ABSTRACT

A VP includes an EPB system configured to switch between activation and release of brakehold and a VCIB that interfaces between an ADS and a VP. The VCIB is configured to provide a standstill status signal to the ADS. The standstill status signal includes a value applied indicating activation of brakehold and a value released indicating release of brakehold. The ADS includes a compute assembly. When the compute assembly requests the VP to activate brakehold, it requests the VP to decelerate until the standstill status signal switches from the value released to the value applied.

AUTONOMOUS DRIVING SYSTEM, VEHICLE CONTROL INTERFACE, AND VEHICLE

This nonprovisional application is based on Japanese Patent Application No. 2021-157678 filed with the Japan Patent Office on Sep. 28, 2021, the entire contents of which are hereby incorporated by reference.

BACKGROUND

Field

The present disclosure relates to an autonomous driving system, a vehicle control interface, and a vehicle.

Description of the Background Art

A technique for autonomous driving of a vehicle has recently been developed. For example, Japanese Patent Laying-Open No. 2018-132015 discloses an autonomous driving system that controls autonomous driving of a vehicle in a centralized manner. This autonomous driving system includes a camera, a laser apparatus, a radar apparatus, an operation apparatus, a gradient sensor, an autonomous driving device, and an autonomous driving electronic control unit (ECU).

SUMMARY

The autonomous driving system may externally be attached to a vehicle main body. In this case, autonomous driving is realized by control of a vehicle by a vehicle platform (which will be described later) in accordance with a control request from the autonomous driving system. During autonomous driving, the vehicle is required to safely be brought to a standstill.

For appropriate coordination between the autonomous driving system and the vehicle platform, an appropriate interface is desirably provided between the autonomous driving system and the vehicle platform. Importance of such an interface may particularly be noticeable when a developer of the autonomous driving system is different from a developer of the vehicle platform.

The present disclosure was made to solve the problem above, and one of objects of the present disclosure is to safely bring a vehicle to a standstill during autonomous driving by providing an appropriate interface between an autonomous driving system and a vehicle platform.

- (1) An autonomous driving system (ADS) according to one aspect of the present disclosure is mountable on a vehicle. The vehicle includes a vehicle platform (VP) that controls the vehicle in accordance with a control request from the ADS. The VP includes an electric parking brake system that switches between activation and release of brakehold and a vehicle control interface that interfaces between the ADS and the VP. The vehicle control interface provides a standstill status signal to the ADS. The standstill status signal includes a value applied indicating activation of the brakehold and a value released indicating release of the brakehold. The ADS includes a compute assembly and a communication module that communicates with the vehicle control interface. When the compute assembly requests the VP to activate the brakehold, the compute assembly

2

requests the VP to decelerate until the standstill status signal switches from the value released to the value applied.

- (2) After the standstill status signal switches to the value applied, the compute assembly continues to request the VP to decelerate also during a period for which the brakehold is active.
- (3) When the standstill status signal has been set to the value applied, the compute assembly causes the VP to switch the standstill status signal from the value applied to the value released by requesting the VP to accelerate.
- (4) A vehicle according to another aspect of the present disclosure includes the ADS described above.
- (5) A vehicle control interface according to yet another aspect of the present disclosure interfaces between an autonomous driving system (ADS) and a vehicle platform (VP) that controls a vehicle in accordance with a control request from the ADS. The VP includes an electric parking brake system that switches between activation and release of brakehold. The vehicle control interface includes a processor and a memory in which a program executable by the processor is stored. The processor provides with the ADS, a standstill status signal including a value applied indicating activation of the brakehold and a value released indicating release of the brakehold. The processor receives a deceleration request from the ADS also after the vehicle comes to a standstill, until the standstill status signal is switched from the value released to the value applied.
- (6) After the standstill status signal switches to the value applied, the processor continues to receive a request for deceleration from the ADS also during a period for which the brakehold is active.
- (7) When the standstill status signal has been set to the value applied, the processor switches the standstill status signal from the value applied to the value released in response to an acceleration request from the ADS.
- (8) When a standstill command provided from the ADS to the VP is a prescribed value applied, the VP activates a function to switch the brakehold.
- (9) A vehicle according to yet another aspect of the present disclosure includes the vehicle control interface described above.
- (10) The vehicle further includes the ADS described above.

The foregoing and other objects, features, aspects and advantages of the present disclosure will become more apparent from the following detailed description of the present disclosure when taken in conjunction with the accompanying drawings.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is a diagram showing overview of a vehicle according to an embodiment of the present disclosure.

FIG. 2 is a diagram showing in further detail, a configuration of an ADS, a VCIB, and a VP.

FIG. 3 is a diagram for illustrating a standstill command.

FIG. 4 is a diagram for illustrating a standstill status signal.

FIG. 5 is a diagram for illustrating a traveling direction signal.

FIG. 6 is a time chart showing control relating to brakehold of the vehicle.

FIG. 7 is a flowchart showing a processing procedure relating to a condition for using a brakeholding function.

FIG. 8 is a flowchart showing a processing procedure in control relating to activation of brakehold.

FIG. 9 is a flowchart showing a processing procedure in control relating to release of brakehold.

FIG. 10 is a diagram showing an overall structure of an Autono-MaaS vehicle.

FIG. 11 is a diagram showing a system architecture of the Autono-MaaS vehicle.

FIG. 12 is a diagram showing a typical workflow in the ADS.

FIG. 13 is a diagram showing relation between a front wheel steer angle rate limitation and a velocity.

FIG. 14 is a state machine diagram of the power mode.

FIG. 15 is a diagram showing details of shift change sequences.

FIG. 16 is a diagram showing immobilization sequences.

FIG. 17 is a diagram showing standstill sequences.

FIG. 18 is a state machine diagram of an autonomy state.

FIG. 19 is a diagram showing an authentication process.

DESCRIPTION OF THE PREFERRED EMBODIMENTS

An embodiment of the present disclosure will be described below in detail with reference to the drawings. The same or corresponding elements in the drawings have the same reference characters allotted and description thereof will not be repeated.

Embodiment

<Overall Configuration>

FIG. 1 is a diagram showing overview of a vehicle according to an embodiment of the present disclosure. A vehicle 1 includes an autonomous driving kit (ADK) 10 and a vehicle platform (VP) 20. ADK 10 is configured as being attachable to VP 20 (mountable on vehicle 1). ADK 10 and VP 20 are configured to communicate with each other through a vehicle control interface (a VCIB 40 which will be described later).

VP 20 can carry out autonomous driving in accordance with control requests from ADK 10. Though FIG. 1 shows ADK 10 at a position distant from VP 20, ADK 10 is actually attached to a rooftop or the like of VP 20. ADK 10 can also be removed from VP 20. While ADK 10 is not attached, VP 20 carries out travel control (travel control in accordance with an operation by a user) in a manual mode.

ADK 10 includes an autonomous driving system (ADS) 11 for autonomous driving of vehicle 1. For example, ADS 11 creates a driving plan of vehicle 1. ADS 11 outputs various control requests for travel of vehicle 1 in accordance with the driving plan to VP 20 in accordance with an application program interface (API) defined for each control request. ADS 11 receives various signals indicating vehicle statuses (statuses of VP 20) from VP 20 in accordance with the API defined for each signal. Then, ADS 11 has the vehicle status reflected on the driving plan. A detailed configuration of ADS 11 will be described with reference to FIG. 2.

VP 20 includes a base vehicle 30 and a vehicle control interface box (VCIB) 40.

Base vehicle 30 carries out various types of vehicle control in accordance with a control request from ADK 10 (ADS 11). Base vehicle 30 includes various systems and various sensors for controlling base vehicle 30. More specifically, base vehicle 30 includes an integrated control manager 31, a brake system 32, a steering system 33, a

powertrain system 34, an active safety system 35, a body system 36, wheel speed sensors 51 and 52, a pinion angle sensor 53, a camera 54, and radar sensors 55 and 56.

Integrated control manager 31 includes a processor and a memory, and integrally controls the systems (brake system 32, steering system 33, powertrain system 34, active safety system 35, and body system 36) involved with operations of vehicle 1.

Brake system 32 is configured to control a braking apparatus provided in each wheel of base vehicle 30. The braking apparatus includes, for example, a disc brake system (not shown) that is operated with a hydraulic pressure regulated by an actuator.

Wheel speed sensors 51 and 52 are connected to brake system 32. Wheel speed sensor 51 detects a rotation speed of a front wheel of base vehicle 30 and outputs the detected rotation speed of the front wheel to brake system 32. Wheel speed sensor 52 detects a rotation speed of a rear wheel of base vehicle 30 and outputs the detected rotation speed of the rear wheel to brake system 32. Brake system 32 outputs to VCIB 40, the rotation speed of each wheel as one of pieces of information included in the vehicle statuses. Brake system 32 generates a braking command to a braking apparatus in accordance with a prescribed control request outputted from ADS 11 through VCIB 40 and integrated control manager 31. Brake system 32 controls the braking apparatus based on the generated braking command. Integrated control manager 31 can calculate a speed of vehicle 1 (vehicle speed) based on the rotation speed of each wheel.

Steering system 33 is configured to control a steering angle of a steering wheel of vehicle 1 with a steering apparatus. The steering apparatus includes, for example, rack-and-pinion electric power steering (EPS) that allows adjustment of a steering angle by an actuator.

Pinion angle sensor 53 is connected to steering system 33. Pinion angle sensor 53 detects an angle of rotation of a pinion gear (a pinion angle) coupled to a rotation shaft of the actuator and outputs the detected pinion angle to steering system 33. Steering system 33 outputs to VCIB 40, the pinion angle as one of pieces of information included in the vehicle statuses. Steering system 33 generates a steering command to the steering apparatus in accordance with a prescribed control request outputted from ADS 11 through VCIB 40 and integrated control manager 31. Steering system 33 controls the steering apparatus based on the generated steering command.

Powertrain system 34 controls an electric parking brake (EPB) system 341 provided in at least one of a plurality of wheels, a parking lock (P-Lock) system 342 provided in a transmission of vehicle 1, and a propulsion system 343 including a shift apparatus (not shown) configured to allow selection of a shift range. A further detailed configuration of powertrain system 34 will be described with reference to FIG. 2.

Active safety system 35 detects an obstacle (a pedestrian, a bicycle, a parked vehicle, a utility pole, or the like) in front or in the rear with the use of camera 54 and radar sensors 55 and 56. Active safety system 35 determines whether or not vehicle 1 may collide with the obstacle based on a distance between vehicle 1 and the obstacle and a direction of movement of vehicle 1. When active safety system 35 determines that there is possibility of collision, it outputs a braking command to brake system 32 through integrated control manager 31 so as to increase braking force.

Body system 36 is configured to control, for example, components such as a direction indicator, a horn, and a wiper (none of which is shown), depending on a state of travel or

an environment around vehicle **1**. Body system **36** controls each component in accordance with a prescribed control request outputted from ADS **11** through VCIB **40** and integrated control manager **31**.

