- (57) **ABSTRACT**
- This application discloses a parametric design method of a roller tooth profile of a work roll for roll forming of a flow channel of a metal bipolar plate. The method includes: (1) an engagement transmission drawing is plotted according to depth h of the flow channel and a rolling period angle, where $h=r_1-r_6$. A first-half surface of a tooth consists of six segments, where the top surface segment, the upper half segment of the tooth side, the root segment, and the transition segments for the top corner and the root corner are arc curves, and the lower half segment of the tooth side is a straight line. (2) With the center O_1 of the upper roller as the origin, a transverse end coordinate system is established, and the six segments of the left-half tooth are designed regarding parameters.

ROLLER TOOTH PROFILE OF WORK ROLL FOR ROLL FORMING OF FLOW CHANNEL OF METAL BIPOLAR PLATE AND PARAMETRIC DESIGN METHOD THEREOF

CROSS-REFERENCE TO RELATED APPLICATIONS

This application claims the benefit of priority from Chinese Patent Application No. 202210697348.5, filed on Jun. 20, 2022. The content of the aforementioned application, including any intervening amendments thereto, is incorporated herein by reference in its entirety.

TECHNICAL FIELD

This application relates to roller tooth profile design of work rolls for roll forming of a metal bipolar plate in a hydrogen fuel cell, and more particularly to a roller tooth profile of a work roll for roll forming of a flow channel of a metal bipolar plate and parametric design method thereof.

BACKGROUND

The metal bipolar plate is a core component of hydrogen fuel cell stacks, whose flow channel can be continuously processed through roll processing. At present, the roller commonly used for the flow channel processing has an involute-tooth profile, which is difficult to process the flow channel whose inclination of a sidewall is right angle. Besides, products produced by such rollers are small in product cycle and poor in heat dissipation, and cannot meet the requirements of product quality.

SUMMARY

A object of the present disclosure is to provide a roller tooth profile of a work roll for roll forming of a flow channel of a metal bipolar plate to overcome the deficiencies in the prior art.

The technical solution of the present disclosure is described below.

In a first aspect, this application provides a roller tooth profile of a work roll for roll forming of a flow channel of a metal bipolar plate, wherein the work roll comprises an upper roller and a lower roller, and each of the upper roller and the lower roller comprises a plurality of teeth and a plurality of grooves; and the roller tooth profile is determined based on flow channel depth h and a rolling period, wherein $h=r_1-r_6$; the rolling period is determined by a period angle φ which is an angle between center lines of two adjacent teeth; r_1 is a radius of a tooth top circle of the upper roller; and r_6 is a radius of a tooth root circle of the upper roller;

a roller tooth profile diagram is plotted according to the flow channel depth h and the rolling period; a first-half surface of a tooth of the upper roller consists of a tooth top surface segment AB, a tooth top angle segment BC, a tooth-side upper half segment CD, a tooth-side lower half segment DE, a tooth root angle segment EF, and a tooth root segment FG; wherein the segment AB is taken from a first circle with a center O_1 of the upper roller as center and the radius r_1 as radius; the segment CD is taken from a second circle with a center O_3 of an adjacent tooth as center and r_3 as radius, wherein r_3 is a distance from the center O_3 to a tooth-side point of the

2

tooth corresponding to the segment AB; the segment BC is an arc transition segment tangent to points B and C and with O_2 as center; the segment DE is a straight segment tangent to point D; the segment FG is an arc segment with O_1 as center and the radius r_6 as radius; and the segment EF is an arc segment tangent to points E and F and with O_5 as center; and

the first-half surface of the tooth is the same as second-half surface of the tooth in shape, and symmetrical with the second-half teeth of the tooth; and the upper roller is the same as the lower roller in roller tooth profile.

In a second aspect, this application provides a work roll for roll forming of a flow channel of a metal bipolar plate, wherein the work roll has the aforementioned roller tooth profile.

