# Cloud-based systems and methods for providing consumer financial data

#### Abstract

Systems and methods are disclosed for providing cloud-based access to consumer financial information. A cloud-based platform may receive a notification from a server, the notification comprising a request to access consumer data associated with a financial services account. After confirming authorization by both the associated financial services account provider and the consumer, the platform may configure a software object identifying the server and at least a portion of the consumer data that the server is authorized to access. After presentation of the configured software object by the third party server, the platform may verify the configured software object, and provide to the server access to the authorized consumer data. The server may then utilize the provided consumer data to perform a mobile service for the consumer.

Inventors: Aiglstorfer; Rodney (Minden, NV)

**Applicant:** Fidelity Information Services, LLC (Jacksonville, FL)

**Family ID:** 50623310

Assignee: Fidelity Information Services, LLC (Jacksonville, FL)

Appl. No.: 18/210916

Filed: June 16, 2023

## **Background/Summary**

CROSS REFERENCE TO RELATED APPLICATIONS (1) This application is a continuation of U.S. patent application Ser. No. 17/188,667, filed Mar. 1, 2021, now allowed, which is a continuation of U.S. patent application Ser. No. 16/800,239, filed Feb. 25, 2020, now U.S. Pat. No. 10,970,705, which is a continuation of U.S. patent application Ser. No. 15/998,857, filed Aug. 17, 2018, now U.S. Pat. No. 10,592,889, which is a continuation of U.S. patent application Ser. No. 14/071,869, filed Nov. 5, 2013, now U.S. Pat. No. 10,055,727, which claims the benefit of priority of U.S. Provisional Application No. 61/722,626, filed Nov. 5, 2012, and U.S. Provisional Application No. 61/722,939, filed Nov. 6, 2012, the disclosures of which are expressly incorporated herein by reference in their entirety. (2) The present application also relates to U.S. patent application Ser. No. 14/072,133, entitled "Systems and Methods for Providing Financial Service Extensions," filed Nov. 5, 2013 (now U.S. Pat. No. 9,514,492), which is expressly incorporated herein by reference in its entirety.

#### BACKGROUND

- I. Technical Field
- (1) The present disclosure generally relates to financial services and transactions enabled on a mobile phone or device. In particular, the present disclosure relates to systems and methods for facilitating mobile banking and commerce, and for authenticating and sharing data with external, third party services and applications over a network.
- II. Background Information
- (2) Consumers use mobile devices (such as tablets and smartphones) for a variety of purposes. More recently, consumers have begun to increase their use of mobile devices to access their banking and financial information. On a variety of handheld mobile devices, consumers can download "banking apps." Consumers can download these "apps" (short for "applications") from

various mobile software distribution platforms, such as from the Apple® iTunes® App Store™ or the Google® Play® Marketplace store. Alternatively, consumers can use web applications delivered over HTTPS, which use either server-side or client-side processing to provide a banking experience within a browser on mobile devices. Typical banking application features include, for example, the ability to view recent transactions and account balances; receive account related alerts; automatically pay bills; transfer funds between accounts; and search for branch and ATM locations.

- (3) While these banking applications are becoming more popular with consumers, the market demand is for more extensive and useful banking and financial services, and other customer offerings. A wide array of financial applications can provide value to the mobile device user, regardless of whether the user is a business or a consumer.
- (4) However, in the universe of mobile financial services, one of the greatest challenges to achieve is encouraging users to sign up for a new service or application. For example, the sign up process often requires users to download a mobile application, create new credentials, and transfer funds from a financial service account into an account associated with the new service.
- (5) What is needed therefore in the field is a straightforward system and method for third party applications or services to be able to automatically access a consumer's banking information, especially when a third party application is provisioned and provided access to a consumer from a common mobile banking platform. At the same time, it would be equally beneficial for a system managing the user's financial information to authenticate a third party application or service prior to the sharing of a user's financial information.

#### **SUMMARY**

- (6) Consistent with a disclosed embodiment, a system is provided for providing cloud-based access to consumer financial data. The system may receive a notification from a server, the notification comprising a request to access consumer data associated with a financial service account. Also, the system may determine that a financial service account provider has authorized access by the server to the consumer data. The system may further determine that one or more consumers associated with the financial service account provider authorize access by the server to the consumer data. The system may configure a software object identifying the server and at least a portion of the consumer data that the server is authorized to access. Additionally, the system may receive a notification from the server, the notification comprising a request to access authorized consumer data. The system may verify the configured software object, and provide to the server access to the authorized consumer data.
- (7) Consistent with a disclosed embodiment, a computer-implemented method is provided for providing cloud-based access to consumer financial data. The method comprises receiving a notification from a server, the notification comprising a request to access consumer data associated with a financial service account. Also, the method includes determining that a financial service account provider authorizes access by the server to the consumer data. The method further comprises determining that one or more consumers associated with the financial service account provider authorize access by the server to the consumer data. Further, the method includes configuring a software object identifying the server and at least a portion of the consumer data that the server is authorized to access. Additionally, the method comprises receiving a notification from the server, the notification comprising a request to access authorized consumer data. The method comprises verifying the configured software object, and providing to the server access to the authorized consumer data.
- (8) Consistent with other disclosed embodiments, non-transitory computer-readable storage media may store program instructions, which are executed by a processor and perform any of the methods described herein.
- (9) It is to be understood that both the foregoing general description and the following detailed description are exemplary and explanatory only and are not restrictive of the claims.

## **Description**

#### BRIEF DESCRIPTION OF THE DRAWINGS

- (1) The accompanying drawings, which are incorporated in and constitute a part of this disclosure, illustrate various disclosed embodiments. In the drawings:
- (2) FIG. **1** is an example of a system for providing cloud-based access to consumer financial data, consistent with disclosed embodiments;
- (3) FIG. **2** is an example of a cloud-based data platform, consistent with disclosed embodiments;
- (4) FIG. **3** is an example of a memory contained within a cloud-based data platform, consistent with disclosed embodiments;
- (5) FIG. 4 is an example of a mobile device, consistent with disclosed embodiments;
- (6) FIG. **5** is an example of a process for providing cloud-based access to consumer financial data, consistent with disclosed embodiments;
- (7) FIG. **6** is an example of a third party authorization process, consistent with disclosed embodiments;
- (8) FIG. 7 is an example of a token configuration process, consistent with disclosed embodiments;
- (9) FIG. 8 is an example of a token operation process, consistent with disclosed embodiments; and
- (10) FIG. **9** is an example of a third party application operation process, consistent with disclosed embodiments.