VCIB **40** is configured to communicate with ADS **11** over a controller area network (CAN). VCIB **40** receives various control requests from ADS **11** or outputs a vehicle status to ADS **11** by executing a prescribed API defined for each signal. When VCIB **40** receives the control request from ADK **202**, it outputs a control command corresponding to the control request to a system corresponding to the control command through integrated control manager **31**. VCIB **40** obtains various types of information on base vehicle **30** from various systems through integrated control manager **31** and outputs the status of base vehicle **30** as the vehicle status to ADS **11**.

Vehicle **1** may be used as one of constituent elements of a mobility as a service (MaaS) system. The MaaS system includes, for example, a data server and a mobility service platform (MSPF) (neither of which is shown), in addition to vehicle **1**.

The MSPF is an integrated platform to which various mobility services are connected. Autonomous driving related mobility services are connected to the MSPF. In addition to the autonomous driving related mobility services, mobility services provided by a ride-share company, a car-sharing company, a rent-a-car company, a taxi company, and an insurance company may be connected to the MSPF.

Vehicle **1** further includes a data communication module (DCM) (not shown) capable of wirelessly communicating with a data server. The DCM outputs vehicle information such as a speed, a position, or an autonomous driving state to the data server. The DCM receives from the autonomous driving related mobility services through the MSPF and the data server, various types of data for management of travel of an autonomous driving vehicle including vehicle **1** in the mobility services.

The MSPF publishes APIs for using various types of data on vehicle statuses and vehicle control necessary for development of ADS **11**. Various mobility services can use various functions provided by the MSPF depending on service contents, by using the APIs published on the MSPF. For example, the autonomous driving related mobility services can obtain operation control data of vehicle **1** or information stored in the data server from the MSPF by using the APIs published on the MSPF. The autonomous driving related mobility services can transmit data for managing an autonomous driving vehicle including vehicle **1** to the MSPF by using the API.

<Detailed Configuration>

FIG. **2** is a diagram showing in further detail, a configuration of ADS **11**, VCIB **40**, and VP **20**. As shown in FIG. **2**, ADS **11** includes a compute assembly **111**, a human machine interface (HMI) **112**, sensors for perception **113**, sensors for pose **114**, and a sensor cleaning **115**.

During autonomous driving of vehicle **1**, compute assembly **111** obtains information indicating an environment around vehicle **1** and information indicating a pose, a behavior, and a position of vehicle **1** from various sensors (which will be described later), and obtains a vehicle status from VP **20** through VCIB **40** and sets a next operation (acceleration, deceleration, or turning) of vehicle **1**. Compute assembly **111** outputs various commands for realizing a next operation to VCIB **40**. Compute assembly **111**

includes communication modules **111A** and **111B**. Communication modules **111A** and **111B** are each configured to communicate with VCIB **40**.

HMI **112** presents information to a user and accepts an operation by the user during autonomous driving, during driving requiring an operation by the user, or at the time of transition between autonomous driving and driving requiring an operation by the user. HMI **112** is constructed to be connected to an input and output apparatus (not shown) such as a touch panel display provided in base vehicle **30**.

Sensors for perception **113** are sensors that perceive an environment around vehicle **1**. Sensors for perception **113** include, for example, at least one of laser imaging detection and ranging (LIDAR), a millimeter-wave radar, and a camera (none of which is shown). The LIDAR measures a distance and a direction to an object, for example, by emitting laser beams of infrared pulses and detecting laser beams reflected by the object. The millimeter-wave radar measures a distance and a direction to an object by emitting millimeter waves and detecting millimeter waves reflected by the object. The camera is arranged, for example, on a rear side of a room mirror and shoots an image of the front of vehicle **1**.

Sensors for pose **114** are sensors that detect a pose, a behavior, or a position of vehicle **1**. Sensors for pose **114** include, for example, an inertial measurement unit (IMU) and a global positioning system (GPS) (neither of which is shown). The IMU detects, for example, an acceleration in a front-rear direction, a lateral direction, and a vertical direction of vehicle **1** and an angular speed in a roll direction, a pitch direction, and a yaw direction of vehicle **1**. The GPS detects a position of vehicle **1** based on information received from a plurality of GPS satellites that orbit the Earth.

Sensor cleaning **115** is configured to remove with a cleaning solution or a wiper, soiling attached to various sensors (a lens of the camera or a portion from which laser beams are emitted) during traveling of vehicle **1**.

VCIB **40** includes a VCIB **41** and a VCIB **42**. Each of VCIBs **41** and **42** includes a processor such as a central processing unit (CPU) and a memory such as a read only memory (ROM) and a random access memory (RAM), although none of them is shown. A program executable by the processor is stored in the memory. VCIB **41** and communication module **111A** are communicatively connected to each other. VCIB **42** and communication module **111B** are communicatively connected to each other. VCIB **41** and VCIB **42** are communicatively connected to each other.

VCIBs **41** and **42** each relay control requests and vehicle information between ADS **11** and VP **20**. More specifically, VCIB **41** generates a control command from a control request from ADS **11** with the use of an API. For example, a control command corresponding to a control request supplied from ADS **11** to VCIB **40** includes a propulsion direction command requesting switching of the shift range, an immobilization command requesting activation/deactivation of EPB system **341** and P-Lock system **342**, an acceleration command requesting acceleration or deceleration of vehicle **1**, a wheel steer angle command requesting a wheel steer angle of a steering wheel, and an autonomization command requesting switching between an autonomous mode and a manual mode. Then, VCIB **41** outputs the generated control command to a corresponding system of a plurality of systems included in VP **20**. VCIB **41** generates information indicating a vehicle status from the vehicle information from each system of VP **20** with the use of the API. The information indicating the vehicle status may be information identical to the vehicle information or may be

information extracted from the vehicle information to be used for processing performed by ADS 11. VCIB 41 provides the generated information indicating the vehicle status to ADS 11. This is also applicable to VCIB 42.

Brake system 32 includes brake systems 321 and 322. Steering system 33 includes steering systems 331 and 332. Powertrain system 34 includes EPB system 341, P-Lock system 342, and propulsion system 343.

Though VCIB 41 and VCIB 42 are basically equivalent in function to each other, they are partially different in systems connected to the VCIBs that are included in VP 20. Specifically, VCIB 41, brake system 321, steering system 331, EPB system 341, P-Lock system 342, propulsion system 343, and body system 36 are communicatively connected to one another through a communication bus. VCIB 42, brake system 322, steering system 332, and P-Lock system 342 are communicatively connected to one another through a communication bus.

As VCIBs 41 and 42 equivalent in function relating to an operation of at least one of (for example, braking or steering) systems are thus included in VCIB 40, control systems between ADS 11 and VP 20 are redundant. Thus, when some kind of failure occurs in the system, the function of VP 20 can be maintained by switching between the control systems as appropriate or disconnection of a control system where failure has occurred.

Brake systems 321 and 322 are each configured to control a braking apparatus. Brake system 321 generates a braking command to the braking apparatus in accordance with a control request outputted from ADS 11 through VCIB 41. Brake system 322 generates a braking command to the braking apparatus in accordance with a control request outputted from ADS 11 through VCIB 42. Brake system 321 and brake system 322 may be equivalent in function to each other. Alternatively, one of brake systems 321 and 322 may be configured to independently control braking force of each wheel and the other thereof may be configured to control braking force such that equal braking force is generated in the wheels. For example, brake systems 321 and 322 may control the braking apparatus based on a braking command generated by any one of them, and when a failure occurs in that brake system, they may control the braking apparatus based on a braking command generated by the other of them.

Steering systems 331 and 332 are each configured to control a steering angle of a steering wheel of vehicle 1 with a steering apparatus. Steering system 331 generates a steering command to the steering apparatus in accordance with a control request outputted from ADS 11 through VCIB 41. Steering system 332 generates a steering command to the steering apparatus in accordance with a control request outputted from ADS 11 through VCIB 42. Steering system 331 and steering system 332 may be equivalent in function to each other. Alternatively, steering systems 331 and 332 may control the steering apparatus based on the steering command generated by any one of them, and when a failure occurs in that steering system, they may control the steering apparatus based on a steering command generated by the other of them.

EPB system 341 controls the EPB in accordance with a control request outputted from ADS 11 through VCIB 41. The EPB is provided separately from the braking apparatus (a disc brake system or the like), and fixes a wheel by an operation of an actuator. The EPB, for example, activates with an actuator, a drum brake for a parking brake provided in at least one of a plurality of wheels to fix the wheel, or activates a braking apparatus to fix a wheel with an actuator

capable of regulating a hydraulic pressure to be supplied to the braking apparatus separately from brake systems 321 and 322.

In the present embodiment, EPB system 341 performs a brakeholding function, and is configured to switch between activation and release of brakehold. The brakeholding function of EPB system 341 will be described in detail with reference to FIGS. 3 to 5.

P-Lock system 342 controls a P-Lock apparatus in accordance with a control request outputted from ADS 11 through VCIB 41. For example, when the control request includes a control request to set the shift range to a parking range (P range), P-Lock system 342 activates the P-Lock apparatus, and when the control request includes a control request to set the shift range to a shift range other than the P range, it deactivates the P-Lock apparatus. The P-Lock apparatus fits a protrusion provided at a tip end of a parking lock pawl, a position of which is adjusted by an actuator, into a tooth of a gear (locking gear) provided as being coupled to a rotational element in the transmission of vehicle 1. Rotation of an output shaft of the transmission is thus fixed and the wheel is fixed.

Propulsion system 343 switches the shift range of the shift apparatus and controls driving force from a drive source (a motor generator and an engine) in accordance with a control request outputted from ADS 11 through VCIB 41. The shift ranges include, for example, a neutral range (N range), a forward travel range (D range), and a rearward travel range (R range) in addition to the P range.

Active safety system 35 is communicatively connected to brake system 321. As described previously, active safety system 35 detects an obstacle in front by using camera 54 and/or radar sensor 55, and when it determines that there is possibility of collision, it outputs a braking command to brake system 321 so as to increase braking force.

Body system 36 controls components such as a direction indicator, a horn, or a wiper in accordance with a control request outputted from ADS 11 through VCIB 41.

For example, when an autonomous mode is selected by an operation by the user onto HMI 112 in vehicle 1, autonomous driving is carried out. During autonomous driving, ADS 11 initially creates a driving plan as described previously. Examples of the driving plan include a plan to continue straight travel, a plan to turn left/right at a prescribed intersection on a predetermined travel path, and a plan to change a travel lane. ADS 11 calculates a controllable physical quantity (an acceleration, a deceleration, and a wheel steer angle) necessary for operations of vehicle 1 in accordance with the created driving plan. ADS 11 splits the physical quantity for each execution cycle time of the API. ADS 11 outputs a control request representing the split physical quantity to VCIB 40 by means of the API. Furthermore, ADS 11 obtains a vehicle status (an actual direction of movement of vehicle 1 and a state of fixation of the vehicle) from VP 20 and creates again the driving plan on which the obtained vehicle status is reflected. ADS 11 thus allows autonomous driving of vehicle 1.

<Brakehold>

A standstill sequence of vehicle 1 relating to brakehold of EPB system 341 will be described in succession. Various commands and signals used at the time of application/release of brakehold will initially be described.

FIG. 3 is a diagram for illustrating a standstill command (Standstill Command). The standstill command is provided from ADS 11 to VP 20. The standstill command can be used only while the autonomous mode has been selected.

