COMPOUNDS AND USES THEREOF

BACKGROUND

The invention relates to compounds useful for modulating BRG1- or BRM-associated factors (BAF) complexes. In particular, the invention relates to compounds useful for treatment of disorders associated with BAF complex function.

Chromatin regulation is essential for gene expression, and ATP-dependent chromatin remodeling is a mechanism by which such gene expression occurs. The human Switch/ Sucrose Non-Fermentable (SWI/SNF) chromatin remodeling complex, also known as BAF complex, has two SWI2-like ATPases known as BRG1 (Brahma-related gene-1) and BRM (Brahma). The transcription activator BRG1, also known as ATP-dependent chromatin remodeler SMARCA4, is encoded by the SMARCA4 gene on chromosome 19. BRG1 is overexpressed in some cancer tumors and is needed for cancer cell proliferation. BRM, also known as probable global transcription activator SNF2L2 and/or ATP-dependent chromatin remodeler SMARCA2, is encoded by the SMARCA2 gene on chromosome 9 and has been shown to be essential for tumor cell growth in cells characterized by loss of BRG1 function mutations. Deactivation of BRG and/or BRM results in downstream effects in cells, including cell cycle arrest and tumor suppression.

SUMMARY

The present invention features compounds useful for modulating a BAF complex. In some embodiments, the compounds are useful for the treatment of disorders associated with an alteration in a BAF complex, e.g., a disorder associated with an alteration in one or both of the BRG1 and BRM proteins. The compounds of the invention, alone or in combination with other pharmaceutically active agents, can be used for treating such disorders.

Disclosed herein is a compound having the structure of Formula I:

Formula I

wherein
B is

optionally substituted C₂-C₉ heteroaryl, or C₂-C₉ heterocyclyl;

m is 0, 1, 2, 3, or 4;

R is H,

2

wherein R¹ is optionally substituted C₁-C₃ alkyl, optionally substituted C₃-C₆ cycloalkyl, optionally substituted C₆-C₁₀ aryl, optionally substituted C₂-C₉ heteroaryl, hydroxy, optionally substituted C₁-C₆ alkoxy, or —NR^{1a}R^{1b}, wherein each R^{1a} and R^{1b} is, independently, H or CH₃;

each R² is, independently, halo, optionally substituted C₁-C₆ alkyl, optionally substituted C₁-C₆ heteroalkyl, optionally substituted C₃-C₁₀ carbocyclyl, optionally substituted C₁-C₆ alkyl C₃-C₁₀ carbocyclyl, optionally substituted C₁-C₆ heteroalkyl C₃-C₁₀ carbocyclyl, optionally substituted C₂-C₉ heterocyclyl, optionally substituted C₁-C₆ alkyl C₂-C₉ heterocyclyl, optionally substituted C₁-C₆ heteroalkyl C₂-C₉ heterocyclyl, optionally substituted C₆-C₁₀ aryl, optionally substituted C₁-C₆ alkyl C₆-C₁₀ aryl, optionally substituted C₁-C₆ heteroalkyl C₆-C₁₀ aryl, optionally substituted C₂-C₉ heteroaryl, optionally substituted C₁-C₆ alkyl C₂-C₉ heteroaryl, optionally substituted C₁-C₆ heteroalkyl C₂-C₉ heteroaryl, optionally substituted C₂-C₆ alkenyl, optionally substituted C₂-C₆ heteroalkenyl, hydroxy, thiol, or optionally substituted amino;

each R³ and R⁵ is, independently, selected from the group consisting of H, optionally substituted C₁-C₆ alkyl, or optionally substituted C₁-C₆ heteroalkyl;

R⁴ is hydrogen, optionally substituted C₁-C₆ alkyl, optionally substituted C₁-C₆ heteroalkyl, optionally substituted C₃-C₁₀ carbocyclyl, optionally substituted C₁-C₆ alkyl C₃-C₁₀ carbocyclyl, optionally substituted C₁-C₆ heteroalkyl C₃-C₁₀ carbocyclyl, optionally substituted C₂-C₉ heterocyclyl, optionally substituted C₁-C₆ alkyl C₂-C₉ heterocyclyl, optionally substituted C₁-C₆ heteroalkyl C₂-C₉ heterocyclyl, optionally substituted C₆-C₁₀ aryl, optionally substituted C₁-C₆ alkyl C₆-C₁₀ aryl, optionally substituted C₁-C₆ heteroalkyl C₆-C₁₀ aryl, optionally substituted C₂-C₉ heteroaryl, optionally substituted C₁-C₆ alkyl C₂-C₉ heteroaryl, or optionally substituted C₁-C₆ heteroalkyl C₂-C₉ heteroaryl; and

A is

wherein X is N or CR^X, wherein R^X is H, halo, optionally substituted C₁-C₆ alkyl, optionally substituted C₁-C₆ heteroalkyl, optionally substituted C₃-C₁₀ carbocyclyl, optionally substituted C₂-C₉ heterocyclyl, optionally substituted C₆-C₁₀ aryl, optionally substituted C₂-C₉ heteroaryl, optionally substituted C₂-C₆ alkenyl, or optionally substituted C₂-C₆ heteroalkenyl;

Y is N or CRY, wherein RY is H, halo, optionally substituted C₁-C₆ alkyl, optionally substituted C₁-C₆ heteroalkyl, optionally substituted C₃-C₁₀ carbocyclyl, optionally substituted C₂-C₉ heterocyclyl, optionally substituted C₆-C₁₀ aryl, optionally substituted C₂-C₉ heteroaryl, optionally substituted C₂-C₆ alkenyl, or optionally substituted C₂-C₆ heteroalkenyl;

3

Z is S, O, or NR^Z , wherein R^Z is H, optionally substituted $\text{C}_1\text{-C}_6$ alkyl, or optionally substituted $\text{C}_1\text{-C}_6$ heteroalkyl;

R^6 and R^7 are, independently, H, halo, optionally substituted $\text{C}_1\text{-C}_6$ alkyl, optionally substituted $\text{C}_1\text{-C}_6$ heteroalkyl, optionally substituted $\text{C}_3\text{-C}_{10}$ carbocyclyl, optionally substituted $\text{C}_2\text{-C}_9$ heterocyclyl, optionally substituted $\text{C}_6\text{-C}_{10}$ aryl, optionally substituted $\text{C}_1\text{-C}_6$ alkyl optionally substituted $\text{C}_6\text{-C}_{10}$ aryl, optionally substituted $\text{C}_2\text{-C}_9$ heteroaryl, optionally substituted $\text{C}_2\text{-C}_6$ alkenyl, optionally substituted $\text{C}_2\text{-C}_6$ heteroalkenyl, or optionally substituted amino, or two R^7 combine with the carbons to which they are attached to form a 5- or 6-membered ring; and

n is 1, 2, 3, or 4,

or a pharmaceutically acceptable salt thereof,

wherein if B is

and R^4 is hydrogen then R^6 is H, halo, optionally substituted $\text{C}_1\text{-C}_6$ alkyl, optionally substituted $\text{C}_1\text{-C}_6$ heteroalkyl, optionally substituted $\text{C}_3\text{-C}_{10}$ carbocyclyl, optionally substituted $\text{C}_2\text{-C}_9$ heterocyclyl, optionally substituted $\text{C}_2\text{-C}_9$ heteroaryl, optionally substituted $\text{C}_2\text{-C}_6$ alkenyl, optionally substituted $\text{C}_2\text{-C}_6$ heteroalkenyl, optionally substituted amino, or $\text{C}_6\text{-C}_{10}$ aryl optionally substituted with one or more substituents selected from optionally substituted $\text{C}_1\text{-C}_6$ alkyl, optionally substituted $\text{C}_1\text{-C}_6$ heteroalkyl, optionally substituted $\text{C}_6\text{-C}_{10}$ aryl, optionally substituted $\text{C}_1\text{-C}_6$ acyl, and cyano, or two substituents combine with the carbons to which they are attached to form a 5- or 6-membered heterocycle.

In some embodiments, B is

In some embodiments, R^1 is $-\text{NR}^{1a}\text{R}^{1b}$, wherein each R^{1a} and R^{1b} is, independently, H or CH_3 .

In some embodiments, the compound of Formula I has the structure of Formula II:

wherein R^{1a} and R^{1b} are, independently, H or CH_3 , or a pharmaceutically acceptable salt thereof.

In some embodiments, m is 0.

In some embodiments, the compound of Formula II has the structure of Formula IIh:

Formula IIh

or a pharmaceutically acceptable salt thereof.

In some embodiments, n is 1. In some embodiments, A is

In some embodiments R⁷ is

In some embodiments, n is 0.

In some embodiments, the compound of Formula II has the structure of Formula III:

Formula III

or a pharmaceutically acceptable salt thereof.

In some embodiments, X is N. In some embodiments, X is CH.

In some embodiments, each R^{1a} and R^{1b} is, independently, selected from the group consisting of H or CH₃. In some embodiments, both R^{1a} and R^{1b} are H. In some embodiments, both R^{1a} and R^{1b} are CH₃. In some embodiments, R^{1a} is H and R^{1b} is CH₃. In some embodiments, both R³ and R⁵ are H.

In some embodiments, R¹ is optionally substituted C₁-C₃ alkyl.

In some embodiments, the compound of Formula I has the structure of Formula III:

Formula III

7

wherein R^1 is optionally substituted C_1 - C_3 alkyl, or a pharmaceutically acceptable salt thereof.

In some embodiments, m is 0.

In some embodiments, the compound of Formula III has the structure of Formula IIIa:

Formula IIIa

or a pharmaceutically acceptable salt thereof.

In some embodiments, the compound of Formula III has the structure of Formula IIIb:

Formula IIIb

or a pharmaceutically acceptable salt thereof.

In some embodiments, A is Z

In some embodiments, the compound of Formula III has the structure of Formula IIIc:

In another aspect, the invention features a pharmaceutical composition that includes any of the foregoing compounds and a pharmaceutically acceptable excipient.

In some embodiments, the pharmaceutical composition includes a compound of Formula I, Formula IV, Formula V, Formula VI, or Formula VII and a pharmaceutically acceptable excipient.

In some embodiments, the compound is any one of compounds 1-241 in Tables 1, 2, 3, and 4.

In another aspect, the invention features a method of decreasing the activity of a BAF complex in a cell, the method involving contacting the cell with an effective amount of any of the foregoing compounds or a pharmaceutical composition thereof.

In some embodiments, the cell is a cancer cell.

In another aspect, the invention features a method of treating a BAF complex-related disorder in a subject in need thereof, the method involving administering to the subject an effective amount of any of the foregoing compounds (e.g., a BRM/BRG1 dual inhibitor compound or a BRM-selective compound) or a pharmaceutical composition thereof.

In some embodiments, the BAF complex-related disorder is cancer.

In a further aspect, the invention features a method of inhibiting BRM, the method involving contacting a cell with an effective amount of any of the foregoing compounds (e.g., a BRM/BRG1 dual inhibitor compound or a BRM-selective compound) or a pharmaceutical composition thereof.

In some embodiments, the cell is a cancer cell.

In another aspect, the invention features a method of inhibiting BRG1, the method involving contacting the cell with an effective amount of any of the foregoing compounds or a pharmaceutical composition thereof.

In some embodiments, the cell is a cancer cell.

In a further aspect, the invention features a method of inhibiting BRM and BRG1, the method involving contacting the cell with an effective amount of any of the foregoing compounds or a pharmaceutical composition thereof.

In some embodiments, the cell is a cancer cell.

In another aspect, the invention features a method of treating a disorder related to a BRG1 loss of function mutation in a subject in need thereof, the method involving administering to the subject an effective amount of any of the foregoing compounds (e.g., a BRM/BRG1 dual inhibitor compound or a BRM-selective compound) or a pharmaceutical composition thereof.

In some embodiments, the disorder related to a BRG1 loss of function mutation is cancer. In other embodiments, the subject is determined to have a BRG1 loss of function disorder, for example, is determined to have a BRG1 loss of function cancer (for example, the cancer has been determined to include cancer cells with loss of BRG1 function).

In another aspect, the invention features a method of inducing apoptosis in a cell, the method involving contacting the cell with an effective amount of any of the foregoing compounds (e.g., a BRM/BRG1 dual inhibitor compound or a BRM-selective compound) or a pharmaceutical composition thereof.

In some embodiments, the cell is a cancer cell.

In a further aspect, the invention features a method of treating cancer in a subject in need thereof, the method including administering to the subject an effective amount of any of the foregoing compounds (e.g., a BRM/BRG1 dual inhibitor compound or a BRM-selective compound) or a pharmaceutical composition thereof.

In some embodiments of any of the foregoing methods, the cancer is non-small cell lung cancer, colorectal cancer, bladder cancer, cancer of unknown primary, glioma, breast cancer, melanoma, non-melanoma skin cancer, endometrial cancer, esophagogastric cancer, pancreatic cancer, hepatobiliary cancer, soft tissue sarcoma, ovarian cancer, head and neck cancer, renal cell carcinoma, bone cancer, non-Hodgkin lymphoma, small-cell lung cancer, prostate cancer, embryonal tumor, germ cell tumor, cervical cancer, thyroid cancer, salivary gland cancer, gastrointestinal neuroendocrine tumor, uterine sarcoma, gastrointestinal stromal tumor, CNS cancer, thymic tumor, Adrenocortical carcinoma, appendiceal cancer, small bowel cancer, or penile cancer.

In some embodiments of any of the foregoing methods, the cancer is non-small cell lung cancer, colorectal cancer, bladder cancer, cancer of unknown primary, glioma, breast cancer, melanoma, non-melanoma skin cancer, endometrial cancer, or penile cancer.

In some embodiments of any of the foregoing methods, the cancer is a drug resistant cancer or has failed to respond to a prior therapy (e.g., vemurafenib, dacarbazine, a CTLA4 inhibitor, a PD1 inhibitor, interferon therapy, a BRAF inhibitor, a MEK inhibitor, radiotherapy, temozolamide, irinotecan, a CAR-T therapy, herceptin, perjeta, tamoxifen, xeloda, docetaxol, platinum agents such as carboplatin, taxanes such as paclitaxel and docetaxel, ALK inhibitors, MET inhibitors, alimta, abraxane, Adriamycin®, gemcitabine, avastin, halaven, neratinib, a PARP inhibitor, ARN810, an mTOR

inhibitor, topotecan, gemzar, a VEGFR2 inhibitor, a folate receptor antagonist, demcizumab, fosbretabulin, or a PDL1 inhibitor).

In some embodiments of any of the foregoing methods, the cancer has or has been determined to have BRG1 mutations. In some embodiments of any of the foregoing methods, the BRG1 mutations are homozygous. In some embodiments of any of the foregoing methods, the cancer does not have, or has been determined not to have, an epidermal growth factor receptor (EGFR) mutation. In some embodiments of any of the foregoing methods, the cancer does not have, or has been determined not to have, an anaplastic lymphoma kinase (ALK) driver mutation. In some embodiments of any of the foregoing methods, the cancer has, or has been determined to have, a KRAS mutation. In some embodiments of any of the foregoing methods, the BRG1 mutation is in the ATPase catalytic domain of the protein. In some embodiments of any of the foregoing methods, the BRG1 mutation is a deletion at the C-terminus of BRG1.

In another aspect, the disclosure provides a method treating a disorder related to BAF (e.g., cancer or viral infections) in a subject in need thereof. This method includes contacting a cell with an effective amount of any of the foregoing compounds (e.g., a BRM/BRG1 dual inhibitor compound or a BRM-selective compound), or pharmaceutically acceptable salts thereof, or any of the foregoing pharmaceutical compositions. In some embodiments, the disorder is a viral infection is an infection with a virus of the Retroviridae family such as the lentiviruses (e.g., Human immunodeficiency virus (HIV) and deltaretroviruses (e.g., human T cell leukemia virus I (HTLV-I), human T cell leukemia virus II (HTLV-II)), Hepadnaviridae family (e.g., hepatitis B virus (HBV)), Flaviviridae family (e.g., hepatitis C virus (HCV)), Adenoviridae family (e.g., Human Adenovirus), Herpesviridae family (e.g., Human cytomegalovirus (HCMV), Epstein-Barr virus, herpes simplex virus 1 (HSV-1), herpes simplex virus 2 (HSV-2), human herpesvirus 6 (HHV-6), Herpesvirus K*, CMV, varicella-zoster virus), Papillomaviridae family (e.g., Human Papillomavirus (HPV, HPV E1)), Parvoviridae family (e.g., Parvovirus B19), Polyomaviridae family (e.g., JC virus and BK virus), Paramyxoviridae family (e.g., Measles virus), Togaviridae family (e.g., Rubella virus). In some embodiments, the disorder is Coflin Siris, Neurofibromatosis (e.g., NF-1, NF-2, or Schwannomatosis), or Multiple Meningioma.