#### DETAILED DESCRIPTION

- (11) The following detailed description refers to the accompanying drawings. Wherever possible, the same reference numbers are used in the drawings and the following description to refer to the same or similar parts. While several illustrative embodiments are described herein, modifications, adaptations and other implementations are possible. For example, substitutions, additions or modifications may be made to the components illustrated in the drawings, and the illustrative methods described herein may be modified by substituting, reordering, removing, or adding steps to the disclosed methods. Accordingly, the following detailed description is not limiting of the disclosed embodiments. Instead, the proper scope is defined by the appended claims.
- (12) Disclosed embodiments provide systems and methods for providing cloud-based access to consumer financial data, for example, to third party service providers seeking to provide mobile services through mobile applications. The mobile applications may provide access to consumer financial data or functions related to financial services. A cloud-based platform, after receiving a data access request from a third party service provider, may determine that the third party service provider is authorized and provisioned by both the consumer and an associated financial service account provider. For example, the cloud-based platform may configure a software object (e.g., a token) providing limited access to the specific consumer financial data and functions that the third party service provider is authorized to access. After the cloud-based platform receives and verifies the software object provided by the third party service provider, the cloud-based platform may authorize the third party service provider to access the specified consumer financial data via the cloud.
- (13) FIG. **1** is an example of a system **100** for providing financial services over a secure network infrastructure, consistent with a disclosed embodiment. System **100** may be configured to perform one or more software processes that, when executed, provide one or more aspects of the disclosed embodiments. The components and arrangement shown in FIG. **1** is not intended to be limiting to the disclosed embodiment as the components used to implement the processes and features disclosed here may vary.
- (14) In accordance with a disclosed embodiment, system **100** includes a cloud platform **101**, a banking system **102**, a third party service provider **103**, and a mobile device **106** configured to communicate over a network, which may include network **104** and wireless carrier network **105**.

For example, mobile device **106** may communicate over wireless carrier network **105**, and may also communicate over network **104** (e.g., via a Wi-Fi connection). Other components known to one of ordinary skill in the art may be included in system **100** to process, transmit, provide, and receive information consistent with the disclosed embodiments. For example, in addition to or in place of mobile device **106**, one or more other client devices (e.g., desktop computer, laptop computer, etc.) may be included to communicate with the components of system **100**. (15) Cloud platform **101** may be a computer-based system including computer system components, such as one or more servers, desktop computers, workstations, tablets, hand held computing devices, memory devices, and/or internal network(s) connecting the components. In one embodiment, cloud platform **101** may be a server that includes one or more processor(s), memory devices, and interface components configured to provide a cloud-based service. As used in this disclosure, services, processes, or applications that are "cloud-based" refer to scalable, distributed execution of one or more software processes over a network using real or virtual server hardware. Cloud platform **101** may be a single server or a distributed computer system including multiple servers or computers that interoperate to perform one or more of the processes and functionalities associated with the disclosed embodiments.

- (16) In some embodiments, cloud platform **101** may be a server that is associated with a financial institution. The financial institution may be, for example, a bank, lender, merchant, credit card provider, or any other entity that provides financial accounts to customers. The financial institution may manage cloud platform **101** such that cloud platform **101** may be used to perform financial services. In some embodiments, the financial institution may be the same institution that is associated with banking system **102**. In other embodiments, the financial institution may be a different institution than that associated with banking system **102**. In alternative embodiments, cloud platform **101** may be hosted and managed by an entity other than a financial institution, such as a network service provider, internet service provider, telecommunications firm, etc. These entities may execute business agreements with financial institutions enabling them to manage financial data via cloud platform **101**.
- (17) Banking system 102 may be a computer-based system associated with a financial institution, such as a bank, credit union, credit card issuer, or other type of financial service entity that generates, provides, manages, and/or maintains financial service accounts. Financial service accounts may include, for example, credit card accounts, checking accounts, savings accounts, loan accounts, reward accounts, and any other types of financial service account. Financial service accounts may be associated with electronic accounts, such as a digital wallet or similar account that may be used to perform electronic transactions, such as purchasing goods and/or services online. Financial service accounts may also be associated with physical financial service account cards, such as a credit or check card that a user may carry on their person and use to perform financial service transactions, such as purchasing goods and/or services at a point of sale (POS) terminal. Banking system 102 may include infrastructure and components that are configured to generate and provide financial service accounts and financial service account cards (e.g., credit cards, check cards, etc.). Banking system 102 may also include infrastructures and components that are configured to store financial data associated with the financial service accounts.
- (18) In embodiments in which cloud platform **101** is also associated with a financial institution, banking system **102** may be associated with the same or a different financial institution. In certain embodiments in which cloud platform **101** and banking system **102** are associated with the same financial institution, cloud platform **101** may be an integrated component of banking system **102**. For example, banking system **102** may be an overall computing system associated with a financial institution, with cloud platform **101** being a component thereof.
- (19) Third party service provider **103** may be a computer-based system associated with a third party. For example, third party service provider **103** may be associated with a merchant configured to provide one or more services to consumers. Third party service provider **103** may include one or

more computing systems that are configured to perform computer-implemented processes, such as a server, desktop, laptop, mobile device, etc.