The standstill command takes any one value of 0, 1, and 2. When the standstill command has the value 0, the standstill command represents that ADS 11 does not request VP 20 to apply/release brakehold (in other words, keep/cancel the standstill). When the standstill command has the value 1, the standstill command represents that ADS 11 requests VP 20 to apply brakehold (the brakeholding function is allowed). When the standstill command has the value 2, the standstill command represents that ADS 11 requests VP 20 to release brakehold.

FIG. 4 is a diagram for illustrating a standstill status signal (Standstill Status). The standstill status signal is provided from VP 20 to ADS 11.

The standstill status signal takes any one value from 0 to 3. When the standstill status signal has the value 0, the standstill status signal represents that the standstill of vehicle 1 has been released (vehicle 1 is not in the standstill). When the standstill status signal has the value 1, the standstill status signal represents that the standstill of vehicle 1 has been applied (vehicle 1 is in the standstill). The standstill status signal=0 means a value released (released). The standstill status signal=1 means a value applied (applied). The standstill status signal=2 means a reserved value. The standstill status signal=3 means an invalid value.

FIG. 5 is a diagram for illustrating a traveling direction signal (Traveling Direction). The traveling direction signal is provided from VP 20 to ADS 11.

The traveling direction signal takes any one value from 0 to 3. When the traveling direction signal has the value 0, the traveling direction signal represents forward travel of vehicle 1. When the traveling direction signal has the value 1, the traveling direction signal represents rearward travel of vehicle 1. When the traveling direction signal has the value 2, the traveling direction signal represents that vehicle 1 is in the standstill. The traveling direction signal=3 is undefined. The traveling direction signal is set to "standstill" (value=2) when a vehicle velocity is zero (0) for a certain period of time.

FIG. 6 is a time chart showing control relating to brakehold of vehicle 1. In FIG. 6, the abscissa represents elapsed time. The ordinate represents a vehicle velocity, an acceleration command, a standstill command, a traveling direction signal, and a standstill status signal sequentially from the top.

Control for activating brakehold will initially be described. In an example shown in FIG. 6, the vehicle velocity has a positive value at initial time t0. The traveling direction signal represents forward travel of vehicle 1. The acceleration command has been set to 0. The standstill command represents "applied", that is, a request for application of brakehold. The standstill status signal represents "released", that is, vehicle 1 not being in the standstill.

At time t1, the acceleration command is set to a value (a negative value) representing a request for deceleration, and the vehicle velocity starts to lower. At time t2, vehicle 1 comes to the standstill. ADS 11 continues to request vehicle 1 to decelerate by setting the acceleration command to the negative value also thereafter. At time t3 after lapse of a certain time period since vehicle 1 came to the standstill (time t2), the traveling direction signal switches from "forward" to "standstill". At subsequent time t4, the standstill status signal switches from "released" to "applied". ADS 11 can thus know that brakehold is active.

As vehicle 1 comes to the standstill (lowering to the vehicle velocity=0), the deceleration command may be set to 0 to stop the deceleration request to vehicle 1. In that case, however, vehicle 1 may move for a short period from stop

of the deceleration request until actual activation of brakehold. In the present embodiment, the acceleration command is always set to the negative value also after vehicle 1 came to the standstill (that is, a period from time t2 at which the vehicle velocity is set to 0 until time t4 at which the standstill status signal switches to "applied") and the request for deceleration of vehicle 1 is continued. Thus, vehicle 1 can be maintained in the standstill status also during a period until activation of brakehold more reliably than in setting of the acceleration command to 0. Therefore, according to the present embodiment, vehicle 1 can safely be brought to the standstill in the autonomous mode.

In succession, control for releasing brakehold will be described. At time t5, the acceleration command switches from the negative value to a positive value and acceleration of vehicle 1 is requested. At time t6, the standstill status signal switches from "applied" to "released". ADS 11 can thus know that brakehold has been released. At subsequent time t7, the vehicle velocity starts to increase and the traveling direction signal switches from "standstill" to "forward".

<Process Flow>

FIG. 7 is a flowchart showing a processing procedure relating to a condition of use of the brakeholding function. This flowchart is performed by being invoked from a main routine (not shown) when a predetermined condition is satisfied or every prescribed computing cycle. Though each step included in flowcharts shown in FIG. 7 and FIGS. 8 and 9 which will be described later is performed by software processing by ADS 11 or VP 20 (integrated control manager 31 or VCIB 40), it may be performed by hardware (electric circuitry) arranged in ADS 11 or VP 20. The step is abbreviated as S below.

In S11, VP 20 determines whether or not vehicle 1 has been set to the autonomous mode. A vehicle mode status is selected, for example, by an operation by the user onto HMI 112. When vehicle 1 has been set to the manual mode (NO in S11), subsequent processing is not performed. When vehicle 1 has been set to the autonomous mode (YES in S11), VP 20 has the process proceed to S12.

In S12, VP 20 determines contents in the standstill command received from ADS 11. When the standstill command indicates "applied", VP 20 allows the brakeholding function (S13). When the standstill command indicates "released", VP 20 does not allow the brakeholding function (S14).

FIG. 8 is a flowchart showing a processing procedure in control relating to activation of brakehold. This flowchart is performed when the standstill command indicates "applied" and the brakeholding function is allowed. In the figure, processing performed by ADS 11 is shown on the left and a series of processing performed by VP 20 is shown on the right. This is also applicable to FIG. 9 which will be described later.

In S21, ADS 11 continues to output the deceleration request to VP 20. While VP 20 receives the deceleration request from ADS 11 (YES in S31), it performs subsequent processing.

In S32, VP 20 determines whether or not vehicle 1 has been in the standstill for a certain period of time (the vehicle velocity=0 for the certain period of time). VP 20 stands by until the certain period of time elapses since the vehicle velocity attained to 0 (NO in S32), and after lapse of the certain period of time (YES in S32), VP 20 has the process proceed to S33.

In S33, VP 20 switches the traveling direction signal to "standstill" and outputs the traveling direction signal indicating "standstill" to ADS 11. Furthermore, VP 20 activates

11

brakehold of EPB system **341** (S34). Processing in S33 and processing in S34 can be performed in an interchanged order.

In S35, VP **20** switches the standstill status signal to “applied” and outputs the standstill status signal indicating “applied” to ADS **11**.

FIG. **9** is a flowchart showing a processing procedure in control relating to release of brakehold. In S41, ADS **11** provides the acceleration request to VP **20**. When VP **20** receives the acceleration request from ADS **11** while brakehold is active (YES in S51), it performs subsequent processing.

In S52, VP **20** releases brakehold of EPB system **341**. Furthermore, VP **20** switches the standstill status signal to “released” and provides the standstill status signal indicating “released” to ADS **11** (S53). Processing in S52 and processing in S53 can be performed in an interchanged order.

In S54, VP **20** switches the traveling direction signal to “forward” and provides the traveling direction signal indicating “forward” to ADS **11**.

As set forth above, in the present embodiment, the acceleration command is maintained at a negative value after time **t2** when the vehicle velocity attained to 0 until brakehold is activated and the standstill status signal switches to “applied”, and the request for deceleration of vehicle **1** is continued. It is thus guaranteed that vehicle **1** reliably maintains the standstill state. Therefore, according to the present embodiment, vehicle **1** can safely be brought to the standstill in the autonomous mode.

Since the acceleration command is maintained at the negative value also while brakehold is active (after time **t4**), it can be guaranteed that vehicle **1** is more reliably maintained in the standstill.

Example

API Specification for TOYOTA Vehicle Platform

1. INTRODUCTION

1.1. Purpose of this Specification

This document is an API specification of vehicle control interface for Autono-MaaS vehicles and contains outline, the way to use and note of APIs.

1.2. Target Vehicle

This specification is applied to the Autono-MaaS vehicles defined by [Architecture Specification for TOYOTA Vehicle Platform attached with Automated Driving System].

1.3. Definition of Term

TABLE 1

Definition of Term

Term	Definition
ADS	Autonomous Driving System
ADK	Autonomous Driving Kit
VP	Vehicle Platform
VCIB	Vehicle Control Interface Box. This is an ECU for the interface and the signal converter between ADS and VP's sub systems.
PCS	Pre-Collision Safety

2. STRUCTURE

2.1. Overall Structure of Autono-MaaS Vehicle

The overall structure of Autono-MaaS is shown (FIG. **10**).

2.2. System Structure of Autono-MaaS Vehicle

System Architecture is shown in FIG. **11**.

3. APPLICATION INTERFACES

3.1. Typical Usage of APIs

In this section, Typical Usage of APIs is described.

A typical workflow of APIs is as follows (FIG. 12). The following example assumes CAN for physical communication.

3.2. APIs for Vehicle Motion Control

In this section, the APIs for vehicle motion control are described.

3.2.1. API List for Vehicle Motion Control

3.2.1.1. Inputs

TABLE 3

Input APIs for vehicle motion control		
Signal Name	Description	Redundancy
Propulsion Direction Command	Request for shift change from/to forward (D range) to/from back (R range)	N/A

TABLE 3-continued

Input APIs for vehicle motion control		
Signal Name	Description	Redundancy
Immobilization Command	Request for turning on/off WheelLock	Applied
Standstill Command	Request for keeping on/off stationary	Applied
Acceleration Command	Request for acceleration/deceleration	Applied
Front Wheel Steer Angle Command	Request for front wheel steer angle	Applied
Vehicle Mode Command	Request for changing from/to manual mode to/from Autonomous Mode	Applied
High Dynamics Command	Request for increasing braking response performance*	Applied

