Background/Summary

FIELD OF THE INVENTION

(1) The present invention relates to heterobicyclic amides and related compounds which are inhibitors of CD38 and are useful in the treatment of cancer.

BACKGROUND OF THE INVENTION

(2) CD38 (cluster of differentiation 38) is a member of the ADP-ribosyl cyclase family that is widely expressed on the surface of multiple cell types and is responsible for the degradation of nicotinamide adenine dinucleotide (NAD.sup.+). CD38 was first characterized as a surface antigen on immune cells as an activation marker, located on the plasma membrane and on the membranes of intracellular organelles (Quarona, V., et al. *Cytometry B Clin Cytom* 84(4): 207-217 (2013)). Human CD38 contains 300 amino acid residues comprising a short N-terminal fragment, a single-pass trans-membrane helix, and a C-terminal catalytic domain. CD38 is generally classified as a type II membrane protein; however, it has also been reported as existing in a type III orientation (Zhao Y Z et al. *Biochim Biophys Acta* 1853(9): 2095-2103 (2012)). CD38 converts NAD.sup.+ to ADP-ribose (ADPR) or cyclic ADPR (cADPR) and nicotinamide (Chini E N et al. *Trends Pharmacol Sci* 39(4): 424-436 (2018)). While NAD.sup.+ is recognized as the major substrate for CD38, it is also known to have other substrates such as nicotinamide adenine dinucleotide phosphate (NADP.sup.+) and nicotinamide mononucleotide (NMN.sup.+). Under some conditions, CD38 can also catalyze base exchange reactions with these same substrates (Preugschat, F et al. *Arch Biochem Biophys*, 479: 114-20 (2008)). This CD38-dependent NAD.sup.+ metabolism regulates levels of extracellular and intracellular metabolites, intracellular Ca.sup.2+, and signal transduction pathways (Horenstein, A L, et al. *Oncoimmunology* 2(9): e26246 (2013)); Chini E N et al. 2018). CD38 also functions as a receptor, and the receptor-ligand activity of CD38 regulates development, activation, and differentiation of multiple immune cell types (Quorona B et al. 2013), and CD31/PECAM-1 has been reported to be a ligand for CD38 (Deaglio S, *J Immunol*, 160: 395-402 (1998)).

(3) CD38 exerts diverse physiological functions, and characterization of CD38 knockout (KO) mice has clarified the various roles played by this protein. CD38 KO mice are characterized by large decreases in endogenous cADPR levels in all tissues/organs analyzed except the brain (Partida-Sanchez S et al. *Nat Med*, 7: 1209-16 (2001); Ceni C et al. *J Biol Chem* 278(42): 40670-40678 (2003)) In the pancreatic islets, loss of CD38 impairs glucose-induced production of cADPR, intracellular Ca.sup.2+, and insulin secretion (Kato J et al. *J Biol Chem*, 274: 1869-72 (1999)). CD38 KO also impairs acetylcholine-induced accumulation of cADPR in acinar cells, leading to marked alteration of Ca.sup.2+ signaling patterns (Fukushi Y et al. *J Biol Chem*, 276: 649-55 (2001)). Likewise, in neutrophils, cADPR production has been shown to regulate both intracellular Ca.sup.2+ release and extracellular Ca.sup.2+ influx during chemotaxis and is required for bacterial clearance in vivo (Partida-Sanchez S et al. *Nat Med*, 7: 1209-16 (2001)). CD38 KO mice also show other defects, including disordered osteoclast formation and function (Sun L et al. *FASEB J*, 17: 369-75 (2003)), altered airway responsiveness (Deshpande D A et al. *Am J Respir Cell Mol Biol*, 32: 149-56 (2005)), impairment of dendritic cell trafficking and reduced humoral immune response (Partida-Sanchez S et al. *Immunity*, 20: 279-91 (2004)), inhibition of α -adrenoceptor-stimulated contraction in the aorta (Mitsui-Saito M et al. *J Vet Med Sci*, 65: 1325-30 (2003)), and cardiac hypertrophy (Takahashi J et al. *Biochem Biophys Res Commun*, 312: 434-40 (2003)). These findings clearly demonstrate the diverse biological roles played by CD38.

(4) CD38 expression has also been associated with the immunosuppressive functions of regulatory