In another aspect, the disclosure provides a method for treating a viral infection in a subject in need thereof. This method includes administering to the subject an effective amount of any of the foregoing compounds (e.g., a BRM/BRG1 dual inhibitor compound or a BRM-selective compound), or pharmaceutically acceptable salts thereof, or any of the foregoing pharmaceutical compositions. In some embodiments, the viral infection is an infection with a virus of the Retroviridae family such as the lentiviruses (e.g., Human immunodeficiency virus (HIV) and deltaretroviruses (e.g., human T cell leukemia virus I (HTLV-I), human T cell leukemia virus II (HTLV-II)), Hepadnaviridae family (e.g., hepatitis B virus (HBV)), Flaviviridae family (e.g., hepatitis C virus (HCV)), Adenoviridae family (e.g., Human Adenovirus), Herpesviridae family (e.g., Human cytomegalovirus (HCMV), Epstein-Barr virus, herpes simplex virus 1 (HSV-1), herpes simplex virus 2 (HSV-2), human herpesvirus 6 (HHV-6), Herpesvirus K*, CMV, varicella-zoster virus), Papillomaviridae family (e.g., Human Papillomavirus (HPV, HPV E1)), Parvoviridae family (e.g., Parvovirus B19), Polyomaviridae family (e.g., JC virus and BK virus),

Paramyxoviridae family (e.g., Measles virus), or Togaviridae family (e.g., Rubella virus).

In some embodiments of any of the foregoing aspects, the compound is a BRM-selective compound. In some embodiments, the BRM-selective compound inhibits the level and/or activity of BRM at least 10-fold greater than the compound inhibits the level and/or activity of BRG1 and/or the compound binds to BRM at least 10-fold greater than the compound binds to BRG1. For example, in some embodiments, a BRM-selective compound has an IC_{50} or IP_{50} that is at least 10-fold lower than the IC_{50} or IP_{50} against BRG1. In some embodiments of any of the foregoing aspects, the compound is a BRM/BRG1 dual inhibitor compound. In some embodiments, the BRM/BRG1 dual inhibitor compound has similar activity against both BRM and BRG1 (e.g., the activity of the compound against BRM and BRG1 within 10-fold (e.g., less than 5-fold, less than 2-fold). In some embodiments, the activity of the BRM/BRG1 dual inhibitor compound is greater against BRM. In some embodiments, the activity of the BRM/BRG1 dual inhibitor compound is greater against BRG1. For example, in some embodiments, a BRM/BRG1 dual inhibitor compound has an IC_{50} or IP_{50} against BRM that is within 10-fold of the IC_{50} or IP_{50} against BRG1.

In another aspect, the invention features a method of treating melanoma, prostate cancer, breast cancer, bone cancer, renal cell carcinoma, or a hematologic cancer in a subject in need thereof, the method including administering to the subject an effective amount of any of the foregoing compounds or pharmaceutical compositions thereof.

In another aspect, the invention features a method of reducing tumor growth of melanoma, prostate cancer, breast cancer, bone cancer, renal cell carcinoma, or a hematologic cancer in a subject in need thereof, the method including administering to the subject an effective amount of any of the foregoing compounds or pharmaceutical compositions thereof.

In another aspect, the invention features a method of suppressing metastatic progression of melanoma, prostate cancer, breast cancer, bone cancer, renal cell carcinoma, or a hematologic cancer in a subject, the method including administering an effective amount of any of the foregoing compounds or pharmaceutical compositions thereof.

In another aspect, the invention features a method of suppressing metastatic colonization of melanoma, prostate cancer, breast cancer, bone cancer, renal cell carcinoma, or a hematologic cancer in a subject, the method including administering an effective amount of any of the foregoing compounds or pharmaceutical compositions thereof.

In another aspect, the invention features a method of reducing the level and/or activity of BRG1 and/or BRM in a melanoma, prostate cancer, breast cancer, bone cancer, renal cell carcinoma, or hematologic cancer cell, the method including contacting the cell with an effective amount of any of the foregoing compounds or pharmaceutical compositions thereof.

In some embodiments of any of the above aspects, the melanoma, prostate cancer, breast cancer, bone cancer, renal cell carcinoma, or hematologic cell is in a subject.

In some embodiments of any of the above aspects, the effective amount of the compound reduces the level and/or activity of BRG1 by at least 5% (e.g., 6%, 7%, 8%, 9%, 10%, 15%, 20%, 25%, 30%, 35%, 40%, 45%, 50%, 55%, 60%, 65%, 70%, 75%, 80%, 85%, 90%, or 95%) as compared to a reference. In some embodiments, the effective amount of the compound that reduces the level and/or activity of BRG1 by at least 50% (e.g., 55%, 60%, 65%,

70%, 75%, 80%, 85%, 90%, or 95%) as compared to a reference. In some embodiments, the effective amount of the compound that reduces the level and/or activity of BRG1 by at least 90% (e.g., 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99%).

In some embodiments, the effective amount of the compound reduces the level and/or activity of BRG1 by at least 5% (e.g., 6%, 7%, 8%, 9%, 10%, 15%, 20%, 25%, 30%, 35%, 40%, 45%, 50%, 55%, 60%, 65%, 70%, 75%, 80%, 85%, 90%, or 95%) as compared to a reference for at least 12 hours (e.g., 14 hours, 16 hours, 18 hours, 20 hours, 22 hours, 24 hours, 30 hours, 36 hours, 48 hours, 72 hours, or more). In some embodiments, the effective amount of the compound that reduces the level and/or activity of BRG1 by at least 5% (e.g., 6%, 7%, 8%, 9%, 10%, 15%, 20%, 25%, 30%, 35%, 40%, 45%, 50%, 55%, 60%, 65%, 70%, 75%, 80%, 85%, 90%, or 95%) as compared to a reference for at least 4 days (e.g., 5 days, 6 days, 7 days, 14 days, 28 days, or more).

In some embodiments of any of the above aspects, the effective amount of the compound reduces the level and/or activity of BRM by at least 5% (e.g., 6%, 7%, 8%, 9%, 10%, 15%, 20%, 25%, 30%, 35%, 40%, 45%, 50%, 55%, 60%, 65%, 70%, 75%, 80%, 85%, 90%, or 95%) as compared to a reference. In some embodiments, the effective amount of the compound that reduces the level and/or activity of BRM by at least 50% (e.g., 55%, 60%, 65%, 70%, 75%, 80%, 85%, 90%, or 95%) as compared to a reference.

In some embodiments, the effective amount of the compound that reduces the level and/or activity of BRM by at least 90% (e.g., 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99%). In some embodiments, the effective amount of the compound reduces the level and/or activity of BRM by at least 5% (e.g., 6%, 7%, 8%, 9%, 10%, 15%, 20%, 25%, 30%, 35%, 40%, 45%, 50%, 55%, 60%, 65%, 70%, 75%, 80%, 85%, 90%, or 95%) as compared to a reference for at least 12 hours (e.g., 14 hours, 16 hours, 18 hours, 20 hours, 22 hours, 24 hours, 30 hours, 36 hours, 48 hours, 72 hours, or more). In some embodiments, the effective amount of the compound that reduces the level and/or activity of BRM by at least 5% (e.g., 6%, 7%, 8%, 9%, 10%, 15%, 20%, 25%, 30%, 35%, 40%, 45%, 50%, 55%, 60%, 65%, 70%, 75%, 80%, 85%, 90%, or 95%) as compared to a reference for at least 4 days (e.g., 5 days, 6 days, 7 days, 14 days, 28 days, or more).

In some embodiments, the subject has cancer. In some embodiments, the cancer expresses BRG1 and/or BRM protein and/or the cell or subject has been identified as expressing BRG1 and/or BRM. In some embodiments, the cancer expresses BRG1 protein and/or the cell or subject has been identified as expressing BRG1. In some embodiments, the cancer expresses BRM protein and/or the cell or subject has been identified as expressing BRM. In some embodiments, the cancer is melanoma (e.g., uveal melanoma, mucosal melanoma, or cutaneous melanoma). In some embodiments, the cancer is prostate cancer. In some embodiments, the cancer is a hematologic cancer, e.g., multiple myeloma, large cell lymphoma, acute T-cell leukemia, acute myeloid leukemia, myelodysplastic syndrome, immunoglobulin A lambda myeloma, diffuse mixed histiocytic and lymphocytic lymphoma, B-cell lymphoma, acute lymphoblastic leukemia (e.g., T-cell acute lymphoblastic leukemia or B-cell acute lymphoblastic leukemia), diffuse large cell lymphoma, or non-Hodgkin's lymphoma. In some embodiments, the cancer is breast cancer (e.g., an ER positive breast cancer, an ER negative breast cancer, triple positive breast cancer, or triple negative breast cancer). In some embodi-

ments, the cancer is a bone cancer (e.g., Ewing's sarcoma). In some embodiments, the cancer is a renal cell carcinoma (e.g., a Microphthalmia Transcription Factor (MITF) family translocation renal cell carcinoma (tRCC)). In some embodiments, the cancer is metastatic (e.g., the cancer has spread to the liver). The metastatic cancer can include cells exhibiting migration and/or invasion of migrating cells and/or include cells exhibiting endothelial recruitment and/or angiogenesis. In other embodiments, the migrating cancer is a cell migration cancer. In still other embodiments, the cell migration cancer is a non-metastatic cell migration cancer. The metastatic cancer can be a cancer spread via seeding the surface of the peritoneal, pleural, pericardial, or subarachnoid spaces. Alternatively, the metastatic cancer can be a cancer spread via the lymphatic system, or a cancer spread hematogenously. In some embodiments, the effective amount of an agent that reduces the level and/or activity of BRG1 and/or BRM is an amount effective to inhibit metastatic colonization of the cancer to the liver.

In some embodiments the cancer harbors a mutation in GNAQ. In some embodiments the cancer harbors a mutation in GNA11. In some embodiments the cancer harbors a mutation in PLCB4. In some embodiments the cancer harbors a mutation in CYSLTR2. In some embodiments the cancer harbors a mutation in BAP1. In some embodiments the cancer harbors a mutation in SF3B1. In some embodiments the cancer harbors a mutation in EIF1AX. In some embodiments the cancer harbors a TFE3 translocation. In some embodiments the cancer harbors a TFEB translocation. In some embodiments the cancer harbors a M/TF translocation. In some embodiments the cancer harbors an EZH2 mutation. In some embodiments the cancer harbors a SUZ12 mutation. In some embodiments the cancer harbors an EED mutation.

In some embodiments, the method further includes administering to the subject or contacting the cell with an anticancer therapy, e.g., a chemotherapeutic or cytotoxic agent, immunotherapy, surgery, radiotherapy, thermotherapy, or photocoagulation. In some embodiments, the anticancer therapy is a chemotherapeutic or cytotoxic agent, e.g., an antimetabolite, antimitotic, antitumor antibiotic, asparagine-specific enzyme, bisphosphonates, antineoplastic, alkylating agent, DNA-Repair enzyme inhibitor, histone deacetylase inhibitor, corticosteroid, demethylating agent, immunomodulatory, janus-associated kinase inhibitor, phosphoinositide 3-kinase inhibitor, proteasome inhibitor, or tyrosine kinase inhibitor.

In some embodiments, the compound of the invention is used in combination with another anti-cancer therapy used for the treatment of uveal melanoma such as surgery, a MEK inhibitor, and/or a PKC inhibitor. For example, in some embodiments, the method further comprises performing surgery prior to, subsequent to, or at the same time as administration of the compound of the invention. In some embodiments, the method further comprises administration of a MEK inhibitor and/or a PKC inhibitor prior to, subsequent to, or at the same time as administration of the compound of the invention.

In some embodiments, the anticancer therapy and the compound of the invention are administered within 28 days of each other and each in an amount that together are effective to treat the subject.

In some embodiments, the subject or cancer has and/or has been identified as having a BRG1 loss of function mutation. In some embodiments, the subject or cancer has and/or has been identified as having a BRM loss of function mutation.

In some embodiments, the cancer is resistant to one or more chemotherapeutic or cytotoxic agents (e.g., the cancer has been determined to be resistant to chemotherapeutic or cytotoxic agents such as by genetic markers, or is likely to be resistant, to chemotherapeutic or cytotoxic agents such as a cancer that has failed to respond to a chemotherapeutic or cytotoxic agent). In some embodiments, the cancer has failed to respond to one or more chemotherapeutic or cytotoxic agents. In some embodiments, the cancer is resistant or has failed to respond to dacarbazine, temozolomide, cisplatin, treosulfan, fotemustine, IMCgp100, a CTLA-4 inhibitor (e.g., ipilimumab), a PD-1 inhibitor (e.g., Nivolumab or pembrolizumab), a PD-L1 inhibitor (e.g., atezolizumab, avelumab, or durvalumab), a mitogen-activated protein kinase (MEK) inhibitor (e.g., selumetinib, binimetinib, or tametinib), and/or a protein kinase C (PKC) inhibitor (e.g., sotrastaurin or IDE196).

In some embodiments, the cancer is resistant to or failed to respond to a previously administered therapeutic used for the treatment of uveal melanoma such as a MEK inhibitor or PKC inhibitor. For example, in some embodiments, the cancer is resistant to or failed to respond to a mitogen-activated protein kinase (MEK) inhibitor (e.g., selumetinib, binimetinib, or tametinib), and/or a protein kinase C (PKC) inhibitor (e.g., sotrastaurin or IDE196).

Chemical Terms

The terminology employed herein is for the purpose of describing particular embodiments and is not intended to be limiting.

For any of the following chemical definitions, a number following an atomic symbol indicates that total number of atoms of that element that are present in a particular chemical moiety. As will be understood, other atoms, such as H atoms, or substituent groups, as described herein, may be present, as necessary, to satisfy the valences of the atoms. For example, an unsubstituted C₂ alkyl group has the formula —CH₂CH₃. When used with the groups defined herein, a reference to the number of carbon atoms includes the divalent carbon in acetal and ketal groups but does not include the carbonyl carbon in acyl, ester, carbonate, or carbamate groups. A reference to the number of oxygen, nitrogen, or sulfur atoms in a heteroaryl group only includes those atoms that form a part of a heterocyclic ring.

The term “acyl,” as used herein, represents a H or an alkyl group that is attached to a parent molecular group through a carbonyl group, as defined herein, and is exemplified by formyl (i.e., a carboxyaldehyde group), acetyl, trifluoroacetyl, propionyl, and butanoyl. Exemplary unsubstituted acyl groups include from 1 to 6, from 1 to 11, or from 1 to 21 carbons.

The term “alkyl,” as used herein, refers to a branched or straight-chain monovalent saturated aliphatic hydrocarbon radical of 1 to 20 carbon atoms (e.g., 1 to 16 carbon atoms, 1 to 10 carbon atoms, 1 to 6 carbon atoms, or 1 to 3 carbon atoms).

An alkylene is a divalent alkyl group. The term “alkenyl,” as used herein, alone or in combination with other groups, refers to a straight chain or branched hydrocarbon residue having a carbon-carbon double bond and having 2 to 20 carbon atoms (e.g., 2 to 16 carbon atoms, 2 to 10 carbon atoms, 2 to 6 carbon atoms, or 2 carbon atoms).

The term “alkynyl,” as used herein, alone or in combination with other groups, refers to a straight chain or branched hydrocarbon residue having a carbon-carbon triple bond and having 2 to 20 carbon atoms (e.g., 2 to 16 carbon atoms, 2 to 10 carbon atoms, 2 to 6 carbon atoms, or 2 carbon atoms).