- (20) Banking system **102** and third party service provider **103** may be configured to communicate with cloud platform **101** via network **104**. Network **104** may be any type of network that provides communications, exchanges information, and/or facilitates the exchange of information between cloud platform **101** and other components of system **100**, such as banking system **102**, third party service provider **103**, and/or mobile device **106**. In one embodiment, network **104** may be the Internet, or any other suitable connection(s) that enables system **100** to send and receive information between the components of system **100**. In other embodiments, one or more components of system **100** may communicate directly through a dedicated communication link(s) (not shown), such as a link between cloud platform **101** and banking system **102**.
- (21) In some embodiments, cloud platform **101** may communicate with banking system **102** and/or third party service provider **103** through one or more application programming interfaces (APIs). The one or more APIs may be configured to allow for the transmission and receipt of data between components, according to one or more processes associated with the provision of a particular service. For example, a peer-to-peer (P2P) transfer API between cloud platform **101** and third party service provider **103** may allow for sharing and processing of particular data associated with completion of a P2P transfer, such as a transfer of money from one consumer's account to another consumer's account.
- (22) Mobile device **106** may be a client device in the form of one or more mobile, computer-based systems. For example, mobile device **106** may be a tablet or smartphone. In alternative embodiments, another client device, such as a desktop computer, laptop computer, tablet computer, server, point of sale device, kiosk, ATM, or the like, may be included in system **100** in place of or in addition to mobile device **106** and perform some or all of the functions of mobile device **106**. In an exemplary embodiment, mobile device **106** may be associated with a consumer that maintains one or more financial accounts with a financial institution associated with cloud platform **101**, banking system **102**, and/or third party service provider **103**.
- (23) In an exemplary embodiment, mobile device **106** may be a device that receives, stores, and/or executes mobile applications. Mobile device **106** may be configured with storage that stores one or more operating systems that perform known operating system functions when executed by one or more processors, such as one or more software processes configured to be executed to run a mobile application.
- (24) Mobile device **106** may also include communication software that, when executed by a processor, provides communications with network **104** and wireless carrier network **105**, such as Web browser software, tablet or smart hand held device networking software, etc. In some embodiments, mobile device **106** may be configured to communicate with banking system **102** and/or third party service provider **103** via network **104** and/or wireless carrier network **105**. In these embodiments, banking system **102** and/or third party service provider **103** may be authorized to execute one or more software processes on mobile device **106** via network **104** and/or wireless carrier network **105**, such as a mobile application or a web applet. Wireless carrier network **105** may be a data service network configured to provide communications, exchange information, and/or facilitate the exchange of information between components of system **100**. It should be understood, however, that wireless carrier network **105** may be any network configured to perform these functions. In certain embodiments, wireless carrier network **105** and network **104** may be the same or otherwise related networks.
- (25) In an exemplary embodiment, system **100** may use infrastructures and components, such as banking system **102** and third party service provider **103** and integrate them into cloud platform **101**, which becomes a point of entry, and facilitates the integration of banking and third party services such that they are made available to mobile device **106** through communication with cloud platform **101**. In other embodiments, cloud platform **101** may provide information and access

enabling banking system **102** and third party service provider **103** to provide the services directly to mobile device **106** via network **104**.

- (26) FIG. 2 further depicts cloud platform 101. Cloud platform 101 may include a cloud server 201. Cloud server 201 may include one or more memories 202, one or more databases 203, one or more processors 204, and one or more interfaces 205. Cloud server 201 may take the form of a general purpose computer, a mainframe computer, a mobile computing device, or any combination of these components. According to some embodiments, cloud server 201 may include a web server or similar computing device that generates, maintains, and provides one or more web sites or similar services, consistent with disclosed embodiments. Cloud server 201 may be standalone, or it may be part of a subsystem, which may be part of a larger system. For example, cloud server 201 may represent distributed servers that are remotely located and communicate over a network (e.g., network 140) or a dedicated network, such as a LAN. In some embodiments, one or more of banking system 102, third party service provider 103, and mobile device 106 may include the components and/or configuration of cloud platform 101 and/or cloud server 201. It should be understood that the illustrated system architecture described herein associated with cloud platform 101 is presented as a non-limiting example only, and that any other system configuration operable to perform the disclosed embodiments is possible.
- (27) Memory **202** may include one or more storage devices configured to store instructions used by processor **204** to perform functions related to disclosed embodiments. For example, memory **202** may be configured with one or more software instructions that may perform one or more operations when executed by processor **204**. The disclosed embodiments are not limited to separate programs or computers configured to perform dedicated tasks. For example, memory **202** may include a single program that performs the functions of server **201** or a program could comprise multiple programs. Additionally, processor **204** may execute one or more programs located remotely from cloud server **201**. For example, banking system **102**, third party service provider **103**, and/or mobile device **106** may, via cloud server **201**, access one or more remote programs that, when executed, perform functions related to certain disclosed embodiments. Memory **202** may also store data that may reflect any type of information in any format that the system may use to perform operations consistent with the disclosed embodiments.
- (28) Cloud server **201** may be communicatively connected to database(s) **203** (e.g., via network **104**) or database **203** may be an integrated component of cloud platform **101** and/or cloud server **201**. Database **203** may include one or more memory devices that store information and are accessed and/or managed through cloud server **201**. By way of example, database(s) **203** may include Oracle<sup>TM</sup> databases, Sybase<sup>TM</sup> databases, or other relational databases or non-relational databases, such as Hadoop sequence files, HBase, or Cassandra. The databases or other files may include, for example, data and information related to the source and destination of a network request, the data contained in the request, etc. Database **203** may include computing components (e.g., database management system, database server, etc.) configured to receive and process requests for data stored in memory devices of database(s) **203** and to provide data from database(s) **203**.
- (29) Processor(s) **204** may include one or more known processing devices, such as a microprocessor from the Pentium<sup>TM</sup> or Xeon<sup>TM</sup> family manufactured by Intel<sup>TM</sup>, the Turion<sup>TM</sup> family manufactured by AMD<sup>TM</sup>, or any of various processors manufactured by Sun Microsystems. The disclosed embodiments are not limited to any type of processor(s) configured in cloud server **201**.
- (30) Interfaces **205** may be one or more devices configured to allow data to be received and/or transmitted by cloud server **201**. Interfaces **205** may include one or more digital and/or analog communication devices that allow cloud server **201** to communicate with other machines and devices, such as other components of system **100**.
- (31) FIG. 3 is a block diagram of memory 202. In addition to the structures and functions described