T (Treg) cells, tumor-associated macrophages (TAMs) and myeloid-derived suppressive cells (MDSCs) (Feng X et al. *Clin Cancer Res* 23(15): 4290-4300 (2017); Krejci J et al. *Blood* 128(3): 384-394 (2016); Chevrier S et al. *Cell* 169(4): 736-749 e718 (2017); Levy A *Neuro Oncol* 14(8): 1037-1049 (2012)). CD38 KO Treg cells are remarkably sensitive to NAD.sup.+ -induced cell death due to their inability to consume NAD.sup.+ (Chen J et al. *J Immunol* 176(8): 4590-4599 (2006); Hubert, S B et al. *J Exp Med*, 207: 2561-8 (2010)). Conversely, Tregs with high CD38 expression are more suppressive than other subsets with lower or no CD38 expression (Krejci et al. 2016; Patton D T et al. *PLoS One* 6(3): e17359 (2011)). Likewise, CD38.sup.high MDSCs possess greater capacity to suppress activated T cells. The activity of such CD38.sup.high MDSCs promoted esophageal tumor growth in mice, an effect that could be inhibited by CD38 blockade (Karakasheva T A et al. *Cancer Res* 75(19): 4074-4085 (2015)). The expansion of functional CD38.sup.+ MDSCs has also been described in colorectal cancer, especially in patients who have previously undergone therapy (Karakasheva T A et al. *JCI Insight* 3(6) (2018)). Broad systems immunology approaches have revealed the association of CD38-expressing tumor-infiltrating lymphocytes (TILs) with poor prognosis in clear cell renal cell carcinoma (ccRCC) and early lung adenocarcinoma (Chevrier S et al. 2017; Lavin Y et al. *Cell* 169(4): 750-765 e717 (2017)). In ccRCC, it was determined that CD38 was co-expressed with other markers of T cell exhaustion, whereas in lung adenocarcinoma, CD38.sup.high Treg cells were enriched in the tumor microenvironment (TME) (Chevrier S et al. 2017; Lavin Y et al. 2017). High co-expression of CD38 and CD101 on TILs in tumor tissue was correlated with poor survival of pancreatic cancer patients (Zhang M et al. *Immunol Invest*, 48: 466-79 (2019)). A study looking into exhausted T cell populations in humans with chronic infection and various cancers identified CD38 as a T cell exhaustion marker, and the presence of such exhausted T cells was linked to more severe disease from HIV infection and dysfunctional TILs in lung cancer (Bengsch B et al. *Immunity* 48(5): 1029-1045 e1025 (2018)). CD38 also dictates the metabolic fitness of T cells, and the inhibition of CD38 expression on T cells upregulates NAD.sup.+ and activates T cells by promoting glutaminolysis, enhancing oxidative phosphorylation, and altering mitochondrial dynamics (Chatterjee S et al. 2018). This study further demonstrated that inhibition of CD38 prevented T cell exhaustion and thereby boosted the efficacy of adoptive T cell therapy (Chatterjee S et al. *Cell Metab* 27(1): 85-100 e108 (2018)).

(5) The role of CD38 in tumorigenesis and immune suppression is an active field of research, with multiple studies associating CD38 with tumor progression. CD38 was shown to promote cervical cancer cell growth by reducing levels of reactive oxygen species and inhibiting apoptosis (Liao S et al. *Mol Carcinog* 56(10): 2245-2257 (2017)), and loss of CD38 in human lung adenocarcinoma cells inhibited cell growth, invasion, and xenograft growth in nude mice (Bu X et al. *Carcinogenesis* 39(2): 242-251 (2017)). CD38 KO mice are more resistant to tumor growth and were shown to efficiently reject B16-F10 melanoma tumors (Baruch B B et al. *Oncotarget*, 9: 31797-811 (2018)). Similarly, targeting CD38 expression or its activity in the TME inhibited glioma progression and prolonged the lifespan of glioma-bearing mice (Blacher E et al. *Int J Cancer* 136(6): 1422-1433 (2013)). CD38 has also been identified as a biomarker of aggressive localized prostate cancer (Sahoo D et al. *Oncotarget*, 9: 6550-61 (2018)).

(6) Recent research has investigated the role of CD38 in an ecto-enzyme cascade that generates immunosuppressive adenosine from NAD.sup.+ . In addition to CD38, this cascade includes ectonucleotide pyrophosphatase/phosphodiesterase 1 (ENPP1) and the 5'-ectonucleotidase CD73. CD38 generates ADPR that is further hydrolyzed by ENPP1 to produce AMP, and the subsequent conversion of AMP to adenosine is regulated by CD73 (Ferretti E et al. *Immunol Lett* 205: 25-30 (2019)). This non-canonical adenosine generation pathway, which relies on CD38, occurs independently of ATP, and bypasses CD39 (Horenstein A L et al. 2013), plays a major role in creating an immunosuppressive TME, wherein dying cells provide NAD.sup.+ that is eventually converted to adenosine (Haag F et al. *Purinergic Signal* 3(1-2): 71-81 (2007); Zhu Y et al.

(7) Furthermore, a recent study demonstrated that cancer cells acquire resistance to immune checkpoint inhibitors that target programmed cell death protein 1 (PD-1) or its ligand (PD-L1) via upregulation of CD38, which blocks CD8^{sup.}+ T cell function through adenosine receptor signaling (Chen L et al. *Cancer Discov* 8(9): 1156-1175 (2018)). CD38 blockade subsequently restored CD8^{sup.}+ T cell proliferation, antitumor cytokine secretion, and cytotoxic capabilities. Pathologic analysis of lung cancer specimens revealed positive immunohistochemical staining for CD38 on tumor cells in 15-23% of cases, and bioinformatic analyses of datasets from non-small cell lung cancer (NSCLC) and melanoma patients revealed a strong correlation between CD38 expression and an inflamed TME (Chen L et al. 2018).

(8) CD38 is one of the main enzymes responsible for the age-related NAD^{sup.}+ decline that occurs in mammals (Hogan K A et al. *Front Immunol* 10: 1187 (2019)). CD38 KO mice are consistently protected from this progressive deficit and age-related metabolic dysfunction (Camacho-Pereira J et al. *Cell Metab*, 23: 1127-39 (2016)). Inhibition of CD38 likewise reversed age-related NAD^{sup.}+ decline and ameliorated several metabolic, structural, and molecular features of aging in chronologically aged and progeroid mice (Camacho-Pereira J et al. 2016). CD38 KO mice are also protected from diet-induced obesity, liver steatosis, and glucose intolerance due to enhanced energy expenditure (Barbosa M T et al. *FASEB J* 21(13): 3629-3639 (2007)).

