CROSS REFERENCE TO RELATED APPLICATIONS

[0001] This application is a National Stage application of International Application No. PCT/CN2022/116807, filed 2 Sep. 2022. This application also claims priority under 35 U.S.C. § 119 to International Patent Application No. PCT/CN2021/116521, filed 3 Sep. 2021.

TECHNICAL FIELD

[0002] The present disclosure relates to compounds that inhibit KRAS. In particular, the present disclosure relates to compounds that inhibit the activity of KRAS G12D, pharmaceutical compositions comprising the compounds and methods of use therefor.

BACKGROUND OF THE INVENTION

[0003] RAS represents a group of monomeric globular proteins of 189 amino acids (21 kDa molecular mass) that are associated with the plasma membrane and that bind either GDP or GTP. RAS acts as a molecular switch. When RAS contains bound GDP, it is in the resting or off position and is “inactive”. In response to exposure of the cell to certain growth promoting stimuli, RAS is induced to exchange its bound GDP for a GTP. With GTP bound, RAS is “switched on” and is able to interact with and activate other proteins (its “downstream targets”). The RAS protein itself has a very low intrinsic ability to hydrolyze GTP back to GDP, thus turning itself into the off state. Switching RAS off requires extrinsic proteins termed GTPase-activating proteins (GAPs) that interact with RAS and greatly accelerate the conversion of GTP to GDP. Any mutation in RAS that affects its ability to interact with GAP or to convert GTP back to GDP will result in a prolonged activation of the protein and consequently a prolonged signal to the cell telling it to continue to grow and divide. Because these signals result in cell growth and division, overactive RAS signaling may ultimately lead to cancer. The most notable members of the RAS are HRAS, KRAS, and NRAS.

[0004] Structurally, RAS proteins contain a G domain that is responsible for the enzymatic activity of RAS, i.e., the guanine nucleotide binding and the hydrolysis (GTPase reaction). It also contains a C-terminal extension, known as the CAAX box, which may be post-translationally modified, and is responsible for targeting the protein to the membrane. The G domain is approximately 21-25 kDa in size and it contains a phosphate binding loop (P-loop). The P-loop represents the pocket where the nucleotides are bound in the protein, and this is the rigid part of the domain with conserved amino acid residues that are essential for nucleotide binding and hydrolysis (Glycine 12, Threonine 26 and Lysine 16). The G domain also contains the Switch I (residues 30-40) and Switch II (residues 60-76) regions, both of which are the dynamic parts of the protein which are often represented as the “spring-loaded” mechanism because of their ability to switch between the resting and loaded state. The key interaction is the hydrogen bonds formed by Threonine-35 and glycine-60 with the gamma-phosphate of GTP that maintain the Switch I and Switch 2 regions, respectively, in their active conformation. After hydrolysis of GTP and release of phosphate, these two relax into the inactive GDP conformation.

[0005] Mutations in the KRAS gene are common events in human tumorigenesis. Indeed, mutations in KRAS are prevalent in the some of the most deadly cancer types: pancreatic (95%), colorectal (45%), and lung (35%). The most common KRAS mutations are found at residue G12 and G13 in the P-loop and at residue Q61.

[0006] Single nucleotide substitutions that result in missense mutations at codons 12 and 13 of the KRAS primary amino acid sequence comprise approximately 40% of these KRAS driver mutations in lung adenocarcinoma. KRAS G12D mutation is present in 25.0% of all pancreatic ductal adenocarcinoma patients, 13.3% of all colorectal carcinoma patients, 10.10% of all rectal carcinoma patients, 4.10% of all non-small cell lung carcinoma patients and 1.7% of all small cell lung carcinoma patients (e.g., see The AACR Project GENIE Consortium, (2017) Cancer Discovery; 7 (8):818-831. Dataset Version 4).

[0007] Compounds that inhibit KRAS activity are still highly desirable and under investigation, including those that disrupt effectors such as guanine nucleotide exchange factors (e.g., see Sun et al., (2012) Agnew Chem Int Ed Engl. 51 (25): 6140-6143 doi: 10.1002/anie.201201358) as well recent advances in the covalent targeting of an allosteric pocket of KRAS G12C (e.g., see Ostrem et al., (2013) Nature 503:548-551 and Fell et al., (2018) ACS Med. Chem. Lett. 9:1230-1234). Clearly there remains a continued interest and effort to develop inhibitors of KRAS, particularly inhibitors of activating KRAS mutants, especially KRAS G12D.