*Reaction time in VP upon a request from ADK

3.2.1.2. Outputs

TABLE 4

Output APIs for vehicle motion control		
Signal Name	Description	Redundancy
Propulsion Direction Status	Current shift status	N/A
Immobilization Status	Status of immobilization (i.e. EPB and Shift P)	Applied
Standstill Status	Standstill status	N/A
Estimated Gliding Acceleration	Estimated vehicle acceleration/deceleration when throttle is fully closed	N/A
Estimated maximum acceleration	Estimated maximum acceleration	Applied
Estimated maximum deceleration	Estimated maximum deceleration	Applied
Front wheel steer angle	Front wheel steer angle	Applied
Front wheel steer angle rate	Front wheel steer angle rate	Applied
Front wheel steer angle rate limitation	Road wheel angle rate limit	Applied
Estimated maximum lateral acceleration	Estimated max lateral acceleration	Applied
Estimated maximum lateral acceleration rate	Estimated max lateral acceleration rate	Applied
Intervention of accelerator pedal	This signal shows whether the accelerator pedal is depressed by a driver (intervention)	N/A
Intervention of brake pedal	This signal shows whether the brake pedal is depressed by a driver (intervention)	N/A
Intervention of steering wheel	This signal shows whether the steering wheel is turned by a driver (intervention)	N/A
Intervention of shift lever	This signal shows whether the shift lever is controlled by a driver (intervention)	N/A
Wheel speed pulse (front left)	Pulse from wheel speed sensor (Front Left Wheel)	N/A
Wheel rotation direction (front left)	Rotation direction of wheel (Front Left)	N/A
Wheel speed pulse (front right)	Pulse from wheel speed sensor (Front Right Wheel)	N/A
Wheel rotation direction (front right)	Rotation direction of wheel (Front Right)	N/A
Wheel speed pulse (rear left)	Pulse from wheel speed sensor (Rear Left Wheel)	Applied
Wheel rotation direction (Rear left)	Rotation direction of wheel (Rear Left)	Applied
Wheel speed pulse (rear right)	Pulse from wheel speed sensor (Rear Right Wheel)	Applied
Wheel rotation direction (Rear right)	Rotation direction of wheel (Rear Right)	Applied
Traveling direction	Moving direction of vehicle	Applied
Vehicle velocity	Estimated longitudinal velocity of vehicle	Applied
Longitudinal acceleration	Estimated longitudinal acceleration of vehicle	Applied
Lateral acceleration	Sensor value of lateral acceleration of vehicle	Applied
Yawrate	Sensor value of yaw rate	Applied
Slipping Detection	Detection of tire glide/spin/skid	Applied
Vehicle mode state	State of whether Autonomous Mode, manual mode	Applied
Readiness for autonomization	Situation of whether the vehicle can transition to Autonomous Mode or not	Applied
Failure status of VP functions for Autonomous Mode	This signal is used to show whether VP functions have some failures mode when a vehicle works as Autonomous Mode.	Applied
PCS Alert Status	Status of PCS (Alert)	N/A
PCS Preparation Status	Status of PCS (Prefill)	N/A
PCS Brake/PCS Brake Hold Status	Status of PCS (PB/PBH)	N/A
ADS/PCS arbitration status	ADS/PCS arbitration status	N/A

15

3.2.2. Details of Each API for Vehicle Motion Control

3.2.2.1. Propulsion Direction Command

Request for shift change from/to forward (D range) to/from back (R range)

Values		
Value	Description	Remarks
0	No Request	
2	R	Shift to R range
4	D	Shift to D range
other	Reserved	

Remarks

Available only when Vehicle mode state = "Autonomous Mode."

Available only when a vehicle is stationary (Traveling direction = "standstill").

Available only when brake is applied.

3.2.2.2. Immobilization Command

Request for Turning on/Off WheelLock

Values

The following table shows a case where EPB and Shift P are used for immobilization.

Value	Description	Remarks
0	No Request	
1	Applied	EPB is turned on and shift position is changed to "P"
2	Released	EPB is turned off and shift position is changed to the value of Propulsion Direction Command

Remarks

This API is used for parking a vehicle.

Available only when Vehicle mode state = "Autonomous Mode."

Changeable only when the vehicle is stationary (Traveling direction = "standstill").

Changeable only while brake is applied.

3.2.2.3. Standstill Command

Request for Applying/Releasing Brake Holding Function

Values		
Value	Description	Remarks
0	No Request	
1	Applied	Brake holding function is allowed.
2	Released	

Remarks

This API is used for choosing a status of whether the brake holding function is allowed.

Available only when Vehicle mode state = "Autonomous Mode."

Acceleration Command (deceleration request) has to be continued until Standstill Status becomes "Applied".

3.2.2.4. Acceleration Command

Request for Acceleration

Values

Estimated maximum deceleration to Estimated maximum acceleration [m/s²]

Remarks

Available only when Vehicle mode state="Autonomous Mode."

Acceleration (+) and deceleration (—) request based on Propulsion Direction Status direction.

The upper/lower limit will vary based on Estimated maximum deceleration and Estimated maximum acceleration.

When acceleration more than Estimated maximum acceleration is requested, the request is set to Estimated maximum acceleration.

16

When deceleration more than Estimated maximum deceleration is requested, the request is set to Estimated maximum deceleration.

In case where a driver operates a vehicle (over-ride), the requested acceleration may not be achieved.

When PCS simultaneously works, VP should choose minimum acceleration (maximum deceleration).

3.2.2.5. Front Wheel Steer Angle Command

Values		
Value	Description	Remarks
—	[unit: rad]	

Remarks

Available only when Vehicle mode state = "Autonomous Mode"

Left is positive value (+). Right is negative value (—).

Front wheel steer angle is set to value (0) when the vehicle is going straight.

This request is set as a relative value from the current one to prevent misalignment of "Front Wheel Steer Angle" from being accumulated.

The request value should be set within Front wheel steer angle rate limit.

In case where a driver operates a vehicle (over-ride), the requested Front Wheel Steer Angle may not be achieved.

3.2.2.6. Vehicle Mode Command

Request for Changing from/to Manual Mode to/from Autonomous Mode

Values		
Value	Description	Remarks
0	No Request	
1	Request For Autonomy	
2	Deactivation Request	means transition request to manual mode

Remarks

N/A

3.2.2.7. High Dynamics Command

If ADK would like to increase braking response performance* of VP, High Dynamics Command should be set to "High".

*Reaction time in VP upon a request from ADK

Values		
Value	Description	Remarks
0	No Request	
1	High	
2-3	Reserved	

Remarks

N/A

3.2.2.8. Propulsion Direction Status

Current Shift Status

Values		
Value	Description	Remarks
0	Reserved	
1	P	
2	R	
3	N	
4	D	

17

-continued

Values		
Value	Description	Remarks
5	Reserved	
6	Invalid value	

Remarks

If VP does not know the current shift status, this output is set to "Invalid Value."

3.2.2.9. Immobilization Status

Each Immobilization System Status

Values

The following table shows a case where EPB and Shift P are used for immobilization.

Value			
Shift	EPB	Description	Remarks
0	0	Shift set to other than P, and EPB Released	
1	0	Shift set to P and EPB Released	
0	1	Shift set to other than P, and EPB applied	
1	1	Shift set to P and EPB Applied	

Remarks

N/A

3.2.2.10. Standstill Status

Status of Standstill

Values		
Value	Description	Remarks
0	Released	
1	Applied	
2	Reserved	
3	Invalid value	

Remarks

N/A

3.2.2.11. Estimated Gliding Acceleration

Acceleration calculated in VP in case that throttle is closed, considering slope, road load and etc.

Values

[unit: m/s²]

Remarks

When the Propulsion Direction Status is "D", acceleration for forward direction shows a positive value.

When the Propulsion Direction Status is "R", acceleration for reverse direction shows a positive value.

3.2.2.12. Estimated Maximum Acceleration

Acceleration calculated in VP in case that throttle is fully open, considering slope, road load and etc.

Values

[unit: m/s²]

Remarks

When the Propulsion Direction Status is "D", acceleration for forward direction shows a positive value.

When the Propulsion Direction Status is "R", acceleration for reverse direction shows a positive value.

3.2.2.13. Estimated Maximum Deceleration

Maximum deceleration calculated in VP in case that brake in VP is requested as maximum, considering slope, road load and etc.

Values

[unit: m/s²]

18

Remarks

When the Propulsion Direction Status is "D", deceleration for forward direction shows a negative value.

When the Propulsion Direction Status is "R", deceleration for reverse direction shows a negative value.

3.2.2.14. Front Wheel Steer Angle

Values		
Value	Description	Remarks
Minimum Value	Invalid value	
others	[unit: rad]	

Remarks

Left is positive value (+). Right is negative value (-).

This signal should show invalid value until VP can calculate correct value or when the sensor is invalid/failed.

3.2.2.15. Front Wheel Steer Angle Rate

Front wheel steer angle rate

Values		
Value	Description	Remarks
Minimum Value	Invalid value	
others	[unit: rad/s]	

Remarks

Left is positive value (+). Right is negative value (-).

This signal should show invalid value until VP can calculate correct value or when the Front wheel angle shows the minimum value.

3.2.2.16. Front wheel steer angle rate limitation

The limit of the Front wheel steer angle rate

Values

[unit: rad/s]

Remarks

The limitation is calculated from the "vehicle speed—steering angle rate" map as shown in following Table 5 and FIG. 13.

A) At a low speed or stopped situation, use fixed value (0.751 [rad/s]).

B) At a higher speed, the steering angle rate is calculated from the vehicle speed using 3.432 m/s³.

TABLE 5

"vehicle speed - steering angle rate" map					
Velocity [km/h]	0.0	36.0	40.0	67.0	84.0
Front Wheel Steer Angle Rate Limitation [rad/s]	0.751	0.751	0.469	0.287	0.253

3.2.2.17. Estimated Maximum Lateral Acceleration

Values

[unit: m/s²] (fixed value: 3.432)

Remarks

Maximum lateral acceleration defined for VP.

3.2.2.18. Estimated Maximum Lateral Acceleration Rate

Values

[unit: m/s³] (fixed value: 3.432)

Remarks

Maximum lateral acceleration rate defined for VP.

3.2.2.19. Intervention of accelerator pedal

This signal shows whether the accelerator pedal is depressed by a driver (intervention).

19

Values		
Value	Description	Remarks
0	Not depressed	
1	depressed	
2	Beyond autonomy acceleration	

Remarks

When a position of accelerator pedal is higher than a defined threshold, this signal is set to “depressed”.

When the requested acceleration calculated from a position of accelerator pedal is higher than the requested acceleration from ADS, this signal is set as “Beyond autonomy acceleration.”

3.2.2.20. Intervention of Brake Pedal

This signal shows whether the brake pedal is depressed by a driver (intervention).

Values		
Value	Description	Remarks
0	Not depressed	
1	depressed	
2	Beyond autonomy deceleration	

Remarks

When a position of brake pedal is higher than a defined threshold value, this signal is set to “depressed”.

When the requested deceleration calculated from a position of brake pedal is higher than the requested deceleration from ADS, this signal is set as “Beyond autonomy deceleration”.

3.2.2.21. Intervention of Steering Wheel

This signal shows whether the steering wheel is operated by a driver (intervention).

Values		
Value	Description	Remarks
0	Not turned	
1	ADS and driver collaboratively work	
2	Only by human driver	

Remarks

In “Intervention of steering wheel = 1”, considering the human driver’s intent, EPS system drives the steering with the Human driver collaboratively.

In “Intervention of steering wheel = 2”, considering the human driver’s intent, the steering request from ADS is not achieved. (The steering will be driven by human driver.)

3.2.2.22. Intervention of Shift Lever

This signal shows whether the shift lever is controlled by a driver (intervention)

Values		
Value	Description	Remarks
0	OFF	
1	ON	Controlled (moved to any shift position)

Remarks

N/A

20

3.2.2.23. Wheel Speed Pulse (Front Left), Wheel Speed Pulse (Front Right), Wheel Speed Pulse (Rear Left), Wheel Speed Pulse (Rear Right)

Values		
Value	Description	Remarks
5	Maximum Value in transmission bits others	Invalid value The sensor is invalid.
10	ticks [unit: —]	The number of pulses per one round wheel depends on VP.

Remarks

A pulse value is integrated at the pulse falling timing.

This wheel speed sensor outputs 96 pulses with a single rotation.

Regardless of invalid/failure of wheel speed sensor, wheel speed pulse will be updated.

When “1” is subtracted from a pulse value which shows “0”, the value changes to “0xFF”. When “1” is added to a pulse value which shows “0xFF”, the value changes to “0”.