(9) CD38 is a cell-surface marker for multiple myeloma and these cells are specifically susceptible to CD38 depletion, thus CD38 offers a useful therapeutic target for this malignancy (Chini E N et al. 2018). Clinical trials have demonstrated that CD38-targeting antibodies are specifically effective in relapsed/refractory multiple myeloma patients (Frerichs K A et al. *Expert Rev Clin Immunol*, 14: 197-206 (2018); van de Donk NWCJ et al. *Front Immunol*, 9: 2134 (2018)), and the anti-CD38 antibody daratumumab has been approved by the FDA for multiple myeloma treatment. Several other therapeutic antibodies against CD38 are now in clinical development for multiple myeloma and other cancers (van de Donk NWCJ 2018).

(10) The literature is replete with references reporting the potential therapeutic benefits of inhibiting abnormal expression or activity of CD38. For example, the following diseases are characterized by abnormal expression or activity of CD38: non-small cell lung cancer, melanoma, checkpoint therapy treated and/or resistant cancers, and adenosine-dependent tumors (Chen L et al. "CD38-mediated immunosuppression as a mechanism of tumor cell escape from PD-1/PD-L1 blockade." *Cancer Discov.* 8, 1156-1175 (2018)); lung cancer (adenocarcinoma) (Bu X et al. "CD38 knockout suppresses tumorigenesis in mice and clonogenic growth of human lung cancer cells." *Carcinogenesis* 39, 242-251 (2018)); cervical cancer (Liao S et al. "CD38 enhances the proliferation and inhibits the apoptosis of cervical cancer cells by affecting the mitochondria functions." *Mol. Carcinog.* 56, 2245-2257 (2017)); glioma (Blacher E et al. Sci.* 39, 424-436 (2018)).

(11) In summation, CD38 is a multifunctional enzyme and signaling receptor that plays important functions in cancer progression, the creation of an immunosuppressive TME, metabolic fitness of T cells, and the modulation of NAD.sup.+ levels in aging and other physiological conditions. The inhibition of CD38 in various disease states—including tumor growth—has already shown clinical promise, and the development of potent and selective small-molecule inhibitors will create therapeutic options for other conditions characterized by abnormal expression or activity of CD38. The compounds, compositions, and methods described herein will help meet these and other needs.

(180) Compounds of the invention also include tautomeric forms. Tautomeric forms result from the swapping of a single bond with an adjacent double bond together with the concomitant migration

of a proton. Tautomeric forms include prototropic tautomers which are isomeric protonation states having the same empirical formula and total charge. Example prototropic tautomers include ketone—enol pairs, amide—imidic acid pairs, lactam—lactim pairs, enamine—imine pairs, and annular forms where a proton can occupy two or more positions of a heterocyclic system, for example, 1H- and 3H-imidazole, 1H-, 2H- and 4H-1,2,4-triazole, 1H- and 2H-isoindole, and 1H- and 2H-pyrazole. Tautomeric forms can be in equilibrium or sterically locked into one form by appropriate substitution. Tautomeric forms can also include methyltropic tautomers, which result from the swapping of a single bond with an adjacent double bond together with the concomitant migration of a methyl group. Methyltropic tautomers can include, for example, 2-methyl-2H-pyrazolo[3,4-c]pyridine and 1-methyl-1H-pyrazolo[3,4-c]pyridine.

(181) Compounds of the invention also include all isotopes of atoms occurring in the intermediates or final compounds. Isotopes include those atoms having the same atomic number but different mass numbers. For example, isotopes of hydrogen include tritium and deuterium. In some embodiments, the compounds of the invention include at least one deuterium atom.

(182) The term, “compound,” as used herein is meant to include all stereoisomers, geometric isomers, tautomers, and isotopes of the structures depicted, unless otherwise specified.

(183) All compounds, and pharmaceutically acceptable salts thereof, can be found together with other substances such as water and solvents (e.g., in the form of hydrates and solvates) or can be isolated.

(184) In some embodiments, the compounds of the invention, or salts thereof, are substantially isolated. By “substantially isolated” is meant that the compound is at least partially or substantially separated from the environment in which it was formed or detected. Partial separation can include, for example, a composition enriched in the compounds of the invention. Substantial separation can include compositions containing at least about 50%, at least about 60%, at least about 70%, at least about 80%, at least about 90%, at least about 95%, at least about 97%, or at least about 99% by weight of a compound of the invention, or salt thereof. Methods for isolating compounds and their salts are routine in the art.

(185) The phrase “pharmaceutically acceptable” is employed herein to refer to those compounds, materials, compositions, and/or dosage forms which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of human beings and animals without excessive toxicity, irritation, allergic response, or other problem or complication, commensurate with a reasonable benefit/risk ratio.

(186) The present invention also includes pharmaceutically acceptable salts of the compounds described herein. As used herein, “pharmaceutically acceptable salts” refers to derivatives of the disclosed compounds wherein the parent compound is modified by converting an existing acid or base moiety to its salt form. Examples of pharmaceutically acceptable salts include, but are not limited to, mineral or organic acid salts of basic residues such as amines; alkali or organic salts of acidic residues such as carboxylic acids; and the like. The pharmaceutically acceptable salts of the present invention include the non-toxic salts of the parent compound formed, for example, from non-toxic inorganic or organic acids. The pharmaceutically acceptable salts of the present invention can be synthesized from the parent compound which contains a basic or acidic moiety by conventional chemical methods. Generally, such salts can be prepared by reacting the free acid or base forms of these compounds with a stoichiometric amount of the appropriate base or acid in water or in an organic solvent, or in a mixture of the two. Lists of suitable salts are found in *Remington's Pharmaceutical Sciences*, 17th ed., Mack Publishing Company, Easton, Pa., 1985, p. 1418 and *Journal of Pharmaceutical Science*, 66, 2 (1977), each of which is incorporated herein by reference in its entirety.

