Background/Summary

CROSS-REFERENCE TO RELATED APPLICATIONS

(1) This application is a U.S. National Phase Application of PCT/CN2020/091434, filed May 20, 2020, which claims the benefit of priority to CN Application No. 201910422337.4, filed May 21, 2019, the contents of which are hereby expressly incorporated by reference in their entirety.

(A) TECHNICAL FIELD

(2) The present invention relates to a novel macrolide derivative, a preparation method thereof, a pharmaceutical composition containing the derivative and application thereof as a therapeutic agent, especially as an inhibitor of one or more protein kinases of TRK, ALK and ROS1.

(B) BACKGROUND OF THE INVENTION

(3) Tropomyosin-related receptor tyrosine kinase (TRK) is a high-affinity receptor of a neurotrophin (NT) (neurotrophic factor (NGF) family of protein). Neurotrophic factor receptor tyrosine kinase genes NTRK1, NTRK2 and NTRK3 encode TRKA, TRKB and TRKC proteins respectively, which are all tyrosine kinases, and collectively referred to as TRK family proteins. All the TRK proteins have a similar extracellular domain structure, but have respective different ligands: NGF binds to TRKA, a brain derived neurotrophic factor (BDNF) and a neurotrophic factor 4 (NT-4) bind to TRKB, and a neurotrophic factor 3 (NT-3) binds to TRKC.

(4) Gene expression studies show that members of the TRK family are widely expressed in neuronal tissues and are related to the maintenance, signal transduction and survival of neuronal cells. NTRK gene is mainly expressed in a nervous system, and is also expressed in embryonic development and adults. When activated by signal induction, TRK may be subject to self-phosphorylation, and activates downstream signal pathways to implement various physiological functions. Downstream signal molecules of TRK comprise SHC, FRS2, PLC γ , MAPK, PI3K, PKC, or the like. Most of these signal molecules are closely related to functions including cell energy exchange, survival and proliferation. If TRK is dysfunctional, the physiological functions of cells may get out of control, and the cells may even become cancer cells. Overexpression, activation, amplification and mutation of the TRK protein and TRK gene fusion are related to many cancers, and the TRK gene fusion refers to the fusion of the members (NTRK1, NTRK2, NTRK3) of the NTRK gene family with another unrelated gene due to chromosome variation. A TRK fusion protein will be in a continuous active state, triggers a permanent signal cascade reaction, and drives the diffusion and growth of a TRK fusion tumor. The cancers comprise neuroblastoma, ovarian cancer, breast cancer, prostate cancer, gastric cancer, gastrointestinal cancer, liver cancer, cholangiocarcinoma, pancreatic cancer, multiple myeloma, astrocytoma, medulloblastoma, neuroglioma, melanoma, thyroid cancer, lung cancer, magnocellular neuroendocrine tumor, colorectal cancer, mammary analogue secretory carcinoma (MASC), sarcoma, head and neck tumor, renal carcinoma, and the like.

(5) A TRK inhibitor is effective in a preclinical pain model, and especially, antagonistic NGF and TRKA antibodies (RN-624) are effective in animal models of inflammatory and neuropathic pain and human clinical trials. In addition, the activation of BDNF/TRKB pathways may be used as a regulator of various types of pains, including inflammatory pain, neuropathic pain and surgical pain. Since TRKA and TRKB kinases may be used as mediators of NGF-driven biological reactions, TRKA and/or other TRK kinase inhibitors may provide effective treatment for chronic pains. The TRK inhibitor can effectively treat inflammatory pain, including but not limited to asthma, interstitial cystitis, ulcerative colitis, inflammatory bowel disease including Crohn's disease, eczema, psoriasis, or the like. The TRKA receptor is very important for a disease process of parasitic infection of *Trypanosoma cruzi* in a human host, therefore, the TRKA inhibitor may be used for treating a Chagas disease and related protozoan infection. TRK/neurotrophic factor pathway, which refers to BDNF/TRKB at the same time, is also related to the cause of neurodegenerative diseases, including multiple sclerosis, Parkinson's disease and Alzheimer's disease. The TRK inhibitor may also be used for treating diseases related to imbalance of bone remodeling regulation, such as osteoporosis, rheumatoid arthritis and bone metastasis.

(6) Anaplastic lymphoma kinase (ALK) is a member of an insulin receptor superfamily of receptor tyrosine kinase, which is closely related to the tumorigenesis of hematopoietic and non-hematopoietic tumors. ALK gene is located on a No. 2 chromosome and mainly expressed in neurons, especially in the course of development. The ALK gene participates in the balanced chromosomal translocation of a nucleolar phosphoprotein (NPM) gene on a No. 5 chromosome in a large subset of anaplastic large cell lymphoma (ALCL). In ALK+ALCL, as a result of translocation, a ubiquitous promoter of NPM drives ectopic expression of the fusion protein, wherein NPM is partially dimerized and an ALK kinase domain is subject to self-phosphorylation and becomes constitutively active. It has been reported that the full-length ALK receptor protein is abnormally expressed in neuroblastoma and glioblastoma. Moreover, the ALK fusion protein has appeared in degenerative large cell lymphoma. The studies on the ALK fusion protein have promoted the possibility of a new treatment method for patients with ALK-positive malignant diseases. ROS1 belongs to the insulin receptor superfamily, and is similar to other tyrosine kinase receptor molecules, and ROS1 plays a role in transmitting growth signals from an external environment of cells into cell nucleuses. Genetic changes of ROS1, such as gene rearrangement, mutation or increased copy number, produce oncogenes that may cause cancers. It is found that ROS1 is in the form of fusion proteins (six different partners of ROS1) in NSCLC patients and exists in about 2% patients suffering NSCLC (Bergethon et al., 2012; Davies et al., 2012). Two other ROS1 gene rearrangements have been detected in various other cancers, and the cancers comprise glioblastoma multiforme, cholangiocarcinoma, ovarian cancer, gastric adenocarcinoma, colorectal cancer, inflammatory myofibroblastoma, angiosarcoma and epithelioid hemangioendothelioma. The ROS1 gene rearrangement results in a fusion protein with a constitutively active kinase domain, the kinase domain activates downstream signal transduction pathways leading to carcinogenic properties in cells, and the carcinogenic properties comprise uncontrolled proliferation and resistance to cell death by prolonging tumor cell survival.

(7) In November, 2018, American FDA approved the listing of TRK inhibitor Larotrectinib, which was a novel oral drug for treating patients with abnormal variation of TRK. Previous studies have shown that the NTRK gene encoding TRK may fuse abnormally with other genes, resulting in a cancer growing in many parts of a body, and the Larotrectinib can selectively inhibit TRK. Meanwhile, there are other TRK kinase inhibitors under study, including LOXO-195 (Loxo Oncology Inc, phase 2) and repotrectinib (TP therapeutics Inc, phase 2). At present, a series of TRK inhibitor patent applications have been published, including WO2015089139A1, WO2006082392A1, WO2007123269A1, and the like. The study and application of the TRK inhibitors have made some progress, but there is still a huge room for improvement. Therefore, it is still necessary to continue to study and develop novel TRK inhibitors.

(C) SUMMARY

(8) In view of the above technical problems, the present invention provides a novel macrolide derivative represented by general formula (I), which can significantly improve the activity of wild-type and mutant TRKA, TRKB and TRKC enzymes. Meanwhile, the compound of the present invention has good pharmacokinetic absorption, significantly increased C_{max}, low clearance rate, significantly improved bioavailability and preferable pharmacokinetic properties.

(9) Therefore, in a first aspect, the present invention provides a compound represented by general formula (I) or a stereoisomer or a tautomer thereof, or a pharmaceutically acceptable salt thereof,

(38) The present invention further provides a method for inhibiting an activity of one or more protein kinases of TRK, ALK and ROS1, comprising contacting the TRK receptor with a compound represented by general formula (I), (II), (III), (IV), (V), (VI), (VII), (VIII) or (IX) or the stereoisomer or the tautomer thereof, or the pharmaceutically acceptable salt thereof, or the pharmaceutical composition thereof.

(39) The present invention further provides use of the compound represented by general formula (I), (II), (III), (IV), (V), (VI), (VII), (VIII) or (IX) or the stereoisomer or the tautomer thereof, or the pharmaceutically acceptable salt thereof, or the pharmaceutical composition thereof in preparing a medicament for treating a disease mediated by one or more protein kinases of TRK, ALK and ROS1, wherein the disease mediated by one or more protein kinases of TRK, ALK and ROS1 is preferably pain, cancer, inflammation, neurodegenerative disease or trypanosome infection, wherein the cancer is preferably neurocytoma, ovarian cancer, breast cancer, prostate cancer, gastric cancer, gastrointestinal cancer, liver cancer, cholangiocarcinoma, pancreatic cancer, multiple myeloma, astrocytoma, medulloblastoma, neuroglioma, melanoma, thyroid cancer, lung cancer, magnocellular neuroendocrine tumor, colorectal cancer, mammary analogue secretory carcinoma, sarcoma, head and neck tumor, and renal carcinoma.

(40) The present invention further provides use of the compound represented by general formula (I), (II), (III), (IV), (V), (VI), (VII), (VIII) or (IX) or the stereoisomer or the tautomer thereof, or the pharmaceutically acceptable salt thereof, or the pharmaceutical composition thereof in preparing an inhibitor of one or more protein kinases of TRK, ALK and ROS1.

(41) The present invention further provides use of the compound represented by general formula (I), (II), (III), (IV), (V), (VI), (VII), (VIII) or (IX) or the stereoisomer or the tautomer thereof, or the pharmaceutically acceptable salt thereof, or the pharmaceutical composition thereof in preparing a medicament for treating pain, cancer, inflammation, neurodegenerative disease or trypanosome infection, wherein the cancer is preferably neurocytoma, ovarian cancer, breast cancer, prostate cancer, gastric cancer, gastrointestinal cancer, liver cancer, cholangiocarcinoma, pancreatic cancer, multiple myeloma, astrocytoma, medulloblastoma, neuroglioma, melanoma, thyroid cancer, lung cancer, magnocellular neuroendocrine tumor, colorectal cancer, mammary analogue secretory carcinoma, sarcoma, head and neck tumor, and renal carcinoma.

(42) The present invention further provides a method for treating a disease symptom of pain, inflammation, neurodegenerative diseases or trypanosome infection, comprising administering a therapeutically effective amount of the compound represented by general formula (I), (II), (III), (IV), (V), (VI), (VII), (VIII) or (IX) or the stereoisomer or the tautomer thereof, or the pharmaceutically acceptable salt thereof, or the pharmaceutical composition to a patient in need.

(43) The present invention further provides a method for treating a cancer, comprising administering a therapeutically effective amount of the compound represented by general formula (I), (II), (III), (IV), (V), (VI), (VII), (VIII) or (IX) or the stereoisomer or the tautomer thereof, or the pharmaceutically acceptable salt thereof, or the pharmaceutical composition thereof to a patient in need, wherein the cancer is preferably neurocytoma, ovarian cancer, breast cancer, prostate cancer, gastric cancer, gastrointestinal cancer, liver cancer, cholangiocarcinoma, pancreatic cancer, multiple myeloma, astrocytoma, medulloblastoma, neuroglioma, melanoma, thyroid cancer, lung cancer, magnocellular neuroendocrine tumor, colorectal cancer, mammary analogue secretory carcinoma, sarcoma, head and neck tumor, and renal carcinoma.

