed concurrently, and nothing requires that the operations be performed in the order illustrated, unless that the context and/or logic clearly indicates otherwise. Structures and functionality presented as separate components in example configurations may be implemented as a combined structure or component. Similarly, structures and functionality presented as a single component may be implemented as separate components. These and other variations, modifications, additions, and improvements fall within the scope of the subject matter herein. (189) Although an overview of the disclosed subject matter has been described with reference to specific example embodiments, various modifications and changes may be made to these embodiments without departing from the broader scope of embodiments of the present disclosure. (190) The embodiments illustrated herein are described in sufficient detail to enable those skilled in the art to practice the teachings disclosed. Other embodiments may be used and derived therefrom, such that structural and logical substitutions and changes may be made without departing from the scope of this disclosure. The Detailed Description, therefore, is not to be taken in a limiting sense, and the scope of various embodiments is defined only by the appended claims, along with the full range of equivalents to which such claims are entitled.

(191) As used herein, the term "or" may be construed in either an inclusive or exclusive sense. Moreover, plural instances may be provided for resources, operations, or structures described herein as a single instance. Additionally, boundaries between various resources, operations, modules, engines, and data stores are somewhat arbitrary, and particular operations are illustrated in a context of specific illustrative configurations. The specification and drawings are, accordingly, to be regarded in an illustrative rather than a restrictive sense.

## **Claims**

- 1. A method comprising: at a server system for a social media application, managing multiple location-based social media galleries, each location-based social media gallery being a predefined collective entity that has an associated anchor location and that comprises a respective set of social media items that were submitted for display via the social media application by multiple different users, each social media item in the respective social media item having respective geo-tag data indicating a geographic location associated with the anchor location of the respective locationbased social media gallery; causing display on a user device of a map-based graphical user interface (GUI) for a social media application, the map-based GUI including a map representing a geographical area; for a plurality of galleries comprising a subset of the multiple location-based social media galleries whose respective anchor locations fall within the geographical area of the displayed map, causing display of a corresponding plurality of gallery icons at the respective anchor locations on the map, each gallery icon being an interactive user-selectable GUI element representing a respective one of the plurality of location-based social media galleries; and responsive to receiving user input selecting one of the plurality of gallery icons via a direct selection input comprising one of a touchscreen tap and a cursor click coincident in on-screen location with the selected gallery in the map-based GUI, causing automated sequential replay on the user device of the set of social media items of the social media gallery corresponding to the selected gallery icon.
- 2. The method of claim 1, wherein each of the social media items has a respective display duration, the automated sequential replay of the set of social media items comprises: displaying media content of a first one of the set of the social media items for the corresponding display duration; at

expiry of the display duration, automatically displaying media content of a next one of the set of social media items; and repeating the operation of displaying a next social media item in sequence until the entire set of social media items has been displayed or until a user input indicating dismissal of the automated sequential replay is received.

- 3. The method of claim 1, wherein: each set of social media items comprises a plurality of ephemeral messages, each ephemeral message having a corresponding gallery participation timer determining a remaining time for continued availability of the ephemeral message as part of the corresponding social media gallery; and wherein the method further comprises, for each ephemeral message, removing the ephemeral message from the corresponding social media gallery at expiry of the corresponding gallery participation timer.
- 4. The method of claim 3, further comprising, in an automated operation performed using one or more computer processors configured therefor, automatically compiling one or more of the plurality of social media galleries based at least in part on the respective geo-tag data of ephemeral messages submitted for display via the social media application.
- 5. The method of claim 3, further comprising, for one or more of the social media galleries, compiling the corresponding gallery in operations comprising: in an automated operation performed using one or more computer processors configured therefor, compiling a set of candidate ephemeral messages for inclusion in a social media gallery based at least in part on respective geotag data of ephemeral messages submitted for public display via the social media application; and in a curation operation performed by a human operator, selecting from the set of candidate ephemeral messages a subset of ephemeral messages that are included in the corresponding social media gallery.
- 6. The method of claim 3, wherein each of the gallery icons comprises a thumbnail image based on photographic or video content of one of the ephemeral messages forming part of the corresponding social media gallery.
- 7. The method of claim 6, further comprising automatically selecting a particular one of the plurality of ephemeral messages as basis for the thumbnail image, automated selection of the particular ephemeral message being based at least in part on timestamp information for the respective ephemeral messages.
- 8. The method of claim 3, wherein: one or more of the social media galleries are ephemeral galleries having respective gallery availability parameters that determine continued availability of the respective ephemeral galleries via the map-based GUI for the social media application; and wherein the method further comprises, for each of the ephemeral galleries, upon expiry of the corresponding gallery availability parameter, discontinuing display of the corresponding gallery icon on the map of the map-based GUI.
- 9. The method of claim 3, wherein a plurality of social media galleries represented on the map by the corresponding plurality of gallery icons comprises two or more different types of social media galleries.
- 10. The method of claim 9, wherein the two or more different types of social media galleries include: a place gallery type, being a gallery associated with a defined location that regularly experiences high levels of social media activity compared to a geographic region in which it is located; and a spike gallery type, being a gallery that is surfaced on the map responsive to one or more attributes of underlying location-based social media activity exceeding a predefined threshold.
- 11. The method of claim 9, wherein the two or more different types of social media galleries are represented on the map by two or more visually distinct types of gallery icons.
- 12. A system comprising: one or more computer processor devices; and memory having stored thereon instructions that, when executed by the one or more computer processor devices, configure the system to perform operations comprising: multiple location-based social media galleries, each location-based social media gallery being a predefined collective entity that has an associated