- previously in connection with FIG. **2**, memory **202** may contain one or more dedicated software modules configured to perform the disclosed embodiments. In one embodiment, these modules may include an authorization engine **301**, a token configuration engine **302**, and a token operation engine **303**.
- (32) Authorization engine **301** may be configured to perform processes associated with the provisioning and authorization of third party service providers (such as third party service provider **103**), applications, and services. An exemplary third party authorization process **520** is described below in association with FIGS. **5** and **6**.
- (33) Token configuration engine **302** may be configured to perform processes associated with generating, programming, and deploying secure software objects, or "tokens," to third party service providers (such as third party service provider **103**) for purposes of identification, verification, and access to authorized consumer financial data. An exemplary token configuration process **530** is described below in association with FIGS. **5** and **7**.
- (34) Token operation engine **303** may be configured to perform processes associated with recognizing and verifying third party tokens, such as those configured by token configuration engine **302**. Token operation engine **303** may be further configured to determine consumer financial data authorized for access by a third party bearing the token. An exemplary token operation process **540** is described below in association with FIGS. **5** and **8**.
- (35) FIG. **4** is a block diagram of mobile device **106**. Mobile device **106** may comprise a memory **401** and one or more processor(s) **405**. Memory **401** may include instructions to enable processor(s) **405** to execute one or more applications, such as server applications, network communication processes, and any other type of application or software known to be available on computer systems.
- (36) In one embodiment, memory **401** includes instructions that, when executed by processor(s) **405**, perform one or more processes consistent with the functionalities disclosed herein. Methods, systems, and articles of manufacture consistent with disclosed embodiments are not limited to separate programs or computers configured to perform dedicated tasks. Moreover, processor(s) **405** may execute one or more programs from remote resources. For example, components of financial services system **100** may access one or more remote programs, that, when executed, perform functions related to disclosed embodiments.
- (37) Memory **401** may include a mobile application **402**, a client operating system **403**, and an authorization engine **404**. Mobile application **402** may be any software object configured to perform a service or process when executed by processor **405**. Mobile application **402** may be associated with one or more entities, such as cloud platform **101**, banking system **102**, third party service provider **103**, combinations of these entities, or other entities. In some embodiments, mobile application **402** may be a financial application that allows a user of mobile device **106** to access and control various financial service accounts, such as those associated with banking system **102**. In other embodiments, mobile application **402** may be another type of application providing access to financial data including, but not limited to, an auction application, a trading application, a game, an application for viewing various media (e.g., television shows, movies, music videos, etc.), or a "wallet" application for making in-person purchases at a point of sale. This list is not intended to be limiting, and one skilled in the art may conceive of any number of software applications hosted on a mobile device that could incorporate access to consumer financial data.
- (38) Client operating system **403** may be a software object or associated series of software objects that provide a graphical user interface to interact with other software contained in memory **401**, such as one or more mobile applications **402**. Examples of client operating systems **403** include, for example, Apple® iOS®, Google® Android®, Microsoft® Windows Mobile®, etc. Client operating system **403** may be pre-loaded onto mobile device **106** by the device manufacturer or may be installed by the user.
- (39) Authorization engine 404 may be configured to perform processes associated with the

provisioning and authorization of third party service providers (such as third party service provider 103), applications, and services. Authorization engine 404 may be configured to interact and communicate with authorization engine 301 of cloud platform 101 via wireless carrier network 105. Authorization engine 404 may assist in execution of various processes to authorize and provision third party service providers, such as third party service provider 103, which may then provide services via one or more mobile applications, such as mobile application 402. An exemplary third party authorization process 520 is described below in association with FIGS. 5 and 6. It should be understood that the illustrated structure of mobile device 106 described herein is presented as a non-limiting example only, and that any other configuration operable to perform the disclosed embodiments is possible. As discussed above, in some embodiments, another client device such as a desktop computer, laptop computer, tablet computer, server, point of sale device, kiosk, ATM, or the like, may be included in system 100 in place of or in addition to mobile device 106 and perform some or all of the functions of mobile device 106.

- (40) FIG. **5** illustrates a consumer financial data access process **500** consistent with certain disclosed embodiments. Process **500**, as well as any or all of the individual steps therein, may be performed by any one or more of cloud platform **101**, banking system **102**, third party service provider **103**, or mobile device **106**. For exemplary purposes, process **500** is described as being performed by cloud platform **101**.
- (41) In a preferred embodiment, authentication information passed from a third party, such as third party service provider **103**, to cloud platform **101** includes Information as to whether or not the third party service has been previously authorized by a consumer to access that consumer's financial information. Once it has been established that the third party service is authorized to access the consumer's financial information, the consumer's financial data, including banking or credit card account information, may be used to initiate and complete a third party transaction initiated from the third party service.
- (42) Cloud platform **101** may receive a request for authorization to access consumer financial data via authorization engine **301** from a third party, such as third party service provider **103** (Step **510**). The request may be received via network **104**, or by other methods, such as by telephone or by postal mail. In some embodiments, the request may contain various information, including but not limited to information identifying the third party, information identifying or exemplifying an application or service that the third party seeks to provide, or information identifying the amount or types of consumer financial data that the third party seeks to access for purposes of providing the application or service.
- (43) In some embodiments, cloud platform **101** may deny or otherwise decline to act on the third party request. In these embodiments, third party service provider **103** may have the option to transmit the request to a different cloud platform or similar service provider, or may alternatively alter their request and re-submit it to cloud platform **101**. In some embodiments, cloud platform **101** may agree to assist third party service provider **103**, and the two parties may enter into a business relationship. In these embodiments, cloud platform **101** may make the business relationship itself or terms and conditions of the relationship contingent upon third party service provider **103** meeting one or more predetermined criteria. For example, in some embodiments, cloud platform **101** may conduct an investigation or other background check into third party service provider **103** and/or individuals associated with it. In other embodiments, cloud platform **101** may insist upon undertaking technical configuration of computing systems associated with third party service provider **103** to ensure compatibility with other components of system **100** and to establish a trusted relationship with third party service provider **103**.
- (44) As part of the trusted business relationship between cloud platform **101** and third party service provider **103**, cloud platform **101** may perform a third party authorization process, such as is disclosed below in connection with FIG. **6** (Step **520**). In brief, according to some embodiments, cloud platform **101** (via authorization engine **301**) may determine if a financial service account