Until the rotation direction is determined just after ECU is activated, a pulse value will be added as the rotation direction is “Forward”.

When detected forward rotation, a pulse value will be added.

When detected reverse rotation, a pulse value will be subtracted.

3.2.2.24. Wheel Rotation Direction (Front Left), Wheel Rotation Direction (Front Right), Wheel Rotation Direction (Rear Left), Wheel Rotation Direction (Rear Right)

Values		
Value	Description	Remarks
0	Forward	
1	Reverse	
2	Reserved	
3	Invalid value	The sensor is invalid.

Remarks

“Forward” is set until the rotation direction is determined after VP is turned on.

3.2.2.25. Traveling Direction

Moving Direction of Vehicle

Values		
Value	Description	Remarks
0	Forward	
1	Reverse	
2	Standstill	
3	Undefined	

Remarks

This signal shows “Standstill” when four wheel speed values are “0” during a constant time.

When shift is changed right after vehicle starts, it is possible to be “Undefined”.

3.2.2.26. Vehicle Velocity

Estimated Longitudinal Velocity of Vehicle

Values		
Value	Description	Remarks
60	Maximum Value in transmission bits others	Invalid value The sensor is invalid.
	Velocity [unit: m/s]	

Remarks

The value of this signal is a positive value when both forward direction and reverse direction.

21**3.2.2.27. Longitudinal Acceleration**
Estimated Longitudinal Acceleration of Vehicle

Values		
Value	Description	Remarks
Minimum Value in transmission bits	Invalid value	The sensor is invalid.
others	Acceleration [unit: m/s ²]	

Remarks
Acceleration (+) and deceleration (–) value based on Propulsion Direction Status direction.

3.2.2.28. Lateral Acceleration
Lateral Acceleration of Vehicle

Values		
Value	Description	Remarks
Minimum Value in transmission bits	Invalid value	The sensor is invalid.
others	Acceleration [unit: m/s ²]	

Remarks
A positive value shows counterclockwise. A negative value shows clockwise.

3.2.2.29. Yaw Rate
Sensor Value of Yaw Rate

Values		
Value	Description	Remarks
Minimum Value in transmission bits	Invalid value	The sensor is invalid.
others	Yaw rate [unit: deg/s]	

Remarks
A positive value shows counterclockwise. A negative value shows clockwise.

3.2.2.30. Slipping Detection
Detection of Tire Glide/Spin/Skid

Values		
Value	Description	Remarks
0	Not Slipping	
1	Slipping	
2	Reserved	
3	Invalid value	

Remarks
This signal is determined as “Slipping” when any of the following systems has been activated.
ABS (Anti-lock Braking System)
TRC (TRaction Control)
VSC (Vehicle Stability Control)
VDIM (Vehicle Dynamics Integrated Management)

3.2.2.31. Vehicle Mode State
Autonomous or Manual Mode

Values		
Value	Description	Remarks
0	Manual Mode	The mode starts from Manual mode.
1	Autonomous Mode	

Remarks
The initial state is set to “Manual Mode.”

22**3.2.2.32. Readiness for Autonomization**

This signal shows whether a vehicle can change to Autonomous Mode or not

Values		
Value	Description	Remarks
0	Not Ready For Autonomous Mode	
1	Ready For Autonomous Mode	
3	Invalid	The status is not determined yet.

Remarks
N/A

3.2.2.33. Failure Status of VP Functions for Autonomous Mode

This signal is used to show whether VP functions have some failures mode when a vehicle works as Autonomous Mode.

Values		
Value	Description	Remarks
0	No fault	
1	Fault	
3	Invalid	The status is not determined yet.

Remarks
N/A

3.2.2.34. PCS Alert Status

Values		
Value	Description	Remarks
0	Normal	
1	Alert	Request alert from PCS system
3	Unavailable	

Remarks
N/A

3.2.2.35. PCS Preparation Status

Prefill Status as the Preparation of PCS Brake

Values		
Value	Description	Remarks
0	Normal	
1	Active	
3	Unavailable	

Remarks
“Active” is a status in which PCS prepares brake actuator to shorten the latency from a deceleration request issued by PCS.
When a value turns to “Active” during Vehicle mode state = “Autonomous Mode,” “ADS/PCS arbitration status” shows “ADS”.

3.2.2.36. PCS Brake/PCS Brake Hold Status

Values			5
Value	Description	Remarks	
0	Normal		10
1	PCS Brake		
2	PCS Brake Hold		
7	Unavailable		
Remarks			
N/A			

3.2.2.37. ADS/PCS arbitration status

Arbitration Status

Values			15
Value	Description	Remarks	
0	No Request		20
1	ADS	ADS	
2	PCS	PCS Brake or PCS Brake Hold	
3	Invalid value		
Remarks			
When acceleration requested by PCS system in VP is smaller than one requested by ADS, the status is set as "PCS".			25
When acceleration requested by PCS system in VP is larger than one requested by ADS, the status is set as "ADS".			

3.3. APIs for BODY Control

3.3.1. API List for BODY Control

3.3.1.1. Inputs

TABLE 6

Input APIs for BODY Control		
Signal Name	Description	Redundancy
Turnsignal command	Command to control the turnsignal mode of the vehicle platform	N/A
Headlight command	Command to control the headlight mode of the vehicle platform	N/A
Hazardlight command	Command to control the hazardlight mode of the vehicle platform	N/A
Horn pattern command	Command to control the pattern of horn ON-time and OFF-time per cycle of the vehicle platform	N/A
Horn cycle command	Command to control the number of horn ON/OFF cycles of the vehicle platform	N/A
Continuous horn command	Command to control of horn ON of the vehicle platform	N/A
Front windshield wiper command	Command to control the front windshield wiper of the vehicle platform	N/A
Rear windshield wiper command	Command to control the rear windshield wiper mode of the vehicle platform	N/A
HVAC (1st row) operation command	Command to start/stop 1st row air conditioning control	N/A
HVAC (2nd row) operation command	Command to start/stop 2nd row air conditioning control	N/A
Target temperature (1st left) command	Command to set the target temperature around front left area	N/A
Target temperature (1st right) command	Command to set the target temperature around front right area	N/A
Target temperature (2nd left) command	Command to set the target temperature around rear left area	N/A
Target temperature (2nd right) command	Command to set the target temperature around rear right area	N/A
HVAC fan (1st row) command	Command to set the fan level on the front AC	N/A
HVAC fan (2nd row) command	Command to set the fan level on the rear AC	N/A
Air outlet (1st row) command	Command to set the mode of 1st row air outlet	N/A
Air outlet (2nd row) command	Command to set the mode of 2nd row air outlet	N/A
Air recirculation command	Command to set the air recirculation mode	N/A
AC mode command	Command to set the AC mode	N/A

3.3.1.2. Outputs

TABLE 7

Output APIs for BODY Control		
Signal Name	Description	Redundancy
Turnsignal status	Status of the current turnsignal/light mode of the vehicle platform	N/A
Headlight status	Status of the current headlight mode of the vehicle platform	N/A
Hazard light status	Status of the current hazardlight mode of the vehicle platform	N/A
Horn status	Status of the current horn of the vehicle platform	N/A
Front windshield wiper status	Status of the current front windshield wiper mode of the vehicle platform	N/A
Rear windshield wiper status	Status of the current rear windshield wiper mode of the vehicle platform	N/A
HVAC (1st row) status	Status of activation of the 1 st row HVAC	N/A
HVAC (2nd row) status	Status of activation of the 2 nd row HVAC	N/A
Target temperature (1st left) status	Status of set temperature of 1 st row left	N/A
Target temperature (1st right) status	Status of set temperature of 1 st row right	N/A
Target temperature (2nd left) status	Status of set temperature of 2 nd row left	N/A
Target temperature (2nd right) status	Status of set temperature of 2 nd row right	N/A
HVAC fan (1st row) status	Status of set fan level of 1 st row	N/A
HVAC fan (2nd row) status	Status of set fan level of 2 nd row	N/A
Air outlet (1st row) status	Status of mode of 1st row air outlet	N/A
Air outlet (2nd row) status	Status of mode of 2nd row air outlet	N/A
Air recirculation status	Status of set air recirculation mode	N/A
AC mode status	Status of set AC mode	N/A
Seat occupancy (1st right) status	Seat occupancy status in 1st right seat	N/A
Seat belt (1st left) status	Status of driver's seat belt buckle switch	N/A
Seat belt (1st right) status	Status of passenger's seat belt buckle switch	N/A
Seat belt (2nd left) status	Seat belt buckle switch status in 2nd left seat	N/A
Seat belt (2nd right) status	Seat belt buckle switch status in 2nd right seat	N/A
Seat belt (3rd left) status	Seat belt buckle switch status in 3rd left seat	N/A
Seat belt (3rd center) status	Seat belt buckle switch status in 3rd center seat	N/A
Seat belt (3rd right) status	Seat belt buckle switch status in 3rd right seat	N/A

3.3.2. Details of Each API for BODY Control

3.3.2.1. Turn Signal Command

Request to Control Turn-Signal

Values		
Value	Description	Remarks
0	OFF	
1	Right	Right blinker ON
2	Left	Left blinker ON
3	Reserved	
Remarks		
N/A		

3.3.2.2. Headlight Command

Request to Control Headlight

Values		
Value	Description	Remarks
0	No Request	Keep current mode
1	TAIL mode request	Side lamp mode
2	HEAD mode request	Lo mode
3	AUTO mode request	Auto mode
4	HI mode request	Hi mode
5	OFF Mode Request	
6-7	Reserved	
Remarks		
This command is valid when headlight mode on the combination switch = "OFF" or "Auto mode = ON."		
Driver operatio overrides this command.		

27

3.3.2.3. Hazard Light Command
Request to Control Hazard Light

Values		
Value	Description	Remarks
0	No Request	
1	ON	

Remarks

Driver operation overrides this command.

Hazardlight is ON while receiving "ON" command.

3.3.2.4. Horn Pattern Command

Request to Choose a Pattern of ON-Time and OFF-Time Per Cycle

Values		
Value	Description	Remarks
0	No request	
1	Pattern 1	ON-time: 250 ms OFF-time: 750 ms
2	Pattern 2	ON-time: 500 ms OFF-time: 500 ms
3	Pattern 3	Reserved
4	Pattern 4	Reserved
5	Pattern 5	Reserved
6	Pattern 6	Reserved
7	Pattern 7	Reserved

Remarks

N/A

3.3.2.5. Horn Cycle Command

Request to Choose the Number of ON and OFF Cycles
Values

0 to 7 [-]

Remarks

N/A

3.3.2.6. Continuous Horn Command

Request to Turn on/Off Horn

Values		
Value	Description	Remarks
0	No request	
1	ON	

Remarks

This command's priority is higher than 3.3.2.4 Horn pattern and 3.3.2.5 Horn cycle command.

Horn is "ON" while receiving "ON" command.

3.3.2.7. Front Windshield Wiper Command

Request to Control Front Windshield Wiper

Values		
Value	Description	Remarks
0	OFF mode request	
1	Lo mode request	
2	Hi mode request	
3	Intermittent mode request	
4	Auto mode request	

28

-continued

Values		
Value	Description	Remarks
5	Mist mode request	One-time wiping
6, 7	Reserved	

Remarks

This command is valid when front windshield wiper mode on a combination switch is "OFF" or "AUTO".