Description

DETAILED DESCRIPTION OF THE INVENTION

(1) Unless stated to the contrary, some terms used in the specification and claims of the present invention are defined as follows:

(2) “Bond” means that the indicated substituent does not exist, and both ends of the substituent are directly bound to form a bond.

(3) “Alkyl”, when regarded as a group or a part of a group, means to comprise C.sub.1-C.sub.20 linear chain or branched aliphatic hydrocarbon groups. It is preferably a C.sub.1-C.sub.10 alkyl, and more preferably a C.sub.1-C.sub.6 alkyl. Examples of alkyl groups comprise, but are not

limited to, methyl, ethyl, n-propyl, isopropyl, n-butyl, isobutyl, tert-butyl, sec-butyl, n-pentyl, 1,1-dimethylpropyl, 1,2-dimethylpropyl, 2,2-dimethylpropyl, 1-ethylpropyl, 2-methylbutyl, 3-methylbutyl, n-hexyl, 1-ethyl-2-methylpropyl, 1,1,2-trimethylpropyl, 1,1-dimethylbutyl, 1,2-dimethylbutyl, 2,2-dimethylbutyl, 1,3-dimethylbutyl, 2-ethylbutyl, 2-methylpentyl, 3-methylpentyl, 4-methylpentyl, 2,3-dimethylbutyl, or the like. The alkyl may be substituted or unsubstituted.

(4) “Alkenyl” refers to an alkyl as defined above consisting of at least two carbon atoms and at least one carbon-carbon double bond, the representative examples of which comprise but are not limited to ethenyl, 1-propenyl, 2-propenyl, 1-, 2- or 3-butenyl, or the like. The alkenyl may be optionally substituted or unsubstituted.

(5) “Alkynyl” refers to an aliphatic hydrocarbon group with one carbon-carbon triple bond, which may be a linear chain or branched chain. It is preferably a C₂-C₁₀ alkynyl, more preferably a C₂-C₆ alkynyl, and most preferably a C₂-C₄ alkynyl. Examples of alkynyl groups comprise, but are not limited to, ethynyl, 1-propynyl, 2-propynyl, 1-, 2- or 3-butynyl, or the like. The alkynyl may be substituted or unsubstituted.

(6) “Cycloalkyl” refers to saturated or partially saturated monocyclic, fused, bridged and spirocyclic carbocycles. It is preferably a C₃-C₁₂ cycloalkyl, more preferably a C₃-C₈ cycloalkyl, and most preferably a C₃-C₆ cycloalkyl. Examples of monocyclic cycloalkyl comprise but are not limited to cyclopropyl, cyclobutyl, cyclopentyl, cyclopentenyl, cyclohexyl, cyclohexenyl, cyclohexadienyl, cycloheptyl, cycloheptatrienyl, cyclooctyl, or the like, and cyclopropyl and cyclohexenyl are preferred. The cycloalkyl may be optionally substituted or unsubstituted.

(7) “Spirocycloalkyl” refers to a 5-18 membered polycyclic group with two or more cyclic structures, and single rings share one carbon atom (called spiro atom) with each other. The ring contains one or more double bonds, but none of the rings has a completely conjugated electron aromatic system. It is preferably 6-14 membered, and more preferably 7-10 membered. According to the number of spiro atoms shared between rings, the spirocycloalkyl may be classified into mono-spiro, di-spiro or multi-spiro-cycloalkyls, preferably mono-spiro and di-spiro-cycloalkyls, and preferably 4 membered/5 membered, 4 membered/6 membered, 5 membered/5 membered, or 5 membered/6 membered. Non-limiting examples of “spirocycloalkyl” comprise, but are not limited to, spiro[4.5]decyl, spiro[4.4]nonyl, spiro[3.5]nonyl, and spiro[2.4]heptyl.

(8) “Fused cycloalkyl” refers to a 5-18 membered all-carbon polycyclic group with two or more cyclic structures sharing a pair of carbon atoms, and one or more rings may contain one or more double bonds, but none of the rings has a completely conjugated R electron aromatic system. The fused cycloalkyl is preferably 6-12 membered, and more preferably 7-10 membered. According to the number of constituent rings, fused cycloalkyls may be classified into bicyclic, tricyclic, tetracyclic or polycyclic fused cycloalkyls, preferably bicyclic or tricyclic, and more preferably 5 membered/5 membered or 5 membered/6 membered bicycloalkyl. Non-limiting examples of “fused cycloalkyl” comprise, but are not limited to, bicyclo[3.1.0]hexyl, bicyclo[3.2.0]hept-1-enyl, bicyclo[3.2.0]heptyl, decalinyl or tetradecahydrophenanthrenyl.

(9) “Bridged cycloalkyl” refers to a 5-18 membered all-carbon polycyclic group with two or more cyclic structures sharing two carbon atoms that are not directly bound with each other, one or more rings may contain one or more double bonds, but none of the rings has a completely conjugated electron aromatic system. The bridged cycloalkyl is preferably 6-12 membered, and more preferably 7-10 membered. It is preferably 6-14 membered, and more preferably 7-10 membered. According to the number of constituent rings, bridged cycloalkyls may be classified into bicyclic, tricyclic, tetracyclic or polycyclic bridged cycloalkyls, preferably bicyclic, tricyclic or tetracyclic, and more preferably bicyclic or tricyclic. Non-limiting examples of “bridged cycloalkyl” comprise, but are not limited to, (1s,4s)-bicyclo[2.2.1]heptyl, bicyclo[3.2.1]octyl, (1s,5s)-bicyclo[3.3.1]nonyl, bicyclo[2.2.2]octyl, and (1r,5r)-bicyclo[3.3.2]decyl.

(10) “Heterocyclyl”, “heterocycle” or “heterocyclic” are used interchangeably in this application,

and all refer to non-aromatic heterocyclyls, wherein one or more ring-forming atoms are heteroatoms, such as oxygen, nitrogen, sulfur atoms, or the like, comprising monocyclic ring, fused ring, bridged ring and spiro ring. Non-aromatic heterocyclyls preferably have a 5-7 membered monocyclic ring or a 7-10 membered bicyclic or tricyclic ring, which may contain 1, 2 or 3 atoms selected from nitrogen, oxygen and/or sulfur. Examples of "heterocyclyl" comprise but are not limited to morpholinyl, oxetanyl, thiomorpholinyl, tetrahydropyranyl, 1,1-dioxo-thiomorpholinyl, piperidinyl, 2-oxo-piperidinyl, pyrrolidinyl, 2-oxo-pyrrolidinyl, piperazine-2-one, 8-oxa-3-azabicyclo[3.2.1]octyl and piperazinyl. The heterocyclyl may be substituted or unsubstituted.

(11) "Spiroheterocyclyl" refers to a 5-18 membered polycyclic group with two or more cyclic structures, and single rings share one atom with each other. The ring contains one or more double bonds, but none of the rings has a completely conjugated n electron aromatic system, wherein one or more ring atoms are selected from heteroatoms of nitrogen, oxygen or S(O). (wherein n is selected from 0, 1 or 2), and the remaining ring atoms are carbon. Spiroheterocyclyl is preferably 6-14 membered, and more preferably 7-10 membered. According to the number of spiro atoms shared between rings, the spiroheterocyclyls may be classified into mono-spiroheterocyclyl, bi-spiroheterocyclyl or multi-spiroheterocyclyl, preferably mono-spiroheterocyclyl and bi-spiroheterocyclyl. Spiroheterocyclyl is more preferably a 4 membered/4 membered, 4 membered/5 membered, 4 membered/6 membered, 5 membered/5 membered, or 5 membered/6 membered mono-spiroheterocyclyl. Non-limiting examples of "spiroheterocyclyl" comprise, but are not limited to, 1,7-dioxaspiro[4.5]decyl, 2-oxa-7-azaspiro[4.4]nonyl, 7-oxaspiro[3.5]nonyl and 5-oxaspiro[2.4]heptyl.

(12) "Fused heterocyclyl" refers to an all-carbon polycyclic group with two or more cyclic structures sharing a pair of atoms, and one or more rings may contain one or more double bonds, but none of the rings has a completely conjugated n electron aromatic system, wherein one or more ring atoms are selected from heteroatoms of nitrogen, oxygen or S(O) (wherein n is selected from 0, 1 or 2), and the remaining ring atoms are carbon. Fused heterocyclyl is preferably 6-14 membered, and more preferably 7-10 membered. According to the number of constituent rings, fused heterocyclyls may be classified into bicyclic, tricyclic, tetracyclic or polycyclic fused heterocyclyls, preferably bicyclic or tricyclic, and more preferably 5 membered/5 membered or 5 membered/6 membered bicyclic fused heterocyclyl. Non-limiting examples of "fused heterocyclyl" comprise, but are not limited to, octahydropyrrolo[3,4-c]pyrrolyl, octahydro-1H-isoindolyl, 3-azabicyclo[3.1.0]hexyl, and octahydrobenzo[b][1,4]dioxine.

(13) "Bridged heterocyclyl" refers to a 5-14 membered or 5-18 membered polycyclic group with two or more cyclic structures sharing two atoms that are not directly bound with each other. One or more rings may contain one or more double bonds, but none of the rings has a completely conjugated π electron aromatic system, wherein one or more ring atoms are selected from heteroatoms of nitrogen, oxygen or S(O).sub. n (wherein n is selected from 0, 1 or 2), and the remaining ring atoms are carbon. Bridged heterocyclyl is preferably 6-14 membered, and more preferably 7-10 membered. According to the number of constituent rings, bridged heterocyclyls may be classified into bicyclic, tricyclic, tetracyclic or polycyclic bridged heterocyclyls, preferably bicyclic, tricyclic or tetracyclic, and more preferably bicyclic or tricyclic. Non-limiting examples of "bridged heterocyclyl" comprise, but are not limited to, 2-azabicyclo[2.2.1]heptyl, 2-azabicyclo[2.2.2]octyl and 2-azabicyclo[3.3.2]decyl.

(14) "Aryl" refers to a carbocyclic aromatic system containing one or two rings, wherein the rings may be bound together in a fused manner. The term "aryl" comprises monocyclic or bicyclic aryls, such as aromatic groups of phenyl, naphthyl, and tetrahydronaphthyl. Preferably, the aryl is a C.sub.6-C.sub.10 aryl, more preferably, the aryl is phenyl and naphthyl, and most preferably, the aryl is naphthyl. The aryl may be substituted or unsubstituted.

(15) "Heteroaryl" refers to a 5-6 membered monocyclic ring or an 8-10 membered bicyclic ring, which may contain 1 to 4 atoms selected from nitrogen, oxygen and/or sulfur. Heteroaryl is

preferably bicyclic heteroaryl. Examples of “heteroaryl” comprise but are not limited to, furanyl, pyridinyl, 2-oxo-1,2-dihydropyridyl, pyridazinyl, pyrimidinyl, pyrazinyl, thienyl, isoxazolyl, oxazolyl, oxadiazolyl, imidazolyl, pyrrolyl, pyrazolyl, triazolyl, tetrazolyl, thiazolyl, isothiazolyl, 1,2,3-thiadiazolyl, benzodioxolyl, benzothienyl, benzimidazolyl, indolyl, isoindolyl, 1,3-dioxo-isoindolyl, quinolinyl, indazolyl, benzisothiazolyl, benzoxazolyl, and benzisoxazolyl,

(16) ##STR00065## ##STR00066## the heteroaryl may be substituted or unsubstituted.