[0008] Thus, there is a need to develop new KRAS (especially KRAS G12D) inhibitors that demonstrate sufficient efficacy for treating KRAS G12D-mediated cancer.

[0056] The present disclosure encompasses any of the Compounds of the Disclosure being isotopically-labelled (i.e., radiolabeled) by having one or more atoms replaced by an atom having a different atomic mass or mass number. Examples of isotopes that can be incorporated into the disclosed compounds include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorous, fluorine and chlorine, such as ^2H (or deuterium (D)), ^3H , ^{11}C , ^{13}C , ^{14}C , ^{15}N , ^{18}O , ^{17}O , ^{31}P , ^{32}P , ^{35}S , ^{18}F , and ^{36}Cl , respectively, e.g., ^3H , ^{11}C , and ^{14}C . In one embodiment, provided is a compound wherein substantially all of the atoms at a position within the Compound of the Disclosure are replaced by an atom having a different atomic mass or mass number. In another embodiment, provided is a compound wherein substantially all of the atoms at a position within the Compound of the Disclosure are replaced by deuterium atoms, e.g., all of the hydrogen atoms of a —CH_3 group are replaced by deuterium atoms to give a —CD_3 group. In another embodiment, provided is a compound wherein a portion of the atoms at a position within the Compound of the disclosure are replaced, i.e., the Compound of the Disclosure is enriched at a position with an atom having a different atomic mass or mass number. In another embodiment, provided is a compound wherein none of the atoms of the Compound of the Disclosure are replaced by an atom having a different atomic mass or mass number. Isotopically-labelled Compounds of the Disclosure can be prepared by methods known in the art.

[0057] Compounds of the Disclosure contain one or more asymmetric centers and may thus give rise to enantiomers, diastereomers, and other stereoisomeric forms. The present disclosure encompasses the use of all such possible forms, as well as their racemic and resolved forms and mixtures thereof. The individual enantiomers can be separated according to methods known in the art in view of the present disclosure. When the compounds described herein contain olefinic double bonds or other centers of geometric asymmetry, and unless specified otherwise, it is intended that they include both E and Z geometric isomers. All tautomers are also encompassed by the present disclosure.

[0058] As used herein, the term “stereoisomers” is a general term for all isomers of individual molecules that differ only in the orientation of their atoms in space. It includes enantiomers and isomers of compounds with more than one chiral center that are not mirror images of one another (diastereomers).

[0059] The term “chiral center” or “asymmetric carbon atom” refers to a carbon atom to which four different groups are attached.

[0060] The terms “enantiomer” and “enantiomeric” refer to a molecule that cannot be superimposed on its mirror image and hence is optically active wherein the enantiomer rotates the plane of polarized light in one direction and its mirror image compound rotates the plane of polarized light in the opposite direction.

[0061] The term “racemic” refers to a mixture of equal parts of enantiomers and which mixture is optically inactive. In one embodiment, Compounds of the Disclosure are racemic.

[0062] The term “absolute configuration” refers to the spatial arrangement of the atoms of a chiral molecular entity (or group) and its stereochemical description, e.g., R or S.

[0063] The stereochemical terms and conventions used in the specification are meant to be consistent with those described in *Pure & Appl. Chem* 68:2193 (1996), unless otherwise indicated.

[0064] The term “enantiomeric excess” or “ee” refers to a measure for how much of one enantiomer is present compared to the other. For a mixture of R and S enantiomers, the percent enantiomeric excess is defined as $|\text{R} - \text{S}| * 100$, where R and S are the respective mole or weight fractions of enantiomers in a mixture such that $\text{R} + \text{S} = 1$. With knowledge of the optical rotation of a chiral substance, the percent enantiomeric excess is defined as $([\alpha]_{\text{obs}} / [\alpha]_{\text{max}}) * 100$, where $[\alpha]_{\text{obs}}$ is the optical rotation of the mixture of enantiomers and $[\alpha]_{\text{max}}$ is the optical rotation of the pure enantiomer. Determination of enantiomeric excess is possible using a variety of analytical techniques, including NMR spectroscopy, chiral column chromatography or optical polarimetry.