The term “amino,” as used herein, represents —N(R^{N1})₂, wherein each R^{N1} is, independently, H, OH, NO₂, N(R^{N2})₂, SO₂OR^{N2}, SO₂R^{N2}, SOR^{N2}, an N-protecting group, alkyl, alkoxy, aryl, arylalkyl, cycloalkyl, acyl (e.g., acetyl, trifluoroacetyl, or others described herein), wherein each of these recited R^{N1} groups can be optionally substituted; or two R^{N1} combine to form an alkylene or heteroalkylene, and wherein each R^{N2} is, independently, H, alkyl, or aryl. The amino groups of the invention can be an unsubstituted amino (i.e., —NH₂) or a substituted amino (i.e., —N(R^{N1})₂).

The term “aryl,” as used herein, refers to an aromatic mono- or polycarbocyclic radical of 6 to 12 carbon atoms having at least one aromatic ring. Examples of such groups include, but are not limited to, phenyl, naphthyl, 1,2,3,4-tetrahydronaphthyl, 1,2-dihydronaphthyl, indanyl, and 1H-indenyl.

The term “arylalkyl,” as used herein, represents an alkyl group substituted with an aryl group. Exemplary unsubstituted arylalkyl groups are from 7 to 30 carbons (e.g., from 7 to 16 or from 7 to 20 carbons, such as C₁-C₆ alkyl C₆-C₁₀ aryl, C₁-C₁₀ alkyl C₆-C₁₀ aryl, or C₁-C₂₀ alkyl C₆-C₁₀ aryl), such as, benzyl and phenethyl. In some embodiments, the alkyl and the aryl each can be further substituted with 1, 2, 3, or 4 substituent groups as defined herein for the respective groups.

The term “azido,” as used herein, represents a —N₃ group.

The term “bridged polycycloalkyl,” as used herein, refers to a bridged polycyclic group of 5 to 20 carbons, containing from 1 to 3 bridges.

The term “cyano,” as used herein, represents a —CN group.

The term “carbocyclyl,” as used herein, refers to a non-aromatic C₃-C₁₂ monocyclic, bicyclic, or tricyclic structure in which the rings are formed by carbon atoms. Carbocyclyl structures include cycloalkyl groups and unsaturated carbocyclyl radicals.

The term “cycloalkyl,” as used herein, refers to a saturated, non-aromatic, and monovalent mono- or polycarbocyclic radical of 3 to 10, preferably 3 to 6 carbon atoms. This term is further exemplified by radicals such as cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl, norbornyl, and adamantyl.

The term “halo,” as used herein, means a fluorine (fluoro), chlorine (chloro), bromine (bromo), or iodine (iodo) radical.

The term “heteroalkyl,” as used herein, refers to an alkyl group, as defined herein, in which one or more of the constituent carbon atoms have been replaced by nitrogen, oxygen, or sulfur. In some embodiments, the heteroalkyl group can be further substituted with 1, 2, 3, or 4 substituent groups as described herein for alkyl groups. Examples of heteroalkyl groups are an “alkoxy” which, as used herein, refers alkyl-O— (e.g., methoxy and ethoxy). A heteroalkylene is a divalent heteroalkyl group. The term “heteroalkenyl,” as used herein, refers to an alkenyl group, as defined herein, in which one or more of the constituent carbon atoms have been replaced by nitrogen, oxygen, or sulfur. In some embodiments, the heteroalkenyl group can be further substituted with 1, 2, 3, or 4 substituent groups as described herein for alkenyl groups. Examples of heteroalkenyl groups are an “alkenoxy” which, as used herein, refers alkenyl-O—. A heteroalkenylene is a divalent heteroalkenyl group. The term “heteroalkynyl,” as used herein, refers to an alkynyl group, as defined herein, in which one or more of the constituent carbon atoms have been replaced by nitrogen, oxygen, or sulfur. In some embodiments, the heteroalkynyl group can be further substituted with 1, 2, 3, or 4 substituent

groups as described herein for alkynyl groups. Examples of heteroalkynyl groups are an "alkynoxy" which, as used herein, refers alkynyl-O—. A heteroalkynylene is a divalent heteroalkynyl group.

The term "heteroaryl," as used herein, refers to an aromatic mono- or polycyclic radical of 5 to 12 atoms having at least one aromatic ring containing 1, 2, or 3 ring atoms selected from nitrogen, oxygen, and sulfur, with the remaining ring atoms being carbon. One or two ring carbon atoms of the heteroaryl group may be replaced with a carbonyl group. Examples of heteroaryl groups are pyridyl, pyrazoyl, benzooxazolyl, benzoimidazolyl, benzothiazolyl, imidazolyl, oxazolyl, and thiazolyl.

The term "heteroarylalkyl," as used herein, represents an alkyl group substituted with a heteroaryl group. Exemplary unsubstituted heteroarylalkyl groups are from 7 to 30 carbons (e.g., from 7 to 16 or from 7 to 20 carbons, such as C₁-C₆ alkyl C₂-C₉ heteroaryl, C₁-C₁₀ alkyl C₂-C₉ heteroaryl, or C₁-C₂₀ alkyl C₂-C₉ heteroaryl). In some embodiments, the alkyl and the heteroaryl each can be further substituted with 1, 2, 3, or 4 substituent groups as defined herein for the respective groups.

The term "heterocyclyl," as used herein, refers a mono- or polycyclic radical having 3 to 12 atoms having at least one ring containing 1, 2, 3, or 4 ring atoms selected from N, O or S, wherein no ring is aromatic. Examples of heterocyclyl groups include, but are not limited to, morpholinyl, thiomorpholinyl, furyl, piperazinyl, piperidinyl, pyranyl, pyrrolidinyl, tetrahydropyranyl, tetrahydrofuranlyl, and 1,3-dioxanlyl.

The term "heterocyclylalkyl," as used herein, represents an alkyl group substituted with a heterocyclyl group. Exemplary unsubstituted heterocyclylalkyl groups are from 7 to 30 carbons (e.g., from 7 to 16 or from 7 to 20 carbons, such as C₁-C₆ alkyl C₂-C₉ heterocyclyl, C₁-C₁₀ alkyl C₂-C₉ heterocyclyl, or C₁-C₂₀ alkyl C₂-C₉ heterocyclyl). In some embodiments, the alkyl and the heterocyclyl each can be further substituted with 1, 2, 3, or 4 substituent groups as defined herein for the respective groups.

The term "hydroxyalkyl," as used herein, represents alkyl group substituted with an —OH group.

The term "hydroxyl," as used herein, represents an —OH group.

The term "N-protecting group," as used herein, represents those groups intended to protect an amino group against undesirable reactions during synthetic procedures. Commonly used N-protecting groups are disclosed in Greene, "Protective Groups in Organic Synthesis," 3rd Edition (John Wiley & Sons, New York, 1999). N-protecting groups include, but are not limited to, acyl, aryloyl, or carbamyl groups such as formyl, acetyl, propionyl, pivaloyl, t-butylacetyl, 2-chloroacetyl, 2-bromoacetyl, trifluoroacetyl, trichloroacetyl, phthalyl, o-nitrophenoxycetyl, α -chlorobutyryl, benzoyl, 4-chlorobenzoyl, 4-bromobenzoyl, 4-nitrobenzoyl, and chiral auxiliaries such as protected or unprotected D, L, or D, L-amino acids such as alanine, leucine, and phenylalanine; sulfonyl-containing groups such as benzenesulfonyl, and p-toluenesulfonyl; carbamate forming groups such as benzyloxycarbonyl, p-chlorobenzyloxycarbonyl, p-methoxybenzyloxycarbonyl, p-nitrobenzyloxycarbonyl, 2-nitrobenzyloxycarbonyl, p-bromobenzyloxycarbonyl, 3,4-dimethoxybenzyloxycarbonyl, 3,5-dimethoxybenzyloxycarbonyl, 2,4-dimethoxybenzyloxycarbonyl, 4-methoxybenzyloxycarbonyl, 2-nitro-4,5-dimethoxybenzyloxycarbonyl, 3,4,5-trimethoxybenzyloxycarbonyl, 1-(p-biphenyl)-1-methylethoxycarbonyl, α,α -dimethyl-3,5-

dimethoxybenzyloxycarbonyl, benzhydryloxy carbonyl, t-butyloxycarbonyl, diisopropylmethoxycarbonyl, isopropylloxycarbonyl, ethoxycarbonyl, methoxycarbonyl, allyloxycarbonyl, 2,2,2-trichloroethoxycarbonyl, phenoxycarbonyl, 4-nitrophenoxycarbonyl, fluorenyl-9-methoxycarbonyl, cyclopentylloxycarbonyl, adamantylloxycarbonyl, cyclohexylloxycarbonyl, and phenylthiocarbonyl, arylalkyl groups such as benzyl, triphenylmethyl, and benzyloxymethyl, and silyl groups, such as trimethylsilyl. Preferred N-protecting groups are alloc, formyl, acetyl, benzoyl, pivaloyl, t-butylacetyl, alanyl, phenylsulfonyl, benzyl, t-butyloxycarbonyl (Boc), and benzyloxycarbonyl (Cbz).

The term "nitro," as used herein, represents an —NO₂ group.

The term "thiol," as used herein, represents an —SH group.

The alkyl, alkenyl, alkynyl, heteroalkyl, heteroalkenyl, heteroalkynyl, carbocyclyl (e.g., cycloalkyl), aryl, heteroaryl, and heterocyclyl groups may be substituted or unsubstituted. When substituted, there will generally be 1 to 4 substituents present, unless otherwise specified. Substituents include, for example: alkyl (e.g., unsubstituted and substituted, where the substituents include any group described herein, e.g., aryl, halo, hydroxy), aryl (e.g., substituted and unsubstituted phenyl), carbocyclyl (e.g., substituted and unsubstituted cycloalkyl), halo (e.g., fluoro), hydroxyl, heteroalkyl (e.g., substituted and unsubstituted methoxy, ethoxy, or thioalkoxy), heteroaryl, heterocyclyl, amino (e.g., NH₂ or mono- or dialkyl amino), azido, cyano, nitro, or thiol. Aryl, carbocyclyl (e.g., cycloalkyl), heteroaryl, and heterocyclyl groups may also be substituted with alkyl (unsubstituted and substituted such as arylalkyl (e.g., substituted and unsubstituted benzyl)).

Compounds of the invention can have one or more asymmetric carbon atoms and can exist in the form of optically pure enantiomers, mixtures of enantiomers such as, for example, racemates, optically pure diastereoisomers, mixtures of diastereoisomers, diastereoisomeric racemates, or mixtures of diastereoisomeric racemates. The optically active forms can be obtained for example by resolution of the racemates, by asymmetric synthesis or asymmetric chromatography (chromatography with a chiral adsorbents or eluant). That is, certain of the disclosed compounds may exist in various stereoisomeric forms. Stereoisomers are compounds that differ only in their spatial arrangement. Enantiomers are pairs of stereoisomers whose mirror images are not superimposable, most commonly because they contain an asymmetrically substituted carbon atom that acts as a chiral center. "Enantiomer" means one of a pair of molecules that are mirror images of each other and are not superimposable. Diastereomers are stereoisomers that are not related as mirror images, most commonly because they contain two or more asymmetrically substituted carbon atoms and represent the configuration of substituents around one or more chiral carbon atoms. Enantiomers of a compound can be prepared, for example, by separating an enantiomer from a racemate using one or more well-known techniques and methods, such as, for example, chiral chromatography and separation methods based thereon. The appropriate technique and/or method for separating an enantiomer of a compound described herein from a racemic mixture can be readily determined by those of skill in the art. "Racemate" or "racemic mixture" means a compound containing two enantiomers, wherein such mixtures exhibit no optical activity; i.e., they do not rotate the plane of polarized light. "Geometric isomer" means isomers that differ in the orientation of substituent atoms in relationship to a carbon-

carbon double bond, to a cycloalkyl ring, or to a bridged bicyclic system. Atoms (other than H) on each side of a carbon-carbon double bond may be in an E (substituents are on 25 opposite sides of the carbon-carbon double bond) or Z (substituents are oriented on the same side) configuration. "R," "S," "S*," "R*," "E," "Z," "cis," and "trans," indicate configurations relative to the core molecule. Certain of the disclosed compounds may exist in atropisomeric forms. Atropisomers are stereoisomers resulting from hindered rotation about single bonds where the steric strain barrier to rotation is high enough to allow for the isolation of the conformers. The compounds of the invention may be prepared as individual isomers by either isomer-specific synthesis or resolved from an isomeric mixture. Conventional resolution techniques include forming the salt of a free base of each isomer of an isomeric pair using an optically active acid (followed by fractional crystallization and regeneration of the free base), forming the salt of the acid form of each isomer of an isomeric pair using an optically active amine (followed by fractional crystallization and regeneration of the free acid), forming an ester or amide 35 of each of the isomers of an isomeric pair using an optically pure acid, amine or alcohol (followed by chromatographic separation and removal of the chiral auxiliary), or resolving an isomeric mixture of either a starting material or a final product using various well known chromatographic methods. When the stereochemistry of a disclosed compound is named or depicted by structure, the named or depicted stereoisomer is at least 60%, 70%, 80%, 90%, 99%, or 99.9% by weight relative to the other stereoisomers. When a single enantiomer is named or depicted by structure, the depicted or named enantiomer is at least 60%, 70%, 80%, 90%, 99%, or 99.9% by weight optically pure. When a single diastereomer is named or depicted by structure, the depicted or named diastereomer is at least 60%, 70%, 80%, 90%, 99%, or 99.9% by weight pure. Percent optical purity is the ratio of the weight of the enantiomer or over the weight of the enantiomer plus the weight of its optical isomer. Diastereomeric purity by weight is the ratio of the weight of one diastereomer or over the weight of all the diastereomers. When the stereochemistry of a disclosed compound is named or depicted by structure, the named or depicted stereoisomer is at least 60%, 70%, 80%, 90%, 99%, or 99.9% by mole fraction pure relative to the other stereoisomers. When a single enantiomer is named or depicted by structure, the depicted or named enantiomer is at least 60%, 70%, 80%, 90%, 99%, or 99.9% by mole fraction pure. When a single diastereomer is named or depicted by structure, the depicted or named diastereomer is at least 60%, 70%, 80%, 90%, 99%, or 99.9% by mole fraction pure. Percent purity by mole fraction is the ratio of the moles of the enantiomer or over the moles of the enantiomer plus the moles of its optical isomer. Similarly, percent purity by moles fraction is the ratio of the moles of the diastereomer or over the moles of the diastereomer plus the moles of its isomer. When a disclosed compound is named or depicted by structure without indicating the stereochemistry, and the compound has at least one chiral center, it is to be understood that the name or structure encompasses either enantiomer of the compound free from the corresponding optical isomer, a racemic mixture of the compound, or mixtures enriched in one enantiomer relative to its corresponding optical isomer. When a disclosed compound is named or depicted by structure without indicating the stereochemistry and has two or more chiral centers, it is to be understood that the name or structure encompasses a diastereomer free of other diastereomers, a number of diastereomers free from

other diastereomeric pairs, mixtures of diastereomers, mixtures of diastereomeric pairs, mixtures of diastereomers in which one diastereomer is enriched relative to the other diastereomer(s), or mixtures of diastereomers in which one or more diastereomer is enriched relative to the other diastereomers. The invention embraces all of these forms.

Unless otherwise defined, all technical and scientific terms used herein have the same meaning as commonly understood by one of ordinary skill in the art to which this invention belongs. Methods and materials are described herein for use in the present disclosure; other, suitable methods and materials known in the art can also be used. The materials, methods, and examples are illustrative only and not intended to be limiting. All publications, patent applications, patents, sequences, database entries, and other references mentioned herein are incorporated by reference in their entirety. In case of conflict, the present specification, including definitions, will control.

Definitions

In this application, unless otherwise clear from context, (i) the term "a" may be understood to mean "at least one"; (ii) the term "or" may be understood to mean "and/or"; and (iii) the terms "comprising" and "including" may be understood to encompass itemized components or steps whether presented by themselves or together with one or more additional components or steps.

As used herein, the terms "about" and "approximately" refer to a value that is within 10% above or below the value being described. For example, the term "about 5 nM" indicates a range of from 4.5 to 5.5 nM.

As used herein, the term "administration" refers to the administration of a composition (e.g., a compound or a preparation that includes a compound as described herein) to a subject or system. Administration to an animal subject (e.g., to a human) may be by any appropriate route. For example, in some embodiments, administration may be bronchial (including by bronchial instillation), buccal, enteral, interdermal, intra-arterial, intradermal, intragastric, intramedullary, intramuscular, intranasal, intraperitoneal, intrathecal, intratumoral, intravenous, intraventricular, mucosal, nasal, oral, rectal, subcutaneous, sublingual, topical, tracheal (including by intratracheal instillation), transdermal, vaginal, and vitreal.