(17) “Fused ring” refers to a polycyclic group with two or more cyclic structures sharing a pair of atoms with each other. One or more rings may contain one or more double bonds, but at least one ring does not have a completely conjugated π electron aromatic system, and meanwhile, at least one ring has a completely conjugated n electron aromatic system, wherein zero, one or more ring atoms of the ring atoms are selected from heteroatoms of nitrogen, oxygen or S(O).sub. n (wherein n is selected from 0, 1 or 2), and the remaining ring atoms are carbon. The fused ring is preferably a bicyclic or tricyclic fused ring, wherein the bicyclic fused ring is preferably a fused ring of aryl or heteroaryl and monocyclic heterocyclyl or monocyclic cycloalkyl. Fused ring is preferably 7-14 membered, and more preferably 8-10 membered. Examples of “fused ring” comprise, but not limited to:

(18) ##STR00067## ##STR00068## ##STR00069##

(19) “Alkoxy” refers to a group of (alkyl-O—), wherein for the definition of alkyl, please refer to the relevant definitions herein. C.sub.1-C.sub.6 alkoxy is preferred. Examples of alkoxy comprise, but not limited to, methoxy, ethoxy, *n*-propoxy, isopropoxy, *n*-butoxy, isobutoxy, tert-butoxy, and the like.

(20) “Haloalkyl” refers to an alkyl substituted by halogen, wherein, for the definitions of halogen and alkyl, please refer to the relevant definitions herein.

(21) “Haloalkoxy” refers to an alkoxy substituted by halogen, wherein, for the definitions of halogen and alkoxy, please refer to the relevant definitions herein.

(22) “Hydroxyalkyl” refers to an alkyl substituted by hydroxy, wherein, for the definition of alkyl, please refer to the relevant definitions herein.

(23) “Alkoxyalkyl” refers to an alkyl substituted by alkoxy, wherein, for the definitions of alkyl and alkoxy, please refer to the relevant definitions herein.

(24) “Hydroxy” refers to an —OH group.

(25) “Halogen” refers to fluorine, chlorine, bromine and iodine.

(26) “Amino” refers to —NH.sub.2.

(27) “Cyano” refers to —CN.

(28) “Nitro” refers to —NO.sub.2.

(29) “Benzyl” refers to —CH.sub.2— phenyl.

(30) “Carboxyl” refers to —C(O)OH.

(31) “Carboxylate” refers to —C(O)O— alkyl or —C(O)O— cycloalkyl, wherein the definitions of alkyl and cycloalkyl are as above.

(32) “DMSO” refers to dimethyl sulfoxide.

(33) “BOC” refers to tert-butoxycarbonyl.

(34) “Ts” refers to p-toluenesulfonyl.

(35) “Leaving group”, is an atom or functional group separated from a larger molecule in a chemical reaction, which is a term used in nucleophilic substitution reaction and elimination reaction. In nucleophilic substitution reaction, a reactant attacked by a nucleophilic reagent is called substrate, while an atom or atomic group broken away with a pair of electrons in the substrate molecule is called a leaving group. A group that accepts electrons easily and has a strong ability of bearing negative charges is a good leaving group. When the pKa of a conjugate acid of the leaving group is smaller, it is easier for the leaving group to separate from other molecules. The reason is that when the pKa of the conjugated acid of the leaving group is smaller, the corresponding leaving group does not need to be combined with other atoms, and the tendency to

exist in the form of anions (or electrically neutral leaving group) is enhanced. Common leaving groups comprise but are not limited to, halogen, —OTs or —OH.

(36) “Substituted” means that one or more hydrogen atoms in a group, preferably at most 5, more preferably 1 to 3 hydrogen atoms, are independently replaced by a corresponding number of substituents. Obviously, substituents are only in their possible chemical positions, and those skilled in the art can determine (through experiments or theories) possible or impossible substitutions without going through much effort. For example, amino or hydroxyl with free hydrogen may be unstable when combined with carbon atoms with unsaturated (e.g., olefinic) bonds.

(37) As used in this specification, “substitute” or “substituted”, unless otherwise specified, means that a group may be substituted by one or more groups selected from the following: alkyl, alkenyl, alkynyl, alkoxy, alkylthio, alkylamino, halogen, mercapto, hydroxy, nitro, cyano, cycloalkyl, heterocyclic, aryl, heteroaryl, cycloalkoxy, heterocyclic alkoxy, cycloalkylthio, heterocycloalkylthio, amino, haloalkyl, hydroxyalkyl, carboxyl, carboxylate, =O, —C(O)R.^{sup.4}, —C(O)OR.^{sup.4}, —OC(O)R.^{sup.4}, —NR.^{sup.5}R.^{sup.6}, —C(O)NR.^{sup.5}R.^{sup.6}, —SO._{sub.2}NR.^{sup.5}R.^{sup.6} or —NR.^{sup.5}C(O)R.^{sup.6}.

(38) R.^{sup.4}, R.^{sup.5} and R.^{sup.6} are each independently selected from hydrogen atom, hydroxy, halogen, alkyl, cycloalkyl, heterocyclyl, aryl or heteroaryl, wherein the alkyl, alkoxy, cycloalkyl, heterocyclyl, aryl or heteroaryl is optionally further substituted by one or more substituents selected from hydroxyl, halogen, nitro, cyano, alkyl, alkoxy, cycloalkyl, heterocyclyl, aryl, heteroaryl, =O, —C(O)R.^{sup.7}, —C(O)OR.^{sup.7}, —OC(O)R.^{sup.7}, —NR.^{sup.8}R.^{sup.9}, —C(O)NR.^{sup.8}R.^{sup.9}, —SO._{sub.2}NR.^{sup.8}R.^{sup.9} or —NR.^{sup.8}C(O)R.^{sup.9}.

(39) Alternatively, R.^{sup.5} and R.^{sup.6} together with the atom bound therewith form a 4-8 membered heterocyclyl, wherein the 4-8 membered heterocyclyl internally contains one or more N, O or S(O)._{sub.r}, and the 4-8 membered heterocyclyl is optionally further substituted by one or more substituents selected from hydroxyl, halogen, nitro, cyano, alkyl, alkoxy, cycloalkyl, heterocyclyl, aryl, heteroaryl, =O, —C(O)R.^{sup.7}, —C(O)OR.^{sup.7}, —OC(O)R.^{sup.7}, —NR.^{sup.8}R.^{sup.9}, —C(O)NR.^{sup.8}R.^{sup.9}, —SO._{sub.2}NR.^{sup.8}R.^{sup.9} or —NR.^{sup.8}C(O)R.^{sup.9}.

(40) R.^{sup.7}, R.^{sup.8} and R.^{sup.9} are each independently selected from hydrogen atom, alkyl, cycloalkyl, heterocyclyl, aryl or heteroaryl, wherein the alkyl, cycloalkyl, heterocyclyl, aryl or heteroaryl, is optionally further substituted by one or more substituents selected from hydroxyl, halogen, nitro, cyano, alkyl, alkoxy, cycloalkyl, heterocyclyl, aryl, heteroaryl, carboxyl or carboxylate.

(41) The compounds of the present invention may contain asymmetric centers or chiral centers, and therefore exist in different stereoisomeric forms. It is contemplated that all stereoisomeric forms of the compounds of the present invention, comprising but not limited to diastereomers, enantiomers and atropisomer and geometric (conformational) isomers and their mixtures, such as racemic mixtures, are within the scope of the present invention.

(42) Unless otherwise stated, the structure described in the present invention also comprises all isomers of this structure (e.g., diastereomers, enantiomers and antimetamers and geometric (conformational) isomer forms; e.g., R and S configurations of each asymmetric center, (Z) and (E) double bond isomers, and (Z) and (E) conformational isomers. Therefore, the single stereoisomer and enantiomer mixtures, diastereomer mixtures and geometric (conformational) isomer mixtures of the compounds of the present invention are all within the scope of the present invention.

(43) “Pharmaceutically acceptable salts” refer to some salts of the above-mentioned compounds which can keep the original biological activity and are suitable for medical use. The pharmaceutically acceptable salt of the compound represented by formula (I) may be a metal salt, an amine salt formed with a suitable acid.

(44) “Pharmaceutical composition” represents a mixture containing one or more compounds described herein or physiologically acceptable salts or prodrugs thereof and other chemical

components, as well as other components such as physiologically acceptable carriers and excipients. The object of the pharmaceutical composition is to promote the administration to organisms and facilitate the absorption of active ingredients to exert biological activity.

(45) Synthesis Methods of the Compounds of the Present Invention

(46) In order to achieve the objects of the present invention, the following technical solutions are adopted by the present invention.

Solution 1

(47) A preparation method of the compound represented by general formula (I) or the stereoisomer or the tautomer thereof, or the pharmaceutically acceptable salt thereof according to the present invention comprises the following steps:

(48) ##STR00070## reacting a compound represented by general formula (Ia) with a compound represented by general formula (Ib) under basic conditions to obtain a compound represented by general formula (Ic); reacting the compound represented by general formula (Ic) in the presence of di-tert-butyl dicarbonate under the conditions of hydrogen and catalyst to obtain a compound represented by general formula (Id); subjecting the compound represented by general formula (Id) to hydrolysis under basic conditions to obtain a compound represented by general formula (Ie); further removing the protecting group PG from the compound represented by general formula (Ie) to obtain a compound represented by general formula (IA); and subjecting the compound represented by general formula (IA) to a condensation reaction in the presence of a condensation reagent under basic conditions to obtain a compound represented by general formula (I); wherein: R.sup.3 is selected from hydrogen atom; R.sup.j is selected from alkyl; R.sup.k is a leaving group, preferably halogen; PG is an amino protecting group, and is preferably tert-butoxycarbonyl; and ring A, ring B, R.sup.1 to R.sup.2, L.sub.1, L.sub.2, p and q are defined as in general formula (I).

Solution 2

(49) A preparation method of the compound represented by general formula (I) or the stereoisomer or the tautomer thereof, or the pharmaceutically acceptable salt thereof according to the present invention comprises the following steps:

(50) ##STR00071## reacting a compound represented by general formula (Ic) under the conditions of triphenylphosphine and water to obtain a compound represented by general formula (If); and subjecting the compound represented by general formula (If) to a condensation reaction under basic conditions to obtain a compound represented by general formula (I); R.sup.3 is selected from hydrogen atom; R.sup.j is selected from alkyl; and ring A, ring B, R.sup.1 to R.sup.2, L.sub.1, L.sub.2, p and q are defined as in general formula (I).

Solution 3

(51) A preparation method of the compound represented by general formula (II) or the stereoisomer or the tautomer thereof, or the pharmaceutically acceptable salt thereof according to the present invention comprises the following steps:

(52) ##STR00072## reacting a compound represented by general formula (IIa) with a compound represented by general formula (IIb) under basic conditions to obtain a compound represented by general formula (IIc); reacting the compound represented by general formula (IIc) in the presence of di-tert-butyl dicarbonate under the conditions of hydrogen and catalyst to obtain a compound represented by general formula (IId); subjecting the compound represented by general formula (IId) to hydrolysis under basic conditions to obtain a compound represented by general formula (IIe); further removing the protecting group PG from the compound represented by general formula (IIe) to obtain a compound represented by general formula (IIA); and subjecting the compound represented by general formula (IIA) to a condensation reaction in the presence of a condensation reagent under basic conditions to obtain a compound represented by general formula (II); wherein: R.sup.3 is selected from hydrogen atom; R.sup.j is selected from alkyl; R.sup.k is a leaving group, preferably halogen; PG is an amino protecting group, and is preferably tert-butoxycarbonyl; and ring B, R.sup.1 to R.sup.2, R.sup.A, Z.sup.1 to Z.sup.7, X, L.sub.2, p and q are defined as in

general formula (II).

