TECHNICAL FIELD OF THE INVENTION

[0002] The present invention relates to compounds and methods useful for the modulation of one or more SWI/SNF-related matrix-associated actin-dependent regulator of chromatin subfamily A ("SMARCA") and/or polybromo-1 ("PB1") protein via ubiquitination and/or degradation by compounds according to the description provided herein. The disclosure also provides pharmaceutically acceptable compositions comprising compounds of the present description and methods of using said compositions in the treatment of various disorders.

BACKGROUND OF THE INVENTION

[0003] Ubiquitin-Proteasome Pathway (UPP) is a critical pathway that regulates key regulator proteins and degrades misfolded or abnormal proteins. UPP is central to multiple cellular processes, and if defective or imbalanced, it leads to pathogenesis of a variety of diseases. The covalent attachment of ubiquitin to specific protein substrates is achieved through the action of E3 ubiquitin ligases.

[0004] There are over 600 E3 ubiquitin ligases which facilitate the ubiquitination of different proteins *in vivo*, which can be divided into four families: HECT-domain E3s, U-box E3s, monomeric RING E3s and multi-subunit E3s. See e.g., Li et al. "Genome-wide and functional annotation of human E3 ubiquitin ligases identifies MULAN, a mitochondrial E3 that regulates the organelle's dynamics and signaling." *PLOS One* 2008, (3) 1487; Berndsen et al. "New insights into ubiquitin E3 ligase mechanism" *Nat. Struct. Mol. Biol.* 2014, 21:301; Deshaies et al. "RING domain E3 ubiquitin ligases" *Ann. Rev. Biochem.* 2009, 78:399; Spratt et al. "RBR E3 ubiquitin ligases: new structures, new insights, new questions" *Biochem.* 2014, 458:421; and Wang et al. "Roles of F-box proteins in cancer" *Nat. Rev. Cancer.* 2014, 14:233.

[0005] UPP plays a key role in the degradation of short-lived and regulatory proteins important in a variety of basic cellular processes, including regulation of the cell cycle, modulation of cell surface receptors and ion channels, and antigen presentation. The pathway has been implicated in several forms of malignancy, in the pathogenesis of several genetic diseases (including cystic fibrosis, Angelman's syndrome, and Liddle syndrome), in immune surveillance/viral pathogenesis, and in the pathology of muscle wasting. Many diseases are associated with an abnormal UPP and negatively affect cell cycle and division, the cellular response to stress and to extracellular modulators, morphogenesis of neuronal networks, modulation of cell surface receptors, ion channels, the secretory pathway, DNA repair and biogenesis of organelles.

[0006] Aberrations in the process have recently been implicated in the pathogenesis of several diseases, both inherited and acquired. These diseases fall into two major groups: (a) those that result from loss of function with the resultant stabilization of certain proteins, and (b) those that result from gain of function, i.e. abnormal or accelerated degradation of the protein target.

[0007] The UPP is used to induce selective protein degradation, including use of fusion proteins to artificially ubiquitinate target proteins and synthetic small-molecule probes to induce proteasome-dependent degradation. Bifunctional compounds composed of a target protein-binding ligand and an E3 ubiquitin ligase ligand, induced proteasome-mediated degradation of selected proteins via their recruitment to E3 ubiquitin ligase and subsequent ubiquitination. These drug-like molecules offer the possibility of temporal control over protein expression. Such compounds are capable of inducing the inactivation of a protein of interest upon addition to cells or administration to an animal or human, and could be useful as biochemical reagents and lead to a new paradigm for the treatment of diseases by removing pathogenic or oncogenic proteins. See e.g., Crews, *Chem. & Biol.* 2010, 17 (6): 551; Schneekloth and Crews, *ChemBioChem* 2005, 6 (1): 40.

[0008] An ongoing need exists in the art for effective treatments for disease, especially hyperplasia and cancers. However, non-specific effects, and the inability to target and modulate certain classes of proteins altogether, such as transcription factors, remain as obstacles to the development of effective anti-cancer agents. As such, small molecule therapeutic agents that leverage UPP mediated protein degradation to target cancer-associated proteins such as one or more SWI/SNF-related matrix-associated actin-dependent regulator of chromatin subfamily A ("SMARCA") and/or polybromo-1 ("PB1") protein hold promise as therapeutic agents. Accordingly, there remains a need to find compounds that are SMARCA degraders useful as therapeutic agents.