Driver input overrides this command.

Windshieldwiper mode is kept while receiving a command.

Wiping speed of intermittent mode is fixed.

3.3.2.8. Rear Windshield Wiper Command

Request to Control Rear Windshield Wiper

Values		
Value	Description	Remarks
0	OFF mode request	
1	Lo mode request	
2	Reserved	
3	Intermittent mode request	
4-7	Reserved	

Remarks

Driver input overrides this command.

Windshieldwiper mode is kept while receiving a command.

Wiping speed of intermittent mode is fixed.

3.3.2.9. HVAC (1st Row) Operation Command

Request to Start/Stop 1st Row Air Conditioning Control

Values		
Value	Description	Remarks
0	No request	
1	ON	
2	OFF	

Remarks

N/A

3.3.2.10. HVAC (2nd Row) Operation Command

Request to Start/Stop 2nd Row Air Conditioning Control

Values		
Value	Description	Remarks
0	No request	
1	ON	
2	OFF	

Remarks

N/A

3.3.2.11. Target Temperature (1st Left) Command

Request to Set Target Temperature in Front Left Area

Values		
Value	Description	Remarks
0	No request	
60 to 85 [unit: ° F.] (by 1.0° F.)	Target temperature	

Remarks

In case ° C. is used in VP, value should be set as ° C.

29

3.3.2.12. Target Temperature (1st Right) Command Request to Set Target Temperature in Front Right Area

Values		
Value	Description	Remarks
0	No request	
60 to 85 [unit: ° F.] (by 1.0° F.)	Target temperature	

Remarks

In case ° C. is used in VP, value should be set as ° C.

3.3.2.13. Target Temperature (2nd Left) Command Request to Set Target Temperature in Rear Left Area

Values		
Value	Description	Remarks
0	No request	
60 to 85 [unit: ° F.] (by 1.0° F.)	Target temperature	

Remarks

In case ° C. is used in VP, value should be set as ° C.

3.3.2.14. Target Temperature (2nd Right) Command Request to Set Target Temperature in Rear Right Area

Values		
Value	Description	Remarks
0	No request	
60 to 85 [unit: ° F.] (by 1.0° F.)	Target temperature	

Remarks

In case ° C. is used in VP, value should be set as ° C.

3.3.2.15. HVAC Fan (1st Row) Command Request to Set Fan Level of Front AC

Values		
Value	Description	Remarks
0	No request	
1 to 7 (Maximum)	Fan level	

Remarks

If you would like to turn the fan level to 0 (OFF), you should transmit "HVAC (1st row) operation command = OFF."
If you would like to turn the fan level to AUTO, you should transmit "HVAC (1st row) operation command = ON."

3.3.2.16. HVAC Fan (2nd Row) Command Request to Set Fan Level of Rear AC

Values		
Value	Description	Remarks
0	No request	
1 to 7 (Maximum)	Fan level	

Remarks

If you would like to turn the fan level to 0 (OFF), you should transmit "HVAC (2nd row) operation command = OFF."
If you would like to turn the fan level to AUTO, you should transmit "HVAC (2nd row) operation command = ON."

30

3.3.2.17. Air Outlet (1st Row) Command Request to Set 1st Row Air Outlet Mode

Values		
Value	Description	Remarks
0	No Operation	
1	UPPER	Air flows to upper body
2	U/F	Air flows to upper body and feet
3	FEET	Air flows to feet
4	F/D	Air flows to feet and windshield defogger

Remarks

N/A

15 3.3.2.18. Air Outlet (2nd Row) Command Request to Set 2nd Row Air Outlet Mode

Values		
Value	Description	Remarks
0	No Operation	
1	UPPER	Air flows to upper body
2	U/F	Air flows to the upper body and feet
3	FEET	Air flows to feet.

Remarks

N/A

30 3.3.2.19. Air Recirculation Command Request to Set Air Recirculation Mode

Values		
Value	Description	Remarks
0	No request	
1	ON	
2	OFF	

Remarks

N/A

40 3.3.2.20. AC Mode Command Request to Set AC Mode

Values		
Value	Description	Remarks
0	No request	
1	ON	
2	OFF	

Remarks

N/A

55 3.3.2.21. Turn Signal Status

Values		
Value	Description	Remarks
0	OFF	
1	Left	
2	Right	
3	Invalid	

Remarks

N/A

31

3.3.2.22. Headlight Status

Values		
Value	Description	Remarks
0	OFF	
1	TAIL	
2	Lo	
3	Reserved	
4	Hi	
5-6	Reserved	
7	Invalid	

Remarks
N/A

3.3.2.23. Hazard Light Status

Values		
Value	Description	Remarks
0	OFF	
1	Hazard	
2	Reserved	
3	Invalid	

Remarks
N/A

3.3.2.24. Horn Status

Values		
Value	Description	Remarks
0	OFF	
1	ON	
2	Reserved	
3	Invalid	

Remarks
In the case that 3.3.2.4 the Horn Pattern Command is active, the Horn status is "1" even if there are OFF periods in some patterns.

3.3.2.25. Front Windshield Wiper Status

Values		
Value	Description	Remarks
0	OFF	
1	Lo	
2	Hi	
3	INT	
4-5	Reserved	
6	Fail	
7	Invalid	

Remarks
N/A

3.3.2.26. Rear Windshield Wiper Status

Values		
Value	Description	Remarks
0	OFF	
1	Lo	
2	Reserved	
3	INT	

32

-continued

Values		
Value	Description	Remarks
4-5	Reserved	
6	Fail	
7	Invalid	

Remarks

10 N/A

3.3.2.27. HVAC (1st Row) Status

Values		
Value	Description	Remarks
0	OFF	
1	ON	

20 Remarks
N/A

3.3.2.28. HVAC (2nd Row) Status

Values		
Value	Description	Remarks
0	OFF	
1	ON	

30 Remarks
N/A

3.3.2.29. Target Temperature (1st Left) Status

Values		
Value	Description	Remarks
0	Lo	Max cold
60 to 85 [unit: ° F.]	Target temperature	
100	Hi	Max hot
FFh	Unknown	

40 Remarks
In case ° C. is used in VP, value should be set as ° C.

3.3.2.30. Target Temperature (1st Right) Status

Values		
Value	Description	Remarks
0	Lo	Max cold
60 to 85 [unit: ° F.]	Target temperature	
100	Hi	Max hot
FFh	Unknown	

55 Remarks
In case ° C. is used in VP, value should be set as ° C.

3.3.2.31. Target Temperature (2nd Left) Status

Values		
Value	Description	Remarks
0	Lo	Max cold
60 to 85 [unit: ° F.]	Target temperature	

65

33

-continued

Values		
Value	Description	Remarks
100	Hi	Max hot
FFh	Unknown	

Remarks

In case ° C. is used in VP, values should be set as ° C.

3.3.2.32. Target Temperature (2nd Right) Status

Values		
Value	Description	Remarks
0	Lo	Max cold
60 to 85 [unit: ° F.]	Target temperature	
100	Hi	Max hot
FFh	Unknown	

Remarks

In case ° C. is used in VP, values should be set as ° C.

3.3.2.33. HVAC Fan (1st Row) Status

Values		
Value	Description	Remarks
0	OFF	
1 to 7	Fan Level	
8	Undefined	

Remarks

N/A

3.3.2.34. HVAC Fan (2nd Row) Status

Values		
Value	Description	Remarks
0	OFF	
1 to 7	Fan Level	
8	Undefined	

Remarks

N/A

3.3.2.35. Air Outlet (1st Row) Status

Values		
Value	Description	Remarks
0	ALL OFF	
1	UPPER	Air flows to upper body
2	U/F	Air flows to upper body and feet
3	FEET	Air flows to feet.
4	F/D	Air flows to feet and windshield defogger operates
5	DEF	Windshield defogger
7	Undefined	

Remarks

N/A

34**3.3.2.36. Air Outlet (2nd Row) Status**

Values		
Value	Description	Remarks
0	ALL OFF	
1	UPPER	Air flows to upper body
2	U/F	Air flows to upper body and feet
3	FEET	Air flows to feet.
7	Undefined	

15 Remarks

N/A

3.3.2.37. Air Recirculation Status

Values		
Value	Description	Remarks
0	OFF	
1	ON	

25 Remarks

N/A

3.3.2.38. AC Mode Status

Values		
Value	Description	Remarks
0	OFF	
1	ON	

35 Remarks

N/A

3.3.2.39. Seat Occupancy (1st Right) Status

Values		
Value	Description	Remarks
0	Not occupied	
1	Occupied	
2	Undecided	In case of IG OFF or communication disruption to seat sensor
3	Failed	

50

Remarks

When there is luggage on the seat, this signal may be set as "Occupied".

3.3.2.40. Seat Belt (1st Left) Status

Values		
Value	Description	Remarks
0	Buckled	
1	Unbuckled	
2	Undetermined	In case where sensor does not work just after IG-ON
3	Fault of a switch	

65 Remarks

N/A

35

3.3.2.41. Seat Belt (1st Right) Status

Values		
Value	Description	Remarks
0	Buckled	
1	Unbuckled	
2	Undetermined	In case where sensor does not work just after IG-ON
3	Fault of a switch	
Remarks		
N/A		

3.3.2.42. Seat Belt (2nd Left) Status

Values		
Value	Description	Remarks
0	Buckled	
1	Unbuckled	
2	Undetermined	In case where sensor does not work just after IG-ON
3	Reserved	
Remarks		
cannot detect sensor failure		

3.3.2.43. Seat Belt (2nd Right) Status

Values		
Value	Description	Remarks
0	Buckled	
1	Unbuckled	
2	Undetermined	In case where sensor does not work just after IG-ON
3	Reserved	
Remarks		
cannot detect sensor failure		

3.3.2.44. Seat Belt (3rd Left) Status

Values		
Value	Description	Remarks
0	Buckled	
1	Unbuckled	
2	Undetermined	In case where sensor does not work just after IG-ON
3	Reserved	
Remarks		
cannot detect sensor failure		

3.3.2.45. Seat Belt (3rd Center) Status

Values		
Value	Description	Remarks
0	Buckled	
1	Unbuckled	
2	Undetermined	In case where sensor does not work just after IG-ON
3	Reserved	
Remarks		
cannot detect sensor failure		

36

3.3.2.46. Seat Belt (3rd Right) Status

Values		
Value	Description	Remarks
0	Buckled	
1	Unbuckled	
2	Undetermined	In case where sensor does not work just after IG-ON
10	3	Reserved
Remarks		
cannot detect sensor failure		

15 3.4. APIs for Power Control

3.4.1. API List for Power Control

3.4.1.1. Inputs

TABLE 8		
Input APIs for Power control		
Signal Name	Description	Redundancy
25	Power mode command	Command to control the power mode of VP
		N/A

3.4.1.2. Outputs

TABLE 9		
Output APIs for Power control		
Signal Name	Description	Redundancy
35	Power mode status	Status of the current power mode of VP
		N/A

3.4.2. Details of Each API for Power Control

40 3.4.2.1. Power Mode Command
Request to Control Power Mode

Values		
Value	Description	Remarks
0	No request	
1	Sleep	Turns OFF the vehicle
2	Wake	Turns ON VCIB
3	Reserved	Reserved for data expansion
50	4	Reserved for data expansion
	5	Reserved for data expansion
	6	Drive
		Turns ON the vehicle

Remarks

The state machine diagram of the power modes is shown in FIG. 8.