Solution 4

(53) A preparation method of the compound represented by general formula (II) or the stereoisomer or the tautomer thereof, or the pharmaceutically acceptable salt thereof according to the present invention comprises the following steps:

(54) ##STR00073## reacting a compound represented by general formula (IIc) under the conditions of triphenylphosphine and water to obtain a compound represented by general formula (IIf); and subjecting the compound represented by general formula (IIf) to a condensation reaction under basic conditions to obtain a compound represented by general formula (II); R^{sup.3} is selected from hydrogen atom; R^{sup.j} is selected from alkyl; and ring B, R^{sup.1} to R^{sup.2}, R^{sup.A}, Z^{sup.1} to Z^{sup.7}, X, L^{sub.2}, p and q are defined as in general formula (II).

Solution 5

(55) A preparation method of the compound represented by general formula (III) or the stereoisomer or the tautomer thereof, or the pharmaceutically acceptable salt thereof according to the present invention comprises the following steps:

(56) ##STR00074## ##STR00075## reacting a compound represented by general formula (IIIa) with a compound represented by general formula (IIIb) under basic conditions to obtain a compound represented by general formula (IIIc); reacting the compound represented by general formula (IIIc) in the presence of di-tert-butyl dicarbonate under the conditions of hydrogen and catalyst to obtain a compound represented by general formula (IIId); subjecting the compound represented by general formula (IIId) to hydrolysis under basic conditions to obtain a compound represented by general formula (IIIe); further removing the protecting group PG from the compound represented by general formula (IIIe) to obtain a compound represented by general formula (IIIA); and subjecting the compound represented by general formula (IIIA) to a condensation reaction in the presence of a condensation reagent under basic conditions to obtain a compound represented by general formula (III); wherein: R^{sup.3} is selected from hydrogen atom; R^{sup.j} is selected from alkyl; R^{sup.1} is a leaving group, preferably halogen; PG is an amino protecting group, and is preferably tert-butoxycarbonyl; and ring B, R^{sup.1} to R^{sup.2}, R^{sup.A}, X, L^{sub.2} and q are defined as in general formula (III).

Solution 6

(57) A preparation method of the compound represented by general formula (III) or the stereoisomer or the tautomer thereof, or the pharmaceutically acceptable salt thereof according to the present invention comprises the following steps:

(58) ##STR00076## reacting a compound represented by general formula (IIIc) under the conditions of triphenylphosphine and water to obtain a compound represented by general formula (IIIf); and subjecting the compound represented by general formula (IIIf) to a condensation reaction under basic conditions to obtain a compound represented by general formula (III); wherein: R^{sup.3} is selected from hydrogen atom; R^{sup.j} is selected from alkyl; and ring B, R^{sup.1} to R^{sup.2}, R^{sup.A}, X, L^{sub.2} and q are defined as in general formula (III).

Solution 7

(59) A preparation method of the compound represented by general formula (IV) or the stereoisomer or the tautomer thereof, or the pharmaceutically acceptable salt thereof according to the present invention comprises the following steps:

(60) ##STR00077## ##STR00078## reacting a compound represented by general formula (IIIa) with a compound represented by general formula (IVa) under basic conditions to obtain a compound represented by general formula (IVb); reacting the compound represented by general formula (IVb) in the presence of di-tert-butyl dicarbonate under the conditions of hydrogen and catalyst to obtain a compound represented by general formula (IVc); subjecting the compound represented by general formula (IVc) to hydrolysis under basic conditions to obtain a compound represented by general formula (IVd); further removing the protecting group PG from the

compound represented by general formula (IVd) to obtain a compound represented by general formula (IVA); and subjecting the compound represented by general formula (IVA) to a condensation reaction in the presence of a condensation reagent under basic conditions to obtain a compound represented by general formula (IV); wherein: R³ is selected from hydrogen atom; R^j is selected from alkyl; R^k is a leaving group, preferably halogen; PG is an amino protecting group, and is preferably tert-butoxycarbonyl; and R¹, R², G¹, G², R^B, R^D, R^E and L² are defined as in general formula (IV).

Solution 8

(61) A preparation method of the compound represented by general formula (IV) or the stereoisomer or the tautomer thereof, or the pharmaceutically acceptable salt thereof according to the present invention comprises the following steps:

(62) ##STR00079## reacting a compound represented by general formula (IVb) under the conditions of triphenylphosphine and water to obtain a compound represented by general formula (IVe); and subjecting the compound represented by general formula (IVe) to a condensation reaction under basic conditions to obtain a compound represented by general formula (IV); wherein: R³ is selected from hydrogen atom; R^j is selected from alkyl; and R¹, R², G¹, G², R^B, R^D, R^E and L² are defined as in general formula (IV).

Solution 9

(63) A preparation method of the compound represented by general formula (V) or the stereoisomer or the tautomer thereof, or the pharmaceutically acceptable salt thereof according to the present invention comprises the following steps:

(64) ##STR00080## ##STR00081## reacting a compound represented by general formula (IIIa) with a compound represented by general formula (Va) under basic conditions to obtain a compound represented by general formula (Vb); reacting the compound represented by general formula (Vb) in the presence of di-tert-butyl dicarbonate under the conditions of hydrogen and catalyst to obtain a compound represented by general formula (Vc); subjecting the compound represented by general formula (Vc) to hydrolysis under basic conditions to obtain a compound represented by general formula (Vd); further removing the protecting group PG from the compound represented by general formula (Vd) to obtain a compound represented by general formula (VA); and subjecting the compound represented by general formula (VA) to a condensation reaction in the presence of a condensation reagent under basic conditions to obtain a compound represented by general formula (V); wherein: R³ is selected from hydrogen atom; R^j is selected from alkyl; R^k is a leaving group, preferably halogen; PG is an amino protecting group, and is preferably tert-butoxycarbonyl; and R¹, R², G¹, G², R^B, R^D, R^E and L² are defined as in general formula (V).

Solution 10

(65) A preparation method of the compound represented by general formula (V) or the stereoisomer or the tautomer thereof, or the pharmaceutically acceptable salt thereof according to the present invention comprises the following steps:

(66) ##STR00082## reacting a compound represented by general formula (Vb) under the conditions of triphenylphosphine and water to obtain a compound represented by general formula (Ve); and subjecting the compound represented by general formula (Ve) to a condensation reaction under basic conditions to obtain a compound represented by general formula (V); wherein: R³ is selected from hydrogen atom; R^j is selected from alkyl; and R¹, R², G¹, G², R^B, R^D, R^E and L² are defined as in general formula (V).

(67) In the above reaction conditions for preparing the general formula (I), (II), (III), (IV) or (V), wherein: the basic conditions are provided by an organic base or an inorganic base. The organic base is selected from N,N-diisopropylethylamine, pyridine, triethylamine, piperidine, N-methylpiperazine and 4-dimethylaminopyridine, and the inorganic base is selected from potassium

phosphate, potassium phosphate trihydrate, potassium acetate, sodium hydroxide, potassium hydroxide, lithium hydroxide, sodium carbonate, potassium carbonate, cesium carbonate, sodium hydride and potassium hydride, and preferably N,N-diisopropylethylamine, sodium hydroxide, potassium hydroxide or lithium hydroxide.

(68) The condensation reagent is selected from 2-(7-benzotriazole oxide)-N,N,N',N'-tetramethyluronium, dicyclohexylcarbodiimide, 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride, N,N'-dicyclohexylcarbodiimide, N,N'-diisopropylcarbodiimide, 1-hydroxy-7-azobenzotriazole, 2-(7-azabenzotriazol-1-yl)-N,N,N',N'-tetramethyluronium hexafluorophosphate, pentafluorophenyl diphenyl phosphinate, benzotriazol-1-yl-oxytris(dimethylamino)phosphonium hexafluorophosphate or benzotriazol-1-yl-oxytripyrrolidinophosphonium hexafluorophosphate; and preferably pentafluorophenyl diphenyl phosphinate.

(D) EMBODIMENTS

(69) The following examples are used to further describe the present invention, but these examples do not limit the scope of the present invention.

EXAMPLES

(70) The examples show the preparation of representative compounds represented by formula (I) and related structural identification data. It should be noted that the following examples are only used to illustrate the present invention, but not to limit the present invention. ¹H NMR spectrum was measured by Bruker instrument (400 MHz), and chemical shift was expressed in ppm. Tetramethylsilane internal standard (0.00 ppm) was employed. ¹H NMR was expressed as follows: s=singlet, d=doublet, t=triplet, m=multiplet, br=broadened, dd=doublet of doublet, and dt=doublet of triplets. If a coupling constant was provided, it was in the unit of Hz.

(71) A mass spectrum was determined by LC/MS, and an ionization method may be ESI or APCI. Yantai Huanghai HSGF254 or Qingdao GF254 silica gel plate was used as silica gel plates for thin layer chromatography. The silica gel plates used for thin layer chromatography (TLC) had a specification of 0.15 mm to 0.2 mm, and products separated and purified by TLC had a specification of 0.4 mm to 0.5 mm.

(72) In general, Yantai Huanghai silica gel with 200-300 meshes was used as a carrier for column chromatography.

(73) In the following examples, unless otherwise specified, all temperatures are in Celsius. Unless otherwise specified, various starting materials and reagents are commercially available or synthesized according to known methods, and the commercially available materials and reagents are directly used without further purification. Unless otherwise specified, the commercially available manufacturers comprise but are not limited to Shanghai Hao Hong Biomedical Technology Co., Ltd., Shanghai Accela ChemBio Inc., and Shanghai Han Feng Chemical Co., Ltd., and the like. CD₃OD: Deuterated methanol. CDCl₃: Deuterated chloroform. DMSO-d₆: Deuterated dimethyl sulfoxide.

(74) Argon atmosphere refers to that a reaction flask is connected with an argon balloon with a volume of about 1 L.

(75) Unless otherwise specified in the examples, a solution in the reaction refers to an aqueous solution.

(76) A compound is purified by silica gel column chromatography eluent system and thin layer chromatography, wherein the eluent system is selected from A: petroleum ether and ethyl acetate system; B: dichloromethane and methanol system; and C: dichloromethane and ethyl acetate system. The volume ratio of the solvent varies according to the difference of the polarity of the compound, and may also be adjusted by adding a small amount of acidic or basic reagents, such as acetic acid or triethylamine, or the like.

Step 1

(78) (R,1E)-N-(3-allyl-5-fluoro-2-hydroxybenzylidene)-2-methylpropane-2-sulfenamide 3-allyl-5-fluoro-2-hydroxybenzaldehyde 1a (2.80 g, 15.5 mmol) (prepared according to patent application WO2014022858), (R)-2-methylpropane-2-sulfinamide 1b (2.07 g, 17.1 mmol) and cesium carbonate (8.08 g, 24.8 mmol) were added to 50 mL of dichloromethane, and reacted overnight at room temperature. After the reaction was completed, the reaction solution was added with water (30 mL), and extracted with dichloromethane (30 mL×3), and then organic phases were combined, dried with anhydrous sodium sulfate, filtered, and concentrated under reduced pressure. The obtained residue was further separated and purified by silica gel column chromatography (eluent: system A) to obtain (R,1E)-N-(3-allyl-5-fluoro-2-hydroxybenzylidene)-2-methylpropane-2-sulfenamide 1c (4.39 g, yellow semisolid) with a yield of 100%.

