Background/Summary

(1) This application is a National Stage Entry of International Application No. PCT/IB2020/055513, filed Jun. 12, 2020, and entitled “FUSED HETEROCYCLIC COMPOUNDS AND THEIR USE AS PEST CONTROL AGENTS” which claims priority to Indian Application No. 201911023447, filed Jun. 13, 2019, the contents of which are incorporated by reference herein.
FIELD OF THE INVENTION

(2) The present invention relates to fused heterocyclic compounds. More particularly, the present invention relates to fused heterocyclic compounds of formula (I) and to the process for the preparation thereof. The present invention further relates to the use of fused heterocyclic compounds of formula (I) as pest control agents.

BACKGROUND OF THE INVENTION

(3) The currently available modern insecticides and acaricides have to satisfy many requirements, for example regarding level of efficacy, residual activity and spectrum of activity as well as further beneficial effects, and the possible use thereof. Efforts have been made during the past decades to develop selective insecticides that are acting specifically on biochemical modes of action being present only in insects or mites, but additionally showing properties that differ from known insecticides in an advantageous way.

(4) Heterocyclic compounds with pesticidal activity are known and described, for example, in WO2016091731, WO2016162318, WO2017061497, WO2017125340, WO2017001311, WO2018095953, WO2019068572 and WO2019038195.

(5) However, by long term use of such pesticides, many pests acquire resistance and the effective control by existing insecticides and germicides that have been used conventionally over years becomes more and more difficult and this phenomenon is even increasing during recent years. Furthermore, some of those existing pesticides are highly toxic, or remain for along time in the environment because of their residual properties, which may become a growing problem due to the disruption of the ecosystem.

(6) Therefore, there is a continuous need for new compounds which are more effective, less toxic, and environmentally safer and/or have different modes of action.

(7) In view of the above, the present invention envisages such compounds that satisfy or overcome drawbacks associated with the prior art.

(8) It has now surprisingly been found that certain novel pesticidally active fused heterocyclic compounds with sulfur containing substituents being subject of this invention have favorable properties as pesticides, as desired.

SUMMARY OF THE INVENTION

(9) Accordingly, the present invention provides a fused heterocyclic compound of formula (I) or agriculturally acceptable salts, isomers/structural isomers, stereo-isomers, diastereomers, enantiomers, tautomers, metal complexes, polymorphs or N-oxides thereof.

(10) ##STR00002##

wherein, R_{sup}.1, Y, Q, A, G, m and E are as defined in the detailed description.

(11) In one embodiment, the present invention provides a process for preparing the compound of formula (I) or agriculturally acceptable salts thereof.

(12) In another embodiment, the present invention provides a composition for controlling or preventing invertebrate pests comprising a biologically effective amount of compound of formula (I), agriculturally acceptable salts, isomers/structural isomers, stereo-isomers, diastereomers, enantiomers, tautomers, metal complexes, polymorphs, or N-oxides thereof and at least one additional component selected from the group consisting of surfactants and auxiliaries.

(13) In yet another embodiment, the composition additionally comprises at least one additional biologically active and compatible compound selected from fungicides, insecticides, nematocides, acaricides, biopesticides, herbicides, plant growth regulators, antibiotics, fertilizers or nutrients.

(14) In still another embodiment, the present invention provides use of the compound of formula (I), agriculturally acceptable salts, isomers/structural isomers, stereo-isomers, diastereomers, enantiomers, tautomers, metal complexes, polymorphs, or N-oxides, composition or combination thereof, for combating invertebrate pests in agricultural crops and/or horticultural crops or parasites on animals.

(15) In yet another embodiment, the present invention provides a method of combating invertebrate pests comprising contacting the invertebrate pests, their habitat, breeding ground, food supply, plant, seed, soil, area, material or environment in which the invertebrate pests are growing or may grow, or the materials, plants, seeds, soils, surfaces or spaces to be protected from pest attack or infestation with a biologically effective amount of the compound of formula (I) or agriculturally acceptable salts, isomers/structural isomers, stereo-isomers, diastereomers, enantiomers, tautomers, metal complexes, polymorphs, or N-oxides, composition or combination thereof.

Description

DETAILED DESCRIPTION OF THE INVENTION

Definitions

(1) The definitions provided herein for the terminologies used in the present disclosure are for illustrative purpose only and in no manner limit the scope of the present invention disclosed in the present disclosure.

(2) As used herein, the terms “comprises”, “comprising”, “includes”, “including”, “has”, “having”, “contains”, “containing”, “characterized by” or any other variation thereof, are intended to cover a non-exclusive inclusion, subject to any limitation explicitly indicated. For example, a composition, mixture, process or method that comprises a list of elements is not necessarily limited to only those elements but may include other elements not expressly listed or inherent to such composition, mixture, process or method.