In a third aspect, this application provides a parametric design method of the aforementioned roller tooth profile, comprising:

establishing a transverse end surface coordinate system with the center O_1 of the upper roller as origin, an abscissa axis as X-axis and an ordinate axis as Y-axis, wherein a coordinate formula for the segment AB is represented by:

$$\begin{cases} x_1 = r_1 \cos \theta_1 \\ y_1 = r_1 \sin \theta_1 \end{cases}; \quad (1)$$

wherein r_1 represents the radius of the tooth top circle of the upper roller; and θ_1 represents a parametric variable of a function of the segment AB, with a range of

$$\left[\frac{\pi}{2}, \frac{\pi}{2} + \alpha \right];$$

the segment BC is an arc transition section between the segment AB and the segment CD, and a coordinate formula of the segment BC is represented by:

$$\begin{cases} x_2 = r_2 \cos \theta_2 + E_2 \\ y_2 = r_2 \sin \theta_2 + F_2 \end{cases}; \quad (2)$$

wherein r_2 is a radius of a transition arc of a tooth top angle; and E_2 and F_2 are coordinates of the center O_2 , and are respectively represented by:

$$E_2 = \frac{(r_3 + r_2)^2}{2r \sin \varphi} + \cot \varphi \frac{-\frac{(r_3 + r_2)^2 \sin \varphi}{r} + \sqrt{\frac{(r_3 + r_2)^2 \sin^2 \varphi}{r^2} - 4 \left[\frac{(r_3 + r_2)^4}{4r^2} - (r_1 - r_2)^2 \right]}}{2}; \quad (3)$$

and

$$F_2 = \frac{-\frac{(r_3 + r_2)^2 \sin \varphi}{r} + \sqrt{\frac{(r_3 + r_2)^2 \sin^2 \varphi}{r^2} - 4 \left[\frac{(r_3 + r_2)^4}{4r^2} - (r_1 - r_2)^2 \right]}}{2}; \quad (4)$$

wherein θ_2 represents a parametric variable of a function of the segment BC, with a range of

$$\left[\arctan \frac{r_1 \cos \alpha - F_2}{-r_1 \sin \alpha - E_2}, \pi + \arctan \frac{F_2 + r \sin \varphi}{E_2 - r \cos \varphi} \right];$$

a coordinate formula for the segment CD is represented by:

$$\begin{cases} x_3 = r_3 \cos \theta_3 - r \sin \varphi; \\ y_3 = r_3 \sin \theta_3 + r \cos \varphi; \end{cases} \quad (5)$$

wherein r_3 is the distance from the center O_3 to the tooth-side point of the tooth corresponding to the segment AB; r is a radius of a pitch circle between the segment AB and the segment FG, and $r = (r_1 + r_6) / 2$, in mm; φ is an angle between the Y-axis and a segment $O_1 O_3$;

φ is obtained according to a flow channel period T through the following formula:

$$\varphi = \frac{T}{r} \cdot \frac{180^\circ}{\pi}; \quad (6)$$

and

θ_3 represents a parametric variable of a function of the segment CD, with a range of

$$\left[\delta - \frac{\pi}{2}, \arctan \frac{F_2 + r \sin \varphi}{E_2 - r \cos \varphi} \right];$$

a coordinate formula for the segment DE is represented by:

$$\begin{cases} x_4 = a + t; \\ y_4 = b + kt; \end{cases} \quad (7)$$

wherein k is a slope of a line where the segment DE is located, and is represented by:

$$k = \frac{\frac{r_3^2 - 2r^2}{2r \sin \varphi} + b \cot \varphi + r \sin \varphi}{r \cos \varphi - b};$$

wherein a and b represent coordinates of point D, and are respectively represented by:

$$a = \frac{r_3^2 - 2r^2}{2r \sin \varphi} + \cot \varphi \cos \varphi \frac{2r^2 - r_3^2}{2r} + \quad (9)$$

$$\cot \varphi \sqrt{\cos^2 \varphi \frac{(r_3^2 - 2r^2)^2}{(2r)^2} - \left[\frac{(r_3^2 - 2r^2)^2}{(2r)^2} - \frac{(2r)^2 \sin^2 \varphi}{4} \right]}; \text{ and}$$

$$b = \cos \varphi \frac{2r^2 - r_3^2}{2r} + \sqrt{\cos^2 \varphi \frac{(r_3^2 - 2r^2)^2}{(2r)^2} - \left[\frac{(r_3^2 - 2r^2)^2}{(2r)^2} - \frac{(2r)^2 \sin^2 \varphi}{4} \right]}; \quad (10)$$