[0065] The term “about,” as used herein, includes the recited number $\pm 10\%$. Thus, “about 10” means 9 to 11.

[0125] or a salt or solvate thereof.

[0126] The present disclosure encompasses the preparation and use of salts of Compounds of the Disclosure. As used herein, the term “pharmaceutically acceptable salt” refers to salts or zwitterionic forms of Compounds of the Disclosure that are suitable for administration to a subject, e.g., a human. Salts of Compounds of the Disclosure can be prepared during the final isolation and purification of the compounds or separately by reacting the compound with a suitable acid. The pharmaceutically acceptable salts of Compounds of the Disclosure can be acid addition salts formed with pharmaceutically acceptable acids. Examples of acids which can be employed to form pharmaceutically acceptable salts include inorganic acids such as nitric, boric, hydrochloric, hydrobromic, sulfuric, and phosphoric, and organic acids such as oxalic, maleic, succinic, and citric. Non-limiting examples of salts of Compounds of the Disclosure include, but are not limited to, the hydrochloride, hydrobromide, hydroiodide, sulfate, bisulfate, 2-hydroxyethanesulfonate, phosphate, hydrogen phosphate, acetate, adipate, alginate, aspartate, benzoate, bisulfate, butyrate, camphorate, camphorsulfonate, digluconate, glycerophosphate, hemisulfate, heptanoate, hexanoate, formate, succinate, fumarate, maleate, ascorbate, isethionate, salicylate, methanesulfonate, mesitylenesulfonate, naphthylsulfonate, nicotinate, 2-naphthalenesulfonate, oxalate, pamoate, pectinate, persulfate, 3-phenylpropionate, picrate, pivalate, propionate, trichloroacetate, trifluoroacetate, phosphate, glutamate, bicarbonate, paratoluenesulfonate, undecanoate, lactate, citrate, tartrate, gluconate, methanesulfonate, ethanedisulfonate, benzene sulfonate, and p-toluenesulfonate salts. In addition, available amino groups present in the compounds of the disclosure can be quaternized with methyl, ethyl, propyl, and butyl chlorides, bromides, and iodides; dimethyl, diethyl, dibutyl, and diamyl

sulfates; decyl, lauryl, myristyl, and steryl chlorides, bromides, and iodides; and benzyl and phenethyl bromides. In light of the foregoing, any reference Compounds of the Disclosure appearing herein is intended to include compounds of Compounds of the Disclosure as well as pharmaceutically acceptable salts, hydrates, or solvates thereof.

[0127] The present disclosure encompasses the preparation and use of solvates of Compounds of the Disclosure. Solvates typically do not significantly alter the physiological activity or toxicity of the compounds, and as such may function as pharmacological equivalents. The term “solvate” as used herein is a combination, physical association and/or solvation of a compound of the present disclosure with a solvent molecule such as, e.g. a disolvate, monosolvate or hemisolvate, where the ratio of solvent molecule to compound of the present disclosure is about 2:1, about 1:1 or about 1:2, respectively. This physical association involves varying degrees of ionic and covalent bonding, including hydrogen bonding. In certain instances, the solvate can be isolated, such as when one or more solvent molecules are incorporated into the crystal lattice of a crystalline solid. Thus, “solvate” encompasses both solution-phase and isolatable solvates. Compounds of the Disclosure can be present as solvated forms with a pharmaceutically acceptable solvent, such as water, methanol, and ethanol, and it is intended that the disclosure includes both solvated and unsolvated forms of Compounds of the Disclosure. One type of solvate is a hydrate. A “hydrate” relates to a particular subgroup of solvates where the solvent molecule is water. Solvates typically can function as pharmacological equivalents. Preparation of solvates is known in the art. See, for example, M. Caira et al, *J Pharmaceut. Sci.*, 93 (3):601-611 (2004), which describes the preparation of solvates of fluticazone with ethyl acetate and with water. Similar preparation of solvates, hemisolvates, hydrates, and the like are described by E. C. van Tonder et al., *AAPS Pharm. Sci. Tech.*, 5 (1):Article 12 (2004), and A. L. Bingham et al., *Chem. Commun.* 603-604 (2001). A typical, non-limiting, process of preparing a solvate would involve dissolving a Compound of the Disclosure in a desired solvent (organic, water, or a mixture thereof) at temperatures above 20° C. to about 25° C., then cooling the solution at a rate sufficient to form crystals, and isolating the crystals by known methods, e.g., filtration. Analytical techniques such as infrared spectroscopy can be used to confirm the presence of the solvate in a crystal of the solvate.