(3) The transitional phrase “consisting of” excludes any element, step or ingredient not specified. If in the claim, such would close the claim to the inclusion of materials other than those recited except for impurities ordinarily associated therewith. When the phrase “consisting of” appears in a clause of the body of a claim, rather than immediately following the preamble, it limits only the element set forth in that clause; other elements are not excluded from the claim as a whole.

(4) The transitional phrase “consisting essentially of” is used to define a composition or method that includes materials, steps, features, components or elements, in addition to those literally disclosed, provided that these additional materials, steps, features, components or elements do not materially affect the basic and novel characteristic(s) of the claimed invention. The term “consisting essentially of” occupies a middle ground between “comprising” and “consisting of”.

(5) Further, unless expressly stated to the contrary, “or” refers to an inclusive “or” and not to an

exclusive “or”. For example, a condition A “or” B is satisfied by any one of the following: A is true (or present) and B is false (or not present), A is false (or not present) and B is true (or present), and both A and B are true (or present).

(6) Also, the indefinite articles “a” and “an” preceding an element or component of the present invention are intended to be nonrestrictive regarding the number of instances (i.e. occurrences) of the element or component. Therefore “a” or “an” should be read to include one or at least one, and the singular word form of the element or component also includes the plural unless the number is obviously meant to be singular.

(7) As referred to in this disclosure, the term “invertebrate pest” includes arthropods, gastropods and nematodes of economic importance as pests. The term “arthropod” includes insects, mites, spiders, scorpions, centipedes, millipedes, pill bugs and symphylans. The term “gastropod” includes snails, slugs and other Stylommatophora. The term “nematode” refers to a living organism of the Phylum Nematoda. The term “helminths” includes roundworms, heartworms, phytophagous nematodes (Nematoda), flukes (Tematoda), acanthocephala and tapeworms (Cestoda).

(8) The term “agronomic” refers to the production of field crops such as for food and fiber and includes the growth of corn, soybeans and other legumes, rice, cereal (e.g., wheat, oats, barley, rye, rice, maize), leafy vegetables (e.g., lettuce, cabbage, and other cole crops), fruiting vegetables (e.g., tomatoes, pepper, eggplant, crucifers and cucurbits), potatoes, sweet potatoes, grapes, cotton, tree fruits (e.g., pome, stone and citrus), small fruit (berries, cherries) and other specialty crops (e.g., canola, sunflower, olives).

(9) The term “nonagronomic” refers to other than field crops, such as horticultural crops (e.g., greenhouse, nursery or ornamental plants not grown in a field), residential, agricultural, commercial and industrial structures, turf (e.g., sod farm, pasture, golf course, lawn, sports field, etc.), wood products, stored product, agro-forestry and vegetation management, public health (i.e. human) and animal health (e.g., domesticated animals such as pets, livestock and poultry, undomesticated animals such as wildlife) applications.

(10) Nonagronomic applications include protecting an animal from an invertebrate parasitic pest by administering a parasitically effective (i.e. biologically effective) amount of a compound of the present invention, typically in the form of a composition formulated for veterinary use, to the animal to be protected. As referred to in the present disclosure and claims, the terms “parasitidal” and “parasitically” refers to observable effects on an invertebrate parasite pest to provide protection of an animal from the pest. Parasitidal effects typically relate to diminishing the occurrence or activity of the target invertebrate parasitic pest. Such effects on the pest include necrosis, death, retarded growth, diminished mobility or lessened ability to remain on or in the host animal, reduced feeding and inhibition of reproduction. These effects on invertebrate parasite pests provide control (including prevention, reduction or elimination) of parasitic infestation or infection of the animal.

(11) The compounds of the present disclosure may be present either in pure form or as mixtures of different possible isomeric forms such as stereoisomers or constitutional isomers. The various stereoisomers include enantiomers, diastereomers, chiral isomers, atropisomers, conformers, rotamers, tautomers, optical isomers, polymorphs, and geometric isomers. Any desired mixtures of these isomers fall within the scope of the claims of the present disclosure. One skilled in the art will appreciate that one stereoisomer may be more active and/or may exhibit beneficial effects when enriched relative to the other isomer(s) or when separated from the other isomer(s). Additionally, the person skilled in the art knows processes or methods or technology to separate, enrich, and/or to selectively prepare said isomers.

(12) The meaning of various terms used in the description shall now be illustrated.

It is to be understood that the phraseology or terminology employed herein is for the purpose of description and not of limitation. Therefore, while the embodiments herein have been described in terms of preferred embodiments, those skilled in the art will recognize that the embodiments herein can be practiced with modification within the spirit and scope of the embodiments as described herein.

(57) Any discussion of documents, acts, materials, devices, articles and the like that has been included in this specification is solely for the purpose of providing a context for the disclosure. It is not to be taken as an admission that any or all of these matters form a part of the prior art base or were common general knowledge in the field relevant to the disclosure as it existed anywhere before the priority date of this application.