SUMMARY OF THE INVENTION

[0009] The present disclosure relates to novel compounds, which function to recruit one or more SMARCA2, SMARCA4, or PB1 protein to E3 ubiquitin ligases for degradation or directly facilitate ubiquitination for degradation, and methods of preparation and uses thereof. In particular, the present disclosure provides bifunctional compounds, which find utility as modulators of targeted ubiquitination of SMARCA and/or PB1 proteins, which are then degraded and/or otherwise inhibited by the bifunctional compounds as described herein. An advantage of the compounds provided herein is that a broad range of pharmacological activities is possible, consistent with the degradation/inhibition of SMARCA and/or PB1 proteins. In addition, the description provides methods of using an amount of the compounds as described herein for the treatment or amelioration of a disease condition, such as cancer, e.g., lung cancer.

[0010] The present application further relates to targeted degradation of SMARCA and/or PB1 proteins through the use of bifunctional molecules, including bifunctional mol-

ecules that link a cereblon-binding moiety to a ligand that binds SMARCA and/or PB1 proteins.

[0011] It has now been found that compounds of this disclosure, and pharmaceutically acceptable compositions thereof, are effective as degraders of SMARCA and/or PB1 proteins. Such compounds have the general formula I:

[0043] As used herein, the term “pharmaceutically acceptable salt” refers to those salts which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of humans and lower animals without undue toxicity, irritation, allergic response and the like, and are commensurate with a reasonable benefit/risk ratio. Pharmaceutically acceptable salts are well known in the art. For example, S. M. Berge et al., describe pharmaceutically acceptable salts in detail in *J. Pharmaceutical Sciences*, 1977, 66, 1-19, incorporated herein by reference. Pharmaceutically acceptable salts of the compounds of this invention include those derived from suitable inorganic and organic acids and bases. Examples of pharmaceutically acceptable, nontoxic acid addition salts are salts of an amino group formed with inorganic acids such as hydrochloric acid, hydrobromic acid, phosphoric acid, sulfuric acid and perchloric acid or with organic acids such as acetic acid, oxalic acid, maleic acid, tartaric acid, citric acid, succinic acid or malonic acid or by using other methods used in the art such as ion exchange. Other pharmaceutically acceptable salts include adipate, alginate, ascorbate, aspartate, benzenesulfonate, benzoate, bisulfate, borate, butyrate, camphorate, camphorsulfonate, citrate, cyclopentanepropionate, digluconate, dodecylsulfate, ethanesulfonate, formate, fumarate, glucoheptonate, glycerophosphate, gluconate, hemisulfate, heptanoate, hexanoate, hydroiodide, 2-hydroxy-ethanesulfonate, lactobionate, lactate, laurate, lauryl sulfate, malate, maleate, malonate, methanesulfonate, 2-naphthalenesulfonate, nicotinate, nitrate, oleate, oxalate, palmitate, pamoate, pectinate, persulfate, 3-phenylpropionate, phosphate, pivalate, propionate, stearate, succinate, sulfate, tartrate, thiocyanate, p-toluenesulfonate, undecanoate, valerate salts, and the like.

Representative alkali or alkaline earth metal salts include sodium, lithium, potassium, calcium, magnesium, and the like. Further pharmaceutically acceptable salts include, when appropriate, nontoxic ammonium, quaternary ammonium, and amine cations formed using counterions such as halide, hydroxide, carboxylate, sulfate, phosphate, nitrate, loweralkyl sulfonate and aryl sulfonate.

Therefore, single stereochemical isomers as well as enantiomeric, diastereomeric,

and geometric (or conformational) mixtures of the present compounds are within the scope of the invention. Unless otherwise stated, all tautomeric forms of the compounds of the invention are within the scope of the invention. Additionally, unless otherwise stated, structures depicted herein are also meant to include compounds that differ only in the presence of one or more isotopically enriched atoms. For example, compounds having the present structures including the replacement of hydrogen by deuterium or tritium, or the replacement of a carbon by a ^{13}C - or ^{14}C -enriched carbon are within the scope of this invention. Such compounds are useful, for example, as analytical tools, as probes in biological assays, or as therapeutic agents in accordance with the present invention.

[0046] As used herein, the term “provided compound” refers to any genus, subgenus, and/or species set forth herein.