wherein t represents a parametric variable of a function of the segment DE, with a range of

$$\left[0, \frac{r_3 (\sin \delta - \cos \delta)}{k + 1} \right];$$

a coordinate formula for the segment EF is represented by:

$$\begin{cases} x_5 = r_5 \cos \theta_5 + E_5; \\ y_5 = r_5 \sin \theta_5 + F_5; \end{cases} \quad (11)$$

wherein r_5 is a radius of the segment EF; an inclination angle of the line where the segment DE is located is expressed by:

$$\delta = \arctan k \quad (12);$$

E_5 and F_5 represent coordinates of the center O_5 , and are respectively represented by:

$$E_5 = \frac{2k[r_5 \cos \delta - kr_5 \sin \delta - ak + b] + \sqrt{4k^2[r_5 \cos \delta - kr_5 \sin \delta - ak + b]^2 - 4(k^2 + 1)[(r_5 \cos \delta - kr_5 \sin \delta - ak + b)^2 - (r_6 + r_5)^2]}}{2(k^2 + 1)}; \text{ and}$$

$$F_5 = k(E_5 - r_5 \sin \delta) + r_5 \cos \delta - ak + b; \quad (14)$$

θ_5 represents a parametric variable of a function of the segment EF, with a range of

$$\left[\arctan \frac{-E_5}{F_5} - \frac{\pi}{2}, \arctan \frac{(k+1)(b - F_5) + r_3 (\sin \delta - \cos \delta)}{(k+1)(a - E_5) + r_3 (\sin \delta - \cos \delta)} \right];$$

a coordinate formula for the segment FG is represented by:

$$\begin{cases} x_6 = r_6 \cos \theta_6; \\ y_6 = r_6 \sin \theta_6; \end{cases} \quad (15)$$

wherein r_6 is a radius of the segment FG; and θ_6 represents a parametric variable of a function of the segment FG, with a range of

$$\left[\frac{\pi}{2} + \arctan \frac{-E_5}{F_5}, \frac{\pi + \varphi}{2} \right];$$

wherein a roller tooth profile curve period T is 1.6-6 mm, wherein the roller tooth profile curve period is equal to the flow channel period T ; r_1 is 20-200 mm; the flow channel depth h is 0.4-3 mm; r_2 is 0.15-0.35 mm; r_3 is 2.3-4.5 mm; r_3 is 0.15-0.35 mm; and an angle α between $O_1 A$ and $O_1 B$ is 0.11-4.3°.

The beneficial effects of the present disclosure are described below.

In this application, a working roller with a new roll shape curve is formed by dividing the left-half shape of an upper roller into six consecutive curves. By using the roll system with the roll shape features, a metal bipolar plate whose flow channel has a sidewall inclination angle approximating a right angle can be processed. Such a metal bipolar plate has high heat dissipation capacity, good rigidity, and good sealing assembly performance, which is the ideal shape for

hydrogen fuel cells. Therefore, so it is necessary to machine the metal bipolar plate whose flow channel has the sidewall inclination angle approximating a right angle.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 schematically shows an engagement of an upper roller and a lower roller according to an embodiment of the present disclosure;

FIG. 2 is an enlarged view of part A in FIG. 1;

FIG. 3 is a partial enlargement of the upper roller according to an embodiment of the present disclosure;

FIG. 4 is an enlarged view of part M in FIG. 3; and

FIG. 5 schematically shows a product whose sidewall inclination angle approximates a right angle produced through roll forming.

DETAILED DESCRIPTION OF EMBODIMENTS

According to known conditions, namely, a depth h of the flow channel and a rolling period, a roller tooth profile of a work roll for roll forming of a flow channel of a metal bipolar plate is determined, as shown in FIGS. 1-4, where $h=r_1-r_6$; the rolling period is determined by a period angle φ which is an angle between center lines of two adjacent teeth; r_1 is a radius of a tooth top circle of the upper roller; and r_6 is a radius of a tooth root circle of the upper roller.