55 [Sleep]

Vehicle power off condition. In this mode, the main battery does not supply power to each system, and neither VCIB nor other VP ECUs are activated.

60 [Wake]

VCIB is awake by the auxiliary battery. In this mode, ECUs other than VCIB are not awake except for some of the body electrical ECUs.

[Driving Mode]

65 Vehicle power on condition. In this mode, the main battery supplies power to the whole VP and all the VP ECUs including VCIB are awake.

37

3.4.2.2. Power Mode Status

Values		
Value	Description	Remarks
0	Reserved	
1	Sleep	
2	Wake	
3	Reserved	
4	Reserved	
5	Reserved	
6	Drive	
7	Unknown	means unhealthy situation would occur

Remarks

VCIB will transmit [Sleep] as Power_Mode_Status continuously for 3000 [ms] after executing the sleep sequence. And then, VCIB will shut down.
ADS should stop transmitting signals to VCIB while VCIB is transmitting [Sleep].

3.5. APIs for Failure Notification

3.5.1. API List for Failure Notification

3.5.1.1. Inputs

TABLE 10

Input APIs for Failure Notification		
Signal Name	Description	Redundancy
N/A	N/A	N/A

3.5.1.2. Outputs

TABLE 11

Output APIs for Failure Notification		
Signal Name	Description	Redundancy
Request for ADS operation		Applied
Impact detection signal		N/A
Performance deterioration of brake system		Applied
Performance deterioration of propulsion system		N/A
Performance deterioration of shift control system		N/A
Performance deterioration of immobilization system		Applied
Performance deterioration of steering system		Applied
Performance deterioration of power supply system		Applied
Performance deterioration of communication system		Applied

3.5.2. Details of each API for Failure Notification

3.5.2.1. Request for ADS Operation

Values		
Value	Description	Remarks
0	No request	
1	Need maintenance	
2	Need to be back to garage	
3	Need to stop immediately	
Others	Reserved	

Remarks

This signal shows a behavior which the ADS is expected to do according to a failure which happened in the VP.

38

3.5.2.2. Impact Detection Signal

Values		
Value	Description	Remarks
0	Normal	
5	Crash detection with activated airbag	
6	Crash detection with shut off high voltage circuit	
7	Invalid value	
Others	Reserved	

Remarks

When the event of crash detection is generated, the signal is transmitted 50 consecutive times every 100 [ms]. If the crash detection state changes before the signal transmission is completed, the high signal of priority is transmitted.
Priority: crash detection > normal

Transmits for 5 s regardless of ordinary response at crash, because the vehicle breakdown judgment system shall be sent a voltage OFF request for 5 s or less after crash in HV vehicle.

Transmission interval is 100 ms within fuel cutoff motion delay allowance time (1 s) so that data can be transmitted more than 5 times.

In this case, an instantaneous power interruption is taken into account.

3.5.2.3. Performance Deterioration of Brake System

Values		
Value	Description	Remarks
0	Normal	—
1	Deterioration detected	—

Remarks

N/A

3.5.2.4. Performance Deterioration of Propulsion System

Values		
Value	Description	Remarks

3.6.2. Details of Each API for Security

3.6.2.1. Door Lock (Front) Command, Door Lock (Rear) Command

Values		
Value	Description	Remarks
45 0	No Request	Not supported in Toyota VP
1	Lock	
2	Unlock	
3	Reserved	

Remarks

- 50 If ADK requests for unlocking front side, both front doors are unlocked.
If ADK requests for unlocking rear side, both 2nd row and trunk doors are unlocked.
If ADK requests for locking any door, it should use "Central door lock command."
(The functionality for individual locking is not supported in Toyota VP.)

3.6.2.2. Central Door Lock Command

55 Request to Control all Doors' Lock

Values		
Value	Description	Remarks
60 0	No Request	
1	Lock (all)	
2	Unlock (all)	
3	Reserved	

65 Remarks
N/A

41

3.6.2.3. Device Authentication Signature the 1st Word, Device Authentication Signature the 2nd Word, Device Authentication Signature the 3rd Word, Device Authentication Signature the 4th Word, Device Authentication Seed the 1st Word, Device Authentication Seed the 2nd Word

Device Authentication Signature the 1st word is presented in from 1st to 8th bytes of the signature.

Device Authentication Signature the 2nd word is presented in from 9th to 16th bytes of the signature.

Device Authentication Signature the 3rd word is presented in from 17th to 24th bytes of the signature.

Device Authentication Signature the 4th word is presented in from 25th to 32nd bytes of the signature.

Device Authentication Seed the 1st word is presented in from 1st to 8th bytes of the seed.

Device Authentication Seed the 2nd word is presented in from 9th to 16th bytes of the seed.

3.6.2.4. Door Lock (1st Left) Status

Values		
Value	Description	Remarks
0	Reserved	
1	Locked	
2	Unlocked	
3	Invalid	

Remarks
N/A

3.6.2.5. Door Lock (1st Right) Status

Values		
Value	Description	Remarks
0	Reserved	
1	Locked	
2	Unlocked	
3	Invalid	

Remarks
N/A

3.6.2.6. Door Lock (2nd Left) Status

Values		
Value	Description	Remarks
0	Reserved	
1	Locked	
2	Unlocked	
3	Invalid	

Remarks
N/A

3.6.2.7. Door Lock (2nd Right) Status

Values		
Value	Description	Remarks
0	Reserved	
1	Locked	
2	Unlocked	
3	Invalid	

Remarks
N/A

42

3.6.2.8. Door Lock Status of all Doors

Values		
Value	Description	Remarks
0	Reserved	
1	All Locked	
2	Anything Unlocked	
3	Invalid	

Remarks

In case any doors are unlocked, "Anything Unlocked."

In case all doors are locked, "All Locked."

3.6.2.9. Alarm System Status

Values		
Value	Description	Remarks
0	Disarmed	Alarm System is not activated.
1	Armed	Alarm System is activated without alarming.
2	Active	Alarm System is activated, and the alarm is beeping.
3	Invalid	

Remarks

25 N/A

3.6.2.9.1. Trip Counter

This counter is incremented in a unit of trips by the Freshness Value management master ECU.

Values

30 0—FFFFh

Remarks

This value is used to create a Freshness value.

For details, please refer to the other material [the specification of Toyota's MAC module].

35 3.6.2.9.2. Reset Counter

This counter is incremented periodically by the Freshness Value management master ECU.

Values

40 0—FFFFh

Remarks

This value is used to create a Freshness value.

For details, please refer to the other material [the specification of Toyota's MAC module].

45 3.6.2.10. 1st Left Door Open Status

Status of the current 1st-left door open/close of the vehicle platform

Values		
Value	Description	Remarks
0	Reserved	
1	Open	
2	Closes	
3	Invalid	

55

Remarks

N/A

3.6.2.11. 1st Right Door Open Status

Status of the Current 1st-Right Door Open/Close

N/A

4. API GUIDES TO CONTROL TOYOTA VEHICLES

This section shows in detail the way of using APIs for Toyota vehicles.

20 4.1. APIs for Vehicle Motion Control

4.1.1. API List for Vehicle Motion Control

Input and output APIs for vehicle motion control are shown in Table 14 and Table 15, respectively. Usage guides of some APIs are presented in the following sections as indicated in each table.

4.1.1.1. Inputs

TABLE 14

Input APIs for Vehicle Motion Control				
	Signal Name	Description	Redundancy	Usage Guide
35	Propulsion Direction Command	Request for shift change from/to forward (D range) to/from back (R range)	N/A	4.1.2.1
	Immobilization Command	Request for turning on/off WheelLock	Applied	4.1.2.2
	Standstill Command	Request for keeping on/off stationary	Applied	4.1.2.3
40	Acceleration Command	Request for acceleration/deceleration	Applied	4.1.2.1 4.1.2.2 4.1.2.3 4.1.2.4 4.1.2.5
	Front Wheel Steer Angle Command	Request for front wheel steer angle	Applied	4.1.2.5
45	Vehicle Mode Command	Request for changing from/to manual mode to/from Autonomous Mode	Applied	4.1.2.6
	High Dynamics Command	Request for increasing braking response performance*	Applied	—

50 *Reaction time in VP upon a request from ADK

4.1.1.2. Outputs

TABLE 15

Output APIs for Vehicle Motion Control			
	Signal Name	Description	Usage Guide
	Propulsion Direction Status	Current shift status	N/A
	Immobilization Status	Status of immobilization (e.g. EPB and Shift P)	Applied
	Standstill Status	Standstill status	N/A
	Estimated Gliding Acceleration	Estimated vehicle acceleration/deceleration when throttle is fully closed	N/A
	Estimated maximum acceleration	Estimated maximum acceleration	Applied
	Estimated maximum deceleration	Estimated maximum deceleration	Applied
	Front wheel steer angle	Front wheel steer angle	Applied

TABLE 15-continued

Output APIs for Vehicle Motion Control			
Signal Name	Description	Redundancy	Usage Guide
Front wheel steer angle rate	Front wheel steer angle rate	Applied	—
Front wheel steer angle rate limitation	Road wheel angle rate limit	Applied	—
Estimated maximum lateral acceleration	Estimated max lateral acceleration	Applied	—
Estimated maximum lateral acceleration rate	Estimated max lateral acceleration rate	Applied	—
Intervention of accelerator pedal	This signal shows whether the accelerator pedal is depressed by a driver (intervention)	N/A	4.1.2.4
Intervention of brake pedal	This signal shows whether the brake pedal is depressed by a driver (intervention)	N/A	—
Intervention of steering wheel	This signal shows whether the steering wheel is turned by a driver (intervention)	N/A	4.1.2.5
Intervention of shift lever	This signal shows whether the shift lever is controlled by a driver (intervention)	N/A	—
Wheel speed pulse (front left)	Pulse from wheel speed sensor (Front Left Wheel)	N/A	—
Wheel rotation direction (front left)	Rotation direction of wheel (Front Left)	N/A	—
Wheel speed pulse (front right)	Pulse from wheel speed sensor (Front Right Wheel)	N/A	—
Wheel rotation direction (front right)	Rotation direction of wheel (Front Right)	N/A	—
Wheel speed pulse (rear left)	Pulse from wheel speed sensor (Rear Left Wheel)	Applied	—
Wheel rotation direction (Rear left)	Rotation direction of wheel (Rear Left)	Applied	—
Wheel speed pulse (rear right)	Pulse from wheel speed sensor (Rear Right Wheel)	Applied	—
Wheel rotation direction (Rear right)	Rotation direction of wheel (Rear Right)	Applied	—
Traveling direction	Moving direction of vehicle	Applied	4.1.2.1 4.1.2.3
Vehicle velocity	Estimated longitudinal velocity of vehicle	Applied	4.1.2.2
Longitudinal acceleration	Estimated longitudinal acceleration of vehicle	Applied	—
Lateral acceleration	Sensor value of lateral acceleration of vehicle	Applied	—
Yawrate	Sensor value of Yaw rate	Applied	—
Slipping Detection	Detection of tire glide/spin/skid	Applied	—
Vehicle mode state	State of whether Autonomous Mode, manual mode or others	Applied	4.1.2.6
Readiness for autonomization	Situation of whether the vehicle can transition to Autonomous Mode or not	Applied	4.1.2.6
Failure status of VP functions for Autonomous Mode	This signal is used to show whether VP functions have some failures mode when a vehicle works as Autonomous Mode.	Applied	—
PCS Alert Status	Status of PCS (Alert)	N/A	—
PCS Preparation Status	Status of PCS (Prefill)	N/A	—
PCS Brake/PCS Brake Hold Status	Status of PCS (PB/PBH)	N/A	—
ADS/PCS arbitration status	ADS/PCS arbitration status	N/A	—

4.1.2. API guides in Details for Vehicle Motion Control

4.1.2.1. Propulsion Direction Command

Please refer to 3.2.2.1 for value and remarks in detail.