(79) MS m/z(ESI): 284.1 [M+1]

Step 2

(R)—N-((1R)-1-(3-allyl-5-fluoro-2-hydroxyphenyl)ethyl)-2-methylpropane-2-sulfenamide (80) (R,1E)-N-(3-allyl-5-fluoro-2-hydroxybenzylidene)-2-methylpropane-2-sulfenamide 1c (4.39 g, 15.5 mmol) was added into 50 mL of tetrahydrofuran, the temperature was controlled at -65° C., and then methylmagnesium bromide (77.5 mL, 77.5 mmol, 1 mol/L) was added dropwise. After the addition, the mixture was transferred to room temperature and reacted overnight. After the reaction was completed, the reaction solution was quenched with water (30 mL), and extracted with ethyl acetate (30 mL×3), and then organic phases were combined, dried with anhydrous sodium sulfate, filtered, and concentrated under reduced pressure. The obtained residue was further separated and purified by silica gel column chromatography (eluent: system A) to obtain (R)—N-((1R)-1-(3-allyl-5-fluoro-2-hydroxyphenyl)ethyl)-2-methylpropane-2-sulfenamide 1d (1.5 g, yellow viscous substance) with a yield of 32.6%.

(81) MS m/z(ESI): 300.1 [M+1]

Step 3

(1R)-2-allyl-6-(1-aminoethyl)-4-fluorophenol

(82) (R)—N-((1R)-1-(3-allyl-5-fluoro-2-hydroxyphenyl)ethyl)-2-methylpropane-2-sulfenamide 1d (0.50 g, 1.67 mmol) was added to 5 mL of dichloromethane, then added with 2 mL of hydrochloride 1,4-dioxane solution (4 mol/L), and reacted at room temperature for 2 hours. After monitoring that the reaction was completed by LC-MS, the reaction solution was filtered, and then a filter cake was taken, dissolved in 10 mL of water, and the pH was adjusted to neutrality with a sodium carbonate solution. The reaction solution was extracted with ethyl acetate (20 mL×3), then organic phases were combined, dried with anhydrous sodium sulfate, filtered, and concentrated under reduced pressure to obtain crude product of (1R)-2-allyl-6-(1-aminoethyl)-4-fluorophenol 1e (yellow and viscous).

(83) MS m/z(ESI): 178.1 [M-16]

Step 4

(1R)-1-(2-(iodomethyl)-5-fluoro-2,3-dihydrobenzofuran-7-yl)ethan-1-amine

(84) Crude product of (1R)-2-allyl-6-(1-aminoethyl)-4-fluorophenol 1e (300 mg) was added to 5 mL of tetrahydrofuran, cooled to 0° C., and then added with iodosuccinimide (516 mg, 2.29 mmol), and reacted at room temperature overnight. After the reaction was completed, the reaction solution was added with 30 mL of water, and extracted with ethyl acetate (30 mL×3), then organic phases were combined, dried with anhydrous sodium sulfate, filtered, and concentrated under reduced pressure. The obtained residue was further separated and purified by silica gel column chromatography (eluent: system B) to obtain (1R)-1-(2-(iodomethyl)-5-fluoro-2,3-dihydrobenzofuran-7-yl)ethan-1-amine if (100 g, brown viscous substance) with a yield of 20%.

(85) MS m/z(ESI): 304.0 [M-16]

Step 5

Tert-butyl ((1R)-1-(2-(iodomethyl)-5-fluoro-2,3-dihydrobenzofuran-7-yl)ethyl) carbamate (86) (1R)-1-(2-(iodomethyl)-5-fluoro-2,3-dihydrobenzofuran-7-yl)ethan-1-amine 1f (500 mg, 1.56 mmol) and triethylamine (316 mg, 3.12 mmol) were dissolved in 5 mL of dichloromethane, then added with di-tert-butyl dicarbonate (374 mg, 1.71 mmol), and reacted at room temperature for 4 hours. After the reaction was completed, a saturated ammonium chloride solution was added for washing, then the reaction solution was dried with anhydrous sodium sulfate, filtered and concentrated to obtain crude product of tert-butyl ((1R)-1-(2-(iodomethyl)-5-fluoro-2,3-dihydrobenzofuran-7-yl)ethyl) carbamate 1g (yellow, viscous).

(87) MS m/z(ESI): 422.1 [M+1]

Step 6

Tert-butyl ((1R)-1-(2-(azidomethyl)-5-fluoro-2,3-dihydrobenzofuran-7-yl)ethyl) carbamate (88) Crude product of tert-butyl ((1R)-1-(2-(iodomethyl)-5-fluoro-2,3-dihydrobenzofuran-7-yl)ethyl) carbamate 1g (170 mg) was added to 2 mL of N,N-dimethylformamide, and then added with sodium azide (32 mg, 0.49 mmol), and reacted at room temperature overnight. The reaction solution was added with 20 mL of water, and extracted with ethyl acetate (20 mL×3), then organic phases were combined, and washed with a saturated sodium chloride solution, dried with anhydrous sodium sulfate, filtered, and concentrated under reduced pressure to obtain crude product of tert-butyl ((1R)-1-(2-(azidomethyl)-5-fluoro-2,3-dihydrobenzofuran-7-yl)ethyl) carbamate 1h (yellow liquid).

(89) MS m/z(ESI): 337.2 [M+1]

Step 7

(1R)-1-(2-(azidomethyl)-5-fluoro-2,3-dihydrobenzofuran-7-yl)ethan-1-amine

(90) Crude product of tert-butyl ((1R)-1-(2-(azidomethyl)-5-fluoro-2,3-dihydrobenzofuran-7-yl)ethyl) carbamate 1h (120 mg) was added to 3 mL of dichloromethane, then added with 1.5 mL of hydrochloride 1,4-dioxane solution, and reacted at room temperature for 2 hours. The reaction solution was concentrated under reduced pressure to obtain crude product of (1R)-1-(2-(azidomethyl)-5-fluoro-2,3-dihydrobenzofuran-7-yl)ethan-1-amine 1i (yellow, viscous).

Step 8

Ethyl 5-(((1R)-1-(2-(azidomethyl)-5-fluoro-2,3-dihydrobenzofuran-7-yl)ethyl)amino)pyrazolo [1,5-a]pyrimidine-3-carboxylate

(91) Crude product of (1R)-1-(2-(azidomethyl)-5-fluoro-2,3-dihydrobenzofuran-7-yl)ethan-1-amine 1i (84 mg), N,N-diisopropylethylamine (280 mg, 2.16 mmol) and ethyl 5-chloropyrazolo[1,5-a]pyrimidine-3-carboxylate 1j (84 mg, 0.4 mmol) were dissolved in 3 mL of n-butylalcohol, and reacted at 120° C. for 5 hours. The reaction solution was concentrated under reduced pressure, and the obtained residue was further separated and purified by silica gel column chromatography (eluent: system A) to obtain ethyl 5-(((1R)-1-(2-(azidomethyl)-5-fluoro-2,3-dihydrobenzofuran-7-yl)ethyl)amino)pyrazolo[1,5-a]pyrimidine-3-carboxylate 1k (120 mg, yellow solid).

(92) MS m/z(ESI): 426.2 [M+1]

Step 9

Ethyl 5-(((1R)-1-(2-(aminomethyl)-5-fluoro-2,3-dihydrobenzofuran-7-yl)ethyl)amino)pyrazolo [1,5-a]pyrimidine-3-carboxylate

(93) Ethyl 5-(((1R)-12-(azidomethyl)-5-fluoro-2,3-dihydrobenzofuran-7-yl)ethyl)amino)pyrazolo[1,5-a]pyrimidine-3-carboxylate 1k (120 mg, 0.28 mmol) and triphenylphosphine (82 mg, 0.31 mmol) were added to 6 mL of mixed solution (tetrahydrofuran:water=2:1), and reacted at room temperature overnight. After the reaction was completed, the reaction solution was added with 20 mL of water, and extracted with ethyl acetate (20 mL×3), and then organic phases were combined, dried with anhydrous sodium sulfate, filtered, and concentrated under reduced pressure. The obtained residue was further separated and purified by silica gel column chromatography (eluent:

Step 4

(2S)-1-(2-(azidomethyl)-7-fluoro-2,3-dihydrobenzo[b][1,4]dioxin-5-yl)ethan-1-one

(106) (2R)-(5-acetyl-7-fluoro-2,3-dihydrobenzo[b][1,4]dioxin-2-yl)methyl methanesulfonic acid 2d (430 mg) was added to 10 mL of N,N-dimethylformamide solution, and then added with sodium azide (193 mg, 2.97 mmol), heated to 55° C., and reacted overnight. After the reaction was completed, the reaction solution was added with 30 mL of water, and extracted with ethyl acetate (30 mL×3), then organic phases were combined, washed with a saturated sodium chloride solution, dried with anhydrous sodium sulfate, filtered and concentrated under reduced pressure. The obtained residue was further separated and purified by silica gel column chromatography (eluent: system A) to obtain (2S)-1-(2-(azidomethyl)-7-fluoro-2,3-dihydrobenzo[b][1,4]dioxin-5-yl)ethan-1-one 2e (230 g, yellow semisolid) with a yield of 65%.

(107) MS m/z(ESI): 252.0 [M+1]

Step 5

1-((2S)-2-(azidomethyl)-7-fluoro-2,3-dihydrobenzo[b][1,4]dioxin-5-yl)ethan-1-amine

(108) (2S)-1-(2-(azidomethyl)-7-fluoro-2,3-dihydrobenzo[b][1,4]dioxin-5-yl)ethan-1-one 2e (230 mg, 0.92 mmol), ammonium acetate (710 mg, 9.2 mmol) and sodium cyanoborohydride (116 mg, 1.84 mmol) were added to 5 mL of methanol, reacted at room temperature for 1 hour, and then heated to reflux, and then reacted overnight. The reaction solution was concentrated under reduced pressure, added with 30 mL of water, and extracted with ethyl acetate (30 mL×3), then organic phases were combined, washed with a saturated sodium chloride solution, dried with anhydrous sodium sulfate, filtered, and concentrated under reduced pressure to obtain 230 mg of crude product of 1-((2S)-2-(azidomethyl)-7-fluoro-2,3-dihydrobenzo[b][1,4]dioxin-5-yl)ethan-1-amine 2f, and the product was subjected to the next reaction without purification.

Step 1

1-(2-((2-(bromomethyl)allyl)oxy)-5-fluorophenyl)ethan-1-one

(336) 3-bromo-2-(bromomethyl)prop-1-ene 14b (4.28 g, 20 mmol) and potassium carbonate (1.66 g, 12 mmol) were dissolved in 40 mL of N,N-dimethylformamide; 1-(5-fluoro-2-hydroxyphenyl)ethan-1-one 14a (1.54 g, 10 mmol) was dissolved in 15 mL of N,N-dimethylformamide, and then dropwise added in the above-mentioned mixed solution, and reacted at room temperature overnight. After the reaction was completed, the reaction solution was added with 100 mL of water, and extracted with ethyl acetate (50 mL×3), and organic phases were combined, washed with saturated brine (200 mL), dried with anhydrous sodium sulfate, filtered,

and concentrated under reduced pressure. The obtained residue was purified by silica gel column chromatography (eluent: system A) to obtain 1-(2-((2-(bromomethyl)allyl)oxy)-5-fluorophenyl)ethan-1-one 14c (1.8 g, grey liquid) with a yield of 62.5%.