[0047] As used herein, the term “and/or” is used in this disclosure to mean either “and” or “or” unless indicated otherwise.

[0048] As used herein, the term “inhibitor” is defined as a compound that binds to and/or inhibits a SMARCA and/or PB1 protein with measurable affinity. In certain embodiments, an inhibitor has an IC_{50} and/or binding constant of less than about 50 μM , less than about 1 μM , less than about 500 nM, less than about 100 nM, less than about 10 nM, or less than about 1 nM.

[0049] As used herein, the term “degrader” is defined as a monovalent or bifunctional compound that binds to and/or inhibits a SMARCA and/or PB1 protein and optionally an E3 ligase with measurable affinity resulting in the ubiquitination and subsequent degradation of the SMARCA and/or PB1 protein. In certain embodiments, a degrader has an DC_{50} of less than about 50 M, less than about 1 μM , less than about 500 nM, less than about 100 nM, less than about 10 nM, or less than about 1 nM. As used herein, the term “monovalent” refers to a compound without an appended E3 ligase.

[0050] A compound of the present invention may be tethered to a detectable moiety. It will be appreciated that such compounds are useful as imaging agents. One of ordinary skill in the art will recognize that a detectable moiety may be attached to a provided compound via a suitable substituent. As used herein, the term “suitable substituent” refers to a moiety that is capable of covalent attachment to a detectable moiety. Such moieties are well known to one of ordinary skill in the art and include groups containing, e.g., a carboxylate moiety, an amino moiety, a thiol moiety, or a hydroxyl moiety, to name but a few. It will be appreciated that such moieties may be directly attached to a provided compound or via a tethering group, such as a bivalent saturated or unsaturated hydrocarbon chain. In some embodiments, such moieties may be attached via click chemistry. In some embodiments, such moieties may be attached via a 1,3-cycloaddition of an azide with an alkyne, optionally in the presence of a copper catalyst. Methods of using click chemistry are known in the art and include those described by Rostovtsev et al., *Angew. Chem. Int. Ed.* 2002, 41, 2596-99 and Sun et al., *Bioconjugate Chem.*, 2006, 17, 52-57.

[0051] As used herein, the term “detectable moiety” is used interchangeably with the term “label” and relates to any moiety capable of being detected, e.g., primary labels and secondary labels. Primary labels, such as radioisotopes (e.g.,

tritium, ^{32}P , ^{33}P , ^{35}S , or ^{14}C), mass-tags, and fluorescent labels are signal generating reporter groups which can be detected without further modifications. Detectable moieties also include luminescent and phosphorescent groups.

[0052] The term “secondary label” as used herein refers to moieties such as biotin and various protein antigens that require the presence of a second intermediate for production of a detectable signal. For biotin, the secondary intermediate may include streptavidin-enzyme conjugates. For antigen labels, secondary intermediates may include antibody-enzyme conjugates. Some fluorescent groups act as secondary labels because they transfer energy to another group in the process of nonradiative fluorescent resonance energy transfer (FRET), and the second group produces the detected signal.

[0053] The terms “fluorescent label”, “fluorescent dye”, and “fluorophore” as used herein refer to moieties that absorb light energy at a defined excitation wavelength and emit light energy at a different wavelength. Examples of fluorescent labels include, but are not limited to: Alexa Fluor dyes (Alexa Fluor 350, Alexa Fluor 488, Alexa Fluor 532, Alexa Fluor 546, Alexa Fluor 568, Alexa Fluor 594, Alexa Fluor 633, Alexa Fluor 660 and Alexa Fluor 680), AMCA, AMCA-S, BODIPY dyes (BODIPY FL, BODIPY R6G, BODIPY TMR, BODIPY TR, BODIPY 530/550, BODIPY 558/568, BODIPY 564/570, BODIPY 576/589, BODIPY 581/591, BODIPY 630/650, BODIPY 650/665), Carboxy-rhodamine 6G, carboxy-X-rhodamine (ROX), Cascade Blue, Cascade Yellow, Coumarin 343, Cyanine dyes (Cy3, Cy5, Cy3.5, Cy5.5), Dansyl, Dapoxyl, Dialkylaminocoumarin, 4',5'-Dichloro-2',7'-dimethoxy-fluorescein, DM-NERF, Eosin, Erythrosin, Fluorescein, FAM, Hydroxycoumarin, IRDyes (IRD40, IRD 700, IRD 800), JOE, Lissamine rhodamine B, Marina Blue, Methoxycoumarin, Naphthofluorescein, Oregon Green 488, Oregon Green 500, Oregon Green 514, Pacific Blue, PyMPO, Pyrene, Rhodamine B, Rhodamine 6G, Rhodamine Green, Rhodamine Red, Rhodol Green, 2',4',5',7'-Tetra-bromosulfone-fluorescein, Tetramethyl-rhodamine (TMR), Carboxytetramethyl-rhodamine (TAMRA), Texas Red, Texas Red-X.