(58) The numerical values mentioned in the description and the description/claims though might form a critical part of the present invention of the present invention, any deviation from such numerical values shall still fall within the scope of the present invention if that deviation follows the same scientific principle as that of the present invention disclosed in the present invention. The inventive compound of the present invention may, if appropriate, be present as mixtures of different possible isomeric forms, especially of stereoisomers, for example E and Z, threo and erythro, and also optical isomers, but if appropriate also of tautomers. Both the E and the Z isomers, and also the threo and erythro isomers, and the optical isomers, any desired mixtures of these isomers and

the possible tautomeric forms are disclosed and claimed.

(59) The term “pest” for the purpose of the present disclosure includes but is not limited to fungi, stramenopiles (oomycetes), bacteria, nematodes, mites, ticks, insects and rodents. Also pest is an animal or plant detrimental to humans or human concerns including crops, livestock, and forestry.

(60) The term “plant” is understood here to mean all plants and plant populations, such as desired and undesired wild plants or crop plants (including naturally occurring crop plants). Crop plants may be plants which can be obtained by conventional breeding and optimization methods or by biotechnological and genetic engineering methods or combinations of these methods, including the transgenic plants and including the plant cultivars which are protectable and non-protectable by plant breeders' rights.

(61) For the purpose of the present disclosure the term “plant” includes a living organism of the kind exemplified by trees, shrubs, herbs, grasses, ferns, and mosses, typically growing in a site, absorbing water and required substances through its roots, and synthesizing nutrients in its leaves by photosynthesis.

(62) Examples of “plant” for the purpose of the present invention include but are not limited to agricultural crops such as wheat, rye, barley, triticale, oats or rice; beet, e.g. sugar beet or fodder beet; fruits and fruit trees, such as pomes, stone fruits or soft fruits, e.g. apples, pears, plums, peaches, almonds, cherries, strawberries, raspberries, blackberries or gooseberries; leguminous plants, such as lentils, peas, alfalfa or soybeans; oil plants, such as rape, mustard, olives, sunflowers, coconut, cocoa beans, castor oil plants, oil palms, ground nuts or soybeans; cucurbits, such as squashes, cucumber or melons; fiber plants, such as cotton, flax, hemp or jute; citrus fruit and citrus trees, such as oranges, lemons, grapefruits or mandarins; any horticultural plants, vegetables, such as spinach, lettuce, asparagus, cabbages, carrots, onions, tomatoes, potatoes, cucurbits or paprika; lauraceous plants, such as avocados, cinnamon or camphor; cucurbitaceae; oleaginous plants; energy and raw material plants, such as cereals, corn, soybean, other leguminous plants, rape, sugar cane or oil palm; tobacco; nuts; coffee; tea; cacao; bananas; peppers; vines (table grapes and grape juice grape vines); hop; turf; sweet leaf (also called Stevia); natural rubber plants or ornamental and forestry plants, such as flowers, shrubs, broad-leaved trees or evergreens, e.g. conifers; and on the plant propagation material, such as seeds, and the crop material of these plants.

(63) Preferably, the plant for the purpose of the present invention includes but is not limited to cereals, corn, rice, soybean and other leguminous plants, fruits and fruit trees, grapes, nuts and nut trees, citrus and citrus trees, any horticultural plants, cucurbitaceae, oleaginous plants, tobacco, coffee, tea, cacao, sugar beet, sugar cane, cotton, potato, tomato, onions, peppers and vegetables, ornamentals, any floricultural plants and other plants for use of human and animals.

(64) The term “plant parts” is understood to mean all parts and organs of plants above and below the ground. For the purpose of the present disclosure the term plant parts includes but is not limited to cuttings, leaves, twigs, tubers, flowers, seeds, branches, roots including taproots, lateral roots, root hairs, root apex, root cap, rhizomes, slips, shoots, fruits, fruit bodies, bark, stem, buds, auxiliary buds, meristems, nodes and internodes.

(65) The term “locus thereof” includes soil, surroundings of plant or plant parts and equipment or tools used before, during or after sowing/planting a plant or a plant part.

(66) Application of the compounds of the present disclosure or the compound of the present disclosure in a composition optionally comprising other compatible compounds to a plant or a plant material or locus thereof include application by a technique known to a person skilled in the art which include but is not limited to spraying, coating, dipping, fumigating, impregnating, injecting and dusting.

(67) The term “applied” means adhered to a plant or plant part either physically or chemically including impregnation.

(68) In one embodiment, the present invention provides a compound of formula (I),

(248) In one embodiment, the present invention provides a composition comprising a biologically effective amount of the compound of formula (I) and at least one additional biological active compatible compound selected from fungicides, insecticides, nematocides, acaricides, biopesticides, herbicides, plant growth regulators, antibiotics, fertilizers and nutrients. The compounds used in the composition and in combination with the compound of formula (I) are also termed as active compatible compounds.