provider, such as banking system **102**, authorizes access to consumer financial data by the trusted third party, such as third party service provider **103**. If the financial service account provider authorizes access, cloud platform **101** may identify consumers relevant to the third party request, and may determine if those consumers individually authorize access by the third party to their consumer financial data. If the consumers also authorize access, cloud platform **101** may configure an access token for the third party. If either the financial service account provider or the individual consumer declines authorization of the third party, cloud platform **101** denies the third party access to the consumer financial data.

- (45) Cloud platform **101** may next perform a token configuration process, such as is disclosed below in connection with FIG. **7** (Step **530**). In brief, according to some embodiments, cloud platform **101** (via token configuration engine **302**) may configure a digital certificate for secure access to consumer financial data by the authorized third party. In some embodiments, the digital certificate may be configured using Secure Sockets Layer (SSL) technology. Cloud platform **101** may determine financial data and functions associated with the authorizing banking system **102**, then determine a subset of the data and functions associated with the authorizing consumers. Within the consumer data and function set, token configuration engine **302** may determine the particular subset of data and functions that the consumer has authorized the third party to access. Engine **302** may then configure a token providing the third party access to the authorized consumer financial data.
- (46) Cloud platform **101** may perform a token operation process, such as is disclosed below in connection with FIG. **8** (Step **540**). In brief, according to some embodiments, cloud platform **101** (via token operation engine **303**) may receive a request for access to consumer financial data by a third party, such as third party service provider **103**. Token operation engine **303** may confirm that the third party is an authorized party, then request, receive, and verify the third party's previously configured digital certificate. Engine **303** may read or execute software instructions stored within the third party token to determine what, if any, consumer financial data that the third party may access for any given consumer, and then provide the third party with the authorized consumer data. (47) FIG. **6** illustrates a third party authorization process (corresponding to Step **520** of process **500** disclosed above) consistent with certain disclosed embodiments. Process **520**, as well as any or all of the individual steps therein, may be performed by any one or more of cloud platform **101**, banking system **102**, third party service provider **103**, or mobile device **106**. For exemplary purposes, FIG. **6** is described as being performed by cloud platform **101**.
- (48) As will be understood by those skilled in the art, there may be multiple ways of establishing a trusted relationship with a third party service, such as exchange of tokens or passing certain authentication information from third party service provider **103** and cloud platform **101**. By creating a trusted relationship, third party service provider **103** may be able to access one or more restricted functional modules, data, libraries or other services within cloud platform **101** not accessible by a untrusted third party. For example, third party service provider **103** may access certain secure and private consumer data and information.
- (49) In one embodiment, cloud platform 101, via authorization engine 301, may determine if a financial service account provider, such as a provider associated with banking system 102, authorizes and authenticates a third party, such as third party service provider 103 (Step 610). Authorization engine 301 may make the determination by transmitting the third party request to banking system 102 via network 104, or by other means. In some embodiments, authorization engine 301 may provide banking system 102 with information about the third party service provider 103 that is seeking authorization, such as identifying information, information about proposed third party services and/or applications, information about types of consumer financial data requested, etc. This list is not intended to be limiting and authorization engine 301 may provide more or less information for any particular third party.
- (50) If the financial service account provider does not authorize and authenticate the third party

- (Step **610**: NO), then authorization engine **301** declines the third party authorization request (Step **620**). Conversely, if banking system **102** does indicate that the third party is authorized and authenticated (Step **610**: YES), then authorization engine **301** proceeds and determines particular consumers associated with the financial service account provider (Step **630**). In some embodiments, the consumers may be existing customers of the financial service account provider, and the financial service account provider may have previously configured a financial service account for the consumers. In other embodiments, banking system **102** may have acquired the consumers' financial data via other means.
- (51) Cloud platform **101**, via authorization engine **301**, may determine if the individual consumers authorize and authenticate the third party (Step **640**). Authorization engine **301** may make the determination by transmitting the third party request to mobile device **106** via wireless carrier network **105**, or by other means. In some embodiments, authorization engine **301** may provide the consumer(s) with information about the third party service provider **103** that is seeking authorization, such as identifying information, information about proposed third party services and/or applications, information about types of consumer financial data requested, etc. This list is not intended to be limiting and authorization engine **301** may provide any appropriate information for any particular third party.
- (52) If the consumer does not authorize and authenticate the third party (Step **640**: NO), then authorization engine **301** declines the third party authorization request (Step **650**). Conversely, if the consumer does indicate that the third party is authorized and authenticated (Step **640**: YES), for example, through mobile application **402** or by an electronic mail message, then authorization engine **301** proceeds to begin configuration of an access token allowing the third party access to financial data (Step **660**).
- (53) In some embodiments, authorization engine **301** may be configured to permit one or more of the financial service account provider associated with banking system **102** and/or the consumer to revoke any authorization or "provisioning" granted to the third party as part of process **520** at any time after the authorization. In these embodiments, authorization engine **301** and other components of cloud platform **101** and cloud server **201** as illustrated in FIG. **2** may be capable of Instantaneously disabling any and all access by the third party to financial data associated with an individual consumer or to any data associated with banking system **102** as a whole.
- (54) FIG. **7** illustrates a token configuration process (corresponding to Step **530** of process **500** disclosed above) consistent with certain disclosed embodiments. Process **530**, as well as any or all of the individual steps therein, may be performed by any one or more of cloud platform **101**, banking system **102**, third party service provider **103**, or mobile device **106**. For exemplary purposes, FIG. **7** is described as being performed by cloud platform **101**.
- (55) Cloud platform **101**, via token configuration engine **302**, may configure a digital certificate for the authorized third party (Step **710**). The purpose of the certificate is to identify the third party and provide enhanced security for consumer data. In some embodiments, the digital certificate may be initially configured at the onset of a trusted business relationship between cloud platform **101** and third party service provider **103**. The certificate and the identification information comprising it may be updated at any time after its initial configuration. As part of a "handshake" over network **104** between cloud platform **101** and third party service provider **103**, cloud platform **101** may require that the third party provide a secure certificate to verify their identity and their "trusted" status. In some embodiments, cloud platform **101** may be capable of revoking the digital certificate of any third party service provider **103**, denying them access to any consumer financial data, financial institution data, or other information and services hosted by cloud platform **101**. Although in preferred embodiments the verification is achieved via a certificate configured using SSL technology, it is understood that token configuration engine **302** may employ any like technology providing secure verification of identity.
- (56) Token configuration engine 302 may determine one or more banking functions and data