As shown in FIG. 4, for a first-half surface of a tooth of the upper roller consists of a tooth top surface segment AB, a tooth top angle segment BC, a tooth-side upper half segment CD, a tooth-side lower half segment DE, a tooth root angle segment EF, and a tooth root segment FG. The segment AB is taken from a first circle with a center O_1 of the upper roller as center and the radius r_1 as radius. The segment CD is taken from a second circle with a center O_3 of an adjacent tooth as center and r_3 as radius, where r_3 is a distance from the center O_3 to a tooth-side point of the tooth corresponding to the segment AB. The segment BC is an arc transition segment tangent to points B and C and with O_2 as center. The segment DE is a straight segment tangent to point D. The segment FG is an arc segment with O_1 as center and the radius r_6 as radius. The segment EF is an arc segment tangent to points E and F and with O_5 as center. With segment O_1A as the symmetry axis, symmetry segments that are respectively axisymmetric with the segment AB, the segment BC, the segment CD, the segment DE, the segment EF and the segment FG. The symmetry segments, the segment AB, the segment BC, the segment CD, the segment DE, the segment EF and the segment FG are connected repeatedly with T as a cycle to form a complete circumferential roll cross-section curve. The design of the upper roller is the same as that of a lower roller.

With the center O_1 of the upper roller as the origin, a transverse end coordinate system is established with an abscissa axis as X-axis and an ordinate axis as Y-axis, and the parameters of the roller tooth profile are designed.

When designing the roller tooth profile, the depth h is selected as 2 mm, and r_1 is selected as 26 mm. According to the formulas $h=r_1-r_6$ and $r=(r_1+r_6)/2$, r_6 and r are calculated to be 24 mm and 25 mm, respectively. α is selected as 2.3° , and θ_1 has the range of $[90^\circ, 92.3^\circ]$. The tooth top surface segment AB the is obtained from formula (1). r_3 is selected as 4.2 mm, T is selected as 5.2 mm, and φ is determined as 12° according to formula (6). The inclination angle δ of the tooth-side lower-half segment DE is determined as 97.2° by formula (12). θ_3 has the range of $[7.2^\circ, 17.7^\circ]$, and the tooth-side upper half segment CD is determined by formula

(2). r_2 is selected as 0.2 mm, and the coordinates of the circle center O_2 (E_2, F_2) are calculated as $(-1, 25.8)$ by formulas (3) and (4), and O_2 has the range of $[92.3^\circ, 197.7^\circ]$. The tooth top angle BC segment is determined by formula (2). The coordinates of the point D (a, b) are calculated as $(-1.06, 24.97)$ by formulas (9) and (10). The slope k of the tooth-side lower half segment DE is determined as -7.9 by formula (8), and the range of t is $(0, 0.8)$. The tooth-side lower half segment DE is determined by formula (7). r_5 is selected as 0.2 mm. The coordinates of circle center O_5 (E_5, F_5) are determined as $(-1.2, 24.2)$ by formulas (13) and (14). The range of θ_5 is $[-87.3^\circ, 7.2^\circ]$, and the tooth root angle segment EF is determined by formula (11). The range of θ_6 is $[92.7^\circ, 96^\circ]$, and the tooth root segment FG is determined by formula (15).

With segment O_1A as the symmetry axis, symmetry segments that are respectively axisymmetric with the segment AB, the segment BC, the segment CD, the segment DE, the segment EF and the segment FG. The symmetry segments, the segment AB, the segment BC, the segment CD, the segment DE, the segment EF and the segment FG are connected repeatedly with T as a cycle to form a complete circumferential roll cross-section curve. The upper roller is the same as the lower roller in roller tooth profile. The roll gap e is selected to be 0.2 mm, and the center distance dr is selected to be 50.2 mm to assemble the upper roller and the lower roller. As shown in FIG. 5, a metal bipolar plate whose flow channel has a period T of 5.55 mm, a depth h of 1.95 mm and a sidewall inclination of approximately right angle is obtained.