(249) The known and reported fungicides, insecticides, nematocides, acaricides, biopesticides, herbicides, plant growth regulators, antibiotics and nutrients can be combined with at least one compound of the formula (I) of the present disclosure. For example, fungicides, insecticides, nematocides, acaricides, biopesticides, herbicides, plant growth regulators, antibiotics, fertilizers and nutrients disclosed and reported in WO2016156129 and/or WO2017153200 can be combined with at least one compound of formula (I) of the present disclosure.

(250) The fungicides, insecticides, nematocides, acaricides, biopesticides, herbicides, plant growth regulators, antibiotics, fertilizers and nutrients reported in WO2016156129 and or WO2017153200 are incorporated herein by way of reference as non-limiting examples to be combined with at least one compound of the formula (I) of the present disclosure.

(251) Particularly, the compounds of the present invention can be mixed with at least one additional biological active compatible compound (mixing partner) which includes but is not limited to insecticides, fungicides, nematocides, bactericides, acaricides, growth regulators such as rooting stimulants, chemosterilants, semiochemicals, repellents, attractants, pheromones, feeding stimulants, other biologically active compounds or entomopathogenic bacteria, virus or fungi to form a multi-component pesticide giving an even broader spectrum of agricultural utility.

(252) Examples of such biologically active compounds or agents/mixing partners with which compound of formula (I) of the present invention can be combined/formulated are disclosed in the WO2019072906A1 (page 27 to 37).

(253) In one embodiment, the biological agents for mixing with compounds of the present invention include *Bacillus thuringiensis*, *Bacillus thuringiensis* delta endotoxin as well as naturally occurring and genetically modified viral insecticides including members of the family Baculoviridae as well as entomophagous fungi.

(254) In certain instances, combinations with other invertebrate pest control compounds or agents having a similar spectrum of control but a different mode of action will be particularly advantageous for resistance management. Thus, compositions of the present invention can further comprise a biologically effective amount of at least one additional invertebrate pest control compounds or agents having a similar spectrum of control but a different mode of action.

Contacting a plant genetically modified to express a plant protection compound (e.g., protein) or the locus of the plant with a biologically effective amount of a compound of the invention can also provide a broader spectrum of plant protection and be advantageous for resistance management.

(255) In one embodiment of the present invention, the biologically effective amount of the compound of formula (I) in the compositions ranges from 0.1% to 99% by weight with respect to the total weight of the composition, preferably from 5% to 50% by weight with respect to the total weight of the composition.

(256) The present invention furthermore provides a method of combating invertebrate pests, said method comprising contacting the invertebrate pests, their habitat, breeding ground, food supply, plant, seed, soil, area, material or environment in which the invertebrate pests are growing or may

grow, or the materials, plants, seeds, soils, surfaces or spaces to be protected from pest attack or infestation with a biologically effective amount of the compound or the composition of the present invention.

(257) Invertebrate pests are controlled and protection of agronomic, horticultural and specialty crops, animal and human health is achieved by applying one or more of the compounds of the present invention, in an effective amount, to the environment of the pests including the agronomic and/or nonagronomic locus of infestation, to the area to be protected, or directly on the pests to be controlled. Thus, the present invention further comprises a method for the control of foliar- and soil-inhabiting invertebrates and protection of agronomic and/or nonagronomic crops, comprising contacting the invertebrates or their environment with a biologically effective amount of one or more of the compounds of the present invention, or with a composition comprising at least one such compound or a composition comprising at least one such compound and an effective amount of at least one additional biologically active compound or agent. A preferred method of contact is by spraying. Alternatively, a granular composition comprising a compound of the present invention can be applied to the plant foliage or the soil. Compounds of the present invention are effective in delivery through plant uptake by contacting the plant with a composition comprising a compound of the present invention applied as a soil drench of a liquid formulation, a granular formulation to the soil, a nursery box treatment or a dip of transplants. Other methods of contact include application of a compound or a composition of the present invention by direct and residual sprays, aerial sprays, seed coats, microencapsulations, systemic uptake, baits, eartags, boluses, foggers, fumigants, aerosols, dusts and many others.

(258) The compounds of the present invention can be incorporated into baits that are consumed by the invertebrates or within devices such as traps and the like. Granules or baits comprising between 0.01-5% active ingredient, 0.05-10% moisture retaining agent(s) and 40-99% vegetable flour are effective in controlling soil insects at very low application rates, particularly at doses of active ingredient that are lethal by ingestion rather than by direct contact. The compounds of the present invention can be applied in their pure state, but most often application will be of a formulation comprising one or more compounds with suitable carriers, diluents, and surfactants and possibly in combination with a food depending on the contemplated end use. A preferred method of application involves spraying a water dispersion or refined oil solution of the compounds. Combinations with spray oils, spray oil concentrations, spreader stickers, adjuvants, other solvents, and synergists such as piperonyl butoxide often enhance compound efficacy.