[0054] The term “mass-tag” as used herein refers to any moiety that is capable of being uniquely detected by virtue of its mass using mass spectrometry (MS) detection techniques. Examples of mass-tags include electrophore release tags such as N-[3-[4'-(p-Methoxytetrafluorobenzyl)oxy]phenyl]-3-methylglyceronyl]isonipecotic Acid, 4'-[2,3,5,6-Tetrafluoro-4-(pentafluorophenoxy)]methyl acetophenone, and their derivatives. The synthesis and utility of these mass-tags is described in U.S. Pat. Nos. 4,650,750, 4,709,016, 5,360,819, 5,516,931, 5,602,273, 5,604,104, 5,610,020, and 5,650,270. Other examples of mass-tags include, but are not limited to, nucleotides, dideoxynucleotides, oligonucleotides of varying length and base composition, oligopeptides, oligosaccharides, and other synthetic polymers of varying length and monomer composition. A large variety of organic molecules, both neutral and charged (biomolecules or synthetic compounds) of an appropriate mass range (100-2000 Daltons) may also be used as mass-tags.

[0055] The terms “measurable affinity” and “measurably inhibit,” as used herein, means a measurable change in a SMARCA and/or PB1 protein activity between a sample comprising a compound of the present invention, or composition thereof, and a SMARCA and/or PB1 protein, and an

equivalent sample comprising a SMARCA and/or PB1 protein, in the absence of said compound, or composition thereof.

unsaturated carbocyclylenyl, a 4-11 membered saturated or partially unsaturated spiro carbocyclylenyl, an 8-10 membered bicyclic saturated or partially unsaturated carbocyclylenyl, a 4-7 membered saturated or partially unsaturated heterocyclylenyl having 1-2 heteroatoms independently selected from nitrogen, oxygen, and sulfur, a 4-11 membered saturated or partially unsaturated spiro heterocyclylenyl having 1-2 heteroatoms independently selected from nitrogen, oxygen, and sulfur, an 8-10 membered bicyclic saturated or partially unsaturated heterocyclylenyl having 1-2 heteroatoms independently selected from nitrogen, oxygen, and sulfur, a 5-6 membered heteroarylenyl having 1-4 heteroatoms independently selected from nitrogen, oxygen, and sulfur, or an 8-10 membered bicyclic heteroarylenyl having 1-5 heteroatoms independently selected from nitrogen, oxygen, or sulfur, and wherein r is 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, or 10, and R is as described herein (e.g., in formula I-a).

[0797] In some embodiments, L is a covalent bond. In some embodiments, each $-Cy-$ is independently an optionally substituted bivalent phenylenyl. In some embodiments, each $-Cy-$ is independently an optionally substituted 8-10 membered bicyclic arylenyl. In some embodiments, each $-Cy-$ is independently an optionally substituted 4-7 membered saturated or partially unsaturated carbocyclylenyl. In some embodiments, each $-Cy-$ is independently an optionally substituted 4-7 membered saturated or partially unsaturated spiro carbocyclylenyl. In some embodiments, each $-Cy-$ is independently an optionally substituted 8-10 membered bicyclic saturated or partially unsaturated carbocyclylenyl. In some embodiments, each $-Cy-$ is independently an optionally substituted 4-7 membered saturated or partially unsaturated heterocyclylenyl having 1-2 heteroatoms independently selected from nitrogen, oxygen, and sulfur. In some embodiments, each $-Cy-$ is independently an optionally substituted 4-7 membered saturated or partially unsaturated spiro heterocyclylenyl having 1-2 heteroatoms independently selected from nitrogen, oxygen, and sulfur. In some embodiments, each $-Cy-$ is independently an optionally substituted 8-10 membered bicyclic saturated or partially unsaturated heterocyclylenyl having 1-2 heteroatoms independently selected from nitrogen, oxygen, and sulfur. In some embodiments, each $-Cy-$ is independently an optionally substituted 5-6 membered heteroarylenyl having 1-4 heteroatoms independently selected from nitrogen, oxygen, and sulfur. In some embodiments, each $-Cy-$ is independently an optionally substituted 8-10 membered bicyclic heteroarylenyl having 1-5 heteroatoms independently selected from nitrogen, oxygen, or sulfur.

methods known to those skilled in the art for analogous compounds and by methods described in detail in the Examples, herein.