associated with a particular financial service account provider, such as that associated with banking system **102** (Step **720**). Examples of banking functions and data that may be associated with a financial services account may include, but are not limited to, the credit score of the consumer, or demographic information associated with the consumer, recent transactions and account balances, configuring account-related alerts, configuring automatic bill payment, transferring funds between accounts, transferring funds to external systems, and locating associated service provider locations. It is understood the foregoing data and functions are exemplary, and that any particular banking system **102** may be capable of providing more or fewer functions and data. Token configuration engine **302** may parse the information using processor **204**, and may store the information in memory **202** or database **203**.

- (57) Within the identified banking functions and data, token configuration engine **302** may determine a subset of the data and functions associated with the consumers that the third party desires to target with services or offers (Step **730**). For example, token configuration engine **302** may be configured to access and scan financial service accounts and/or data associated with the consumers, and determine which functions and data are present in each individual consumer's account within banking system **102**. Token configuration engine **302** may parse the accounts using processor **204**, and may store the information relating to the associated functions and/or data in memory **202** or database **203**.
- (58) Next, token configuration engine **302** may determine a further subset of consumer data and/or functions that the third party, such as third party service provider **103**, is authorized to access (Step **740**). Token configuration engine **302** may be configured to communicate directly with authorization engine **301** to determine the authorized data and/or functions authorized by both the financial service account provider and the individual consumer (for example, during authorization process **520**). Alternatively, token configuration engine **302** may determine the authorized data and/or functions from information stored in memory **202** and/or database **203**.
- (59) Token configuration engine **302** may configure a software object, such as an application programming interface, relating to the financial information authorized for access in the processes described previously (Step **750**). The software object (e.g., a "token") may be configured to inform components of system 100, such as cloud platform 101, what data and/or functions that banking system **102** and individual consumers have authorized third party service provider **103** to access. (60) In some embodiments, the token may contain various categories or arrangements of the possible consumer financial data or functions that the third party could potentially access, along with an indication of whether or not third party service provider **103** is actually authorized to access the data. For example, a consumer's financial service account hosted on banking system **102** may be configured to transfer funds between accounts, transfer funds to external systems, show account balances, and set up recurring payments. In one embodiment, a particular third party service provider **103** may be authorized to access certain information (e.g., only the account balances), and token configuration engine **302** may configure the token for that particular third party service provider **103** to reflect that authorization status. In some embodiments, a particular third party may be "preferred" by one or more of the consumer or the financial service provider, and may thus be authorized to access more data. For example, in the scenario discussed above, one service provider might only be able to access the account balances of a consumer, while a "preferred" third party service provider might be able to access the funds transfer and recurring payment functions as well as the account balances. In these embodiments, the various tokens for each service provider are configured by token configuration engine **302** to reflect their individual levels of authorization. Upon configuration, token configuration engine **302** may store one or more copies of the configured token in memory 202 and/or database 203, and may provide a copy of the token to the third party service provider **103** via network **104**.
- (61) The information contained within the token is invariably sensitive, private information and, before the token leaves the secured environment of cloud platform **101**, certain steps may help to

ensure that unauthorized parties are not able to access, view, and use the information. In some embodiments, token configuration engine **302** may configure additional encryption for the token. In other embodiments, token configuration engine **302** may implement a password protection scheme for the token. In these embodiments, the password protection scheme may further comprise configuring and implementing additional security questions to further limit access. In some embodiments, cloud platform 101 may generate terms of service or other similar security and usage agreements, and require acknowledgement of the terms of service by third party service provider **103**. The token may be configured with one or more layers of required authorization (for example, using the OAuth 2 standard), and may require verification by one or both of cloud platform 101 or third party service provider **103** to display or access authorization data contained within the token. Token configuration engine **302** may configure the token so the information contained within the token cannot be downloaded by any end user. In some embodiments, the configured token security credentials may include biometric or other physical characteristics provided by one or more of banking system **102** or third party service provider **103** to access the authorized data or functions. In other embodiments, the credentials may include physical devices required for access, such as a key, dongle, card, or other such device. Token configuration engine 302 may further configure the token to operate under Hypertext Transfer Protocol Secure (HTTPS) or other comparable security protections over network **104**.