FIG. 15 shows shift change sequences in detail.

First deceleration is requested by Acceleration Command and the vehicle is stopped. When Traveling direction is set to “standstill”, any shift position can be requested by Propulsion Direction Command. (In FIG. 15, “D” “R”).

Deceleration has to be requested by Acceleration Command until completing shift change.

After shift position is changed, acceleration/deceleration can be chosen based on Acceleration Command.

While Vehicle mode state=Autonomous Mode, driver’s shift lever operation is not accepted.

4.1.2.2. Immobilization Command

Please refer to 3.2.2.2 for value and remarks in detail.

FIG. 16 shows how to activate/deactivate immobilization function.

Deceleration is requested with Acceleration Command to make a vehicle stop. When Vehicle velocity goes to zero, Immobilization function is activated by Immobilization Command=“Applied”. Acceleration Command is set to Deceleration until Immobilization Status is set to “Applied”.

When deactivating Immobilization function, Immobilization Command=“Released” has to be requested and simul-

taneously Acceleration Command has to be set as deceleration until confirming Immobilization Status=“Released”.

After Immobilization function is deactivated, the vehicle can be accelerated/decelerated based on Acceleration Command.

4.1.2.3. Standstill Command

Please refer to 3.2.2.3 for value and remarks in detail.

In case where Standstill Command is set as “Applied”, brakehold function can be ready to be used and brakehold function is activated in a condition where a vehicle stops and Acceleration Command is set as Deceleration (<0). And then Standstill Status is changed to “Applied”. On the other hand, in case where Standstill Command is set as “Released”, brakehold function is deactivated.

FIG. 17 shows standstill sequences.

To make a vehicle stop, deceleration is requested with Acceleration Command.

When the vehicle stops for a while, Traveling direction is changed to “standstill”. Even during Standstill status=“Applied”, deceleration shall be requested with Acceleration Command.

If you want the vehicle to move forward, Acceleration Command is set as Acceleration (>0). Then brake hold function is released and the vehicle is accelerated.

4.1.2.4. Acceleration Command

Please refer to 3.2.2.4 for value and remarks in detail.

The below shows how a vehicle behaves when an acceleration pedal is operated.

In case where the accelerator pedal is operated, a maximum acceleration value of either 1) one calculated from accelerator pedal stroke or 2) Acceleration Command input from ADK is chosen. ADK can see which value is selected by checking Intervention of accelerator pedal.

The below shows how a vehicle behaves when a brake pedal is operated.

Deceleration value in the vehicle is the sum of 1) one calculated from the brake pedal stroke and 2) one requested from ADK.

4.1.2.5. Front Wheel Steer Angle Command

Please refer to 3.2.2.5 for value and remarks in detail.

The below shows the way of using Front Wheel Steer Angle Command.

Front Wheel Steer Angle Command is set as a relative value from Front wheel steer angle.

For example, in case where Front wheel steer angle=0.1 [rad] and a vehicle goes straight;

If ADK would like to go straight, Front Wheel Steer Angle Command should be set to $0+0.1=0.1$ [rad].

If ADK requests to steer by -0.3 [rad], Front Wheel Steer Angle Command should be set to $-0.3+0.1=-0.2$ [rad].

The below shows how a vehicle behaves when a driver operates the steering.

A maximum value is selected either from 1) one calculated from steering wheel operation by the driver or 2) one requested by ADK.

Note that Front Wheel Steer Angle Command is not accepted if the driver strongly operates the steering wheel. This situation can be found by Intervention of steering wheel flag.

4.1.2.6. Vehicle Mode Command

The state machine of mode transition for Autono-MaaS vehicle is shown in FIG. 18.

The explanation of each state is shown as follows.

State	Description
Manual	A vehicle begins with this state and is under a control of a human driver. ADK cannot give any controls (except some commands) to VP. Power mode status and Vehicle mode state are in the followings: Power mode status = Wake or Drive Vehicle mode state = Manual Mode
Autonomy	ADK can communicate to VP after authentication is successful. VP is under the control of the ADK as a result of being issued "Request for Autonomy." Power mode status and Vehicle mode state are in the followings: Power mode status = Drive Vehicle mode state = Autonomous Mode

The explanation of each transition is shown as follows.

Transition	Conditions
a	When the following conditions are established, the mode will be transitioned from Manual to Autonomy: The ADK is authenticated, Power mode status = Drive, Readiness for autonomization = Ready For Autonomy Vehicle Mode Command = Request For Autonomy.
b	When the following conditions are established, the mode will be transitioned from Autonomy to Manual: Vehicle Mode Command = Deactivation Request.

4.2. APIs for BODY Control

4.2.1. API List for BODY Control

4.2.1.1. Inputs

TABLE 16

Input APIs for BODY Control			
Signal Name	Description	Redundancy	Usage Guide
Turnsignal command	Command to control the turnsignallight mode of the vehicle platform	N/A	—
Headlight command	Command to control the headlight mode of the vehicle platform	N/A	—
Hazardlight command	Command to control the hazardlight mode of the vehicle platform	N/A	—
Horn pattern command	Command to control the pattern of horn ON-time and OFF-time per cycle of the vehicle platform	N/A	—

TABLE 16-continued

Input APIs for BODY Control			
Signal Name	Description	Redundancy	Usage Guide
Horn cycle command	Command to control the number of horn ON/OFF cycles of the vehicle platform	N/A	—
Continuous horn command	Command to control of horn ON of the vehicle platform	N/A	—
Front windshield wiper command	Command to control the front windshield wiper of the vehicle platform	N/A	—
Rear windshield wiper command	Command to control the rear windshield wiper mode of the vehicle platform	N/A	—
HVAC (1st row) operation command	Command to start/stop 1st row air conditioning control	N/A	—
HVAC (2nd row) operation command	Command to start/stop 2nd row air conditioning control	N/A	—
Target temperature (1st left) command	Command to set the target temperature around front left area	N/A	—
Target temperature (1st right) command	Command to set the target temperature around front right area	N/A	—
Target temperature (2nd left) command	Command to set the target temperature around rear left area	N/A	—
Target temperature (2nd right) command	Command to set the target temperature around rear right area	N/A	—
HVAC fan (1st row) command	Command to set the fan level on the front AC	N/A	—
HVAC fan (2nd row) command	Command to set the fan level on the rear AC	N/A	—
Air outlet (1st row) command	Command to set the mode of 1st row air outlet	N/A	—
Air outlet (2nd row) command	Command to set the mode of 2nd row air outlet	N/A	—
Air recirculation command	Command to set the air recirculation mode	N/A	—
AC mode command	Command to set the AC mode	N/A	—

4.5.2. API guides in Details for Security

4.5.2.1. Device Authentication Protocol

Device authentication is applied when the VCIB is activated from “Sleep” mode.

After the authentication succeeds, the VCIB can start to communicate with ADK.

Authentication process is as shown in FIG. 19 Authentication Process.

Authentication Specification		
Item	Specification	Note
Encryption algorithms	AES	FIPS 197
Key length	128 bit	—
Block cipher modes of operation	CBC	SP 800-38A
Hash algorithms	SHA-256	FIPS 180-4
Seed length	128 bit	—
Signature length	256 bit	—

Though an embodiment of the present disclosure has been described, it should be understood that the embodiment disclosed herein is illustrative and non-restrictive in every respect. The scope of the present disclosure is defined by the terms of the claims and is intended to include any modifications within the scope and meaning equivalent to the terms of the claims.

What is claimed is:

1. An autonomous driving system (ADS) mountable on a vehicle, the vehicle including a vehicle platform (VP) that controls the vehicle in accordance with a control request from the ADS, the VP including an electric parking brake system that switches between activation and release of brakehold and a vehicle control interface that interfaces between the ADS and the VP, the vehicle control interface providing a standstill status signal to the ADS, the standstill status signal including a first value, indicating activation of the brakehold, and a second value, indicating release of the brakehold, the ADS comprising:

a compute assembly; and
a communication module that communicates with the vehicle control interface, wherein
the compute assembly is configured to;
create a driving plan of the vehicle,
generate control requests in accordance with the driving plan, the control requests including a standstill command, and
output the standstill command to the VP, the standstill command including a third value, indicating allowing the brakehold and requesting to apply the brakehold, or a fourth value, indicating not allowing the brakehold,

55

when the compute assembly outputs the standstill command including the third value, the compute assembly requests the VP to decelerate, and

in response to the standstill status signal switching from the second value to the first value, the compute assembly continues to request the VP to decelerate during an entire period for which the brakehold is active. 5

2. The ADS according to claim 1, wherein

when the standstill status signal has been set to the first value, the compute assembly causes the VP to switch the standstill status signal from the first value to the second value by requesting the VP to accelerate. 10

3. A vehicle comprising the ADS according to claim 1.

4. A vehicle control interface that interfaces between an autonomous driving system (ADS) and a vehicle platform (VP) that controls a vehicle in accordance with a control request from the ADS, the VP including an electric parking brake system that switches between activation and release of brakehold, the vehicle control interface comprising: 15

a processor; and

a memory in which a program executable by the processor is stored, wherein 20

the processor is configured to:

provide the ADS with a standstill status signal including a first value indicating activation of the brakehold and a second value indicating release of the brakehold, and 25

56

receive, from the ADS, a standstill command, the standstill command being generated by the ADS in accordance with a driving plan created by the ADS, the standstill command including a third value, indicating allowing the brakehold and requesting to apply the brakehold, or a fourth value, indicating not allowing the brakehold,

receive, when the ADS outputs the standstill command including the third value, a request for the VP to decelerate, and

in response to the standstill status signal switching from the second value to the first value, the processor continues to receive requests from the ADS to decelerate during an entire period for which the brakehold is active.

5. The vehicle control interface according to claim 4, wherein

when the standstill status signal has been set to the first value, the processor switches the standstill status signal from the first value to the second value in response to an acceleration request from the ADS.

6. A vehicle comprising the vehicle control interface according to claim 4.

7. The vehicle according to claim 6, further comprising the ADS.