[0818] In the Schemes below, where a particular protecting group, leaving group, or transformation condition is depicted, one of ordinary skill in the art will appreciate that other protecting groups, leaving groups, and transformation conditions are also suitable and are contemplated. Such

groups and transformations are described in detail in March's Advanced Organic Chemistry: Reactions, Mechanisms, and Structure, M. B. Smith and J. March 5th Edition, John Wiley & Sons, 2001, Comprehensive Organic Transformations, R. C. Larock, 2nd Edition, John Wiley & Sons, 1999, and Protecting Groups in Organic Synthesis, T. W. Greene and P. G. M. Wuts, 3rd edition, John Wiley & Sons, 1999, the entirety of each of which is hereby incorporated herein by reference.

In some embodiments, pharmaceutically acceptable compositions of this invention are administered without food. In other embodiments, pharmaceutically acceptable compositions of this invention are administered with food.

[0855] The amount of compounds of the present invention that may be combined with the carrier materials to produce a composition in a single dosage form will vary depending upon the host treated, the particular mode of administration. Preferably, provided compositions should be formulated so that a dosage of between 0.01-100 mg/kg body weight/day of the compound can be administered to a patient receiving these compositions.

[0856] It should also be understood that a specific dosage and treatment regimen for any particular patient will depend upon a variety of factors, including the activity of the specific compound employed, the age, body weight, general health, sex, diet, time of administration, rate of excretion, drug combination, and the judgment of the treating physician and the severity of the particular disease being treated. The amount of a compound of the present invention in the composition will also depend upon the particular compound in the composition.

[0859] The activity of a compound utilized in this invention as a degrader and/or inhibitor of one or more SMARCA or PB1, or a mutant thereof, may be assayed in vitro, in vivo or in a cell line. In vitro assays include assays that determine inhibition of either the activity and/or the subsequent functional consequences of activated SMARCA or PB1 protein, or a mutant thereof. Alternate in vitro assays quantitate the ability of the inhibitor to bind to a SMARCA or PB1 protein. Inhibitor binding may be measured by radiolabeling the inhibitor prior to binding, isolating the inhibitor/SMARCA or PB1 complex and determining the amount of radiolabel bound. Alternatively, inhibitor binding may be determined by running a competition experiment where new inhibitors are incubated with a SMARCA or PB1 protein bound to known radioligands. Representative in vitro and in vivo assays useful in assaying a SMARCA or PB1 inhibitor include those described and disclosed in, e.g., Tanaka et al. “Design and Characterization of Bivalent BET Inhibitors” *Nat. Chem. Biol.* 2016, 12 (12): 1089; Schiaffino-Ortega et al. “SWI/SNF as targets in cancer therapy” *J. Hematol. Oncol.* 2014, 7:81; Filippakopoulos et al. “Histone Recognition and Large-Scale Structural Analysis of the Human Bromodomain Family” *Cell* 2012, 149:214. Detailed conditions for assaying a compound utilized in this invention as a degrader and/or inhibitor of a SMARCA or PB1 protein, or a mutant thereof, are set forth in the Examples below.

[0860] Chromatin is a complex combination of DNA and protein that makes up chromosomes. Chromatin functions to package, strengthen, and control expression and DNA replication. The chromatin structure is controlled by a series of post-translational modifications, most commonly within the “histone tails” which extend beyond the core nucleosome structure. These epigenetic modifications including acetylation, methylation, phosphorylation, ubiquitinylation, and SUMOylation, is then interpreted by the cell to allow gene specific regulation of chromatin structure and thereby transcription. Histone modifications are dynamic, as they can be added or removed in response to specific stimuli, and these modifications direct both structural changes to chromatin and alterations in gene transcription. Distinct classes of enzymes, namely histone acetyltransferases (HATs) and histone deacetylases (HDACs), acetylate or de-acetylate specific histone lysine residues (Struhl, *Genes Dev.* 1989, 12 (5): 599).