III. Compositions

[0128] In one aspect, the present disclosure provides compositions comprising the compound of the disclosure, or a pharmaceutically acceptable salt or solvate thereof, and a pharmaceutically acceptable carrier.

[0129] Pharmaceutical compositions for use in accordance with the present disclosure are formulated in a conventional manner using one or more physiologically acceptable carriers comprising excipients and/or auxiliaries that facilitate processing of Compound of the Disclosure.

[0130] These pharmaceutical compositions can be manufactured, for example, by conventional mixing, dissolving, granulating, dragee-making, emulsifying, encapsulating, entrapping, or lyophilizing processes. Proper formulation is dependent upon the route of administration chosen. When a therapeutically effective amount of the Compound of the Disclosure is administered orally, the composition typically

is in the form of a tablet, capsule, powder, solution, or elixir. When administered in tablet form, the composition additionally can contain a solid carrier, such as a gelatin or an adjuvant. The tablet, capsule, and powder contain about 0.01% to about 95%, and preferably from about 1% to about 50%, of a Compound of the Disclosure. When administered in liquid form, a liquid carrier, such as water, petroleum, or oils of animal or plant origin, can be added. The liquid form of the composition can further contain physiological saline solution, dextrose or other saccharide solutions, or glycols. When administered in liquid form, the composition contains about 0.1% to about 90%, and preferably about 1% to about 50%, by weight, of a Compound of the Disclosure.

[0131] When a therapeutically effective amount of a Compound of the Disclosure is administered by intravenous, cutaneous, or subcutaneous injection, the composition is in the form of a pyrogen-free, parenterally acceptable aqueous solution. The preparation of such parenterally acceptable solutions, having due regard to pH, isotonicity, stability, and the like, is within the skill in the art. A preferred composition for intravenous, cutaneous, or subcutaneous injection typically contains, an isotonic vehicle.

[0132] Compounds of the Disclosure can be readily combined with pharmaceutically acceptable carriers well-known in the art. Standard pharmaceutical carriers are described in Remington's Pharmaceutical Sciences, Mack Publishing Co., Easton, PA, 19th ed. 1995. Such carriers enable the active agents to be formulated as tablets, pills, dragees, capsules, liquids, gels, syrups, slurries, suspensions and the like, for oral ingestion by a subject to be treated. Pharmaceutical preparations for oral use can be obtained by adding the Compound of the Disclosure to a solid excipient, optionally grinding the resulting mixture, and processing the mixture of granules, after adding suitable auxiliaries, if desired, to obtain tablets or dragee cores. Suitable excipients include, for example, fillers and cellulose preparations. If desired, disintegrating agents can be added.

[0133] Compound of the Disclosure can be formulated for parenteral administration by injection, e.g., by bolus injection or continuous infusion. Formulations for injection can be presented in unit dosage form, e.g., in ampules or in multidose containers, with an added preservative. The compositions can take such forms as suspensions, solutions, or emulsions in oily or aqueous vehicles, and can contain formulatory agents such as suspending, stabilizing, and/or dispersing agents.

[0134] Pharmaceutical compositions for parenteral administration include aqueous solutions of the active agent in water-soluble form. Additionally, suspensions of a Compound of the Disclosure can be prepared as appropriate oily injection suspensions. Suitable lipophilic solvents or vehicles include fatty oils or synthetic fatty acid esters. Aqueous injection suspensions can contain substances which increase the viscosity of the suspension. Optionally, the suspension also can contain suitable stabilizers or agents that increase the solubility of the compounds and allow for the preparation of highly concentrated solutions. Alternatively, a present composition can be in powder form for constitution with a suitable vehicle, e.g., sterile pyrogen-free water, before use.

[0135] Compounds of the Disclosure also can be formulated in rectal compositions, such as suppositories or retention enemas, e.g., containing conventional suppository bases. In addition to the formulations described previously,

the Compound of the Disclosure also can be formulated as a depot preparation. Such long-acting formulations can be administered by implantation (for example, subcutaneously or intramuscularly) or by intramuscular injection. Thus, for example, the Compound of the Disclosure can be formulated with suitable polymeric or hydrophobic materials (for example, as an emulsion in an acceptable oil) or ion exchange resins.