(259) The rate of application required for effective control (i.e. "biologically effective amount") will depend on such factors as the species of invertebrate to be controlled, the pest's life cycle, life stage, its size, location, time of year, host crop or animal, feeding behavior, mating behavior, ambient moisture, temperature, and the like. Under normal circumstances, application rates of about 0.01 to 2 kg of active ingredient per hectare are sufficient to control pests in agronomic ecosystems, but as little as 0.0001 kg/hectare may be sufficient or as much as 8 kg/hectare may be required. For nonagronomic applications, effective use rates will range from about 1.0 to 50 mg/square meter but as little as 0.1 mg/square meter may be sufficient or as much as 150 mg/square meter may be required. One skilled in the art can easily determine the biologically effective amount necessary for the desired level of invertebrate pest control.

(260) The animal pest, i.e. the insects, arachnids and nematodes, the plant, soil or water in which the plant is growing can be contacted with compounds of formula (I), their N-oxides and salts or composition(s) containing them by any application method known in the art. As such, "contacting" includes both direct contact (applying the compounds/compositions directly on the animal pest or plant typically to the foliage, stem or roots of the plant) and indirect contact (applying the compounds/compositions to the locus of the animal pest or plant).

(261) The compounds of the present invention or the pesticidal compositions comprising them may be used to protect growing plants and crops from attack or infestation by animal pests, especially

insects, acaridae or arachnids by contacting the plant/crop with a pesticidally effective amount of at least one compound of the present invention. The term “crop” refers both to growing and harvested crops.

(262) In one embodiment, the present invention provides a method for protecting crops from attack or infestation by invertebrate pests, which comprises contacting the crop with a biologically effective amount of the compound or the composition of the present invention, isomer, polymorph, N-oxide or salt thereof.

(263) The compounds of the present invention are employed as such or in form of compositions by treating the insects or the plants, plant propagation materials, such as seeds, soil, surfaces, materials or rooms to be protected from insecticidal attack with an insecticidally effective amount of the active compounds. The application can be carried out both before and after the infection of the plants, plant propagation materials, such as seeds, soil, surfaces, materials or rooms by the insects.

(264) In one embodiment, the present invention provides to a method for the protection of seeds from soil insects and of the seedlings roots and shoots from soil and foliar insects comprising contacting the seeds before sowing and/or after pre-germination with the compound or the composition of the present invention, N-oxide or salt thereof.

(265) Furthermore, the present invention provides a method for treating or protecting animals against infestation or infection by parasites which comprises orally, topically or parenterally administering or applying to the animals a biologically effective amount of compound or composition of the present invention, isomer, polymorph, N-oxide or veterinary acceptable salt thereof.

(266) For use in treating crop plants, the rate of application (applying effective dosages) of the compound of the present invention may be in the range of 1 gai to 5000 gai per hectare in agricultural or horticultural crops, preferably from 25 g to 600 g per hectare, more preferably from 50 g to 500 g per hectare.

(267) The compounds and the compositions of the present invention are particularly useful in the control of a multitude of insects on various cultivated plants, such as cereal, root crops, oil crops, vegetables, spices, ornamentals, for example seed of durum and other wheat, barley, oats, rye, maize (fodder maize and sugar maize/sweet and field corn), soybeans, oil crops, crucifers, cotton, sunflowers, bananas, rice, oilseed rape, turnip rape, sugarbeet, fodder beet, eggplants, potatoes, grass, lawn, turf, fodder grass, tomatoes, leeks, pumpkin/squash, cabbage, iceberg lettuce, pepper, cucumbers, melons, *Brassica* species, melons, beans, peas, garlic, onions, carrots, tuberous plants such as potatoes, sugar cane, tobacco, grapes, petunias, geranium/pelargoniums, pansies and impatiens.

(268) Particularly, the compound or the composition of the present invention are useful in protecting agricultural crops such as cereals, corn, rice, soybean and other leguminous plants, fruits and fruit trees, grapes, nuts and nut trees, citrus and citrus trees, any horticultural plants, cucurbitaceae, oleaginous plants, tobacco, coffee, tea, cacao, sugar beet, sugar cane, cotton, potato, tomato, onions, peppers and other vegetables, and ornamentals.

(269) The compounds of the present invention are effective through both contact (via soil, glass, wall, bed net, carpet, plant parts or animal parts), and ingestion (bait or plant part).

(270) The compounds of the present invention may also be applied against non-crop invertebrate pests, such as ants, termites, wasps, flies, mosquitos, crickets, or cockroaches. For use against said non-crop pests, compounds of the present invention are preferably used in a bait composition.

(271) The bait can be a liquid, a solid or a semisolid preparation (e.g. a gel). Solid baits can be formed into various shapes and forms suitable to the respective application e.g. granules, blocks, sticks, disks. Liquid baits can be filled into various devices to ensure proper application, e.g. open containers, spray devices, droplet sources, or evaporation sources. Gels can be based on aqueous or oily matrices and can be formulated to particular necessities in terms of stickyness, moisture retention or aging characteristics.