(187) Synthesis

(188) Compounds of the invention, including salts thereof, can be prepared using known organic synthesis techniques and can be synthesized according to any of numerous possible synthetic

routes.

(189) The reactions for preparing compounds of the invention can be carried out in suitable solvents which can be readily selected by one of skill in the art of organic synthesis. Suitable solvents can be substantially nonreactive with the starting materials (reactants), the intermediates, or products at the temperatures at which the reactions are carried out, e.g., temperatures which can range from the solvent's freezing temperature to the solvent's boiling temperature. A given reaction can be carried out in one solvent or a mixture of more than one solvent. Depending on the particular reaction step, suitable solvents for a particular reaction step can be selected by the skilled artisan.

(190) Preparation of compounds of the invention can involve the protection and deprotection of various chemical groups. The need for protection and deprotection, and the selection of appropriate protecting groups, can be readily determined by one skilled in the art. The chemistry of protecting groups can be found, for example, in T. W. Greene and P. G. M. Wuts, *Protective Groups in Organic Synthesis*, 3rd. Ed., Wiley & Sons, Inc., New York (1999), which is incorporated herein by reference in its entirety.

(191) Reactions can be monitored according to any suitable method known in the art. For example, product formation can be monitored by spectroscopic means, such as nuclear magnetic resonance spectroscopy (e.g., ¹H or ¹³C), infrared spectroscopy, spectrophotometry (e.g., UV-visible), or mass spectrometry, or by chromatography such as high performance liquid chromatography (HPLC) or thin layer chromatography.

(192) The expressions, "ambient temperature," "room temperature," and "RT", as used herein, are understood in the art, and refer generally to a temperature, e.g. a reaction temperature, that is about the temperature of the room in which the reaction is carried out, for example, a temperature from about 20° C. to about 30° C.

(193) Compounds of Formula I can be prepared according to numerous preparatory routes known in the literature. Example synthetic methods for preparing compounds of the invention are provided in the Schemes below. Unless noted otherwise, all substituents are as defined herein.

(194) ##STR00042##

(195) Scheme 1 shows the synthesis of analogs following a general route that utilizes well-established chemistry. Substituted haloaromatic esters can be coupled with a 5-membered heteroaromatic ring via several different methods known to one skilled in the art (Step 1). These include coupling an aromatic tributylstannane in the presence of a Pd catalyst such as Pd(PPh.sub.3).sub.2Cl.sub.2 in a polar solvent such as DMF at elevated temperature, coupling a boronic acid or boronic ester in the presence of a Pd/Cu catalyst such as Pd(dppf)Cl.sub.2 and CuI and a base such as sodium carbonate or cesium fluoride in a solvent such as DMF, and coupling a substituted imidazole in the presence of a Pd catalyst such as Pd.sub.2dba.sub.3, a ligand such as tBuXPhos, and a base such as K.sub.3PO.sub.4 in a non-polar solvent such as toluene at elevated temperature. The resulting esters can be hydrolyzed by a base such as sodium hydroxide in the presence of water to give carboxylic acids (Step 2), which can then be converted to the desired amide analogs by coupling amines NH.sub.2(L).sub.nQ using amide coupling reagents such as HATU in the presence of a base such as diisopropylethylamine in a polar solvent such as DMF (Step 3). Alternatively the substituted ester products of Step 1 can be converted directly to the desired amide analogs by treating with amines NH.sub.2(L).sub.nQ in the presence of trimethylaluminum in a nonpolar solvent such as toluene (Step 4).

(196) ##STR00043##

(197) Scheme 2 shows the synthesis of substituted aromatic ester intermediates following a route that utilizes well-established chemistry. Aromatic dichlorides, which may be commercially available or can be made via routes known to one skilled in the art, can be converted to enol ethers by coupling to tributyl(1-ethoxyvinyl)stannane in the presence of a Pd catalyst such as Pd(PPh.sub.3)Cl.sub.2 in a polar solvent such as DMF at elevated temperature (Step 1). A 5-

membered heteroaromatic may be introduced (Step 2) using coupling conditions described in Scheme 1, Step 1. Treatment of the enol ethers with KMnO_4 , NaIO_4 and water in a nonpolar solvent such as dioxane at room temperature gives substituted esters (Step 3), which can then be converted to amide analogs using the conditions described in Scheme 1, Steps 2 and 3, or Step 4.

(198) ##STR00044##

(199) Scheme 3 shows an alternative route to substituted aromatic esters, which can be prepared from aromatic dichlorides by first treating with carbon monoxide in the presence of a Pd catalyst such as Pd(dppf)Cl_2 , an amine base such as triethylamine, and an alcohol such as methanol in a polar solvent such as DMF at elevated temperature (Step 1). The resulting chloroesters can then be coupled with a 5-membered heteroaromatic ring using the coupling conditions described in Scheme 1, Step 1.