As used herein, the term "BAF complex" refers to the BRG1- or HRBM-associated factors complex in a human cell.

As used herein, the term "BAF complex-related disorder" refers to a disorder that is caused or affected by the level of activity of a BAF complex.

As used herein, the term "BRG1 loss of function mutation" refers to a mutation in BRG1 that leads to the protein having diminished activity (e.g., at least 1% reduction in BRG1 activity, for example 2%, 5%, 10%, 25%, 50%, or 100% reduction in BRG1 activity). Exemplary BRG1 loss of function mutations include, but are not limited to, a homozygous BRG1 mutation and a deletion at the C-terminus of BRG1.

As used herein, the term "BRG1 loss of function disorder" refers to a disorder (e.g., cancer) that exhibits a reduction in BRG1 activity (e.g., at least 1% reduction in BRG1 activity, for example 2%, 5%, 10%, 25%, 50%, or 100% reduction in BRG1 activity).

As used herein, the term "BRM-selective compound," refers to a compound that has greater activity against BRM than against BRG1 (e.g., the compound inhibits the level

and/or activity of BRM at least 2-fold (e.g., at least 5-fold, at least 10-fold, at least 20-fold, at least 50-fold, at least 100-fold) greater than the compound inhibits the level and/or activity of BRG1 and/or the compound binds to BRM at least 2-fold (e.g., at least 5-fold, at least 10-fold, at least 20-fold, at least 50-fold, at least 100-fold) greater than the compound binds to BRG1). For example, in some embodiments, a BRM-selective compound has an IC_{50} or IP_{50} that is at least 2-fold (e.g., at least 5-fold, at least 10-fold, at least 20-fold, at least 50-fold, at least 100-fold) lower than the IC_{50} or IP_{50} against BRG1.

As used herein, the term “BRM/BRG1 dual inhibitor compound” refers to a compound that has activity against both BRM and BRG1. In some embodiments, a BRM/BRG1 dual inhibitor compound has similar activity against both BRM and BRG1 (e.g., the activity of the compound against BRM and BRG1 is within 10-fold (e.g., less than 5-fold, less than 2-fold)). For example, in some embodiments, a BRM/BRG1 dual inhibitor compound has an IC_{50} or IP_{50} against BRM that is within 10-fold of the IC_{50} or IP_{50} against BRG1.

The term “cancer” refers to a condition caused by the proliferation of malignant neoplastic cells, such as tumors, neoplasms, carcinomas, sarcomas, leukemias, and lymphomas.

As used herein, a “combination therapy” or “administered in combination” means that two (or more) different agents or treatments are administered to a subject as part of a defined treatment regimen for a particular disease or condition. The treatment regimen defines the doses and periodicity of administration of each agent such that the effects of the separate agents on the subject overlap. In some embodiments, the delivery of the two or more agents is simultaneous or concurrent and the agents may be co-formulated. In some embodiments, the two or more agents are not co-formulated and are administered in a sequential manner as part of a prescribed regimen. In some embodiments, administration of two or more agents or treatments in combination is such that the reduction in a symptom, or other parameter related to the disorder is greater than what would be observed with one agent or treatment delivered alone or in the absence of the other. The effect of the two treatments can be partially additive, wholly additive, or greater than additive (e.g., synergistic). Sequential or substantially simultaneous administration of each therapeutic agent can be effected by any appropriate route including, but not limited to, oral routes, intravenous routes, intramuscular routes, and direct absorption through mucous membrane tissues. The therapeutic agents can be administered by the same route or by different routes. For example, a first therapeutic agent of the combination may be administered by intravenous injection while a second therapeutic agent of the combination may be administered orally.

By “determining the level” of a protein or RNA is meant the detection of a protein or an RNA, by methods known in the art, either directly or indirectly. “Directly determining” means performing a process (e.g., performing an assay or test on a sample or “analyzing a sample” as that term is defined herein) to obtain the physical entity or value. “Indirectly determining” refers to receiving the physical entity or value from another party or source (e.g., a third party laboratory that directly acquired the physical entity or value). Methods to measure protein level generally include, but are not limited to, western blotting, immunoblotting, enzyme-linked immunosorbent assay (ELISA), radioimmunoassay (RIA), immunoprecipitation, immunofluorescence, surface plasmon resonance, chemiluminescence, fluorescent polarization, phosphorescence, immunohistochemical

analysis, matrix-assisted laser desorption/ionization time-of-flight (MALDI-TOF) mass spectrometry, liquid chromatography (LC)-mass spectrometry, microcytometry, microscopy, fluorescence activated cell sorting (FACS), and flow cytometry, as well as assays based on a property of a protein including, but not limited to, enzymatic activity or interaction with other protein partners. Methods to measure RNA levels are known in the art and include, but are not limited to, quantitative polymerase chain reaction (qPCR) and Northern blot analyses.

By a “decreased level” or an “increased level” of a protein or RNA is meant a decrease or increase, respectively, in a protein or RNA level, as compared to a reference (e.g., a decrease or an increase by about 5%, about 10%, about 15%, about 20%, about 25%, about 30%, about 35%, about 40%, about 45%, about 50%, about 55%, about 60%, about 65%, about 70%, about 75%, about 80%, about 85%, about 90%, about 95%, about 100%, about 150%, about 200%, about 300%, about 400%, about 500%, or more; a decrease or an increase of more than about 10%, about 15%, about 20%, about 50%, about 75%, about 100%, or about 200%, as compared to a reference; a decrease or an increase by less than about 0.01-fold, about 0.02-fold, about 0.1-fold, about 0.3-fold, about 0.5-fold, about 0.8-fold, or less; or an increase by more than about 1.2-fold, about 1.4-fold, about 1.5-fold, about 1.8-fold, about 2.0-fold, about 3.0-fold, about 3.5-fold, about 4.5-fold, about 5.0-fold, about 10-fold, about 15-fold, about 20-fold, about 30-fold, about 40-fold, about 50-fold, about 100-fold, about 1000-fold, or more). A level of a protein may be expressed in mass/vol (e.g., g/dL, mg/mL, μ g/mL, ng/mL) or percentage relative to total protein in a sample.

By “decreasing the activity of a BAF complex” is meant decreasing the level of an activity related to a BAF complex, or a related downstream effect. A non-limiting example of decreasing an activity of a BAF complex is Sox2 activation. The activity level of a BAF complex may be measured using any method known in the art, e.g., the methods described in Kadoch et al. Cell, 2013, 153, 71-85, the methods of which are herein incorporated by reference.

As used herein, the term “inhibiting BRM” refers to blocking or reducing the level or activity of the ATPase catalytic binding domain or the bromodomain of the protein. BRM inhibition may be determined using methods known in the art, e.g., a BRM ATPase assay, a Nano DSF assay, or a BRM Luciferase cell assay.

The term “pharmaceutical composition,” as used herein, represents a composition containing a compound described herein formulated with a pharmaceutically acceptable excipient and appropriate for administration to a mammal, for example a human. Typically, a pharmaceutical composition is manufactured or sold with the approval of a governmental regulatory agency as part of a therapeutic regimen for the treatment of disease in a mammal. Pharmaceutical compositions can be formulated, for example, for oral administration in unit dosage form (e.g., a tablet, capsule, caplet, gelcap, or syrup); for topical administration (e.g., as a cream, gel, lotion, or ointment); for intravenous administration (e.g., as a sterile solution free of particulate emboli and in a solvent system suitable for intravenous use); or in any other pharmaceutically acceptable formulation.

A “pharmaceutically acceptable excipient,” as used herein, refers to any ingredient other than the compounds described herein (for example, a vehicle capable of suspending or dissolving the active compound) and having the properties of being substantially nontoxic and non-inflammatory in a patient. Excipients may include, for example:

antiadherents, antioxidants, binders, coatings, compression aids, disintegrants, dyes (colors), emollients, emulsifiers, fillers (diluent), film formers or coatings, flavors, fragrances, glidants (flow enhancers), lubricants, preservatives, printing inks, sorbents, suspending or dispersing agents, sweeteners, and waters of hydration. Exemplary excipients include, but are not limited to: butylated hydroxytoluene (BHT), calcium carbonate, calcium phosphate (dibasic), calcium stearate, croscarmellose, crosslinked polyvinyl pyrrolidone, citric acid, crospovidone, cysteine, ethylcellulose, gelatin, hydroxypropyl cellulose, hydroxypropyl methylcellulose, lactose, magnesium stearate, maltitol, mannitol, methionine, methylcellulose, methyl paraben, microcrystalline cellulose, polyethylene glycol, polyvinyl pyrrolidone, povidone, pregelatinized starch, propyl paraben, retinyl palmitate, shellac, silicon dioxide, sodium carboxymethyl cellulose, sodium citrate, sodium starch glycolate, sorbitol, starch (corn), stearic acid, sucrose, talc, titanium dioxide, vitamin A, vitamin E, vitamin C, and xylitol.

As used herein, the term “pharmaceutically acceptable salt” means any pharmaceutically acceptable salt of a compound, for example, any compound of Formula I, Formula IV, Formula V, Formula VI, or Formula VII. Pharmaceutically acceptable salts of any of the compounds described herein may include those that are within the scope of sound medical judgment, suitable for use in contact with the tissues of humans and animals without undue toxicity, irritation, allergic response and are commensurate with a reasonable benefit/risk ratio. Pharmaceutically acceptable salts are well known in the art. For example, pharmaceutically acceptable salts are described in: Berge et al., *J. Pharmaceutical Sciences* 66:1-19, 1977 and in *Pharmaceutical Salts: Properties, Selection, and Use*, (Eds. P. H. Stahl and C. G. Wermuth), Wiley-VCH, 2008. The salts can be prepared in situ during the final isolation and purification of the compounds described herein or separately by reacting a free base group with a suitable organic acid.

The compounds of the invention may have ionizable groups so as to be capable of preparation as pharmaceutically acceptable salts. These salts may be acid addition salts involving inorganic or organic acids or the salts may, in the case of acidic forms of the compounds of the invention be prepared from inorganic or organic bases. Frequently, the compounds are prepared or used as pharmaceutically acceptable salts prepared as addition products of pharmaceutically acceptable acids or bases. Suitable pharmaceutically acceptable acids and bases and methods for preparation of the appropriate salts are well-known in the art. Salts may be prepared from pharmaceutically acceptable non-toxic acids and bases including inorganic and organic acids and bases. Representative acid addition salts include acetate, adipate, alginate, ascorbate, aspartate, benzenesulfonate, benzoate, bisulfate, borate, butyrate, camphorate, camphorsulfonate, citrate, cyclopentanepropionate, digluconate, dodecylsulfate, ethanesulfonate, fumarate, glucoheptonate, glycerophosphate, hemisulfate, heptonate, hexanoate, hydrobromide, hydrochloride, hydroiodide, 2-hydroxyethanesulfonate, lactobionate, lactate, laurate, lauryl sulfate, malate, maleate, malonate, methanesulfonate, 2-naphthalenesulfonate, nicotinate, nitrate, oleate, oxalate, palmitate, pantoate, pectinate, persulfate, 3-phenylpropionate, phosphate, picrate, pivalate, propionate, stearate, succinate, sulfate, tartrate, thiocyanate, toluenesulfonate, undecanoate, and valerate salts. Representative alkali or alkaline earth metal salts include sodium, lithium, potassium, calcium, and magnesium, as well as nontoxic ammonium, quaternary ammonium, and amine cations, including, but not limited to

ammonium, tetramethylammonium, tetraethylammonium, methylamine, dimethylamine, trimethylamine, triethylamine, and ethylamine.

By a “reference” is meant any useful reference used to compare protein or RNA levels. The reference can be any sample, standard, standard curve, or level that is used for comparison purposes. The reference can be a normal reference sample or a reference standard or level. A “reference sample” can be, for example, a control, e.g., a predetermined negative control value such as a “normal control” or a prior sample taken from the same subject; a sample from a normal healthy subject, such as a normal cell or normal tissue; a sample (e.g., a cell or tissue) from a subject not having a disease; a sample from a subject that is diagnosed with a disease, but not yet treated with a compound of the invention; a sample from a subject that has been treated by a compound of the invention; or a sample of a purified protein or RNA (e.g., any described herein) at a known normal concentration. By “reference standard or level” is meant a value or number derived from a reference sample. A “normal control value” is a pre-determined value indicative of non-disease state, e.g., a value expected in a healthy control subject. Typically, a normal control value is expressed as a range (“between X and Y”), a high threshold (“no higher than X”), or a low threshold (“no lower than X”). A subject having a measured value within the normal control value for a particular biomarker is typically referred to as “within normal limits” for that biomarker. A normal reference standard or level can be a value or number derived from a normal subject not having a disease or disorder (e.g., cancer); a subject that has been treated with a compound of the invention. In preferred embodiments, the reference sample, standard, or level is matched to the sample subject sample by at least one of the following criteria: age, weight, sex, disease stage, and overall health. A standard curve of levels of a purified protein or RNA, e.g., any described herein, within the normal reference range can also be used as a reference.

As used herein, the term “subject” refers to any organism to which a composition in accordance with the invention may be administered, e.g., for experimental, diagnostic, prophylactic, and/or therapeutic purposes. Typical subjects include any animal (e.g., mammals such as mice, rats, rabbits, non-human primates, and humans). A subject may seek or be in need of treatment, require treatment, be receiving treatment, be receiving treatment in the future, or be a human or animal who is under care by a trained professional for a particular disease or condition.

As used herein, the terms “treat,” “treated,” or “treating” mean therapeutic treatment or any measures whose object is to slow down (lessen) an undesired physiological condition, disorder, or disease, or obtain beneficial or desired clinical results. Beneficial or desired clinical results include, but are not limited to, alleviation of symptoms; diminishment of the extent of a condition, disorder, or disease; stabilized (i.e., not worsening) state of condition, disorder, or disease; delay in onset or slowing of condition, disorder, or disease progression; amelioration of the condition, disorder, or disease state or remission (whether partial or total); an amelioration of at least one measurable physical parameter, not necessarily discernible by the patient; or enhancement or improvement of condition, disorder, or disease. Treatment includes eliciting a clinically significant response without excessive levels of side effects. Treatment also includes prolonging survival as compared to expected survival if not receiving treatment. Compounds of the invention may also be used to

119

“prophylactically treat” or “prevent” a disorder, for example, in a subject at increased risk of developing the disorder.

As used herein, the terms “variant” and “derivative” are used interchangeably and refer to naturally-occurring, synthetic, and semi-synthetic analogues of a compound, peptide, protein, or other substance described herein. A variant or derivative of a compound, peptide, protein, or other substance described herein may retain or improve upon the biological activity of the original material.

The details of one or more embodiments of the invention are set forth in the description below. Other features, objects, and advantages of the invention will be apparent from the description and from the claims.

DETAILED DESCRIPTION

The present disclosure features compounds useful for the inhibition of BRG1 and/or BRM. These compounds may be used to modulate the activity of a BAF complex, for example, for the treatment of a BAF-related disorder, such as cancer. Exemplary compounds described herein include compounds having a structure according to Formula I, Formula IV, Formula V, or Formula VII:

or a pharmaceutically acceptable salt thereof.

In some embodiments, the compound, or pharmaceutically acceptable salt thereof, has the structure of any one of compounds 1-241 in Tables 1, 2, 3, and 4.

Other embodiments, as well as exemplary methods for the synthesis or production of these compounds, are described herein.

Pharmaceutical Uses

The compounds described herein are useful in the methods of the invention and, while not bound by theory, are believed to exert their ability to modulate the level, status, and/or activity of a BAF complex, i.e., by inhibiting the activity of the BRG1 and/or BRM proteins within the BAF complex in a mammal. BAF complex-related disorders include, but are not limited to, BRG1 loss of function mutation-related disorders.