- (62) FIG. **8** illustrates a token operation process (corresponding to Step **540** of process **500** disclosed above) consistent with certain disclosed embodiments. Process **540**, as well as any or all of the individual steps therein, may be performed by any one or more of cloud platform **101**, banking system **102**, third party service provider **103**, or mobile device **106**. For exemplary purposes, FIG. **8** is described as being performed by cloud platform **101**.
- (63) Cloud platform **101**, via token operation engine **303**, may receive a request from third party service provider **103** to access consumer financial information, such as banking data and functions as described previously (Step **810**). The request may be received electronically via network **104**, or may be received by alternative means such as by telephone or by postal mail.
- (64) In some embodiments, token operation engine **303** may request (Step **820**) and receive (Step **830**) a previously-configured digital certificate for purposes of identification. In some embodiments, token configuration engine **302** may have configured the certificate for the third party as part of the authorization or token configuration processes described above, or may have done so at the onset of a business relationship between cloud platform **101** and third party service provider **103**.
- (65) Token operation engine **303** may verify that the identification certificate proffered by third party service provider **103** is valid (Step **840**). The verification of the certificate may be performed by any means known to those possessing ordinary skill in the art. As an example, processor **204** may read information contained in the certificate, compare it to identification information stored in memory **202** and/or database **203**, and upon confirmation that the proffered information matches the stored information for the certificate, provide a notification to the third party service provider computer system (not shown) that the certificate is valid.
- (66) Token operation engine **303** may determine consumer financial data and/or functions that the third party is authorized to access for a given consumer (Step **850**). As discussed previously, a "token" in the context of the disclosed embodiments is a configured software object containing information relating to access levels to various types of consumer data or functions for a given third party service provider. For example, token operation engine **303**, via processor **204**, may read a token proffered by third party service provider **103**, and determine from the stored information therein which consumer data or functions, if any, that the third party is authorized to access. (67) Token operation engine **303** may compare the authorized information stored within the token to the specific data and functions that the third party has requested to access. If the request exceeds the authorization levels stored in the token, token operation engine **303** may deny access to the

unauthorized data or functions, and may provide an indication as such to third party service provider **103**. If the requested data and/or functions are authorized based on the token information, token operation engine **303** may provide access to the data and/or functions (Step **860**). In some embodiments, token operation engine 303 may permit only access to the data, not digital copies of the data Itself, in order to provide security and prevent unauthorized dissemination of sensitive financial information. In these embodiments, access to the data is provided via remote, cloudbased, read-only access, and the consumer data is not transmitted to the third party service provider. Token operation engine 303 may provide access to the stored financial data or functions from within memory **202** and/or database **203** via a link over network **104**, or may provide access to that information directly from banking system **102** over network **104**. In some embodiments, any or all of cloud platform **101**, banking system **102**, or the individual consumer (via authorization engine **404** of mobile device **106**) may be configured to revoke authorization and access by third party service provider **103** to specific data or services at any time subsequent to an initial authorization. In these embodiments, as discussed above, token configuration engine **302** may revoke or otherwise cancel the initially configured token. If some level of more limited access by third party service provider **103** is still authorized, token configuration engine **302** may configure a new token based on the revised authorization and access circumstances.

- (68) FIG. **9** illustrates a third party application operation process **900** consistent with certain disclosed embodiments. Process **900**, as well as any or all of the individual steps therein, may be performed by any one or more of cloud platform **101**, banking system **102**, third party service provider **103**, or mobile device **106**. For exemplary purposes, FIG. **8** is described as being performed by third party service provider **103**.
- (69) In one embodiment, third party service provider 103 may receive a request from a consumer to provide a mobile service (Step 910). The request may be received from mobile device 106, and may comprise a request or invitation for third party service provider 103 to perform or provide a mobile service to the consumer using consumer financial data. In some embodiments, the request may be associated with a mobile application 402 that is associated with one or more of the consumer, a financial service account provider, such as that associated with banking system 102, or third party service provider 103. In alternative embodiments, the third party service provider may offer a mobile service or application to the consumer via mobile device 106 or other means over wireless carrier network 105, and may receive an indication of offer acceptance from mobile device 106.
- (70) Third party service provider **103** may request (Step **920**) and receive (Step **930**) authorization to seek access to consumer financial information. This authorization may be achieved in substantially the same manner as that described in authorization process **520** described above. Furthermore, third party service provider **103** may seek and secure authorization via cloud platform **101** from the consumer and from banking system **102**. In some embodiments, the consumer may authorize third party service provider **103** as part and parcel of their initial request for the mobile service.
- (71) Third party service provider **103** may determine consumer financial data or functions required to perform the requested mobile service (Step **940**). In some embodiments, third party service provider **103** may have previously configured application **402** to provide the requested mobile service, and application **402** may contain Information relating to the required data or functions. (72) After determining the consumer financial data and/or functions necessary to perform the requested mobile service(s), third party service provider **103** may request (Step **950**) and receive (Step **960**) access to those data and/or functions via cloud platform **101**. In some embodiments, cloud platform **101** (via token configuration engine **302**) may respond to the third party request by performing a token configuration process substantially similar to token configuration process **530** described above.
- (73) After receiving the configured token from cloud platform 101, third party service provider 103

may, instantaneously or at a later time, proffer the token to cloud platform **101** to access the required consumer financial data and/or functions (Step **970**). In some embodiments, cloud platform **101** (via token operation engine **303**) may respond to the third party proffering of the token by performing a token operation process substantially similar to token operation process **540** described above.

- (74) In some embodiments, the foregoing steps complete the process, and with access to the necessary consumer financial data and/or functions, third party service provider 103 may provide the requested mobile service to the consumer via one or more mobile applications 402 contained within memory 401 and executed by processor 405 of mobile device 106. In alternative embodiments, however, third party service provider 103 may prompt a consumer to accept a service or an offer relating to consumer financial information spontaneously, without receiving a previous request from the consumer. As a non-limiting example, third party service provider 103 may be an entity engaged in the advertising industry. Third party service provider 103 may receive a request from one of its clients, such as a merchant providing goods and services to consumers. The merchant may desire to provide certain consumers with incentive offers, free items, gift cards, or the like to promote its business, and may employ third party service provider 103 to access the consumer data in order to provide those items.
- (75) In these embodiments, third party service provider **103** may perform additional operational steps. Third party service provider **103** may determine consumers who are eligible or otherwise targeted for a mobile service, such as the incentive offers, gift cards, etc., disclosed above (Step **980**). For example, if third party service provider **103** is tasked with providing an incentive offer to patrons of a restaurant, third party service provider 103 may desire to access transaction histories of consumers to determine individuals who have recently dined at the restaurant. The restaurant may then provide the consumers with offers as an incentive for a repeat visit. Alternatively, third party service provider **103** may use the transaction history information to determine individuals who have recently dined at other restaurants (e.g., competitors). The restaurant may be interested in providing these consumers with a particular incentive offer in order to increase their market share relative to the other competing restaurants. Therefore, third party service provider **103** may seek authorization to access consumer financial data as described above. Third party service provider 103 may then determine specific consumers to target for the mobile service based on to the accessed consumer financial data and/or functions. After accessing the data and determining the consumers that are eligible for the mobile offer/service, third party service provider **103** may provide the mobile service to the eligible consumers using the processes described previously (Step 990).
- (76) The foregoing description has been presented for purposes of illustration. It is not exhaustive and is not limited to the precise forms or embodiments disclosed. Modifications and adaptations will be apparent to those skilled in the art from consideration of the specification and practice of the disclosed embodiments. For example, the described implementations include software, but systems and methods consistent with the disclosed embodiments be implemented as a combination of hardware and software or in hardware alone. Examples of hardware include computing or processing systems, including personal computers, servers, laptops, mainframes, micro-processors and the like. Additionally, although aspects of the disclosed embodiments are described as being stored in memory, one skilled in the art will appreciate that these aspects can also be stored on other types of computer readable media, such as secondary storage devices, for example, hard disks, floppy disks, or CD ROM, or other forms of RAM or ROM, USB media, DVD, or other optical drive media.
- (77) Computer programs based on the written description and disclosed methods are within the skill of an experienced developer. The various programs or program modules can be created using any of the techniques known to one skilled in the art or can be designed in connection with existing software. For example, program sections or program modules can be designed in or by means of