(200) ##STR00045##

(201) Scheme 4 shows a synthetic route to imidazole substituted amide analogs. Beginning from a commercially available chloro-nitroheteroaromatic amine, an imidazole ring can be introduced by treatment with imidazole in the presence of a base such as K_2CO_3 in a polar solvent such as DMF at elevated temperature (Step 1). The amine can then be converted to a bromide by treatment with CuBr_2 and isopentyl nitrite in a polar solvent such as acetonitrile at elevated temperature (Step 2). Reacting with vinylmagnesium bromide in an aprotic solvent such as THF at low temperature (Step 3) followed by treatment with an amine in the presence of carbon monoxide, a Pd catalyst such as Pd(dppf)Cl_2 , an amine base such as triethylamine in a polar solvent such as DMSO at elevated temperature (Step 4) provides imidazole substituted amide analogs.

(231) Pharmaceutical Formulations and Dosage Forms

(232) When employed as pharmaceuticals, the compounds of the invention can be administered in the form of pharmaceutical compositions. A pharmaceutical composition refers to a combination of a compound of the invention, or its pharmaceutically acceptable salt, and at least one pharmaceutically acceptable carrier. These compositions can be prepared in a manner well known in the pharmaceutical art, and can be administered by a variety of routes, depending upon whether local or systemic treatment is desired and upon the area to be treated. Administration may be oral, topical (including ophthalmic and to mucous membranes including intranasal, vaginal and rectal delivery), pulmonary (e.g., by inhalation or insufflation of powders or aerosols, including by nebulizer; intratracheal, intranasal, epidermal and transdermal), ocular, or parenteral.

(233) This invention also includes pharmaceutical compositions which contain, as the active ingredient, one or more of the compounds of the invention above in combination with one or more pharmaceutically acceptable carriers. In making the compositions of the invention, the active ingredient is typically mixed with an excipient, diluted by an excipient or enclosed within such a carrier in the form of, for example, a capsule, sachet, paper, or other container. When the excipient serves as a diluent, it can be a solid, semi-solid, or liquid material, which acts as a vehicle, carrier or medium for the active ingredient. Thus, the compositions can be in the form of tablets, pills, powders, lozenges, sachets, cachets, elixirs, suspensions, emulsions, solutions, syrups, aerosols (as a solid or in a liquid medium), ointments containing, for example, up to 10% by weight of the active compound, soft and hard gelatin capsules, suppositories, sterile injectable solutions, and sterile packaged powders.

(234) The compositions can be formulated in a unit dosage form. The term "unit dosage form" refers to a physically discrete unit suitable as unitary dosages for human subjects and other mammals, each unit containing a predetermined quantity of active material calculated to produce the desired therapeutic effect, in association with a suitable pharmaceutical excipient.

(235) The active compound can be effective over a wide dosage range and is generally

administered in a pharmaceutically effective amount. It will be understood, however, that the amount of the compound actually administered will usually be determined by a physician, according to the relevant circumstances, including the condition to be treated, the chosen route of administration, the actual compound administered, the age, weight, and response of the individual patient, the severity of the patient's symptoms, and the like.

(236) For preparing solid compositions such as tablets, the principal active ingredient is mixed with a pharmaceutical excipient to form a solid pre-formulation composition containing a homogeneous mixture of a compound of the present invention. When referring to these pre-formulation compositions as homogeneous, the active ingredient is typically dispersed evenly throughout the composition so that the composition can be readily subdivided into equally effective unit dosage forms such as tablets, pills and capsules. This solid pre-formulation is then subdivided into unit dosage forms of the type described above containing from, for example, 0.1 to about 500 mg of the active ingredient of the present invention.

(237) The tablets or pills of the present invention can be coated or otherwise compounded to provide a dosage form affording the advantage of prolonged action. For example, the tablet or pill can comprise an inner dosage and an outer dosage component, the latter being in the form of an envelope over the former. The two components can be separated by an enteric layer which serves to resist disintegration in the stomach and permit the inner component to pass intact into the duodenum or to be delayed in release. A variety of materials can be used for such enteric layers or coatings, such materials including a number of polymeric acids and mixtures of polymeric acids with such materials as shellac, cetyl alcohol, and cellulose acetate.

(238) The liquid forms in which the compounds and compositions of the present invention can be incorporated for administration orally or by injection include aqueous solutions, suitably flavored syrups, aqueous or oil suspensions, and flavored emulsions with edible oils such as cottonseed oil, sesame oil, coconut oil, or peanut oil, as well as elixirs and similar pharmaceutical vehicles.

(239) Compositions for inhalation or insufflation include solutions and suspensions in pharmaceutically acceptable, aqueous or organic solvents, or mixtures thereof, and powders. The liquid or solid compositions may contain suitable pharmaceutically acceptable excipients as described supra. In some embodiments, the compositions are administered by the oral or nasal respiratory route for local or systemic effect. Compositions can be nebulized by use of inert gases. Nebulized solutions may be breathed directly from the nebulizing device or the nebulizing device can be attached to a face masks tent, or intermittent positive pressure breathing machine. Solution, suspension, or powder compositions can be administered orally or nasally from devices which deliver the formulation in an appropriate manner.

(240) The amount of compound or composition administered to a patient will vary depending upon what is being administered, the purpose of the administration, such as prophylaxis or therapy, the state of the patient, the manner of administration, and the like. In therapeutic applications, compositions can be administered to a patient already suffering from a disease in an amount sufficient to cure or at least partially arrest the symptoms of the disease and its complications. Effective doses will depend on the disease condition being treated as well as by the judgment of the attending clinician depending upon factors such as the severity of the disease, the age, weight and general condition of the patient, and the like.