[0861] Bromodomains, which are approximately 110 amino acids long, are found in a large number of chromatin-associated proteins and have been identified in approximately 70 human proteins, often adjacent to other protein motifs (Jeanmougin et al., *Trends Biochem. Sci.* 1997, 22

(5): 151; Tamkun et al., *Cell* 1992, 7 (3): 561). Interactions between bromodomains and modified histones may be an important mechanism underlying chromatin structural changes and gene regulation. Bromodomain-containing proteins have been implicated in disease processes including cancer, inflammation and viral replication. See, e.g., Prinjha et al, *Trends Pharm. Sci.* 2012, 33 (3): 146; Muller et al. *Expert Rev.* 2011, 13 (29): 1.

[0862] Cell-type specificity and proper tissue functionality requires the tight control of distinct transcriptional programs that are intimately influenced by their environment. Alterations to this transcriptional homeostasis are directly associated with numerous disease states, most notably cancer, immuno-inflammation, neurological disorders, and metabolic diseases. Bromodomains reside within key chromatin modifying complexes that serve to control distinctive disease-associated transcriptional pathways. An example of such a complex is the switch/sucrose nonfermenting (“SWI/SNF”) chromatin-remodeling complex, which has been reported to be involved in gene regulation, cell lineage specification and development, and comprises a number of bromodomain containing subunits, including SWI/SNF-related matrix-associated actin-dependent regulator of chromatin subfamily A member 2 and 4 (SMARCA2 and SMARCA4) and polybromo-1 (PB1; also known as PBRM1). SMARCA2 and SMARCA4, also known as transcription activators Brahma homologue (BRM) and Brahma-related gene 1 (BRG1) respectively, are mutually exclusive helicase/ATPase proteins of the large ATP-dependent SWI/SNF chromatin-remodeling complexes involved in transcriptional regulation of gene expression. In some embodiments, a provided compound binds to one or more SMARCA2, SMARCA4, or PB1 bromodomains. In some embodiments, a provided compound binds to one or more SMARCA2, SMARCA4, or PB1 ATPase domains.

[0863] Representative SMARCA2, SMARCA4, and/or PB1 inhibitors include those described and disclosed in e.g., Gerstenberger et al. *J. Med. Chem.* 2016, 59 (10): 4800; Theodoulou et al. *Curr. Opin. Chem. Bio.* 2016, 33:58; Vangamudi et al. *Cancer Res.* 2015, 75 (18): 3865; the entirety of each of which is herein incorporated by reference.

[0864] As used herein, the terms “treatment,” “treat,” and “treating” refer to reversing, alleviating, delaying the onset of, or inhibiting the progress of a disease or disorder, or one or more symptoms thereof, as described herein. In some embodiments, treatment may be administered after one or more symptoms have developed. In other embodiments, treatment may be administered in the absence of symptoms. For example, treatment may be administered to a susceptible individual prior to the onset of symptoms (e.g., in light of a history of symptoms and/or in light of genetic or other susceptibility factors). Treatment may also be continued after symptoms have resolved, for example to prevent or delay their recurrence.

[0865] Provided compounds are degraders and/or inhibitors of one or more SMARCA2, SMARCA4, or PB1 protein and are therefore useful for treating one or more disorders associated with activity of one or more of SMARCA2, SMARCA4, or PB1 protein. Thus, in certain embodiments, the present invention provides a method for treating a SMARCA2-mediated, SMARCA4-mediated, or PB1-mediated disorder comprising the step of administering to a patient in need thereof a compound of the present invention, or pharmaceutically acceptable composition thereof.

Accordingly, another embodiment of the present invention relates to treating or lessening the severity of one or more diseases in which one or more SMARCA2, SMARCA4, or PB1, or a mutant thereof, are known to play a role.

[0882] SMARCA2 has recently been reported as a synthetic lethal target in SMARCA4-deficient cancers (e.g., cancers comprising SMARCA4 loss of function mutations and/or cancers having reduced or absent expression, e.g., due to epigenetic alterations). SMARCA2 depletion has been shown to selectively inhibit the growth of SMARCA4-mutant cancer cells (Hoffman et al., PNAS 2014, 111 (8): 3128; Oike et al., Cancer Res. 2013, 73 (17): 5508). In some embodiments, the cancer treated by a provided compound is a SMARCA4-deficient cancer (e.g., a cancer harboring a loss of function mutation and/or having reduced or absent SMARCA4 expression).