(337) MS m/z(ESI): 287.1 [M+1]

Step 2

1-(5-fluoro-2-((2-(methoxymethyl)allyl)oxy)phenyl)ethan-1-one

(338) 1-(2-((2-(bromomethyl)allyl)oxy)-5-fluorophenyl)ethan-1-one 14c (1.8 g, 6.29 mmol) was dissolved in 20 mL of methanol, added with sodium methanolate (1.37 g, 25.16 mmol), and reacted at room temperature overnight. After the reaction was completed, the reaction solution was concentrated under reduced pressure, added with 100 mL of water for dissolution, and extracted with ethyl acetate (50 mL×3), then organic phases were combined, washed with saturated brine (200 mL), dried with anhydrous sodium sulfate, filtered, and concentrated under reduced pressure. The obtained residue was purified by silica gel column chromatography (eluent: system A) to obtain 1-(5-fluoro-2-((2-(methoxymethyl)allyl)oxy)phenyl)ethan-1-one 14d (1.1 g, yellow oily substance) with a yield of 73.8%.

Step 3

1-(5-fluoro-2-hydroxy-3-(2-(methoxymethyl)allyl)phenyl)ethan-1-one

(340) 1-(5-fluoro-2-((2-(methoxymethyl)allyl)oxy)phenyl)ethan-1-one 14d (1.1 g, 4.6 mmol) was heated to 220° C., and then stirred and reacted for 8 hours. After the reaction was completed, the reaction solution was cooled to room temperature to obtain crude product of 1-(5-fluoro-2-hydroxy-3-(2-(methoxymethyl)allyl)phenyl)ethan-1-one 14e (1.1 g, brown viscous substance), which was directly used for the next reaction without purification.

(341) MS m/z(ESI): 239.1[M+1]

Step 4

1-(5-fluoro-2-(iodomethyl)-2-(methoxymethyl)-2,3-dihydrobenzofuran-7-yl)ethan-1-one

(342) 1-(5-fluoro-2-hydroxy-3-(2-(methoxymethyl)allyl)phenyl)ethan-1-one 14e (1.1 g, 4.6 mmol) was dissolved in 10 mL of acetonitrile, added with iodine (2.34 g, 9.2 mmol) and sodium bicarbonate (1.55 g, 18.4 mmol), and reacted at room temperature overnight. After the reaction was completed, the reaction solution was added with 100 mL of water, and then slowly added with sodium thiosulfate solid, and stirred for dissolution until the color of the solution was no longer light, then the solution was extracted with ethyl acetate (50 mL×3), then organic phases were combined, washed with 100 mL of saturated brine, dried with anhydrous sodium sulfate, filtered, and concentrated under reduced pressure. The obtained residue was purified by silica gel column chromatography (eluent: system A) to obtain 1-(5-fluoro-2-(iodomethyl)-2-(methoxymethyl)-2,3-dihydrobenzofuran-7-yl)ethan-1-one 14f (1.4 g, brown viscous substance) with a yield of 83.6%.

(343) MS m/z(ESI): 365.0 [M+1]

Step 5

1-(2-(azidomethyl)-5-fluoro-2-(methoxymethyl)-2,3-dihydrobenzofuran-7-yl)ethan-1-one

(344) 1-(5-fluoro-2-(iodomethyl)-2-(methoxymethyl)-2,3-dihydrobenzofuran-7-yl)ethan-1-one 14f (1.4 g, 3.84 mmol) was dissolved in 15 mL of N,N-dimethylformamide, added with sodium azide (500 mg, 7.69 mmol), heated to 60° C., and then reacted overnight. After the reaction was completed, the reaction solution was cooled to room temperature and poured into 100 mL of water, and extracted with ethyl acetate (50 mL×3), then organic phases were combined, washed with 100 mL of saturated brine, dried with anhydrous sodium sulfate, filtered, and concentrated under reduced pressure. The obtained residue was purified by silica gel column chromatography (eluent: system A) to obtain 1-(2-(azidomethyl)-5-fluoro-2-(methoxymethyl)-2,3-dihydrobenzofuran-7-yl)ethan-1-one 14g (430 mg, yellow viscous substance) with a yield of 41.2%.

1-(5-fluoro-2-hydroxy-3-((2-methylallyl)oxy)phenyl)ethan-1-one

(512) 1-(5-fluoro-2,3-dihydroxyphenyl)ethan-1-one 23a (1.7 g, 10 mmol) was dissolved in 20 mL of N,N-dimethylformamide, added with potassium carbonate (1.52 g, 11 mmol), and stirred at room temperature; 3-bromo-2-methylpropene (1.35 g, 10 mmol) was dissolved in 15 mL of N,N-dimethylformamide, and then dropwise added in the above-mentioned mixed solution, and warmed up to 50° C. and reacted at 50° C. overnight. After the reaction was completed, the reaction solution

was added with 100 mL of water and extracted with ethyl acetate (50 mL×3), then organic phases were combined, washed with saturated brine (100 mL×2), dried with anhydrous sodium sulfate, filtered, and concentrated under reduced pressure. The obtained residue was purified by silica gel column chromatography (eluent: system A) to obtain 1-(5-fluoro-2-hydroxy-3-((2-methylallyl)oxy)phenyl)ethan-1-one 23b (430 mg, yellow oily substance) with a yield of 19.1%.

Step 2

1-(7-fluoro-3-(iodomethyl)-3-methyl-2,3-dihydrobenzo[b][1,4]dioxin-5-yl)ethan-1-one (513) 1-(5-fluoro-2-hydroxy-3-((2-methylallyl)oxy)phenyl)ethan-1-one 23b (130 mg, 0.58 mmol) and sodium bicarbonate (97 mg, 1.16 mmol) were dissolved in 5 mL of acetonitrile, added with iodine (176 mg, 0.7 mmol), reacted at 60° C. for 4 hours; warmed up to 85° C., and continuously reacted for 3 hours. After the reaction was completed, the reaction solution was cooled to room temperature then was added with 50 mL of water, and then slowly added with sodium thiosulfate solid, and stirred for dissolution until the color of the solution was no longer light, then the solution was extracted with ethyl acetate (20 mL×3), then organic phases were combined, washed with saturated brine (50 mL), dried with anhydrous sodium sulfate, filtered, and concentrated under reduced pressure. The obtained residue was purified by silica gel column chromatography (eluent: system A) to obtain 1-(7-fluoro-3-(iodomethyl)-3-methyl-2,3-dihydrobenzo[b][1,4]dioxin-5-yl)ethan-1-one 23c (190 mg, faint yellow solid) with a yield of 93.6%.

Biological Evaluation

Test Example 1 Determination of the Compounds of the Present Invention on Activities of TRKA, TRKB, TRKC, TRKA(G595R), TRKA(G667C) and TRKC(G623R) Kinases

(566) The following method was used to determine the inhibition degrees of the compounds of the present invention on the activity of recombinant human NTRK family kinase in vitro. In this method, HTRF® KinEASE-TK tyrosine kinase kit (article number: 62TK0PEB) of Cisbio company was used, and the principle of the kit was based on time-resolved fluorescence resonance energy transfer (TF-FRET), and the inhibition of the compounds on the activity of the NTRK kinase was reflected by determining a phosphorylation degree of a biotinylated polypeptide substrate mediated by NTRK kinase. For detailed experimental operation, please refer to the kit instruction. Recombinant human wild-type NTRK proteins were purchased from Carna bioscience (the article numbers were TRKA #08-186, TRKB #08-187 and TRKC #08-197 respectively), and recombinant human mutant NTRK proteins were purchased from SignalChem (the article numbers were TRKA G595R #N16-12BG-10, TRKA G667C #N16-12CG-10, and TRKC G623R #N18-12CH-10 respectively).

(567) The experimental methods were operated according to the steps in the kit instruction, and were briefly described as follows: a test compound was first dissolved in DMSO to prepare a storage solution, and then diluted in gradient with a buffer provided in the kit. A final concentration of the test compound in the reaction system ranged from 1,000 nM to 0.004 nM. An ATP Km value concentration of each NTRK protein was determined by using an ATP solution diluted in gradient (Sangon Biotech (Shanghai) Co., Ltd., A600311). According to the Km value obtained, the ATP concentrations in the reaction system were set as 100 μ M for TRKA, 10 μ M for TRKB, 50 μ M for TRKC, 7 μ M for TRKA(G595R), 1 μ M for TRKA(G667C) and 100 μ M for TRKC(G623R). The reaction was carried out in a 384-well microplate. Firstly, the compound and a certain amount of corresponding NTRK protein were added to the wells and incubated for 5 minutes to 10 minutes at room temperature. Then, the ATP solution and the biotinylated polypeptide substrate solution were added to the reaction solution and incubated with shaking at room temperature for 60 minutes. Then, an anti-phosphorylated tyrosine antibody coupled with a europium compound and streptavidin coupled with modified allophycocyanin XL665 were added to the reaction, and continuously incubated with shaking at room temperature for 1 hour. After incubation, fluorescence intensity values of each well at an excitation wavelength of 304 nm, and emission wavelengths of 620 nm and 665 nm were determined in a TF-FRET mode on a microplate reader. Compared with the fluorescence intensity ratio of a control group (0.1% DMSO), the percentage inhibition rates of the compound at each concentration were calculated, and the IC_{sub.50} value of the compound was obtained by performing nonlinear regression analysis for logarithmic value of the compound concentration-inhibition rate by GraphPad Prism 5 software, which can be seen in Table 1.

Test Example 2 Determination of the Compounds of the Present Invention on Cell Proliferation Activities of BAF3 LMNA-TRKA.SUP.WT .and BAF3 LMNA-TRKA.SUP.G667C

(569) The following method was used to determine the effects of the compounds of the present invention on cell proliferation. BAF3 cells were purchased from National Infrastructure of Cell Line Resource (Beijing Headquarter). For TRKA, BAF3 cells were used to construct three stable cell lines of BAF3 LMNA-TRKA.sup.WT and BAF3 LMNA-TRKA.sup.G667C The above three cell lines were used to determine the inhibition of the compounds on cell activities. The cells were cultured in an RPMI 1640 medium containing 10% fetal bovine serum, 100 U penicillin and 100 μ g/mL streptomycin. The cells were cultured in a 5% CO_{sub.2} incubator at 37° C. The activities of the cells were determined by CellTiter-Glo® Luminescent Cell Viability Assay kit (Promega, article number: G7573).

(570) The experimental methods were operated according to the steps in the kit instruction, and were briefly described as follows: a test compound was first dissolved in DMSO to prepare a storage solution, and then diluted in gradient with the corresponding cell culture medium to prepare a test sample. A final concentration of the compound ranged from 1 μ M to 0.15 nM. Cells in logarithmic growth phase were inoculated into a 96-well cell culture plate at a suitable density, and the cells were cultured in a 5% CO_{sub.2} incubator at 37° C. overnight. After adding the sample of the test compound, the cells were continuously cultured for 72 hours. After the culture, 50 μ L of CellTiter-Glo detection solution was added to each well, shaken for 5 minutes, and then stood for 10 minutes, and the luminescence values of each well were read on the microplate reader using a

Luminance mode. By comparing with the absorbance value of a control group (0.3% DMSO), the percentage inhibition rates of the compound at each concentration were calculated, and the IC_{sub.50} value of the compound on inhibiting cell proliferation was obtained by performing nonlinear regression analysis for logarithmic value of the compound concentration-inhibition rate by GraphPad Prism 5 software, which can be seen in Table 2.