(241) The compositions administered to a patient can be in the form of pharmaceutical compositions described above. These compositions can be sterilized by conventional sterilization techniques, or may be sterile filtered. Aqueous solutions can be packaged for use as is, or lyophilized, the lyophilized preparation being combined with a sterile aqueous carrier prior to administration.

(242) The therapeutic dosage of the compounds of the present invention can vary according to, for example, the particular use for which the treatment is made, the manner of administration of the compound, the health and condition of the patient, and the judgment of the prescribing physician.

The proportion or concentration of a compound of the invention in a pharmaceutical composition can vary depending upon a number of factors including dosage, chemical characteristics (e.g., hydrophobicity), and the route of administration. For example, the compounds of the invention can be provided in an aqueous physiological buffer solution containing about 0.1 to about 10% w/v of the compound for parenteral administration. Some typical dose ranges are from about 1 µg/kg to about 1 g/kg of body weight per day. In some embodiments, the dose range is from about 0.01 mg/kg to about 100 mg/kg of body weight per day. The dosage is likely to depend on such variables as the type and extent of progression of the disease or disorder, the overall health status of the particular patient, the relative biological efficacy of the compound selected, formulation of the excipient, and its route of administration. Effective doses can be extrapolated from dose-response curves derived from in vitro or animal model test systems.

(243) The compounds of the invention can also be formulated in combination with one or more additional active ingredients which can include any pharmaceutical agent such as anti-viral agents, anti-cancer agents, vaccines, antibodies, immune enhancers, immune suppressants, anti-inflammatory agents and the like.

EXAMPLES

(244) The invention will be described in greater detail by way of specific examples. The following examples are offered for illustrative purposes, and are not intended to limit the invention in any manner. Those of skill in the art will readily recognize a variety of non-critical parameters which can be changed or modified to yield essentially the same results. The compounds of the Examples were found to be inhibitors of CD38 according to one or more of the assays provided herein.

(245) Equipment: ¹H NMR Spectra were recorded at 300 or 400 MHz using a Bruker AVANCE 300 MHz/400 MHz spectrometer. NMR interpretation was performed using Bruker Topspin software to assign chemical shift and multiplicity. In cases where two adjacent peaks of equal or unequal height were observed, these two peaks may be labeled as either a multiplet or as a doublet. In the case of a doublet, a coupling constant using this software may be assigned. In any given example, one or more protons may not be observed due to obscuration by water and/or solvent peaks. Example A

(736) CD38 Enzyme Assay

(737) The CD38 enzyme assay was performed as described previously (Becherer, J D, et al. J. Med. Chem. 2015, 58, 7021-7056). Briefly, 200 nL of a dose response titration of each test compound dissolved in 100% DMSO was spotted in clear polystyrene 384-well plate (Thermo #-264704) using a Mosquito (FTP Labtech). A 10 µL solution of 2 nM CD38 (BPS Biosciences #71227) suspended in 100 mM HEPES ((4-(2-hydroxyethyl)-1-piperazineethanesulfonic acid, pH=7.5), 4 mM EDTA (2,2',2'',2'''-(ethane-1,2-diyl dinitrilo)tetraacetic acid) and 1 mM CHAPS (3-[(3-cholamidopropyl)dimethylammonio]-1-propanesulfonate) was incubated with test compound at 25° C. for 30 min. The enzyme reaction was initiated by adding 10 µL. of 400 µM nicotinamide adenine dinucleotide (NAD-), 1000 µM (E)-2-(2-(pyridin-4-ylmethylene)hydrazineyl)pyridine in buffer containing 5 mM sodium acetate (pH=5.2) and 1 mM CHAPS The reactions were incubated at 25° C. and the absorbance at 405 nm was measured after 15 minutes and 60 min on an Envision plate reader (Perkin Elmer) The absorbance values from the 15 min timepoint were subtracted from

the absorbance value from the 60 min timepoint.

(738) The compound 4-(((1r,4r)-4-(2-methoxyethoxy)cyclohexyl)amino)-1-methyl-6-(thiazol-5-yl)quinolin-2(1H)-one was synthesized as previously described (Haffner C D, et al. J. Med. Chem. 2015, 58, 3548-3571). Control wells containing a negative control of 1% DMSO vehicle or a positive control of 100 μ M 4-(((1r,4r)-4-(2-methoxyethoxy)cyclohexyl)amino)-1-methyl-6-(thiazol-5-yl)quinolin-2(1H)-one were used to calculate the % inhibition as described below.

$$(739) \%inhibition = 100 \times \frac{SUB_{\text{cmpd}} - SUB_{\text{min}}}{SUB_{\text{max}} - SUB_{\text{min}}}$$

where SUB.sub.cmpd is the subtracted value for the individual compound treated well, SUB.sub.min is the average of the subtracted values of the 4-(((1r,4r)-4-(2-methoxyethoxy)cyclohexyl)amino)-1-methyl-6-(thiazol-5-yl)quinolin-2(1H)-one positive control wells and SUB.sub.max is the average of the subtracted values of the DMSO negative control wells.

(740) The % inhibition values were plotted as a function of compound concentration and the following 4-parameter fit was applied to derive the IC.sub.50 values:

$$(741) Y = \text{Bottom} + \frac{(\text{Top} - \text{Bottom})}{(1 + (\frac{X}{IC_{50}})^{\text{HillCoefficient}})}$$

where top and bottom are normally allowed to float, but may be fixed at 100 or 0 respectively in a 3-parameter fit. The Hill Coefficient is normally allowed to float but may also be fixed at 1 in a 3-parameter fit. Y is the % inhibition and X is the compound concentration.