anchor location and that comprises a respective set of social media items that were submitted for display via the social media application by multiple different users, each social media item in the respective social media item having respective geo-tag data indicating a geographic location associated with the anchor location of the respective location-based social media gallery; causing display on a user device of a map-based graphical user interface (GUI) for a social media application, the map-based GUI including a map representing a geographical area; for a plurality of galleries comprising a subset of the multiple location-based social media galleries whose respective anchor locations fall within the geographical area of the displayed map, causing display of a corresponding plurality of gallery icons at the respective anchor locations on the map, each gallery icon being an interactive user-selectable GUI element representing a respective one of the plurality of location-based social media galleries; and responsive to receiving user input selecting one of the plurality of gallery icons via a direct selection input comprising one of a touchscreen tap and a cursor click coincident in on-screen location with the selected gallery in the map-based GUI, causing automated sequential replay on the user device of the set of social media items of the social media gallery corresponding to the selected gallery icon.

- 13. The system of claim 12, wherein each of the social media items has a respective display duration, the replay mechanism further being configured to provide the automated sequential replay of the selected set of social media items by performing operations comprising: displaying media content of a first one of the set of the social media items for the corresponding display duration; at expiry of the display duration, automatically displaying media content of a next one of the set of social media items; and repeating the operation of displaying a next social media item in sequence until the entire set of social media items has been displayed or until a user input indicating dismissal of the automated sequential replay is received.
- 14. The system of claim 12, wherein each set of social media items comprises a plurality of ephemeral messages, each ephemeral message having a corresponding gallery participation timer determining a remaining time for continued availability of the ephemeral message as part of the corresponding social media gallery; and wherein the system further comprises a gallery management system comprising one or more computer processor devices configured to, for each ephemeral message, remove the ephemeral message from the corresponding social media gallery at expiry of the corresponding gallery participation timer.
- 15. The system of claim 14, wherein the gallery management system is further configured to, in an automated operation, compile one or more of the plurality of social media galleries based at least in part on the respective geo-tag data of ephemeral messages submitted for display via the social media application.
- 16. The system of claim 14, wherein the gallery management system is further configured to, for one or more of the plurality of social media galleries, compile the corresponding gallery in operations comprising: in an automated operation performed by the gallery management system, compiling a set of candidate ephemeral messages for inclusion in a social media gallery based at least in part on respective geo-tag data of ephemeral messages submitted for public display via the social media application; and enable selection by a human operator of a subset of ephemeral messages from the set of candidate ephemeral messages, the ephemeral messages included in the corresponding gallery being limited to the selected subset of ephemeral messages.
- 17. The system of claim 14, wherein a plurality of social media galleries represented on the map by the corresponding plurality of gallery icons comprises two or more different types of social media galleries on the map, the map engine further being configured to represent the two or more different types of social media galleries on the map by two or more visually distinct types of gallery icons.
- 18. A non-transitory computer readable storage medium having stored thereon instructions for causing a machine, when executing the instructions, to perform operations comprising: at a server system for a social media application, managing multiple location-based social media galleries,

each location-based social media gallery being a predefined collective entity that has an associated anchor location and that comprises a respective set of social media items that were submitted for display via the social media application by multiple different users, each social media item in the respective social media item having respective geo-tag data indicating a geographic location associated with the anchor location of the respective location-based social media gallery; causing display on a user device of a map-based graphical user interface (GUI) for a social media application, the map-based GUI including a map representing a geographical area; for a plurality of galleries comprising a subset of the multiple location-based social media galleries whose respective anchor locations fall within the geographical area of the displayed map, causing display of a corresponding plurality of gallery icons at the respective anchor locations on the map, each gallery icon being an interactive user-selectable GUI element representing a respective one of the plurality of location-based social media; and responsive to receiving user input selecting one of the plurality of gallery icons via a direct selection input comprising one of a touchscreen tap and a cursor click coincident in on-screen location with the selected gallery in the map-based GUI, causing automated sequential replay on the user device of the set of social media items of the social media gallery corresponding to the selected gallery icon.