What is claimed is:

1. A roller tooth profile of a work roll for roll forming of a flow channel of a metal bipolar plate, wherein the work roll comprises an upper roller and a lower roller, and each of the upper roller and the lower roller comprises a plurality of teeth and a plurality of grooves; and the roller tooth profile is determined based on flow channel depth h and a rolling period, wherein $h=r_1-r_6$; the rolling period is determined by a period angle φ which is an angle between center lines of two adjacent teeth; r_1 is a radius of a tooth top circle of the upper roller; and r_6 is a radius of a tooth root circle of the upper roller;

a roller tooth profile diagram is plotted according to the flow channel depth h and the rolling period; a first-half surface of a tooth of the upper roller consists of a tooth top surface segment AB, a tooth top angle segment BC, a tooth-side upper half segment CD, a tooth-side lower half segment DE, a tooth root angle segment EF, and a tooth root segment FG; wherein the segment AB is taken from a first circle with a center O_1 of the upper roller as center and the radius r_1 as radius; the segment CD is taken from a second circle with a center O_3 of an adjacent tooth as center and r_3 as radius, wherein r_3 is a distance from the center O_3 to a tooth-side point of the tooth corresponding to the segment AB; the segment BC is an arc transition segment tangent to points B and C and with O_2 as center; the segment DE is a straight segment tangent to point D; the segment FG is an arc segment with O_1 as center and the radius r_6 as radius; and the segment EF is an arc segment tangent to points E and F and with O_5 as center; and the first-half surface of the tooth is the same as second-half surface of the tooth in shape, and symmetrical with the second-half teeth of the tooth; and the upper roller is the same as the lower roller in roller tooth profile.

7

2. A work roll for roll forming of a flow channel of a metal bipolar plate, wherein the work roll has the roller tooth profile of claim 1.

3. A parametric design method of the roller tooth profile of claim 1, comprising:

establishing a transverse end surface coordinate system with the center O_1 of the upper roller as origin, an abscissa axis as X-axis and an ordinate axis as Y-axis, wherein a coordinate formula for the segment AB is represented by:

$$\begin{cases} x_1 = r_1 \cos \theta_1; \\ y_1 = r_1 \sin \theta_1; \end{cases} \quad (1)$$

wherein r_1 represents the radius of the tooth top circle of the upper roller; and θ_1 represents a parametric variable of a function of the segment AB, with a range of

$$\left[\frac{\pi}{2}, \frac{\pi}{2} + \alpha \right];$$

the segment BC is an arc transition section between the segment AB and the segment CD, and a coordinate formula of the segment BC is represented by:

$$\begin{cases} x_2 = r_2 \cos \theta_2 + E_2; \\ y_2 = r_2 \sin \theta_2 + F_2; \end{cases} \quad (2)$$

wherein r_2 is a radius of a transition arc of a tooth top angle; and E_2 and F_2 are coordinates of the center O_2 , and are respectively represented by:

$$E_2 = \frac{(r_3 + r_2)^2}{2r \sin \varphi} + \cot \varphi \frac{\frac{-(r_3 + r_2)^2 \sin \varphi}{r} + \sqrt{\frac{(r_3 + r_2)^2 \sin^2 \varphi}{r^2} - 4 \left[\frac{(r_3 + r_2)^2}{4r^2} - (r_1 - r_2)^2 \right]}}{2}; \quad (3)$$

and

$$F_2 = \frac{\frac{-(r_3 + r_2)^2 \sin \varphi}{r} + \sqrt{\frac{(r_3 + r_2)^2 \sin^2 \varphi}{r^2} - 4 \left[\frac{(r_3 + r_2)^4}{2r^2} - (r_1 - r_2)^2 \right]}}{2}; \quad (4)$$

wherein θ_2 represents a parametric variable of a function of the segment BC, with a range of

$$\left[\arctan \frac{r_1 \cos \alpha - F_2}{-r_1 \sin \alpha - E_2}, \pi + \arctan \frac{F_2 + r \sin \varphi}{E_2 - r \cos \varphi} \right]; \quad (5)$$

a coordinate formula for the segment CD is represented by:

$$\begin{cases} x_3 = r_3 \cos \theta_3 - r \sin \varphi; \\ y_3 = r_3 \sin \theta_3 + r \cos \varphi; \end{cases} \quad (5)$$

wherein r_3 is the distance from the center O_3 to the tooth-side point of the tooth corresponding to the segment AB; r is a radius of a pitch circle between

8

the segment AB and the segment FG, and $r = (r_1 + r_6)/2$, in mm; γ is an angle between the Y-axis and a segment $O_1 O_3$;