(742) IC.sub.50 data for the compounds of the invention according to this assay are provided in Table A-1 below (“+” is <0.01 μ M; “++” is ≥ 0.01 and <0.1 μ M; “+++” is ≥ 0.1 μ M and <1 μ M; and “++++” is ≥ 1 μ M).

In Vivo PD Study

(775) C57BL/6 mice were dosed with vehicle and the dose range of each CD38 inhibitor in a formulation of 0.5% hydroxypropyl methylcellulose (HPMC)+0.1% Tween 80 adjusted to pH~3.5 with citric acid buffer. Plasma PK samples were collected at the endpoint. About 500 µL whole blood was collected into a 1.5 mL tube containing 20 µL of 15% dipotassium ethylenediaminetetraacetic acid (EDTA-2K) solution. The sample was centrifuged at 6000 rpm, 4° C. for 5 minutes to isolate about 200 µL plasma and sent to bioanalysis. Whole spleen and left lobes of liver samples were collected at endpoint for NAD.sup.+ or ADPR measurement. Liver and spleen samples were cut down to 100-400 mg/each with the wet weights recorded and placed in a tube containing 0.5 N perchloric acid (1:4 ratio, (mg/µL)) within 30 seconds. The samples were snap frozen in dry ice and stored at -80° C.

(776) Samples were stored at -80° C. with sample preparation performed immediately after removal from the freezer due to instability of NAD.sup.+ in matrixes at room temperature. Medal bead Lysing matrix was added to each tube along with a 4 fold dilution of the sample with 80:20 acetonitrile:water containing a CD38 inhibitor and O18NAD.sup.+. Samples were homogenized on a MP FastPrep-24 at 6 m/sec for 60 seconds. The homogenate was centrifuged at 13,000 rpm for 5 minutes with the supernatant transferred to 96 well plate and diluted 1:10 with water. Analysis of NAD.sup.+ was performed by injecting 10 µL on a Zorbax Hillic Plus column on an Agilent 1290 HPLC and a Sciex API4000 Mass Spectrometer monitoring the 664-428 transition for NAD.sup.+ and 668-136 for O18NAD.sup.+ internal standard. The LC separation was achieved with mobile phase A—water with 0.1% ammonium acetate and mobile phase B—acetonitrile w/0.1% formic acid starting with 98% mobile phase A followed by 0.5 min gradient to 5% mobile phase. Data was reported as an area ratio of NAD.sup.+ to the O18NAD.sup.+ internal standard.

Example C. Efficacy Study in a B16F10 Model

(784) B16-F10 tumor cells (ATCC, Cat #CRL-6475) were maintained in vitro as a monolayer culture in DMEM medium (Gibco, Cat #11995-040) supplemented with 10% heat inactivated fetal bovine serum (Biological Industries, Cat #04-002-1A), 100 U/mL penicillin and 100 g/mL streptomycin (Hyclone, Cat #SV30010) at 37° C. in an atmosphere of 5% CO.sub.2 in air. The tumor cells were routinely subcultured twice weekly by trypsin-EDTA (Gibco, Cat #25200-072) treatment. The cells growing to a confluency around 70%-80% were harvested and counted for tumor inoculation. The cultured B16-F10 cells were harvested, re-suspended in base medium at a density of 2×10^7 cells/mL with viability >90%. 6-8 weeks of Female C57BL/6 mouse (Shanghai LingChang Biotech Co., LTD) was inoculated subcutaneously at the right flank with 1×10^6 in 0.05 mL base medium for tumor development. Tumors were calipered in two dimensions to monitor growth as the mean volume approached the desired range. Tumor volume (TV) was calculated using the formula: $TV = 0.5 \times a \times b^2$ where a and b are the long and short diameters of the tumor.

(785) Mice were assigned into 4 groups with 12 mice per group. The treatments were started on the second day after inoculation (defined as D1) and mice were treated with Vehicle (p.o. QD), Example 7 (300 mg/kg, p.o. QD), Vehicle+anti-mPD-L1 (10 mg/kg, i.p., QW), Example 7 (300 mg/kg, p.o. QD)+anti-mPD-L1 (10 mg/kg, i.p., QW), respectively. The tumor sizes were measured three times per week during the treatment. Survival was monitored with tumor volume exceeding 2000 mm³ as endpoint. Anti-mPD-L1 was obtained from BioXCell (catalogue number BE0101, lot number 696618M).

(786) A 60 μ L sample of whole blood was collected into a tube containing 8 μ L of 15% dipotassium ethylenediaminetetraacetic acid (EDTA-2K) solution at Day 1 and endpoint. The samples were centrifuged at 4° C., 5000 rpm for 5 minutes to isolate 20 μ L plasma and sent to bioanalysis. Whole spleen, left lobes of liver and tumor samples were collected at endpoint for NAD.sup.+ or ADPR measurement. Tissue samples were cut down to 100-400 mg/each with the wet weights recorded and placed in a tube containing 0.5 N perchloric acid (1:4 ratio, (mg/ μ L)) within 1 min 30 seconds. The samples were snap frozen in dry ice and stored at -80° C. Example 7

compound levels were determined by HPLC-MS/MS analysis. A stock solution of Example 7 was prepared at 1 mg/mL in DMSO. For undiluted plasma samples, an aliquot of 10 μ L sample was added to 200 μ L internal standard (IS) (Diclofenac, 400 ng/mL) in acetonitrile (ACN). The mixture was vortexed for 10 minutes at 750 rpm and centrifuged at 6000 rpm for 10 minutes. An aliquot of 1.0 μ L supernatant was injected for LC-MS/MS analysis. For 10-fold diluted plasma samples, an aliquot of 3 μ L sample was added with 27 μ L blank plasma, then added to 600 μ L IS (Diclofenac, 100 ng/mL) in ACN. The mixture was vortexed for 5 minutes at 750 rpm and centrifuged at 14,000 rpm for 5 minutes. An aliquot of 1.0 μ L supernatant was injected for LC-MS/MS analysis.