(272) The bait employed in the composition is a product, which is sufficiently attractive to incite insects such as ants, termites, wasps, flies, mosquitos, crickets etc. or cockroaches to eat it. The attractiveness can be manipulated by using feeding stimulants or sex pheromones. Food stimulants are chosen, for example, but not exclusively, from animal and/or plant proteins (meat-, fish or blood meal, insect parts, egg yolk), from fats and oils of animal and/or plant origin, or mono-, oligo- or polyorganosaccharides, especially from sucrose, lactose, fructose, dextrose, glucose, starch, pectin or even molasses or honey. Fresh or decaying parts of fruits, crops, plants, animals, insects or specific parts thereof can also serve as a feeding stimulant. Sex pheromones are known to be more insect specific. Specific pheromones are described in the literature and are known to those skilled in the art.

(273) For use in bait compositions, the typical content of active ingredient is from 0.001 weight % to 15 weight %, desirably from 0.001 weight % to 5% weight % of active compound.

(274) Formulations of compounds of the present invention as aerosols (e.g. in spray cans), oil sprays or pump sprays are highly suitable for the non-professional user for controlling pests such as flies, fleas, ticks, mosquitos or cockroaches. Aerosol recipes are preferably composed of the active compound, solvents such as lower alcohols (e.g. methanol, ethanol, propanol, butanol), ketones (e.g. acetone, methyl ethyl ketone), paraffin hydrocarbons (e.g. kerosenes) having boiling ranges of approximately 50 to 250° C., dimethylformamide, N-methylpyrrolidone, dimethyl sulfoxide, aromatic hydrocarbons such as toluene, xylene, water, furthermore auxiliaries such as emulsifiers such as sorbitol monooleate, oleyl ethoxylate having 3-7 mol of ethylene oxide, fatty alcohol ethoxylate, perfume oils such as ethereal oils, esters of medium fatty acids with lower alcohols, aromatic carbonyl compounds, if appropriate stabilizers such as sodium benzoate, amphoteric surfactants, lower epoxides, triethyl orthoformate and, if required, propellants such as propane, butane, nitrogen, compressed air, dimethyl ether, carbon dioxide, nitrous oxide, or mixtures of these gases.

(275) The oil spray formulations differ from the aerosol recipes in that no propellants are used. For use in spray compositions, the content of active ingredient is from 0.001 to 80 weights %, preferably from 0.01 to 50 weight % and most preferably from 0.01 to 15 weight %.

(276) The compounds of the present invention and their respective compositions can also be used in mosquito and fumigating coils, smoke cartridges, vaporizer plates or long-term vaporizers and also in moth papers, moth pads or other heat-independent vaporizer systems.

(277) The methods to control infectious diseases transmitted by insects (e.g. malaria, dengue and yellow fever, lymphatic filariasis, and leishmaniasis) with compounds of formula (I) and its respective compositions also comprise treating surfaces of huts and houses, air spraying and impregnation of curtains, tents, clothing items, bed nets, tsetse-fly trap or the like. Insecticidal compositions for application to fibers, fabric, knitgoods, nonwovens, netting material or foils and tarpaulins preferably comprise a mixture including the insecticide, optionally a repellent and at least one binder. Suitable repellents for example are N,N-diethyl-meta-toluamide (DEET), N,N-diethylphenylacetamide (DEPA), 1-(3-cyclohexan-1-yl-carbonyl)-2-methylpiperine, (2-hydroxymethylcyclohexyl) acetic acid lactone, 2-ethyl-1,3-hexandiol, indalone, Methylneodecanamide (MNDA), a pyrethroid not used for insect control such as {(+/-)-3-allyl-2-methyl-4-oxocyclopent-2-(+)-enyl-(+)-trans-chrysantemate (Esbiothrin), a repellent derived from or identical with plant extracts like limonene, eugenol, (+)-Eucamadol (1), (-)-1-epi-eucamadol or crude plant extracts from plants like *Eucalyptus maculata*, *Vitex rotundifolia*, *Cymbopogon martinii*, *Cymbopogon citratus* (lemon grass), *Cymbopogon nardus* (citronella). (278) The impregnation of curtains and bednets is done in general by dipping the textile material

into emulsions or dispersions of the insecticide or spraying them onto the nets.

(279) The compounds of the present invention and their compositions can be used for protecting wooden materials such as trees, board fences, sleepers, etc. and buildings such as houses, outhouses, factories, but also construction materials, furniture, leathers, fibers, vinyl articles, electric wires and cables etc. from ants and/or termites, and for controlling ants and termites from doing harm to crops or human being (e.g. when the pests invade into houses and public facilities). The compounds of the present invention are applied not only to the surrounding soil surface or into the under-floor soil in order to protect wooden materials but it can also be applied to lumbered articles such as surfaces of the under-floor concrete, alcove posts, beams, plywoods, furniture, etc., wooden articles such as particle boards, half boards, etc. and vinyl articles such as coated electric wires, vinyl sheets, heat insulating material such as styrene foams, etc.