For detailed experimental operation, please refer to the kit instruction. The recombinant human ALK(G1202R) and ALK(L1196M, G1202R) were both purchased from SignalChem (the article numbers were ALK(G1202R) #A 19-12HG-10, and ALK (L 1196M, G1202R) #A 19-12NG-10 respectively).

(579) The experimental flow was briefly described as follows: a test compound was first dissolved in DMSO to prepare a storage solution, and then diluted in gradient with a buffer provided in the kit. A final concentration of the test compound in the reaction system ranged from 1000 nM to 0.004 nM. An ATP K_m value concentration of each ALK protein was determined by using an ATP solution diluted in gradient (Sangon Biotech (Shanghai) Co., Ltd., A600311). According to the K_m value obtained, the ATP concentrations in the reaction system were set as 10 μ M for ALK(G1202R) and 25 μ M for ALK(L1196M, G1202R). The reaction was carried out in a 384-well microplate. Firstly, the compound and a certain amount of corresponding ALK protein were added to the wells and incubated for 5 minutes to 10 minutes at room temperature. Then, the ATP solution and the

biotinylated polypeptide substrate solution were added to the reaction solution and incubated with shaking at room temperature for 60 minutes. Then, an anti-phosphorylated tyrosine antibody coupled with a europium compound and streptavidin coupled with modified allophycocyanin XL665 were added to the reaction, and continuously incubated with shaking at room temperature for 1 hour. After incubation, fluorescence intensity values of each well at an excitation wavelength of 304 nM, and emission wavelengths of 620 nM and 665 nM were determined in a TF-FRET mode on a microplate reader, and the fluorescence intensity ratio 665/620 of each hole was calculated. By comparing with the fluorescence intensity ratio of a control group (0.1% DMSO), the percentage inhibition rates of the compound at each concentration were calculated, and the IC_{sub}.50 value of the compound was obtained by performing nonlinear regression analysis for logarithmic value of the compound concentration-inhibition rate by GraphPad Prism 5 software, which can be seen in Table 5.

Test Example 6 Determination of the Compounds of the Present Invention on Activities of ROS1 and ROS1(G2032R) Kinases

(581) The following method was used to determine the inhibition degrees of the compounds of the present invention on the activity of recombinant human ROS1 kinase in vitro. In this method, HTRF® KinEASE-TK tyrosine kinase kit (article No. 62TK0PEB) of Cisbio company was used, the principle of the kit was based on time-resolved fluorescence resonance energy transfer (TF-FRET), and the inhibition of the compounds on the activity of the ROS1 kinase was reflected by determining a phosphorylation degree of a biotinylated polypeptide substrate mediated by ROS1 kinase. For detailed experimental operation, please refer to the kit instruction. The recombinant human ROS1 and ROS1(G2032R) were both purchased from SignalChem (the article numbers were R14-11G-10 and ROS1(G2032R) #R14-12BG-10 respectively).

(582) The experimental flow was briefly described as follows: a test compound was first dissolved in DMSO to prepare a storage solution, and then diluted in gradient with a buffer provided in the kit. A final concentration of the test compound in the reaction system ranged from 1000 nM to 0.004 nM. An ATP Km value concentration of each ROS1 protein was determined by using an ATP solution diluted in gradient (Sangon Biotech (Shanghai) Co., Ltd., A600311). According to the Km value obtained, the ATP concentrations in the reaction system were set as 1 μM for ROS1 and 0.5 μM for ROS1(G2032R). The reaction was carried out in a 384-well microplate. Firstly, the compound and a certain amount of corresponding ROS1 protein were added to the wells and incubated for 5 minutes to 10 minutes at room temperature. Then, the ATP solution and the biotinylated polypeptide substrate solution were added to the reaction solution and incubated with shaking at room temperature for 60 minutes. Then, an anti-phosphorylated tyrosine antibody coupled with a europium compound and streptavidin coupled with modified allophycocyanin XL665 were added to the reaction, and continuously incubated with shaking at room temperature for 1 hour. Test Example 7 Determination of the Compounds of the Present Invention on Cell Proliferation Activities of H2228 (Human Lung Cancer Cells) and KARPAS-299 (Human Anaplastic Large Cell Lymphoma Cell)

(584) The following method was used to determine the effects of the compounds of the present invention on cell proliferation. H2228 cells (containing EML4-ALK fusion) were purchased from Cell Resource Center of Shanghai Institutes for Biological Sciences, Chinese Academy of Sciences. KARPAS-299 cells (containing NPM-ALK fusion) were purchased from Nanjing COBIOER Biotechnology Co., Ltd. The above two cell lines were used to determine the inhibition of the compounds on cell activities. The cells were cultured in an RPMI 1640 medium containing 10% fetal bovine serum, 100 U penicillin, 100 g/mL streptomycin, and 1 mM Sodium Pyruvate. The cells were cultured in a 5% CO₂ incubator at 37° C. The activity of the cells was determined by CellTiter-Glo® Luminescent Cell Viability Assay kit (Promega, article number: G7573).

(585) The experimental methods were operated according to the steps in the kit instruction, and were briefly described as follows: a test compound was first dissolved in DMSO to prepare a storage solution, and then diluted in gradient with the corresponding cell culture medium to prepare a test sample. A final concentration of the compound ranged from 10 μ M to 1.5 nM. Cells in logarithmic growth phase were inoculated into a 96-well cell culture plate at a suitable density, and the cells were cultured in a 5% CO₂ incubator at 37° C. overnight. After adding the sample of the test compound, the cells were continuously cultured for 72 hours. After the culture, 50 μ L of CellTiter-Glo detection solution was added to each well, shaken for 5 minutes, and then stood for 10 minutes, and the luminescence values of each well were read on the microplate reader using a Luminescence mode. By comparing with the numerical value of a control group (0.3% DMSO), the percentage inhibition rates of the compound at each concentration were calculated, and the IC₅₀ value of the compound on inhibiting cell proliferation was obtained by performing nonlinear regression analysis for logarithmic value of the compound concentration-inhibition rate by GraphPad Prism 5 software, which can be seen in Table 7.

(586) TABLE-US-00009 TABLE 7 IC₅₀ data of the compounds of the present invention on inhibiting activities of H2228 and KARPAS-299 Compound IC₅₀ (nM) No. H2228 KARPAS-299 8 164.4 65.5 25 — 52.7 Conclusion: the compounds of the present invention have both preferable inhibitory effects on proliferation for H2228 cells and KARPAS-299 cells.

Test Example 8 Pharmacokinetic Study of the Compounds of the Present Invention on ICR Mice

(587) 1. Experimental Purpose

(588) In this study, ICR mice were used as test animals, and LC/MS/MS method was used to determine the drug concentrations in plasma of mice injected intravenously or administered intragastrically with repotrectinib and the compounds of the present invention, and to study the pharmacokinetic characteristics of the compounds of the present invention in mice.

(589) 2. Experimental Solution

(590) 2.1 Experimental Drugs and Animals

(591) Repotrectinib, the compound of Example 5, the compound of Example 8 and the compound of Example 25.

(592) ICR mice, male, 29.0 g to 33.8g, purchased from Beijing Charles River Laboratory Animal Technology Co., Ltd.

(593) Animal quality certificate number: 33000800001184.

(594) 2.2 Drug Preparation

(595) Intravenous injection group: an appropriate amount of drug was weighed, and added with mixed solvent (DMA: 30% Solutol HS-15: Saline=10:10:80 (v/v/v)) to prepare the drug with a final concentration of 0.2 mg/mL.

(596) Oral gavage administration group: an appropriate amount of drug was weighed, added with an appropriate amount of sodium carboxymethyl cellulose (CMC-Na, containing 0.5% Tween 80), vortex shaken, and ultrasonically prepared into 0.5 mg/kg suspension.

(597) 2.3 Administration

(598) For ICR mice, each compound to be tested was divided into an intravenous injection group (9 mice in each group) and an intragastric group (9 mice in each group). The ICR mice were fasted overnight and then administered by orbital intravenous injection (administration dose of 1 mg/kg, and administration volume of 5 mL/kg) and administered by intragastric injection (administration dose of 5 mg/kg, and administration volume of 10 mL/kg), and ate 4 hours after administration.

3. Operation

(599) About 0.2 mL of blood was collected via jugular vein before administration and 0.083 hour, 0.25 hour, 0.5 hour, 1 hour, 2 hours, 4 hours, 8 hours, 12 hours and 24 hours after administration, and heparin sodium was used for anticoagulation. The collected blood samples were placed on ice, and plasma was separated by centrifugation (centrifugation condition: 1500 g, 10 minutes). The collected plasma was stored at -40°C . to -20°C . before analysis.

(600) LC-MS/MS was used to determine the contents of different compounds to be tested in mouse plasma after intravenous injection and intragastric administration.

(601) 4. Results of Pharmacokinetic Parameters

(602) The pharmacokinetic parameters of the compounds of the present invention and the positive control can be seen in Table 8.

(603) TABLE-US-00010 TABLE 8 Results of pharmacokinetic parameters

(604) Conclusion: compared with repotrectinib, the compound of Example 5, the compound of Example 8 and the compound of Example 25 of the present invention have significantly higher C_{max} and AUC_{sub.0-∞}, lower clearance rates, significantly improved bioavailabilities, good pharmacokinetic absorption and better pharmacokinetic properties. Especially, compared with repotrectinib, the C_{max}, AUC_{sub.0-∞} and bioavailability of the compound of Example 8 are respectively 14.7 times, 10.6 times and 4.1 times that of repotrectinib, which well confirms that when ring B in general formula (I) of the present invention is benzoheterocyclyl, the pharmacokinetic absorption of the compound will be improved significantly, and the compound of the present invention has pharmacokinetic advantages.