The cells growing to a confluency around 70%-80% were harvested and counted for tumor inoculation. The cultured MC-38 cells were harvested, re-suspended in base medium at a density of 1×10^6 cells/mL with viability>90%. 6-8 weeks of Female C57BL/6 mouse (Shanghai LingChang Biotech Co., LTD) was inoculated subcutaneously at the right flank with 1×10^6 in 0.1 mL base medium for tumor development. Tumors were calipered in two dimensions to monitor growth as the mean volume approached the desired range. Tumor volume (TV) was calculated using the formula: $TV = 0.5 a \times b^2$ where a and b are the long and short diameters of the tumor. Anti-mPD-1 from BioXCell (catalogue number BE0146, lot number 73501901) was used.

(791) The mice were assigned into 4 groups with 12 mice per group. The treatments were started on the second day after inoculation (defined as Day 0) and mice were treated with Vehicle (0.5% HPMC+0.1% Tween 80 in pH 3.5 Citric Buffer) (0.2 mL/20 g, p.o., BID), Example 7 (60 mg/kg, p.o., BID), Vehicle+Anti-mPD-1 (0.2 mL/20 g, p.o., BID+5 mg/kg, i.p., BIW), Example 7+Anti-mPD-1 (60 mg/kg, p.o., BID+5 mg/kg, i.p., BIW), respectively. On Day 1, Day 7, Day 15 and Day 22, the mice were measured body temperature. The tumor sizes were measured three times per week during the treatment. Survival was monitored with tumor volume exceeding 2000 mm³ as endpoint. The entire study was terminated on Day 28.

(792) A 60 μ L sample of whole blood was collected into a tube containing 8 μ L of 15% dipotassium ethylenediaminetetraacetic acid (EDTA-2K) solution. The sample was centrifuged at 4° C., 5000 rpm for 5 minutes to isolate 20 μ L plasma and sent to bioanalysis. Whole spleen, left lobes of liver and tumor samples were collected at endpoint for NAD⁺ or ADPR measurement. Tissue samples were cut down to 100-400 mg/each with the wet weights recorded and placed in a tube containing 0.5 N perchloric acid (1:4 ratio, (mg/ μ L)) within 1 min 30 seconds. The samples were snap frozen in dry ice and stored at -80° C.

(793) Example 7 compound levels were determined by HPLC-MS/MS analysis. A stock solution of Example 7 was prepared at 3 mg/mL in DMSO. For undiluted plasma samples, an aliquot of 10 μ L sample was added to 200 μ L internal standard (IS) (Diclofenac, 400 ng/mL) in acetonitrile (ACN). For diluted samples, an aliquot of 1 μ L sample was added with 9 μ L blank plasma and the dilution factor was 10. The mixture was vortexed for 10 minutes and centrifuged at 5800 rpm for 10 minutes. An aliquot of 0.5 μ L supernatant was injected for LC-MS/MS analysis.

Example E. Efficacy Study in a Cloudman S91 Model

(798) Cloudman S91 (ATCC, CCL-53.1TM) cells were maintained in vitro as a monolayer culture in F12K medium (Gibco, #21127-002) supplemented with 2.5% heat inactivated fetal bovine serum (Gibco, Cat #10099-141) and 15% horse serum (Biological Industries, #04-004-1A), 100 U/mL penicillin and 100 µg/mL streptomycin (Hyclone, Cat #SV30010) at 37° C. in an atmosphere of 5% CO₂ in air. The tumor cells were routinely subcultured twice weekly by trypsin-EDTA (Gibco, Cat #25200-072) treatment. The cells growing to a confluency around 70%-80% were harvested and counted for tumor inoculation. The cultured Cloudman S91 cells were harvested, re-suspended in base medium at a density of 5×10⁶ cells/mL with viability>90%. 8-10 weeks of female DBA/2 mice (Vital River) were inoculated subcutaneously at the right flank with 5×10⁶ in 0.1 mL base medium for tumor development. Tumors were calipered in two dimensions to monitor growth as the mean volume approached the desired range. Tumor volume (TV) was calculated using the formula: $TV = 0.5 \times a \times b^2$ where a and b are the long and short diameters of the tumor. Anti-mPD-1 from BioXCell (catalogue number BE0146, lot number 73501901) was used.

On Day 1, Day 8, Day 15 and Day 22, the mice were measured body temperature. The tumor sizes were measured three times per week during the treatment. Survival was monitored with tumor volume exceeding 2000 mm³ as endpoint. The entire study was terminated on Day 29. A 60 µL sample of whole blood was collected into a tube containing 5 µL of 15% dipotassium ethylenediaminetetraacetic acid (EDTA-2K) solution. The sample was centrifuged at 4° C., 6000 rpm for 5 minutes to isolate 20 µL plasma and sent to bioanalysis.