(281) Seed Treatment

(282) The present invention further provides a treated seed comprising the compounds of the present invention, particularly in an amount ranging from about 0.0001% to about 1% by weight of the seed before treatment.

(283) The compounds of the present invention are also suitable for the treatment of seeds in order to protect the seed from insect pest, in particular from soil-living insect and mite pests and the resulting plant's roots and shoots against soil pests and foliar insects.

(284) The compounds of the present invention are particularly useful for the protection of the seed from soil pests and the resulting plant's roots (white grub, termites, wireworms) and shoots against soil pests and foliar insects. The protection of the resulting plant's roots and shoots is preferred. More preferred is the protection of resulting plant's shoots from piercing and sucking insects, wherein the protection from aphids, jassids, thrips and white fly is most preferred.

(285) The present invention therefore comprises a method for the protection of seeds from insects, in particular from soil insects and of the seedling roots and shoots from insects, in particular from soil and foliar insects, said method comprising contacting the seeds before sowing and/or after pregermination with a compound of the present invention thereof. Particularly preferred is a method, wherein the plant's roots and shoots are protected, more preferably a method, wherein the plants shoots are protected from piercing and sucking insects, most preferably a method, wherein the plants shoots are protected from aphids.

(286) The term seed embraces seeds and plant propagules of all kinds including but not limited to true seeds, seed pieces, suckers, corms, bulbs, fruit, tubers, grains, cuttings, cut shoots and the like and means in a preferred embodiment true seeds.

(287) The term seed treatment comprises all suitable seed treatment techniques known in the art, such as seed dressing, seed coating, seed dusting, seed soaking and seed pelleting.

(288) The present invention also comprises seeds coated with or containing the active compound. (289) The term "coated with and/or containing" generally signifies that the active ingredient is for the most part on the surface of the propagation product at the time of application, although a greater or lesser part of the ingredient may penetrate into the propagation product, depending on the method of application. When the propagation product is (re)planted, it may absorb the active ingredient along with moisture.

(290) Suitable seed is seeds of cereals, root crops, oil crops, vegetables, spices, ornamentals, for

example seed of durum and other wheat, barley, oats, rye, maize (fodder maize and sugar maize/sweet and field corn), soybeans, oil crops, crucifers, cotton, sunflowers, bananas, rice, oilseed rape, turnip rape, sugarbeet, fodder beet, eggplants, potatoes, grass, lawn, turf, fodder grass, tomatoes, leeks, pumpkin/squash, cabbage, iceberg lettuce, pepper, cucumbers, melons, *Brassica* species, melons, beans, peas, garlic, onions, carrots, tuberous plants such as potatoes, sugar cane, tobacco, grapes, petunias, geranium/pelargoniums, pansies and impatiens.

(291) In addition, the compounds of the present invention may be used for treating seed from plants, which tolerate the action of herbicides or fungicides or insecticides owing to breeding, including genetic engineering methods.

(292) For example, the compound of the present invention can be employed in treatment of seeds from plants, which are resistant to herbicides from the group consisting of the sulfonylureas, imidazolinones, glufosinate-ammonium or glyphosate-isopropylammonium and analogous active substances (see for example, EP242236, EP242246) (WO92/00377) (EP257993, U.S. Pat. No. 5,013,659) or in transgenic crop plants, for example cotton, with the capability of producing *Bacillus thuringiensis* toxins (Bt toxins) which make the plants resistant to certain pests (EP142924, EP193259),

(293) Furthermore, the compound of the present invention can be used for the treatment of seeds from plants, which have modified characteristics in comparison with existing plants, which can be generated for example by traditional breeding methods and/or the generation of mutants, or by recombinant procedures). For example, a number of cases have been described of recombinant modifications of crop plants for the purpose of modifying the starch synthesized in the plants (e.g. WO92/11376, WO92/14827, WO91/19806) or of transgenic crop plants having a modified fatty acid composition (WO91/13972).

(435) As described herein, the compounds of formula (I) show insecticidal activities which are exerted with respect to numerous insects which attacks on important agricultural crops. The compounds of the present invention were assessed for their activity as described in the following tests:

BIOLOGY EXAMPLES

Example A: *Helicoverpa armigera*

(436) Diet incorporation method was used, in which the required quantity of test compounds were weighed and dissolved in a surfactant solution, kept on vortex for 90 min for proper mixing, then was diluted with water to the desired test concentrations. The solutions were incorporated into semi-synthetic diet when the temperature reached approximately 50° C. in the bioassay containers. The diet and solution was stirred thoroughly for properly mixing and then left to cool for 30 min. The solidified diet was cut into equal pieces, and then each piece was transferred into one cell of the bio-assay trays. A single third starved instar larva was released into each of these cells of the

bioassay trays and each tray was covered with a lid. The bio-assay trays were kept under laboratory conditions at a temperature of 25° C. and relative humidity of 70%. Observations on dead, moribund and alive larvae were recorded at 96 h after the release of the larvae. Percent mortality was calculated by combining dead and moribund larvae and comparing the result to the one of the untreated control. The compounds 15 21 25 26 28 32 39 83 87 90 91 93 97 99 101 102 103 104 109 118 120 126 and 136 showed an activity higher than 70 percent mortality @ 300 PPM.