[0136] In particular, the Compounds of the Disclosure can be administered orally, buccally, or sublingually in the form of tablets containing excipients, such as starch or lactose, or in capsules or ovules, either alone or in admixture with excipients, or in the form of elixirs or suspensions containing flavoring or coloring agents. Such liquid preparations can be prepared with pharmaceutically acceptable additives, such as suspending agents. Compound of the Disclosure also can be injected parenterally, for example, intravenously, intramuscularly, subcutaneously, or intracoronarily. For parenteral administration, the Compound of the Disclosure are typically used in the form of a sterile aqueous solution which can contain other substances, for example, salts or monosaccharides, such as mannitol or glucose, to make the solution isotonic with blood.

Example 32: Cellular Proliferation Assay in GP2d Cells

[0310] The inhibitory effect of test compounds on cellular proliferation was determined using CellTiterGlo® luminescent cell viability assay (Promega) following manufacturer's instruction.

[0311] GP2d cells (ECACC #95090715) were cultured in DMEM medium supplemented with 10% fetal bovine serum, 10 U/ml penicillin and 10 ug/ml streptomycin. Cells were plated in 96-well plates at a density of 2000 cells/well and allowed attach for 120-24 hours. Then the cells were treated with various concentrations of test compounds for 72 hours. CellTiter-Glo® Reagent was added to wells and incubated for 10 minutes at room temperature. The plates were read on GloMax® 96 Microplate Luminometer or compatible microplate readers. The percentage of cellular viability was calculated as:

Cellular viability = (mean *RLU* sample – mean *RLU* blank)/

(*RLU* cell control – *RLU* blank) × 100. *IC*₅₀ value was calculated using

GraphPad Prism (San Diego, CA). The assays were carried out in triplicates.

Example 33: Detection of Phosphorylation of
ERK1/2 in AGS Cells

[0312] The inhibitory effect of test compounds on phosphorylation of ERK1/2 were determined using the AlphaLISA® SureFire® Ultra™ p-ERK 1/2 (Thr202/Tyr204) assay following the manufacturer's instructions (ALISU-PERK-A500, PerkinElmer Inc.).

[0313] AGS cells (ATCC CRL-1739) with KRAS-G12D mutation were cultured in DMEM medium supplemented with 10% fetal bovine serum, 10 U/ml penicillin and 10 μg/ml streptomycin. Cells were plated in 96-well plates at a density of 4000 cells/well. After 16-18 hours incubation, various concentrations of compounds were added to cells with a final concentration of 0.2% DMSO. After 3 hours, the medium was removed, and the cells were lysed in 50 uL lysis buffer. 10 uL of lysate was transferred to a half area 96-well plate, 5 ul of acceptor mix was added to wells and incubated at room temperature for 1 hour, then 5 ul of donor mix was added to wells. After 1 hour incubation at room temperature, the plate was read on an Alpha Technology-compatible plate reader, using standard AlphaLISA settings. The assays were carried out in duplicates.

At first, the AGS cells (40000 cells/well) were seeded in 96-well plate culture overnight and treated with KRAS-G12D compounds inhibitors at concentrations of 1, 0.33, 0.11, 0.03, 0.01, 0.004, 0.001, 0.0004, 0.0001 μM for 3 h at 37° C. Then, add an equal volume (100 μL) of 8% paraformaldehyde solution to fix and crosslink the cells to the microplate for 15 minutes. Add 100 μL of 1× permeabilization solution to wells for 30 min and add 100 μL of 1× blocking solution for 2 h. Wash with PBS 3 times after each reaction. At last, Incubation with primary antibody (Anti-mouse β-Actin and Anti-rabbit p-ERK) and secondary antibody (Goat anti-Mouse IgG H&L IRDye 800CW and Goat anti-Rabbit IgG H&L IRDye 680RW) for 2 h, As appropriate, image the microplate with an IR scanner or develop the HRP labeled microplate and read it with a spectrophotometer. The fluorescence signal was monitored using a microplate reader (Azure biosystems, Sapphire biomolecular imager) using excitation and emission wavelengths of 680 and 800 nm, respectively. Export data. The inhibitor dose-response curves were analyzed using normalized *IC*₅₀ regression curve fitting with control based normalization.