An aspect of the present invention relates to methods of treating disorders related to BRG1 loss of function mutations such as cancer (e.g., non-small cell lung cancer, colorectal cancer, bladder cancer, cancer of unknown primary, glioma, breast cancer, melanoma, non-melanoma skin cancer, endometrial cancer, or penile cancer) in a subject in need thereof. Another aspect of the invention relates to methods of treating cancer by administering a compound that selectively inhibits BRM. For example, the compound that selectively inhibits BRM is a compound as described herein. In some embodiments, the compound is administered in an amount and for a time effective to result in one or more (e.g., two or more, three or more, four or more) of: (a) reduced tumor size, (b) reduced rate of tumor growth, (c) increased tumor cell death (d) reduced tumor progression, (e) reduced number of metastases, (f) reduced rate of metastasis, (g) decreased tumor recurrence (h) increased survival of subject, (i) increased progression free survival of subject.

Treating cancer can result in a reduction in size or volume of a tumor. For example, after treatment, tumor size is reduced by 5% or greater (e.g., 10%, 20%, 30%, 40%, 50%, 60%, 70%, 80%, 90%, or greater) relative to its size prior to treatment. Size of a tumor may be measured by any reproducible means of measurement. For example, the size of a tumor may be measured as a diameter of the tumor.

Treating cancer may further result in a decrease in number of tumors. For example, after treatment, tumor number is reduced by 5% or greater (e.g., 10%, 20%, 30%, 40%, 50%, 60%, 70%, 80%, 90%, or greater) relative to number prior to treatment. Number of tumors may be measured by any reproducible means of measurement, e.g., the number of tumors may be measured by counting tumors visible to the naked eye or at a specified magnification (e.g., 2x, 3x, 4x, 5x, 10x, or 50x).

Treating cancer can result in a decrease in number of metastatic nodules in other tissues or organs distant from the primary tumor site. For example, after treatment, the number of metastatic nodules is reduced by 5% or greater (e.g., 10%, 20%, 30%, 40%, 50%, 60%, 70%, 80%, 90% or greater)

relative to number prior to treatment. The number of metastatic nodules may be measured by any reproducible means of measurement. For example, the number of metastatic nodules may be measured by counting metastatic nodules visible to the naked eye or at a specified magnification (e.g., 2×, 10×, or 50×).

Treating cancer can result in an increase in average survival time of a population of subjects treated according to the present invention in comparison to a population of untreated subjects. For example, the average survival time is increased by more than 30 days (more than 60 days, 90 days, or 120 days). An increase in average survival time of a population may be measured by any reproducible means. An increase in average survival time of a population may be measured, for example, by calculating for a population the average length of survival following initiation of treatment with the compound of the invention. An increase in average survival time of a population may also be measured, for example, by calculating for a population the average length of survival following completion of a first round of treatment with a pharmaceutically acceptable salt of the invention.

Treating cancer can also result in a decrease in the mortality rate of a population of treated subjects in comparison to an untreated population. For example, the mortality rate is decreased by more than 2% (e.g., more than 5%, 10%, or 25%). A decrease in the mortality rate of a population of treated subjects may be measured by any reproducible means, for example, by calculating for a population the average number of disease-related deaths per unit time following initiation of treatment with a pharmaceutically acceptable salt of the invention. A decrease in the mortality rate of a population may also be measured, for example, by calculating for a population the average number of disease-related deaths per unit time following completion of a first round of treatment with a pharmaceutically acceptable salt of the invention.

Exemplary cancers that may be treated by the invention include, but are not limited to, non-small cell lung cancer, small-cell lung cancer, colorectal cancer, bladder cancer, glioma, breast cancer, melanoma, non-melanoma skin cancer, endometrial cancer, esophagogastric cancer, pancreatic cancer, hepatobiliary cancer, soft tissue sarcoma, ovarian cancer, head and neck cancer, renal cell carcinoma, bone cancer, non-hodgkin lymphoma, prostate cancer, embryonal tumor, germ cell tumor, cervical cancer, thyroid cancer, salivary gland cancer, gastrointestinal neuroendocrine tumor, uterine sarcoma, gastrointestinal stromal tumor, CNS cancer, thymic tumor, Adrenocortical carcinoma, appendiceal cancer, small bowel cancer and penile cancer.

Combination Formulations and Uses Thereof

The compounds of the invention can be combined with one or more therapeutic agents. In particular, the therapeutic agent can be one that treats or prophylactically treats any cancer described herein.

Combination Therapies

A compound of the invention can be used alone or in combination with an additional therapeutic agent, e.g., other agents that treat cancer or symptoms associated therewith, or in combination with other types of treatment to treat cancer. In combination treatments, the dosages of one or more of the therapeutic compounds may be reduced from standard dosages when administered alone. For example, doses may be determined empirically from drug combinations and permutations or may be deduced by isobolographic analysis (e.g.,

Black et al., *Neurology* 65:S3-S6, 2005). In this case, dosages of the compounds when combined should provide a therapeutic effect.

In some embodiments, the second therapeutic agent is a chemotherapeutic agent (e.g., a cytotoxic agent or other chemical compound useful in the treatment of cancer). These include alkylating agents, antimetabolites, folic acid analogs, pyrimidine analogs, purine analogs and related inhibitors, vinca alkaloids, epipodophyllotoxins, antibiotics, L-Asparaginase, topoisomerase inhibitors, interferons, platinum coordination complexes, anthracenedione substituted urea, methyl hydrazine derivatives, adrenocortical suppressant, adrenocorticosteroides, progestins, estrogens, antiestrogen, androgens, antiandrogen, and gonadotropin-releasing hormone analog. Also included is 5-fluorouracil (5-FU), leucovorin (LV), irinotecan, oxaliplatin, capecitabine, paclitaxel and doxorubicin. Non-limiting examples of chemotherapeutic agents include alkylating agents such as thiopeta and cyclophosphamide; alkyl sulfonates such as busulfan, improsulfan and piposulfan; aziridines such as benzodopa, carboquone, meturedopa, and uredopa; ethylenimines and methylamelamines including altretamine, triethylenemelamine, triethylenephosphoramide, triethylenethiophosphoramide and trimethylolmelamine; acetogenins (especially bullatacin and bullatacinone); a camptothecin (including the synthetic analogue topotecan); bryostatins; calyculins; CC-1065 (including its adozelesin, carzelesin and bizelesin synthetic analogues); cryptophycins (particularly cryptophycin 1 and cryptophycin 8); dolastatin; duocarmycin (including the synthetic analogues, KW-2189 and CB1-TM1); eleutherobin; pancratistatin; a sarcodictyin; spongistatin; nitrogen mustards such as chlorambucil, chlornaphazine, cholophosphamide, estramustine, ifosfamide, mechlorethamine, mechlorethamine oxide hydrochloride, melphalan, novembichin, phenesterine, prednimustine, trofosfamide, uracil mustard; nitrosoureas such as carmustine, chlorozotocin, fotemustine, lomustine, nimustine, and ranimustine; antibiotics such as the enediyne antibiotics (e.g., calicheamicin, especially calicheamicin gammall and calicheamicin omegall (see, e.g., Agnew, *Chem. Intl. Ed Engl.* 33:183-186 (1994)); dynemicin, including dynemicin A; bisphosphonates, such as clodronate; an esperamicin; as well as neocarzinostatin chromophore and related chromoprotein enediyne antibiotic chromophores), aclacinomysins, actinomycin, anthramycin, azaserine, bleomycins, cactinomycin, carabacin, caminomycin, carzinophilin, chromomycins, dactinomycin, daunorubicin, detorubicin, 6-diazo-5-oxo-L-norleucine, Adriamycin® (doxorubicin, including morpholino-doxorubicin, cyanomorpholino-doxorubicin, 2-pyrrolino-doxorubicin and deoxydoxorubicin), epirubicin, esorubicin, idarubicin, marcellomycin, mitomycins such as mitomycin C, mycophenolic acid, nogalamycin, olivomycins, peplomycin, potfiromycin, puromycin, quelamycin, rodorubicin, streptonigrin, streptozocin, tubercidin, ubenimex, zinostatin, zorubicin; anti-metabolites such as methotrexate and 5-fluorouracil (5-FU); folic acid analogues such as denopterin, methotrexate, pteropterin, trimetrexate; purine analogs such as fludarabine, 6-mercaptopurine, thiamiprine, thioguanine; pyrimidine analogs such as ancitabine, azacitidine, 6-azauridine, carmofur, cytarabine, dideoxyuridine, doxifluridine, enocitabine, floxuridine; androgens such as calusterone, dromostanolone propionate, epitiotanol, mepitiostane, testolactone; anti-adrenals such as aminoglutethimide, mitotane, trilostane; folic acid replenisher such as frolinic acid; aceglatone; aldophosphamide glycoside; aminolevulinic acid; eniluracil; amsacrine; bestabucil; bisantrene; edatraxate; defofamine; demecol-

cine; diaziquone; elfomithine; elliptinium acetate; an epothilone; etoglucid; gallium nitrate; hydroxyurea; lentinan; lonidainine; maytansinoids such as maytansine and ansamitocins; mitoguazone; mitoxantrone; mopidanmol; nitraerine; pentostatin; phenamet; pirarubicin; losoxantrone; podophyllinic acid; 2-ethylhydrazide; procarbazine; PSK® polysaccharide complex (JHS Natural Products, Eugene, Oreg.); razoxane; rhizoxin; sizofuran; spirogermanium; tenuazonic acid; triaziquone; 2,2',2"-trichlorotriethylamine; trichothecenes (especially T-2 toxin, verracurin A, roridin A and anguidine); urethan; vindesine; dacarbazine; mannomustine; mitobronitol; mitolactol; pipobroman; gacytosine; arabinoside ("Ara-C"); cyclophosphamide; thiotepa; taxoids, e.g., Taxol® paclitaxel (Bristol-Myers Squibb Oncology, Princeton, N.J.), ABraxane®, cremophor-free, albumin-engineered nanoparticle formulation of paclitaxel (American Pharmaceutical Partners, Schaumburg, Ill.), and Taxotere® doxetaxel (Rhône-Poulenc Rorer, Antony, France); chlorambucil; Gemzar® gemcitabine; 6-thioguanine; mercaptopurine; methotrexate; platinum coordination complexes such as cisplatin, oxaliplatin and carboplatin; vinblastine; platinum; etoposide (VP-16); ifosfamide; mitoxantrone; vincristine; Navelbine® vinorelbine; novantrone; teniposide; edatrexate; daunomycin; aminopterin; xeloda; ibandronate; irinotecan (e.g., CPT-11); topoisomerase inhibitor RFS 2000; difluoromethylornithine (DMFO); retinoids such as retinoic acid; capecitabine; and pharmaceutically acceptable salts, acids or derivatives of any of the above. Two or more chemotherapeutic agents can be used in a cocktail to be administered in combination with the first therapeutic agent described herein. Suitable dosing regimens of combination chemotherapies are known in the art and described in, for example, Saltz et al. (1999) *Proc ASCO* 18:233a and Douillard et al. (2000) *Lancet* 355:1041-7.

In some embodiments, the second therapeutic agent is a therapeutic agent which is a biologic such a cytokine (e.g., interferon or an interleukin (e.g., IL-2)) used in cancer treatment. In some embodiments the biologic is an anti-angiogenic agent, such as an anti-VEGF agent, e.g., bevacizumab (Avastin®). In some embodiments the biologic is an immunoglobulin-based biologic, e.g., a monoclonal antibody (e.g., a humanized antibody, a fully human antibody, an Fc fusion protein or a functional fragment thereof) that agonizes a target to stimulate an anti-cancer response, or antagonizes an antigen important for cancer. Such agents include Rituxan (Rituximab); Zenapax (Daclizumab); Simulect (Basiliximab); Synagis (Palivizumab); Remicade (Infliximab); Herceptin (Trastuzumab); Mylotarg (Gemtuzumab ozogamicin); Campath (Alemtuzumab); Zevalin (Ibritumomab tiuxetan); Humira (Adalimumab); Xolair (Omalizumab); Bexxar (Tositumomab-1-131); Raptiva (Efalizumab); Erbitux (Cetuximab); Avastin (Bevacizumab); Tysabri (Natalizumab); Actemra (Tocilizumab); Vectibix (Panitumumab); Lucentis (Ranibizumab); Soliris (Eculizumab); Cimzia (Certolizumab pegol); Simponi (Golimumab); Ilaris (Canakinumab); Stelara (Ustekinumab); Arzerra (Ofatumumab); Prolia (Denosumab); Numax (Motavizumab); ABThrax (Raxibacumab); Benlysta (Belimumab); Yervoy (Ipilimumab); Adcetris (Brentuximab Vedotin); Perjeta (Pertuzumab); Kadcyla (Ado-trastuzumab emtansine); and Gazyva (Obinutuzumab). Also included are antibody-drug conjugates.

The second agent may be a therapeutic agent which is a non-drug treatment. For example, the second therapeutic agent is radiation therapy, cryotherapy, hyperthermia and/or surgical excision of tumor tissue.

The second agent may be a checkpoint inhibitor. In one embodiment, the inhibitor of checkpoint is an inhibitory antibody (e.g., a monospecific antibody such as a monoclonal antibody). The antibody may be, e.g., humanized or fully human. In some embodiments, the inhibitor of checkpoint is a fusion protein, e.g., an Fc-receptor fusion protein. In some embodiments, the inhibitor of checkpoint is an agent, such as an antibody, that interacts with a checkpoint protein. In some embodiments, the inhibitor of checkpoint is an agent, such as an antibody, that interacts with the ligand of a checkpoint protein. In some embodiments, the inhibitor of checkpoint is an inhibitor (e.g., an inhibitory antibody or small molecule inhibitor) of CTLA-4 (e.g., an anti-CTLA4 antibody such as ipilimumab/Yervoy or tremelimumab). In some embodiments, the inhibitor of checkpoint is an inhibitor (e.g., an inhibitory antibody or small molecule inhibitor) of PD-1 (e.g., nivolumab/Opdivo®; pembrolizumab/Keytruda®; pidilizumab/CT-011). In some embodiments, the inhibitor of checkpoint is an inhibitor (e.g., an inhibitory antibody or small molecule inhibitor) of PDL1 (e.g., MPDL3280A/RG7446; MEDI4736; MSB0010718C; BMS 936559). In some embodiments, the inhibitor of checkpoint is an inhibitor (e.g., an inhibitory antibody or Fc fusion or small molecule inhibitor) of PDL2 (e.g., a PDL2/Ig fusion protein such as AMP 224). In some embodiments, the inhibitor of checkpoint is an inhibitor (e.g., an inhibitory antibody or small molecule inhibitor) of B7-H3 (e.g., MGA271), B7-H4, BTLA, HVEM, TIM3, GAL9, LAG3, VISTA, KIR, 2B4, CD160, CGEN-15049, CHK 1, CHK2, A2aR, B-7 family ligands, or a combination thereof.

In any of the combination embodiments described herein, the first and second therapeutic agents are administered simultaneously or sequentially, in either order. The first therapeutic agent may be administered immediately, up to 1 hour, up to 2 hours, up to 3 hours, up to 4 hours, up to 5 hours, up to 6 hours, up to 7 hours, up to, 8 hours, up to 9 hours, up to 10 hours, up to 11 hours, up to 12 hours, up to 13 hours, 14 hours, up to hours 16, up to 17 hours, up 18 hours, up to 19 hours up to 20 hours, up to 21 hours, up to 22 hours, up to 23 hours up to 24 hours or up to 1-7, 1-14, 1-21 or 1-30 days before or after the second therapeutic agent

Pharmaceutical Compositions

The compounds of the invention are preferably formulated into pharmaceutical compositions for administration to a mammal, preferably, a human, in a biologically compatible form suitable for administration in vivo. Accordingly, in an aspect, the present invention provides a pharmaceutical composition comprising a compound of the invention in admixture with a suitable diluent, carrier, or excipient.

The compounds of the invention may be used in the form of the free base, in the form of salts, solvates, and as prodrugs. All forms are within the scope of the invention. In accordance with the methods of the invention, the described compounds or salts, solvates, or prodrugs thereof may be administered to a patient in a variety of forms depending on the selected route of administration, as will be understood by those skilled in the art. The compounds of the invention may be administered, for example, by oral, parenteral, buccal, sublingual, nasal, rectal, patch, pump, or transdermal administration and the pharmaceutical compositions formulated accordingly. Parenteral administration includes intravenous, intraperitoneal, subcutaneous, intramuscular, transepithelial, nasal, intrapulmonary, intrathecal, rectal, and topical modes of administration. Parenteral administration may be by continuous infusion over a selected period of time.