Example B: *Spodoptera litura*

(437) Diet incorporation method was used, in which the required quantity of test compounds were weighed and dissolved in surfactant solution, kept on vortex for 90 min for proper mixing, then diluted with water to the desired test concentrations. The solutions were incorporated into semi-synthetic diet when the temperature reached approximately 50° C. in the bioassay containers. The diet and solution was stirred thoroughly for properly mixing and was left to cool for 30 min. The solidified diet was cut into equal pieces, and then each piece was transferred into one cell of the bio-assay trays. A single starved third instar larva was released into each of these cells of the bioassay trays and the tray was covered with a lid. The bio-assay trays were kept under laboratory conditions at a temperature of 25° C. and relative humidity of 70%. Observations on dead, moribund and alive larvae were recorded at 96 h after the release of the larvae. Percent mortality was calculated by combining dead and moribund larvae and comparing the result to the one of the untreated control. The compounds 15 21 25 26 37 63 83 87 90 93 101 103 118 126 129 and 134 showed an activity higher than 70 percent mortality @ 300 PPM.

Example C: *Plutella xylostella*

(438) The leaf dip method was used for testing, wherein the required quantity of the compounds were weighed and dissolved in a surfactant solution, kept on a Vortex at 2000 rpm with zirconia beads for 90 min for proper mixing and then diluted with 0.01% Triton-X solution to the desired test concentration. Cabbage leaves were dipped in the solution for 10 seconds, shade dried for 20 min and then transferred to bioassay trays. A single second instar larva was released into each bioassay tray cell and the tray was covered with a lid. The bio-assay trays were kept under laboratory conditions at a temperature of 25° C. and relative humidity of 70%. Observations on dead, moribund and living larvae were recorded at 72 h after the release. Percent mortality was calculated by combining dead and moribund larvae and comparing the result to the one of the untreated control. The compounds 5 6 9 12 15 18 20 21 22 25 26 27 28 29 30 32 34 35 37 39 40 43 46 48 50 62 63 66 67 69 70 71 74 80 81 83 87 88 90 91 93 95 96 99 100 101 103 104 109 114 115 118 119 129 130 131 133 135 136 and 137 showed an activity higher than 70 percent mortality @ 300 PPM.

Example D: *Bemisia tabaci*

(439) The leaf dip method was used for testing, wherein the required quantity of the test compounds were weighed and dissolved in surfactant solution, kept on a Vortex at 2000 rpm with zirconia beads for 90 min for proper mixing and then diluted with 0.01% Triton-X solution to the desired test concentration. Cotton leaves were dipped in the solution for 10 seconds, shade dried for 20 min and then the leaves were kept in glass units with the petiole dipped in water. Known numbers of freshly emerged adults were released and kept in the plant growth chamber at a temperature of 25° C. and relative humidity of 70%. Observations on dead, moribund and living adults were recorded at 72 h after the release. Percent mortality was calculated by combining dead and moribund adults and comparing the result to the one of the untreated control. The compound 22 and 119 showed an activity higher than 70 percent mortality @ 300 PPM.

Example E: *Myzus persicae*

(440) The leaf dip method was used for testing, wherein the required quantity of the test compounds were weighed and dissolved in a surfactant solution, kept on a Vortex at 2000 rpm with zirconia beads for 90 min for proper mixing and then diluted with 0.01% Triton-X solution to the desired test concentration. Capsicum leaves were dipped in the solution for 10 seconds, shade dried

for 20 min and then the leaves were kept in glass units with the petiole dipped in water. Known numbers of third instar nymphs were released into the glass units and then kept in the plant growth chambers at a temperature of 25° C. and relative humidity of 70%. Observations on dead, moribund and living nymphs were recorded at 72 h after the release. Percent mortality was calculated by combining dead and moribund nymphs and comparing the result to the one of the untreated control. The compounds 9 14 16 22 23 50 71 104 and 131 were showing efficacy higher than 70 percent mortality @ 300 PPM.

Example F: *Nilaparvata lugens*

(441) Seedling dip method was used for screening, wherein the required quantity of the test compounds were weighed and dissolved in surfactant solution, kept on a Vortex at 2000 rpm with zirconia beads for 90 min for proper mixing, then diluted with 0.01% Triton-X solution to the desired test concentration. Paddy seedlings were dipped in the solution for 10 seconds, shade dried for 20 min and then transferred into glass tubes with the roots kept in water. Known numbers of third instar nymphs were released into the test tubes and the tubes were kept in the plant growth chamber at a temperature of 25° C. and relative humidity of 75%. Observations on dead, moribund and living nymphs were recorded at 72 h after the release.