(605) Remarks: repotrectinib was prepared according to patent application WO2017007759, and its specific structure was as follows:

5. The compound or the stereoisomer or the tautomer thereof, or the pharmaceutically acceptable salt thereof according to claim 1, wherein ring B is selected from a 8-10 membered bicyclic heteroaryl, and preferably selected from: ##STR00156## ##STR00157## ##STR00158##

6. The compound or the stereoisomer or the tautomer thereof, or the pharmaceutically acceptable salt thereof according to claim 3, which is a compound represented by general formula (IV) or (V) or a stereoisomer or a tautomer thereof, or a pharmaceutically acceptable salt thereof, ##STR00159## wherein: G.sup.1 and G.sup.2 are the same or different, and are each independently selected from bonds, —N(R.sup.g)—, —(CR.sup.hR.sup.i)— and —O—; R.sup.g is selected from hydrogen atom, alkyl and cycloalkyl, wherein the alkyl or cycloalkyl is optionally further substituted by one or more substituents selected from halogen, hydroxy and alkoxy; R.sup.h and R.sup.i are the same or different and are each independently selected from hydrogen atom, deuterium, halogen, hydroxy, alkoxy, alkyl, alkenyl, alkynyl, cycloalkyl, heterocyclyl, aryl and heteroaryl, wherein the alkyl, alkenyl, alkynyl, cycloalkyl, heterocyclyl, aryl or heteroaryl is optionally further substituted by one or more substituents selected from hydroxy, halogen, nitro, cyano, alkoxy, cycloalkyl, heterocyclyl, aryl, heteroaryl, —C(O)R.sup.4, —C(O)OR.sup.4, —OC(O)R.sup.4, —NR.sup.5R.sup.6, —C(O)NR.sup.5R.sup.6, —SO.sub.2NR.sup.5R.sup.6 and —NR.sup.5C(O)R.sup.6; alternatively, R.sup.h and R.sup.i together with the carbon atom bound therewith form a C.sub.3-C.sub.8 cycloalkyl or 3-8 membered heterocyclyl, wherein the 3-8 membered heterocyclyl internally contains one or more N, O or S(O).sub.r, and the C.sub.3-C.sub.8 cycloalkyl or 3-8 membered heterocyclyl is optionally further substituted by one or more substituents selected from hydroxyl, halogen, nitro, cyano, alkyl, alkoxy, cycloalkyl, heterocyclyl, aryl, heteroaryl, =O, —C(O)R.sup.4, —C(O)OR.sup.4, —OC(O)R.sup.4, —NR.sup.5R.sup.6, —C(O)NR.sup.5R.sup.6, —SO.sub.2NR.sup.5R.sup.6 and —NR.sup.5C(O)R.sup.6; each R.sup.1 and R.sup.2 are the same or different, and are each independently selected from hydrogen atom, hydroxyl, halogen, nitro, cyano, alkyl, alkoxy, cycloalkyl, heterocyclyl, aryl, heteroaryl, —C(O)R.sup.4, —C(O)OR.sup.4, —OC(O)R.sup.4, —NR.sup.5R.sup.6, —C(O)NR.sup.5R.sup.6, —SO.sub.2NR.sup.5R.sup.6 and —NR.sup.5C(O)R.sup.6, wherein the alkyl, alkoxy, cycloalkyl, heterocyclyl, aryl or heteroaryl is optionally further substituted by one or more substituents selected from hydroxy, halogen, nitro, cyano, alkoxy, cycloalkyl and heterocyclyl; preferably, R.sup.1 and R.sup.2 are each independently selected from hydrogen atom, halogen, amino, cyano, alkyl, alkoxy, haloalkyl, haloalkoxy, hydroxyalkyl and alkoxyalkyl; and more preferably, R.sup.1 and R.sup.2 are each independently selected from hydrogen atom, amino, cyano, F, Cl, Br, methyl, hydroxymethyl, halomethyl and methoxymethyl; R.sup.B is selected from hydrogen atom, alkyl and alkoxy, wherein the alkyl or alkoxy is substituted by one or more substituents selected from hydroxy, halogen, nitro, cyano, alkoxy, cycloalkyl, heterocyclyl, aryl, heteroaryl, —C(O)R.sup.4, —

C(O)OR.sup.4, —OC(O)R.sup.4, —NR.sup.5R.sup.6, —C(O)NR.sup.5R.sup.6, —SO.sub.2NR.sup.5R.sup.6(w and —NR.sup.5C(O)R.sup.6; and R.sup.B is preferably selected from hydrogen atom and methyl, wherein the methyl is optionally further substituted by one or more substituents selected from halogen, hydroxy, cycloalkyl, alkoxy and —NR.sup.5R.sup.6; R.sup.D and R.sup.E are the same or different, and are each independently selected from hydrogen atom, deuterium, halogen, hydroxy, alkoxy, alkyl, alkenyl, alkynyl, cycloalkyl, heterocyclyl, aryl, heteroaryl, —C(O)R.sup.4, —C(O)OR.sup.4, —OC(O)R.sup.4, —NR.sup.5R.sup.6, —C(O)NR.sup.5R.sup.6, —SO.sub.2NR.sup.5R.sup.6 and —NR.sup.5C(O)R.sup.6, wherein the alkyl, alkenyl, alkynyl, cycloalkyl, heterocyclyl, aryl or heteroaryl is optionally further substituted by one or more substituents selected from hydroxy, halogen, nitro, cyano, alkoxy, cycloalkyl, heterocyclyl, aryl, heteroaryl-C(O)R.sup.4, —C(O)OR.sup.4, —OC(O)R.sup.4, —NR.sup.5R.sup.6, —C(O)NR.sup.5R.sup.6, —SO.sub.2NR.sup.5R.sup.6 and —NR.sup.5C(O)R.sup.6; alternatively, R.sup.D and R.sup.E together with the carbon atom bound therewith form a C.sub.3-C.sub.6 cycloalkyl or 3-6 membered heterocyclyl, wherein the 3-6 membered heterocyclyl internally contains one or more N, O or S(O).sub.r, and the C.sub.3-C.sub.6 cycloalkyl or 3-6 membered heterocyclyl is optionally further substituted by one or more substituents selected from hydroxyl, halogen, nitro, cyano, alkyl, alkoxy, cycloalkyl, heterocyclyl, aryl, heteroaryl, =O, —C(O)R.sup.4, —C(O)OR.sup.4, —OC(O)R.sup.4, —NR.sup.5R.sup.6, —C(O)NR.sup.5R.sup.6, —SO.sub.2NR.sup.5R.sup.6 and —NR.sup.5C(O)R.sup.6; and L.sub.2, r, and R.sup.3 to R.sup.6 are defined as in claim 3.

7. The compound or the stereoisomer or the tautomer thereof, or the pharmaceutically acceptable salt thereof according to claim 6, which is a compound represented by general formula (VI), (VII), (VIII) or (IX) or a stereoisomer or a tautomer thereof, or a pharmaceutically acceptable salt thereof, ##STR00160## wherein: L.sub.2, G.sup.1, G.sup.2, R.sup.1 to R.sup.3, R.sup.B, R.sup.D and R.sup.E are defined as in claim 6.

8. The compound or the stereoisomer or the tautomer thereof, or the pharmaceutically acceptable salt thereof according to claim 1, wherein: L.sub.2 is selected from —(CR.sup.dR.sup.e).sub.n—; R.sup.d is selected from hydrogen atom; R.sup.e is selected from hydrogen atom, alkyl and alkoxy, and preferably hydrogen atom or methyl, wherein the alkyl or alkoxy is substituted by one or more halogens; and n is 1, 2 or 3.

9. The compound or the stereoisomer or the tautomer thereof, or the pharmaceutically acceptable salt thereof according to claim 1, wherein the compound is selected from: ##STR00161## ##STR00162## ##STR00163## ##STR00164## ##STR00165## ##STR00166## ##STR00167##

10. A preparation method of the compound represented by general formula (I) or the stereoisomer or the tautomer thereof, or the pharmaceutically acceptable salt thereof according to claim 1, wherein the method comprises: ##STR00168## subjecting a compound represented by general formula (IA) to a condensation reaction under basic conditions to obtain a compound represented by general formula (I); wherein: ring A, ring B, R.sup.1 to R.sup.3, L.sub.1, L.sub.2, p and q are defined as in claim 1.

11. A preparation method of the compound represented by general formula (I) or the stereoisomer or the tautomer thereof, or the pharmaceutically acceptable salt thereof according to claim 1, wherein the method comprises: ##STR00169## subjecting a compound represented by general formula (If) to a condensation reaction under basic conditions to obtain a compound represented by general formula (I); wherein: R.sup.j is selected from alkyl; and ring A, ring B, R.sup.1 to R.sup.3, L.sub.1, L.sub.2, p and q are defined as in claim 1.

12. A compound represented by general formula (IA) or a stereoisomer or a tautomer thereof, ##STR00170## wherein: L.sub.1 is —X—CHR.sup.A; X is selected from —N(R.sup.c)—, —O— or and —S(O).sub.r—; and preferably —NH—; R.sup.A is selected from hydrogen atom and alkyl, wherein the alkyl is optionally further substituted by one or more substituents selected from halogen, hydroxy, alkoxy and cycloalkyl; and R.sup.A is preferably methyl; R.sup.c is selected

from hydrogen atom, alkyl and cycloalkyl, wherein the alkyl or cycloalkyl is optionally further substituted by one or more substituents selected from halogen, hydroxy, alkoxy and cycloalkyl; alternatively, when X is selected from —N(R^{sup.c})—, R^{sup.A} and R^{sup.c} together with the carbon atom and nitrogen atom respectively bound therewith form a 4-8 membered heterocyclyl, wherein the 4-8 membered heterocyclyl internally contains one or more N, O or S(O)_r, and the 4-8 membered heterocyclyl is optionally further substituted by one or more substituents selected from hydroxyl, halogen, nitro, cyano, alkyl, alkoxy, cycloalkyl, heterocyclyl, aryl, heteroaryl, =O, —C(O)R^{sup.4}, —C(O)OR^{sup.4}, —OC(O)R^{sup.4}, —NR^{sup.5}R^{sup.6}, —C(O)NR^{sup.5}R^{sup.6}, —SO₂NR^{sup.5}R^{sup.6} and —NR^{sup.5}C(O)R^{sup.6}; and ring A, ring B, R^{sup.1} to R^{sup.6}, L₂, M_q and r are defined as in claim 1.

13. The compound or the stereoisomer or the tautomer thereof according to claim 12, wherein the compound is selected from: ##STR00171## ##STR00172## ##STR00173## ##STR00174## ##STR00175##

14. A preparation method of the compound represented by general formula (IA) or the stereoisomer or the tautomer thereof according to claim 12, wherein the method comprises: ##STR00176## reacting a compound represented by general formula (Ic) in the presence of di-tert-butyl dicarbonate under the conditions of hydrogen and catalyst to obtain a compound represented by general formula (Id); subjecting the compound represented by general formula (Id) to hydrolysis under basic conditions to obtain a compound represented by general formula (Ie); and further removing the protecting group PG from the compound represented by general formula (Ie) to obtain a compound represented by general formula (IA); wherein: R^{sup.3} is selected from hydrogen atom; R^{sup.j} is selected from alkyl; PG is an amino protecting group, and is preferably tert-butoxycarbonyl; and ring A, ring B, R^{sup.1} to R^{sup.2}, L₁, L₂, p and q are defined as in claim 12.

15. A pharmaceutical composition, wherein the pharmaceutical composition comprises an effective amount of the compound or the stereoisomer or the tautomer thereof, or the pharmaceutically acceptable salt thereof according to claim 1, and a pharmaceutically acceptable carrier, an excipient or a combination thereof.

16. A method for inhibiting an activity of one or more protein kinases of TRK, ALK and ROS1, comprising administering a therapeutically effective amount of the compound or the stereoisomer or the tautomer thereof, or the pharmaceutically acceptable salt thereof according to claim 1 to a patient in need.

17. A method for treating a disease symptom of pain, inflammation, neurodegenerative diseases or trypanosome infection, comprising administering a therapeutically effective amount of the compound or the stereoisomer or the tautomer thereof, or the pharmaceutically acceptable salt thereof according to claim 1.

18. A method for treating a cancer, comprising administering a therapeutically effective amount of the compound or the stereoisomer or the tautomer thereof, or the pharmaceutically acceptable salt thereof according to claim 1 to a patient in need, wherein the cancer is preferably neurocytoma, ovarian cancer, breast cancer, prostate cancer, gastric cancer, gastrointestinal cancer, liver cancer, cholangiocarcinoma, pancreatic cancer, multiple myeloma, astrocytoma, medulloblastoma, neuroglioma, melanoma, thyroid cancer, lung cancer, magnocellular neuroendocrine tumor, colorectal cancer, mammary analogue secretory carcinoma, sarcoma, head and neck tumor, and renal carcinoma.