A compound of the invention may be orally administered, for example, with an inert diluent or with an assimilable edible carrier, or it may be enclosed in hard or soft shell gelatin capsules, or it may be compressed into tablets, or it may be incorporated directly with the food of the diet. For oral therapeutic administration, a compound of the invention may be incorporated with an excipient and used in the form of ingestible tablets, buccal tablets, troches, capsules, elixirs, suspensions, syrups, and wafers. A compound of the invention may also be administered parenterally. Solutions of a compound of the invention can be prepared in water suitably mixed with a surfactant, such as hydroxypropylcellulose. Dispersions can also be prepared in glycerol, liquid polyethylene glycols, DMSO, and mixtures thereof with or without alcohol, and in oils. Under ordinary conditions of storage and use, these preparations may contain a preservative to prevent the growth of microorganisms. Conventional procedures and ingredients for the selection and preparation of suitable formulations are described, for example, in Remington's Pharmaceutical Sciences (2003, 20th ed.) and in The United States Pharmacopeia: The National Formulary (USP 24 NF19), published in 1999. The pharmaceutical forms suitable for injectable use include sterile aqueous solutions or dispersions and sterile powders for the extemporaneous preparation of sterile injectable solutions or dispersions. In all cases the form must be sterile and must be fluid to the extent that may be easily administered via syringe. Compositions for nasal administration may conveniently be formulated as aerosols, drops, gels, and powders. Aerosol formulations typically include a solution or fine suspension of the active substance in a physiologically acceptable aqueous or non-aqueous solvent and are usually presented in single or multidose quantities in sterile form in a sealed container, which can take the form of a cartridge or refill for use with an atomizing device. Alternatively, the sealed container may be a unitary dispensing device, such as a single dose nasal inhaler or an aerosol dispenser fitted with a metering valve which is intended for disposal after use. Where the dosage form comprises an aerosol dispenser, it will contain a propellant, which can be a compressed gas, such as compressed air or an organic propellant, such as fluorochlorohydrocarbon. The aerosol dosage forms can also take the form of a pump-atomizer. Compositions suitable for buccal or sublingual administration include tablets, lozenges, and pastilles, where the active ingredient is formulated with a carrier, such as sugar, acacia, tragacanth, gelatin, and glycerine. Compositions for rectal administration are conveniently in the form of suppositories containing a conventional suppository base, such as cocoa butter. A compound described herein may be administered intratumorally, for example, as an intratumoral injection. Intratumoral injection is injection directly into the tumor vasculature and is specifically contemplated for discrete, solid, accessible tumors. Local, regional, or systemic administration also may be appropriate. A compound described herein may advantageously be contacted by administering an injection or multiple injections to the tumor, spaced for example, at approximately, 1 cm intervals. In the case of surgical intervention, the present invention may be used preoperatively, such as to render an inoperable tumor subject to resection. Continuous administration also may be applied where appropriate, for example, by implanting a catheter into a tumor or into tumor vasculature.

The compounds of the invention may be administered to an animal, e.g., a human, alone or in combination with pharmaceutically acceptable carriers, as noted herein, the proportion of which is determined by the solubility and

chemical nature of the compound, chosen route of administration, and standard pharmaceutical practice.

Dosages

The dosage of the compounds of the invention, and/or compositions comprising a compound of the invention, can vary depending on many factors, such as the pharmacodynamic properties of the compound; the mode of administration; the age, health, and weight of the recipient; the nature and extent of the symptoms; the frequency of the treatment, and the type of concurrent treatment, if any; and the clearance rate of the compound in the animal to be treated. One of skill in the art can determine the appropriate dosage based on the above factors. The compounds of the invention may be administered initially in a suitable dosage that may be adjusted as required, depending on the clinical response. In general, satisfactory results may be obtained when the compounds of the invention are administered to a human at a daily dosage of, for example, between 0.05 mg and 3000 mg (measured as the solid form). Dose ranges include, for example, between 10-1000 mg (e.g., 50-800 mg). In some embodiments, 50, 100, 150, 200, 250, 300, 350, 400, 450, 500, 550, 600, 650, 700, 750, 800, 850, 900, 950, or 1000 mg of the compound is administered.

Alternatively, the dosage amount can be calculated using the body weight of the patient. For example, the dose of a compound, or pharmaceutical composition thereof, administered to a patient may range from 0.1-50 mg/kg (e.g., 0.25-25 mg/kg). In exemplary, non-limiting embodiments, the dose may range from 0.5-5.0 mg/kg (e.g., 0.5, 1.0, 1.5, 2.0, 2.5, 3.0, 3.5, 4.0, 4.5, or 5.0 mg/kg) or from 5.0-20 mg/kg (e.g., 5.5, 6.0, 6.5, 7.0, 7.5, 8.0, 8.5, 9.0, 9.5, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, or 20 mg/kg).

13

Step 1: Preparation of tert-butyl N-[2-oxo-2-[(4-phenylthiazol-2-yl)amino]ethyl]carbamate (i-1a)

To a solution of 2-(tert-butoxycarbonylamino)acetic acid (1 g, 5.71 mmol) in dimethylformamide (DMF) (20 mL) was added 1-[Bis(dimethylamino)methylene]-1H-1,2,3-triazolo [4,5-b]pyridinium 3-oxide hexafluorophosphate (HATU) (2.39 g, 6.28 mmol) and N-Ethyl-N-(propan-2-yl)propan-2-amine (DIPEA) (2.21 g, 17.13 mmol). The solution was stirred for 10 minutes and then 4-phenylthiazol-2-amine (1.01 g, 5.71 mmol) was added. The solution was stirred at 30° C. for 12 hrs. The reaction solution was poured into water (200 mL) and then extracted with EtOAc (200 mL). The organic layer was washed with aqueous citric acid (100 mL*5), brine (200 mL) and then dried over Na₂SO₄. The solution was concentrated in vacuum. The residue was purified through column chromatography (SiO₂, PE/EtOAc=20/1~3/1) to give intermediate i-1a as a yellow solid.

¹H NMR (400 MHz, CDCl₃) δ=10.08 (brs, 1H), 7.83-7.81 (m, 2H), 7.45-7.41 (m, 2H), 7.36-7.34 (m, 1H), 7.28 (s, 1H), 7.17 (s, 1H), 4.04 (s, 2H), 1.51 (s, 9H) ppm.

LCMS (ESI) m/z: [M+H]⁺=333.9.

Step 2: Preparation of 2-amino-N-(4-phenylthiazol-2-yl)acetamide hydrochloride salt (i-1b)

To a solution of intermediate i-1a (100 mg, 284.94 μmol) in dioxane (5 mL) was added HCl/dioxane (4 M, 5 mL), then the solution was stirred at 30° C. for 1 hr. The reaction solution was concentrated in vacuum to give intermediate i-1b (HCl salt) as a white solid, which was used for the next step directly.

LCMS (ESI) m/z: [M+H]⁺=233.9.

128

Step 3: Preparation of 3-(dimethylsulfamoyl)-N-[2-oxo-2-[(4-phenylthiazol-2-yl)amino]ethyl]benzamide (compound 13)

13

To a solution of 3-(dimethylsulfamoyl)benzoic acid (75.72 mg, 330.31 μmol) in DCM (10 mL) was added HATU (125.59 mg, 330.31 μmol) and DIPEA (155.24 mg, 1.20 mmol). The solution was stirred for 10 min and then intermediate i-1b (81 mg, 300.28 μmol) was added. The solution was stirred at 30° C. for 12 hr. The reaction solution was poured into water (50 mL) and extracted with EtOAc (100 mL). The organic layer was washed with brine (50 mL), dried (Na₂SO₄) and concentrated in vacuum. To the residue was added MeOH (20 mL) and stirred for 20 min, a white solid was formed. The solid was filtered and dried in vacuum to give compound 13 as a white solid.

LCMS (ESI) m/z: [M+H]⁺=444.9.

¹H NMR (400 MHz, DMSO-d₆) δ=12.49 (s, 1H), 9.32 (t, J=5.6 Hz, 1H), 8.27-8.25 (m, 2H), 7.96-7.90 (m, 3H), 7.81-7.80 (m, 1H), 7.64 (s, 1H), 7.46-7.42 (m, 2H), 7.33-7.30 (m, 1H), 4.23 (d, J=5.6 Hz, 2H), 2.65 (s, 6H) ppm.

Example 2. Preparation of Compound (S)—N-(4-(methylthio)-1-oxo-1-((4-phenylthiazol-2-yl)amino)butan-2-yl)benzamide (compound 42)

129

Step 1: Preparation of (S)-tert-butyl 4-(methylthio)-1-oxo-1-((4-phenylthiazol-2-yl)amino)butan-2-ylcarbamate (intermediate i-2a)

To a solution of (2S)-2-(tert-butoxycarbonylamino)-4-methylsulfanylbutanoic acid (1 g, 4.01 mmol) in DCM (20 mL) was added 2-ethoxy-1-ethoxycarbonyl-1,2-dihydroquinoline (EEDQ) (1.24 g, 5.01 mmol) and then 4-phenylthiazol-2-amine (589.05 mg, 3.34 mmol) was added. The mixture was stirred at 28° C. for 3 hr. The reaction mixture was diluted with EtOAc (400 mL). The organic layer was washed with brine (40 mL), dried over Na₂SO₄, filtered and concentrated under reduced pressure to give a residue. The residue was purified by column chromatography (SiO₂, Petroleum ether/Ethyl acetate=50/1 to 8/1) to give intermediate i-2a as a white solid.

¹H NMR (400 MHz, METHANOL-d₄) δ 7.89 (d, J=7.6 Hz, 2H), 7.43-7.35 (m, 3H), 7.30-7.27 (m, 1H), 4.41-4.32 (m, 1H), 2.62-2.55 (m, 2H), 2.20-2.11 (m, 4H), 2.00-1.94 (m, 1H), 1.46-1.39 (m, 9H) ppm.

LCMS (ESI) m/z: [M+H]⁺=408.2.

Step 2: Preparation of (S)-2-amino-4-(methylthio)-N-(4-phenylthiazol-2-yl)butanamide trifluoroacetate salt (intermediate i-2b)

To a solution of intermediate i-2a (200 mg, 490.74 μmol) in DCM (5 mL) was added TFA (0.25 mL). The mixture was stirred at 28° C. for 2 hr. To the reaction solution was added a.q. NaHCO₃ to adjust pH to 7 and then extracted with

130

EtOAc (100 mL*2). The combined organic layers were washed with brine (20 mL), dried over Na₂SO₄, filtered and concentrated under reduced pressure to give a residue.

The residue was purified by prep-HPLC (TFA condition; column: Phenomenex Synergi C18 150*25*10 μm; mobile phase: [water (0.1% TFA)-ACN]; B %: 15%-45%, 12 min) and lyophilized to give the TFA salt of intermediate i-2b as a white solid.

¹H NMR (400 MHz, METHANOL-d₄) δ 7.91-7.89 (m, 2H), 7.46 (s, 1H), 7.42-7.38 (m, 2H), 7.32-7.31 (m, 1H), 4.27-4.23 (m, 1H), 2.67-2.63 (m, 2H), 2.33-2.22 (m, 2H), 2.14 (s, 3H) ppm.

LCMS (ESI) m/z: [M+H]⁺=308.1.

Step 3: Preparation of (S)-N-(4-(methylthio)-1-oxo-1-((4-phenylthiazol-2-yl)amino)butan-2-yl)benzamide (compound 42)

To a solution of benzoic acid (43.70 mg, 357.80 μmol) in DCM (2 mL) was added EEDQ (120.66 mg, 487.91 μmol) and then intermediate i-2b (100 mg, 325.27 μmol) was added. The mixture was stirred at 28° C. for 3 hr. The reaction mixture was diluted with EA (150 mL), washed with 10% aqueous citric acid (50 mL*4), dried over Na₂SO₄, filtered and concentrated under reduced pressure to give a residue. The residue was purified by prep-HPLC (TFA condition; column: Phenomenex Synergi C18 150*25*10 μm; mobile phase: [water (0.1% TFA)-ACN]; B %: 45%-75%, 13 min) and lyophilized to give compound 42 as a white solid.

¹H NMR (400 MHz, METHANOL-d₄) δ 7.91-7.88 (m, 4H), 7.60-7.51 (m, 1H), 7.50-7.48 (m, 2H), 7.38-7.36 (m, 3H), 7.29-7.27 (m, 1H), 4.93-4.89 (m, 1H), 2.70-2.63 (m, 2H), 2.28-2.21 (m, 2H), 2.13 (s, 3H) ppm.

Example 3. Preparation of (S)-3-(N,N-dimethylsulfamoyl)-N-(4-(methylthio)-1-oxo-1-((4-phenylthiazol-2-yl)amino)butan-2-yl)benzamide (compound 24)

To a solution of 3-(dimethylsulfamoyl)benzoic acid (59.66 mg, 260.22 μ mol) in DCM (2 mL) was added EEDQ (96.52 mg, 390.33 μ mol) and then (2S)-2-amino-4-methylsulfanyl-N-(4-phenylthiazol-2-yl)butanamide (80 mg, 260.22 μ mol) was added. The mixture was stirred at 28° C. for 2 hr. The reaction mixture was diluted with EtOAc (150 mL). The organic layer was washed with brine (50 mL), dried over Na₂SO₄, filtered and concentrated under reduced pressure to give a residue. The residue was purified by column chromatography (SiO₂, Petroleum ether/Ethyl acetate=50/1 to 1:1) and lyophilized to give compound 24 as a white solid.

¹H NMR (400 MHz, DMSO-d₆) δ 12.55 (s, 1H), 9.10 (d, J=6.8 Hz, 1H), 8.28-8.26 (m, 2H), 7.92-7.89 (m, 3H), 7.80-7.76 (m, 1H), 7.64 (s, 1H), 7.45-7.41 (m, 2H), 7.36-7.30 (m, 1H), 4.83-4.76 (m, 1H), 2.65 (s, 6H), 2.61-2.55 (m, 2H), 2.21-2.16 (m, 2H), 2.10 (s, 3H) ppm.

LCMS (ESI) m/z: [M+H]⁺=519.2.

Example 4. Preparation of (S)-3-(N,N-dimethylsulfamoyl)-N-(1-oxo-1-((4-phenylthiazol-2-yl)amino)propan-2-yl)benzamide (compound 12)

Step 1: Preparation of (S)-tert-butyl (1-oxo-1-((4-phenylthiazol-2-yl)amino)propan-2-yl)carbamate (intermediate 4a)

To a solution of (2S)-2-(tert-butoxycarbonylamino)propanoic acid (200 mg, 1.06 mmol) in THE (5 mL) was added EEDQ (392.09 mg, 1.59 mmol), then 4-phenylthiazol-2-amine (186.29 mg, 1.06 mmol) was added to the mixture. The mixture was stirred at 25° C. for 12 hr. Citric acid (10%) 80 mL (40*2) was added and the reaction mixture was extracted with EtOAc (100 mL*2). The combined organic layers were washed with brine (20 mL), dried over Na₂SO₄, filtered and concentrated under reduced pressure to give a residue. The residue was purified by column chromatography (SiO₂, Petroleum ether/Ethyl acetate=50/1 to 5:1) to give intermediate i-4a as a white solid. ¹H NMR (400 MHz, DMSO-d₆) δ 12.29 (s, 1H), 7.96-7.84 (m, 2H), 7.63 (s, 1H), 7.49-7.39 (m, 2H), 7.35-7.30 (m, 1H), 7.25 (d, J=6.8 Hz, 1H), 4.31-4.20 (m, 1H), 1.38 (s, 7H), 1.28 (d, J=7.2 Hz, 4H) ppm.

LCMS (ESI) m/z: [M+H]⁺=347.9.

SFC HPLC: AD-3-MeOH(DEA)-5-40-3 mL-35T.I, 1.584 min.

Step 2: Preparation of (S)-2-amino-N-(4-phenylthiazol-2-yl)propanamide (intermediate i-4b)

To a solution of intermediate i-4a (300 mg, 863.48 μ mol) in DCM (5 mL) was added TFA (0.5 mL). The mixture was stirred at 25° C. for 2 hr. The reaction solution was poured into water (20 mL) and adjusted pH to 7 with NaHCO₃. The reaction mixture was extracted with EA (100 mL*2). The combined organic layers were washed with brine (40 mL), dried over Na₂SO₄, filtered and concentrated under reduced pressure to give intermediate i-4b as a white solid which was used to the next step without further purification.