φ is obtained according to a flow channel period T through the following formula:

$$\varphi = \frac{T}{r} \cdot \frac{180^\circ}{\pi}; \quad (6)$$

and

θ_3 represents a parametric variable of a function of the segment CD, with a range of

$$\left[\delta - \frac{\pi}{2}, \arctan \frac{F_2 + r \sin \varphi}{E_2 - r \cos \varphi} \right];$$

a coordinate formula for the segment DE is represented by:

$$\begin{cases} x_4 = a + t; \\ y_4 = b + kt; \end{cases} \quad (7)$$

wherein k is a slope of a line where the segment DE is located, and is represented by:

$$k = \frac{\frac{r_3^2 - 2r^2}{2r \sin \varphi} + b \cot \varphi + r \sin \varphi}{r \cos \varphi - b};$$

wherein a and b represent coordinates of point D, and are respectively represented by:

$$a = \frac{r_3^2 - 2r^2}{2r \sin \varphi} + \cot \varphi \cos \varphi \frac{2r^2 - r_3^2}{2r} + \cot \varphi \sqrt{\cos^2 \varphi \frac{(r_3^2 - 2r^2)^2}{(2r)^2} - \left[\frac{(r_3^2 - 2r^2)^2}{(2r)^2} - \frac{(2r)^2 \sin^2 \varphi}{4} \right]}; \quad (9)$$

and

$$b = \cos \varphi \frac{2r^2 - r_3^2}{2r} + \sqrt{\cos^2 \varphi \frac{(r_3^2 - 2r^2)^2}{(2r)^2} - \left[\frac{(r_3^2 - 2r^2)^2}{(2r)^2} - \frac{(2r)^2 \sin^2 \varphi}{4} \right]}; \quad (10)$$

wherein t represents a parametric variable of a function of the segment DE, with a range of

$$\left[0, \frac{r_3 (\sin \delta - \cos \delta)}{k + 1} \right];$$

a coordinate formula for the segment EF is represented by:

$$\begin{cases} x_5 = r_5 \cos \theta_5 + E_5; \\ y_5 = r_5 \sin \theta_5 + F_5; \end{cases} \quad (11)$$

wherein r_5 is a radius of the segment EF;

9

an inclination angle of the line where the segment DE is located is expressed by:

$$\delta = \arctan k \quad (12);$$

E_5 and F_5 represent coordinates of the center O_5 , and are respectively represented by:

$$E_5 = \frac{2k[r_5 \cos \delta - kr_5 \sin \delta - ak + b] + \sqrt{4k^2[r_5 \cos \delta - kr_5 \sin \delta - ak + b]^2 - 4(k^2 + 1)[(r_5 \cos \delta - kr_5 \sin \delta - ak + b)^2 - (r_6 + r_5)^2}}{2(k^2 + 1)}; \quad (13)$$

and

$$F_5 = k(E_5 - r_5 \sin \delta) + r_5 \cos \delta - ak + b; \quad (14)$$

θ_5 represents a parametric variable of a function of the segment EF, with a range of

$$\left[\arctan \frac{-E_5}{F_5} - \frac{\pi}{2}, \arctan \frac{(k+1)(b-F_5) + r_3(\sin \delta - \cos \delta)}{(k+1)(a-E_5) + r_3(\sin \delta - \cos \delta)} \right]; \quad (15)$$

10

a coordinate formula for the segment FG is represented by:

$$\begin{cases} x_6 = r_6 \cos \theta_6, \\ y_6 = r_6 \sin \theta_6, \end{cases} \quad (15)$$

wherein r_6 is a radius of the segment FG; and θ_6 represents a parametric variable of a function of the segment FG, with a range of

$$\left[\frac{\pi}{2} + \arctan \frac{-E_5}{F_5}, \frac{\pi + \varphi}{2} \right];$$

wherein a roller tooth profile curve period T is 1.6-6 mm, wherein the roller tooth profile curve period is equal to the flow channel period T; r_1 is 20-200 mm; the flow channel depth h is 0.4-3 mm; r_2 is 0.15-0.35 mm; r_5 is 2.3-4.5 mm; r_5 is 0.15-0.35 mm; and an angle α between O_1A and O_1B is 0.11-4.3°.

4. A method for machining a work roll for roll forming of a flow channel of a metal bipolar plate, comprising: obtaining a roller tooth profile of the work roll through the parametric design method of claim 3; and machining the work roll based on the roller tooth profile.