.Net Framework, .Net Compact Framework (and related languages, such as Visual Basic, C, etc.), Java, C++, Objective-C, HTML, HTML/AJAX combinations, XML, or HTML with included Java applets. One or more of such software sections or modules can be integrated into a computer system or existing e-mail or browser software.

(78) Moreover, while illustrative embodiments have been described herein, the scope of any and all embodiments having equivalent elements, modifications, omissions, combinations (e.g., of aspects across various embodiments), adaptations and/or alterations as would be appreciated by those skilled in the art based on the present disclosure. The limitations in the claims are to be interpreted broadly based on the language employed in the claims and not limited to examples described in the present specification or during the prosecution of the application. The examples are to be construed as non-exclusive. Furthermore, the steps of the disclosed routines may be modified in any manner, including by reordering steps and/or inserting or deleting steps. It is intended, therefore, that the specification and examples be considered as illustrative only, with a true scope and spirit being indicated by the following claims and their full scope of equivalents.

## **Claims**

- 1. A system, comprising: at least one memory storing instructions; and at least one processor configured to execute the instructions to: send, by a service provider, a request for access to user data on a cloud platform, the request including a digital certificate indicating a user associated with the user data has authorized the service provider to access to the user data; receive, by the service provider, the requested user data based on a determination by the cloud platform that the service provider has authorized access; determine, by the service provider, that the user is eligible for a service via the service provider based on the user data; send, by the service provider, a request to the user via a mobile device to accept the eligible service; receive, by the service provider, a response from the user, via the mobile device; and provide, by the service provider, the eligible service to the user via the mobile device.
- 2. The system of claim 1, wherein the determination by the cloud platform that the service provider has authorized access further comprises: determining that the requested user data does not exceed an authorized portion of the user data.
- 3. The system of claim 1, wherein the digital certificate comprises a Secure Sockets Layer (SSL) certificate.
- 4. The system of claim 1, wherein the digital certificate further indicates the authorization status of the service provider.
- 5. The system of claim 1, wherein the digital certificate further indicates that the service provider has previously accessed data associated with the user.
- 6. The system of claim 1, wherein the user data comprises transaction history data associated with the user.
- 7. The system of claim 1, wherein the user data comprises information associated with a financial services account or a banking function associated with the user.
- 8. The system of claim 1, wherein the user data further comprises data associated with transfer of money from one consumer's account to another consumer's account.
- 9. The system of claim 1, wherein the user data further comprises data associated with configuring recurring payments.
- 10. The system of claim 1, wherein the eligible service further comprises an incentive offer to purchase goods or services from a merchant.
- 11. A method performed by one or more processors, the method comprising: sending, by a service provider, a request for access to user data on a cloud platform, the request including a digital certificate indicating a user associated with the user data has authorized the service provider to access to the user data; receiving, by the service provider, the requested user data based on a

determination by the cloud platform that the service provider has authorized access; determining, by the service provider, that the user is eligible for a service via the service provider based on the user data; sending, by the service provider, a request to the user via a mobile device to accept the eligible service; receiving, by the service provider, a response from the user, via the mobile device; and providing, by the service provider, the eligible service to the user via the mobile device.

- 12. The method of claim 11, wherein the determination by the cloud platform that the service provider has authorized access further comprises: determining that the requested user data does not exceed an authorized portion of the user data.
- 13. The method of claim 11, wherein the digital certificate comprises a Secure Sockets Layer (SSL) certificate.
- 14. The method of claim 11, wherein the digital certificate further indicates the authorization status of the service provider.
- 15. The method of claim 11, wherein the digital certificate further indicates that the service provider has previously accessed data associated with the user.
- 16. The method of claim 11, wherein the user data comprises transaction history data associated with the user.
- 17. The method of claim 11, wherein the user data comprises information associated with a financial services account or a banking function associated with the user.
- 18. The method of claim 11, wherein the user data further comprises data associated with transfer of money from one consumer's account to another consumer's account.
- 19. The method of claim 11, wherein the user data further comprises data associated with configuring recurring payments.
- 20. A non-transitory computer-readable medium storing instructions executable by one or more processors to cause a computer system to execute a method, comprising: send, by a service provider, a request for access to user data on a cloud platform, the request including a digital certificate indicating a user associated with the user data has authorized the service provider to access to the user data; receive, by the service provider, the requested user data based on a determination by the cloud platform that the service provider has authorized access; determine, by the service provider, that the user is eligible for a service via the service provider based on the user data; send, by the service provider, a request to the user via a mobile device to accept the eligible service; receive, by the service provider, a response from the user, via the mobile device; and provide, by the service provider, the eligible service to the user via the mobile device.