¹H NMR (400 MHz, DMSO-d₆) δ 7.93-7.87 (m, 2H), 7.60 (s, 1H), 7.46-7.39 (m, 2H), 7.35-7.28 (m, 1H), 5.46 (s, 2H), 3.59-3.57 (m, 1H), 3.33 (s, 3H), 1.23 (d, J=6.8 Hz, 3H) ppm.

40

Step 1: Preparation of tert-butyl N-[2-oxo-2-(3-phenyl anilino)ethyl] carbamate (intermediate i-5a)

i-5a

To a solution of 2-(tert-butoxycarbonylamino)acetic acid (113.87 mg, 650.03 μmol) in DCM (3 mL) was added DIPEA (229.12 mg, 1.77 mmol) and HATU (337.04 mg, 886.41 μmol). The mixture was stirred at 25° C. for 10 min. 3-phenylaniline (100.00 mg, 590.94 μmol) was added and the mixture was stirred at 25° C. for 2 hr. The reaction mixture was quenched by addition water (10 mL), and then extracted with ethyl acetate (10 mL*2). The combined organic layers were washed with water (10 mL*2), dried over Na₂SO₄, filtered and concentrated under reduced pressure to give a crude product. To the residue was added a solvent (EA:PE=1:5, v/v, 10 mL) and stirred for 10 min then filtered, the solid was dried in vacuum to give Intermediate i-5a as a pale yellow solid.

LCMS (ESI) m/z: [M+Na]⁺=349.2.

Step 2: Preparation of 2-amino-N-(3-phenylphenyl)acetamide (intermediate i-5b) trifluoroacetate salt

i-5b

To a solution of Intermediate i-5a (70.11 mg, 201.48 μmol) in DCM (3 mL) was added TFA (150.00 μL). The

135

mixture was stirred at 25° C. for 1 hr. The reaction mixture was concentrated to dryness to give a residue, which was slurried with methyl t-butyl ether (5 mL) and the solid collected by filtration, and dried in vacuum to afford intermediate i-5b (TFA salt) as a light yellow solid, which was used in next step without further purification.

LCMS (ESI) m/z: [M+H]⁺=227.2.

Step 3: Preparation of 3-(dimethylsulfamoyl)-N-[2-oxo-2-(3-phenyl anilino)ethyl]benzamide (compound 40)

To a solution of 3-(dimethylsulfamoyl)benzoic acid (45.59 mg, 198.87 μmol) in DCM (3 mL) was added DIPEA (77.11 mg, 596.62 μmol) and HATU (113.43 mg, 298.31 μmol). The mixture was stirred at 25° C. for 10 min and then intermediate i-5b was added and the mixture was stirred at 25° C. for 2 hr. The reaction mixture was concentrated in vacuo to give a residue. To the residue was added a mixture of methanol:water=1:1, v/v, (4 mL) and stirred for 10 min, then filtered, the filter cake was washed with methanol (2 mL) and then lyophilized to give compound 40 as a white solid.

¹H NMR (400 MHz, DMSO-d₆) δ 10.22 (s, 1H), 9.24 (m, 1H), 8.19-8.32 (m, 2H), 7.90-8.00 (m, 2H), 7.73-7.86 (m, 1H), 7.56-7.65 (m, 3H), 7.32-7.51 (m, 5H), 4.14 (m, 2H), 2.63-2.68 (m, 6H) ppm; LCMS (ESI) m/z: [M+H]⁺=438.2.

Example 6. Preparation of 3-(methylsulfamoyl)-N-[2-oxo-2-[(4-phenylthiazol-2-yl)amino]ethyl]benzamide (compound 26)

136

Step 1: Preparation of 2-amino-N-(4-phenylthiazol-2-yl)acetamide (intermediate 6a) trifluoroacetate salt

i-6a

To a solution of tert-butyl N-[2-oxo-2-[(4-phenylthiazol-2-yl)amino]ethyl]carbamate (500 mg, 1.50 mmol) in DCM (3 mL) was added TFA (2.22 mL). The mixture was stirred at 25° C. for 1 h. The reaction mixture was evaporated to dryness. To the residue was added MTBE/PE=(2/1, 30 mL) and stirred for 10 min, then filtered to give a solid which was dried in vacuum to give intermediate i-6a (TFA salt) as a yellow solid.

LCMS (ESI) m/z: [M+H]⁺=234.2.

Step 2: Preparation of 3-(methylsulfamoyl)-N-[2-oxo-2-[(4-phenylthiazol-2-yl)amino]ethyl]benzamide (compound 26)

26

To a mixture of 3-(methylsulfamoyl)benzoic acid (46.13 mg, 214.33 μmol) in DCM (2 mL) was added HATU (89.64 mg, 235.75 μmol) and DIPEA (138.5 mg, 1.07 mmol) at 25° C. The mixture was stirred at 25° C. for 10 min and then intermediate 6a (50 mg, 143.96 μmol) was added and stirred for 1 h. The reaction mixture was evaporated to dryness to give the crude product. To the residue was added MeOH (30 mL) and stirred for 10 min, then filtered and the filter cake was washed with MeOH (30 mL). The solid was dried in vacuo to give compound 26 as a white solid.

Example 9. Preparation of 3-(dimethylsulfamoyl)-N-[2-oxo-2-[[4-(2-pyridyl)thiazol-2-yl]amino]ethyl]benzamide (compound 32)

Step 1: Preparation of 2-amino-N-[4-(2-pyridyl)thiazol-2-yl]acetamide (intermediate 9a) trifluoroacetate salt

To a solution of tert-butyl N-[2-oxo-2-[[4-(2-pyridyl)thiazol-2-yl]amino]ethyl]carbamate (250 mg, 665.39 μmol) in DCM (2 mL) was added TFA (1.10 mL). The mixture was stirred at 25° C. for 1 h. The reaction mixture was evaporated to dryness. To the residue was added MTBE/PE=(2/1, 30 mL) and stirred for 10 min then filtered. The solid was dried in vacuum to give intermediate i-9a (TFA salt) as a yellow solid.

LCMS (ESI) m/z: $[M+H]^+=234.9$.

Step 2: Preparation of 3-(dimethylsulfamoyl)-N-[2-oxo-2-[[4-(2-pyridyl)thiazol-2-yl]amino]ethyl]benzamide (compound 32)

To a mixture of 3-(dimethylsulfamoyl)benzoic acid (98.73 mg, 430.66 μmol) in DCM (2 mL) was added HATU (180.13 mg, 473.73 μmol) and DIPEA (278.30 mg, 2.15

140

mmol) at 25° C. The mixture was stirred at 25° C. for 10 min, then intermediate 9a (150 mg, 430.66 μmol) was added and stirred for 1 h. The reaction mixture was evaporated to dryness. To the residue was added MeOH (30 mL) and stirred for 10 min, then filtered and the filter cake was washed with MeOH (30 mL). The filter cake was evaporated to dryness to give compound 32 as an off-white solid.

Step 2: Preparation of (2S)-2-amino-4-phenyl-N-(4-phenylthiazol-2-yl)butanamide (intermediate i-16b)

To a mixture of Intermediate i-16a (270.00 mg, 569.67 μmol) in DCM (10.0 mL) was added trifluoroacetic acid (923.19 μL) in one portion at 20° C. under N_2 . The mixture was stirred at 20° C. for 1 hour. The reaction mixture was concentrated under reduced pressure to give intermediate i-16b (TFA salt) as yellow oil, which was used in the next step without further purification.

Step 3: Preparation of N-[(1S)-3-phenyl-1-[(4-phenylthiazol-2-yl)carbamoyl]propyl]benzamide (compound 49)

To a mixture of HATU (57.62 mg, 151.54 μmol) and benzoic acid (13.57 mg, 111.13 μmol) in DCM (2.0 mL) was added DIPEA (52.23 mg, 404.11 μmol) in one portion at 20° C. under N_2 . The mixture was stirred at 20° C. for 10 min. Then intermediate i-16b (50.0 mg, 110.75 μmol) was added and the mixture was stirred at 20° C. for 2 hours. The reaction mixture was concentrated under reduced pressure to give a residue. The residue was triturated in MeOH (10.0 mL), the solid was collected by filtration and dried in vacuum to give compound 49 as a white solid.

Step 2: Preparation of (S)-(9H-fluoren-9-yl)methyl-tert-butyl (6-oxo-6-((4-phenylthiazol-2-yl)amino)hexane-1,5-diyl)dicarbamate (intermediate i-53b)

To a solution of intermediate i-53a (500 mg, 977.50 μmol) in DCM (5.0 mL) was added EEDQ (362.59 mg, 1.47 mmol) and 4-phenylthiazol-2-amine (172.27 mg, 977.50 μmol). The reaction mixture was stirred at 20° C. for 18 hr. The reaction mixture was poured into water (10.0 mL). The solution was extracted with EtOAc (10.0 mL*3). The combined organic extracts were washed with brine (20.0 mL), dried over Na_2SO_4 and filtered. The filtrate was concentrated to give a residue. The residue was purified by column chromatography (SiO_2 , Petroleum ether/Ethyl acetate=100:1 to 1:1) to give intermediate i-53b as a yellow oil.

Step 3: Preparation of (S)-(9H-fluoren-9-yl)methyl (5-amino-6-oxo-6-((4-phenylthiazol-2-yl)amino)hexyl)carbamate (intermediate i-53c)

To a solution of intermediate i-53b (440 mg, 586.68 μmol) in DCM (5.0 mL) was added TFA (417.85 μL). The reaction mixture was stirred at 20° C. for 2 hrs. The reaction mixture was adjusted to pH 8 with saturated NaHCO_3 solution. The solution was extracted with EtOAc (5.0 mL*3). The combined organic extracts were washed with brine (10.0 mL), dried over Na_2SO_4 and filtered. The filtrate was concentrated to give a residue. The residue was triturated with MTBE (10.0 mL). The solution was filtered. The filter cake was dried in vacuum to give intermediate i-53c as a white solid. LCMS (ESI) m/z: $[\text{M}+\text{Na}]^+=549.4$.

Chiral HPLC: AS-3-MeOH (DEA)-5-40-3ML-35T, 2.386 min.

Step 4: Preparation of (S)-(9H-fluoren-9-yl)methyl (5-benzamido-6-oxo-6-((4-phenylthiazol-2-yl)amino)hexyl)carbamate (intermediate i-53d)

To a solution of benzoic acid (41.68 mg, 341.33 μmol , 52.10 μL) in DCM (2.0 mL) was added HATU (142.76 mg, 375.46 μmol), DIEA (176.46 mg, 1.37 mmol) and intermediate i-53c (190 mg, 341.33 μmol). The reaction mixture was stirred at 20° C. for 3 hr. The reaction mixture was poured into water (2.0 mL). The solution was extracted with EtOAc (2.0 mL*3). The combined organic extracts were washed with brine (5.0 mL), dried over Na_2SO_4 and filtered. The filtrate was concentrated to give a residue. The residue was purified by flash silica gel chromatography (PE:EA=50:1-10:1-3:1-1:1) to give intermediate i-53d as a white solid.

Step 5: Preparation of (S)—N-(6-amino-1-oxo-1-((4-phenylthiazol-2-yl)amino)hexan-2-yl)benzamide (intermediate i-53e)

To a solution of intermediate i-53d (120 mg, 179.50 μmol) in DCM (1.2 mL) was added piperidine (120.00 μL). The solution was stirred at 20° C. for 2 hr. The mixture was poured into water (2.0 mL). The reaction mixture was diluted with saturated NaHCO_3 solution (5 mL) and extracted with EtOAc (2.0 mL*3). The combined organic extracts were washed with brine (5.0 mL), dried over Na_2SO_4 and filtered. The filtrate was concentrated to give a residue. The residue was purified by prep-HPLC (column: Phenomenex Synergi C18 150*25*10 μm ; mobile phase: [water(0.225% FA)-ACN]; B %: 17%-37%, 7 min) to give intermediate i-53e (FA salt) as a white solid.

Example 54. Preparation of 3-(isopropylsulfonyl)-N-(2-oxo-2-((4-phenylthiazol-2-yl)amino)ethyl)benzamide (compound 6)

Step 1: Preparation of methyl 3-(isopropylthio)benzoate (intermediate i-54a)

To a solution of methyl 3-sulfanylbenzoate (200.0 mg, 1.19 mmol) in THE (2.0 mL) was added 2-iodopropane

209

(303.17 mg, 1.78 mmol). Then NaH (57.07 mg, 1.43 mmol, 60% purity) was added in small portions over 5 min. The reaction mixture was stirred at 20° C. for 1 hr and then poured into 1N HCl (6 mL). The solution was extracted with EtOAc (5.0 mL*3). The combined organic extracts were washed with brine (10.0 mL), dried over Na₂SO₄ and filtered. The filtrate was concentrated to give a residue. The residue was purified by column chromatography (SiO₂, PE/EA=100/1-1/1) to give intermediate i-54a as yellow oil.

LCMS (ESI) m/z: [M+H]⁺=211.3.

Step 2: Preparation of methyl
3-(isopropylsulfonyl)benzoate (intermediate i-54b)

To a solution of intermediate i-54a (200.0 mg, 883.15 μmol) in DCM (2.0 mL) was added m-CPBA (320.04 mg, 1.58 mmol, 85% purity). The mixture was stirred at 20° C. for 1 hr and then poured into saturated a.q NaHCO₃ (30.0 mL). The solution was extracted with EtOAc (20.0 mL*3). The combined organic extracts were washed with brine (50.0 mL), dried over Na₂SO₄ and filtered. The filtrate was concentrated to give intermediate i-54b as a white solid, which was used directly in the next step.

LCMS (ESI) m/z: [M+H]⁺=243.3.

Step 3: Preparation of 3-(isopropylsulfonyl)benzoic
acid (intermediate i-54c)

To a solution of intermediate i-54b (300.0 mg, 1.24 mmol) in dioxane (3.0 mL) and water (2.0 mL) was added LiOH (59.30 mg, 2.48 mmol). The reaction mixture was stirred at 20° C. for 1 hr and then adjusted pH 6 with saturated citric acid solution. Then the solution was extracted with EtOAc (10.0 mL*3). The combined organic extracts were washed with brine (20.0 mL), dried over Na₂SO₄ and filtered. The filtrate was concentrated to give a residue. The residue was purified with column chromatography (SiO₂, PE:EA=50:1-20:1-10:1-3:1) to give intermediate i-54c as a white solid.

Step 1: Preparation of methyl 4-[[[(1S)-3-methylsulfonyl-1-[(4-phenylthiazol-2-yl)carbamoyl]propyl]carbamoyl]benzoate (intermediate i-63a)

To a solution of 4-methoxycarbonylbenzoic acid (85.49 mg, 474.54 μ mol) in DCM (5 mL) were added DIPEA (183.99 mg, 1.42 mmol) and HATU (198.48 mg, 522.00 μ mol). The mixture was stirred at 30° C. for 10 min. (2S)-2-amino-4-methylsulfonyl-N-(4-phenylthiazol-2-yl)butanamide (200 mg, 474.54 μ mol) was added and the reaction mixture was stirred at 30° C. for 2 hr. The reaction mixture was quenched by addition water (10 mL) and extracted with ethyl acetate (10 mL $\times$ 2). The combined organic extracts were washed with water (10 mL), dried over Na₂SO₄, filtered and concentrated under reduced pressure to give intermediate i-63a as colorless oil, which was used in next step without further purification.

A mixture of 3-methylbenzenethiol (100.0 mg, 805.13 μmol), bromocyclopropane (292.21 mg, 2.42 mmol) and t-BuOK (99.38 mg, 885.65 μmol) in DMSO (0.5 mL) was stirred at 100° C. for 12 hr. The reaction mixture was diluted with water (2.0 mL) and extracted with EtOAc (2.0 mL*3). The combined organic extracts were dried over Na_2SO_4 , filtered and concentrated under reduced pressure to give a residue. The residue was purified by column chromatography (SiO_2 , Petroleum ether) to give intermediate i-72a as colorless oil.

^1H NMR (400 MHz, CDCl_3) δ =7.18 (s, 1H), 7.10 (d, J=4.0 Hz, 3H), 6.88-6.86 (m, 1H), 2.29-2.25 (m, 3H), 2.14-2.09 (m, 1H), 1.01-0.96 (m, 2H), 0.63-0.60 (m, 2H) ppm.

Step 2: Preparation of 3-cyclopropylsulfonylbenzoic acid (intermediate i-72b)

-continued

Preparation of (S)-4-amino-N-(4-(methylthio)-1-oxo-1-((4-(3-(pyridin-4-yl)phenyl)thiazol-2-yl)amino)butan-2-yl)benzamide (Compound 87)

**250**

-continued

Compound 87

Step 1: Preparation of 2-bromo-1-(3-bromophenyl)ethenone (Intermediate B)

B

251

To a solution of 1-(3-bromophenyl)ethanone (200 g, 1.00 mol, 132.45 mL) in CHCl_3 (250 mL) was added Br_2 (240.86 g, 1.51 mol, 77.70 mL) under N_2 dropwise at 20°C . The mixture was stirred at 80°C for 1 hr. The reaction mixture was concentrated to give intermediate B (279.27 g, crude) as yellow oil, which was used for next step directly.

Step 2: Preparation of
4-(3-bromophenyl)thiazol-2-amine (Intermediate C)

To a solution of thiourea (229.23 g, 3.01 mol) in EtOH (1.5 L) was added intermediate B (279 g, 1.00 mol). The mixture was stirred at 85°C for 2 hr. Then the mixture was concentrated in vacuum to give a residue. The residue was poured into NaHCO_3 (2 L) solution to adjust pH to 8, then the solution was extracted with EA (2 L*3). The combined organic layers were washed with brine (4 L), dried over Na_2SO_4 and filtered. The filtrate was concentrated to give a residue. The residue was purified by column chromatography (SiO_2 , PE:EA=5:1) to give intermediate C (130 g, 494.40 mmol, 49.25% yield) as a yellow solid. LCMS (ESI) m/z : $[\text{M}+\text{H}]^+=257.0$. ^1H NMR (400 MHz, $\text{DMSO}-d_6$) δ =7.98 (m, 1H), 7.79 (d, J =8.0 Hz, 1H), 7.44-7.42 (m, 1H), 7.33-7.29 (m, 1H), 7.14 (s, 1H), 7.09 (s, 2H) ppm.

Step 3: Preparation of 4-[3-(4-pyridyl)phenyl]thiazol-2-amine (Intermediate E)

4-(3-bromophenyl)thiazol-2-amine (20 g, 78.40 mmol), 4-pyridylboronic acid (28.9 g, 239.18 mmol), ditert-butyl (cyclopentyl)phosphane;dichloropalladium;iron (2.56 g, 3.92 mmol) and K_3PO_4 (66.56 g, 313.56 mmol) were taken up in dioxane (240 mL) and H_2O (24 mL). The mixture was purged with N_2 three times and then stirred at 80°C for 7 hr. Water (800 mL) was added and the mixture was extracted with EtOAc (800 mL*3). The combined organic layers were washed with brine, dried over anhydrous Na_2SO_4 , filtered and concentrated under vacuum. The residue was added into DCM (30 mL) and MTBE (100 mL) and then stirred for 5 min. The precipitate was collected through filtration and washed with MTBE (10 mL) to give the intermediate E (16.2 g, 61.17 mmol, 78.03% of yield) as a yellow solid.

LCMS (ESI) m/z : $[\text{M}+\text{H}]^+=254.0$.

252

Step 4: Preparation of tert-butyl N-[(1S)-3-methylsulfanyl-1-[[4-[3-(4-pyridyl)phenyl]thiazol-2-yl]carbamoyl]propyl]carbamate (Intermediate G)

To a mixture of intermediate E (12.6 g, 49.74 mmol) and (2S)-2-(tert-butoxycarbonylamino)-4-methylsulfanylbutanoic acid (18.6 g, 74.61 mmol) in DCM (900 mL) was added EEDQ (24.6 g, 99.48 mmol) and the mixture was stirred at 25°C for 2 hr. The solvent was removed in vacuum. The residue was triturated with DCM (100 mL) followed by MeOH (200 mL) to give the intermediate G (11.7 g, 23.73 mmol, 47.71% yield, ee %=99.44%) as a white solid. LCMS (ESI) m/z : $[\text{M}+\text{H}]^+=485.1$. ^1H NMR (400 MHz, DMSO) δ =12.39 (s, 1H), 8.68-8.66 (m, 2H), 8.30 (s, 1H), 8.02-7.99 (m, 1H), 7.83 (s, 1H), 7.76-7.74 (m, 3H), 7.61-7.57 (m, 1H), 7.28 (d, J =7.6 Hz, 1H), 4.31-4.30 (m, 1H), 2.65-2.44 (m, 2H), 2.06 (s, 3H) 2.01-1.85 (m, 2H), 1.38 (s, 9H) ppm. Note: The key point of this reaction is the concentration. (1 mmol E with 17-18 mL DCM was the best condition)

Step 5: Preparation of (2S)-2-amino-4-methylsulfanyl-N-[4-[3-(4-pyridyl)phenyl]thiazol-2-yl]butanamide (Intermediate H)

A mixture of intermediate G (11.5 g, 23.73 mmol) in MeOH (50 mL) was added HCl/dioxane (4 M, 100 mL) and the mixture was stirred at 25°C for 1 hr. The mixture was poured into MTBE (1000 mL) and the precipitate was collected by filtration to give the intermediate H (9.99 g, 23.73 mmol, 100.00% yield, HCl salt) as a yellow solid. LCMS (ESI) m/z : $[\text{M}+\text{H}]^+=385.0$

253

Step 6: Preparation of 4-amino-N-[(1S)-3-methylsulfonyl-1-[[4-[3-(4-pyridyl)phenyl]thiazol-2-yl]carbamoyl]propyl]benzamide (Intermediate E)

To a mixture of intermediate H (4 g, 9.50 mmol) and 4-aminobenzoic acid (1.30 g, 9.50 mmol) in DMF (40 mL)

254

was added DIEA (4.91 g, 38.01 mmol, 6.62 mL), EDCI (2.73 g, 14.25 mmol) and HOBt (1.93 g, 14.25 mmol). The solution was stirred at 25° C. for 14 hr and then poured into water (200 mL) and the precipitate was collected by filtration. The solid was triturated in MeOH (200 mL) (a gelatinous solid was formed). The precipitate was collected by filtration and the solid was further purified by column chromatography (SiO₂, DCM:MeOH=80:1-20:1) to give Compound 87 (2.13 g, 4.19 mmol, 44.11% yield, ee %=99.28%) as a white solid. LCMS (ESI) m/z: [M+H]⁺=504.0. ¹H NMR (400 MHz, DMSO) δ=12.40 (s, 1H), 8.68-8.66 (m, 2H), 8.31-8.30 (m, 1H), 8.22 (d, J=7.2 Hz, 1H), 8.02-7.99 (m, 1H), 7.82 (s, 1H), 7.76-7.74 (m, 3H), 7.67-7.63 (m, 2H), 7.61-7.57 (m, 1H), 6.58-6.54 (m, 2H), 5.67 (s, 2H), 4.72-4.67 (m, 1H), 2.65-2.54 (m, 2H), 2.12-2.06 (in, 5H) ppm.

Example 88. Assay for ATPase Catalytic Activity of BRM and BRG-1

The ATPase catalytic activity of BRM or BRG-1 was measured by the in vitro biochemical assay using ADP-Glo™ (Promega, V9102). The ADP-Glo™ kinase assay is performed in two steps once the reaction is complete. The first step is to deplete any unconsumed ATP in the reaction. The second step is to convert the reaction product ADP to ATP, which will be utilized by the luciferase to generate luminescence and be detected by a luminescence reader, such as Envision.

The assay reaction mixture (10 μL) contains 30 nM of BRM or BRG-1, 20 nM salmon sperm DNA (from Invitro-

gen, UltraPure™ Salmon Sperm DNA Solution, cat #15632011), and 400 μM of ATP in the ATPase assay buffer, which comprises of 20 mM Tris, pH 8, 20 mM MgCl₂, 50 mM NaCl, 0.1% Tween-20, and 1 mM fresh DTT (Pierce™ DTT (Dithiothreitol), cat #20290). The reaction is initiated by the addition of the 2.5 μL ATPase solution to 2.5 μL ATP/DNA solution on low volume white Proxiplate-384 plus plate (Perkin Elmer, cat #6008280) and incubates at room temperature for 1 hour. Then following addition of 5 μL of ADP-Glo™ Reagent provided in the kit, the reaction incubates at room temperature for 40 minutes. Then 10 μL of Kinase Detection Reagent provided in the kit is added to convert ADP to ATP, and the reaction incubates at room

287

temperature for 60 minutes. Finally, luminescence measurement is collected with a plate-reading luminometer, such as Envision.

BRM and BRG-1 were synthesized from high five insect cell lines with a purity of greater than 90%. IP₅₀ data for compounds 1-241 from the ATPase catalytic activity assay described herein are shown in Tables 5 and 6 below.

Example 89. Effects of BRG1/BRM ATPase Inhibition on the Growth of Uveal Melanoma and Hematological Cancer Cell Lines

Procedure: Uveal melanoma cell lines (92-1, MP41, MP38, MP46), prostate cancer cell lines (LNCAP), lung cancer cell lines (NCIH1299), and immortalized embryonic kidney lines (HEK293T) were plated into 96 well plates with growth media (See Table 7). BRG1/BRM ATPase inhibitor, Compound 87, was dissolved in DMSO and added to the cells in a concentration gradient from 0 to 10 micromolar at the time of plating. Cells were incubated at 37 degrees Celsius for 3 days. After three days of treatment, the media was removed from the cells, and 30 microliters of TrypLE (Gibco) was added to cells for 10 minutes. Cells were detached from the plates, and resuspended with the addition of 170 microliters of growth media. Cells from two DMSO-treated control wells were counted, and the initial number of cells plated at the start of the experiment, were re-plated into fresh-compound containing plates for an additional four days at 37 degrees Celsius. At day 7, cells were harvested as described above. On day 3 and day 7, relative cell growth was measured by the addition of Cell-titer glo (Promega), and luminescence was measured on an Envision plate reader (Perkin Elmer). The concentration of compound at which each cell line's growth was inhibited by 50% (GI₅₀), was calculated using Graphpad Prism, and is plotted below. For multiple myeloma cell lines (OPM2, MM1 S,

291

LP1), ALL cell lines (TALL1, JURKAT, RS411), DLBCL cell lines (SUDHL6, SUDHL4, DB, WSUDLCL2, PFEIFFER), AML cell lines (OCIAML5), MDS cell lines (SKM1), ovarian cancer cell lines (OV7, TYKNU), esophageal cancer cell lines (KYSE150), rhabdoid tumor lines (RD, G402, G401, HS729, A204), liver cancer cell lines (HLF, HLE, PLCRPF5), and lung cancer cell lines (SW1573, NCIH2444), the above methods were performed with the following modifications: Cells were plated in 96 well plates, and the next day, BRG1/BRM ATPase inhibitor, Compound 87, was dissolved in DMSO and added to the cells in a concentration gradient from 0 to 10 micromolar. At the time of cell splitting on days 3 and 7, cells were split into new 96 well plates, and fresh compound was added four hours after re-plating.

Table 7 lists the tested cell lines and growth media used.

Cell Lines and Growth Media		
Cell Line	Source	Growth Media
TYKNU	JCRB	EMEM + 20% FBS
WSUDLCL2	DSMZ	RPMI1640 + 10% FBS

Results: As shown in FIG. 1, the uveal melanoma and hematologic cancer cell lines were more sensitive to BRG1/BRM inhibition than the other tested cell lines. Inhibition of the uveal melanoma and hematologic cancer cell lines was maintained through day 7.

Example 90. Comparison of BRG1/BRM Inhibitors to Clinical PKC and MEK Inhibitors in Uveal Melanoma Cell Lines

Procedure: Uveal melanoma cell lines, 92-1 or MP41, were plated in 96 well plates in the presence of growth media (See Table 7). BAF ATPase inhibitors (Compound 87), PKC inhibitor (LXS196; MedChemExpress), or MEK inhibitor (Selumetinib; Selleck Chemicals) were dissolved in DMSO and added to the cells in a concentration gradient from 0 to 10 micromolar at the time of plating. Cells were incubated at 37 degrees Celsius for 3 days. After three days of treatment, cell growth was measured with Cell-titer glow (Promega), and luminescence was read on an Envision plate reader (Perkin Elmer).

Results: As shown in FIG. 2, Compound 87 showed comparable growth inhibition of uveal melanoma cells as the clinical PKC and MEK inhibitors. Further, compound 87 was found to result in a faster onset of inhibition than the clinical PKC and MEK inhibitors.

Example 91. Synthesis of Compound B

BRG1/BRM Inhibitor Compound B has the structure:

Compound B was synthesized as shown in Scheme 2 below.

Scheme 2. Synthesis of Compound B

293

Step 1: Preparation of (S)-1-(methylsulfonyl)-N-(4-(methylthio)-1-oxo-1-((4-(3-(pyridin-4-yl)phenyl)thiazol-2-yl)amino)butan-2-yl)-1H-pyrrole-3-carboxamide (Compound B)

To a mixture of (2S)-2-amino-4-methylsulfanyl-N-[4-[3-(4-pyridyl)phenyl]thiazol-2-yl]butanamide (2 g, 4.75 mmol, HCl salt) and 1-methylsulfonylpyrrole-3-carboxylic acid (898.81 mg, 4.75 mmol) in DMF (20 mL) was added EDCI (1.37 g, 7.13 mmol), HOBt (962.92 mg, 7.13 mmol) and DIEA (2.46 g, 19.00 mmol, 3.31 mL) and the mixture was stirred at 25° C. for 3 hours. The mixture was poured into H₂O (100 mL) and the precipitate was collected by filtration. The solid was triturated in MeOH (20 mL) and the precipitate was collected by filtration. The solid was dissolved in DMSO (10 mL) and then the mixture was poured into MeOH (50 mL) and the formed precipitate was collected by filtration and lyophilized to give Compound B (2.05 g, 3.66 mmol, 77.01% yield) as a white solid. LCMS (ESI) m/z [M+H]⁺=555.9. ¹H NMR (400 MHz, DMSO) δ 12.49 (s, 1H), 8.68-8.66 (m, 2H), 8.46 (d, J=7.2 Hz, 1H), 8.31-8.30 (m, 1H), 8.02-8.00 (m, 1H), 7.94-7.96 (m, 1H), 7.83 (s, 1H), 7.73-7.74 (m, 3H), 7.61-7.57 (m, 1H), 7.31-7.29 (m, 1H), 6.79-6.77 (m, 1H), 4.74-4.69 (m, 1H), 3.57 (s, 3H), 2.67-2.53 (m, 2H), 2.13-2.01 (m, 5H). SFC: AS-3-MeOH (DEA)-40-3 mL-35T.lcm, t=0.932 min, ee %=100%.

Example 92. Effects of BRG1/BRM ATPase Inhibition on the Growth of Uveal Melanoma, Hematological Cancer, Prostate Cancer, Breast Cancer, and Ewing's Sarcoma Cell Lines

Procedure: All cell lines described above in Example 89 were also tested as described above with Compound B. In addition, the following cell lines were also tested as follows. Briefly, for Ewing's sarcoma cell lines (CADOES1, RDES, SKES1), retinoblastoma cell lines (WERIRB1), ALL cell lines (REH), AML cell lines (KASUMI1), prostate cancer cell lines (PC3, DU145, 22RV1), melanoma cell lines (SH4, SKMEL28, WM115, COLO829, SKMEL3, A375), breast cancer cell lines (MDAMB415, CAMA1, MCF7, BT474,

294

HCC1419, DU4475, BT549), B-ALL cell lines (SUPB15), CML cell lines (K562, MEG01), Burkitt's lymphoma cell lines (RAMOS2G64C10, DAUDI), mantle cell lymphoma cell lines (JEKO1, REC1), bladder cancer cell lines (HT1197), and lung cancer cell lines (SBC5), the above methods were performed with the following modifications: Cells were plated in 96 well plates, and the next day, BRG1/BRM ATPase inhibitor, Compound B, was dissolved in DM10 and added to the cells in a concentration gradient from 0 to 10 micromolar. At the time of cell splitting on days 3 and 7, cells were split into new 96 well plates, and fresh compound was added four hours after re-plating.