[0883] It has also been shown that certain cancers are dependent on SMARCA4 for disease progression and are vulnerable to SMARCA4 inhibition, including certain acute leukemia and small cell lung cancers (Hohmann et al., Trends in Genetics, 2014, 30 (8): 356). In some embodiments, the cancer treated by a provided compound is leukemia (e.g., acute leukemia, e.g., acute myeloid leukemia), breast cancer, small cell lung cancer, or malignant rhabdoid tumors (MRT) (e.g., a SNF5-deficient malignant rhabdoid tumor).

[0885] In some embodiments, the present invention provides a method of treating malignant rhabdoid tumors (MRT) in a patient in need thereof, comprising administering a compound of the present invention, or a pharmaceutically acceptable salt thereof.

[0886] Compounds according to the invention are useful in the treatment of inflammatory or obstructive airways diseases, resulting, for example, in reduction of tissue damage, airways inflammation, bronchial hyperreactivity, remodeling or disease progression. Inflammatory or obstructive airways diseases to which the present invention is applicable include asthma of whatever type or genesis including both intrinsic (non-allergic) asthma and extrinsic (allergic) asthma, mild asthma, moderate asthma, severe asthma, bronchitic asthma, exercise-induced asthma, occupational asthma and asthma induced following bacterial infection. Treatment of asthma is also to be understood as embracing treatment of subjects, e.g. of less than 4 or 5 years of age, exhibiting wheezing symptoms and diagnosed or diagnosable as “wheezy infants”, an established patient

category of major medical concern and now often identified as incipient or early-phase asthmatics.

[0887] Compounds according to the invention are useful in the treatment of heteroimmune diseases. Examples of such heteroimmune diseases include, but are not limited to, graft versus host disease, transplantation, transfusion, anaphylaxis, allergies (e.g., allergies to plant pollens, latex, drugs, foods, insect poisons, animal hair, animal dander, dust mites, or cockroach calyx), type I hypersensitivity, allergic conjunctivitis, allergic rhinitis, and atopic dermatitis.

[0888] Prophylactic efficacy in the treatment of asthma will be evidenced by reduced frequency or severity of symptomatic attack, e.g. of acute asthmatic or bronchoconstrictor attack, improvement in lung function or improved airways hyperreactivity. It may further be evidenced by reduced requirement for other, symptomatic therapy, such as therapy for or intended to restrict or abort symptomatic attack when it occurs, for example anti-inflammatory or bronchodilatory. Prophylactic benefit in asthma may in particular be apparent in subjects prone to “morning dipping”. “Morning dipping” is a recognized asthmatic syndrome, common to a substantial percentage of asthmatics and characterized by asthma attack, e.g. between the hours of about 4 to 6 am, i.e. at a time normally substantially distant from any previously administered symptomatic asthma therapy.

[0889] Compounds of the current invention can be used for other inflammatory or obstructive airways diseases and conditions to which the present invention is applicable and include acute lung injury (ALI), adult/acute respiratory distress syndrome (ARDS), chronic obstructive pulmonary, airways or lung disease (COPD, COAD or COLD), including chronic bronchitis or dyspnea associated therewith, emphysema, as well as exacerbation of airways hyperreactivity consequent to other drug therapy, in particular other inhaled drug therapy. The invention is also applicable to the treatment of bronchitis of whatever type or genesis including, but not limited to, acute, arachidic, catarrhal, croupus, chronic or phthinoid bronchitis. [0959] The compounds and compositions, according to the method of the present invention, may be administered using any amount and any route of administration effective for treating or lessening the severity of a cancer, an autoimmune disorder, a proliferative disorder, an inflammatory disorder, a neurodegenerative or neurological disorder, schizophrenia, a bone-related disorder, liver disease, or a cardiac disorder. The exact amount required will vary from subject to subject, depending on the species, age, and general condition of the subject, the severity of the infection, the particular agent, its mode of administration, and the like. Compounds of the invention are preferably formulated in dosage unit form for ease of administration and uniformity of dosage. The expres-

sion "dosage unit form" as used herein refers to a physically discrete unit of agent appropriate for the patient to be treated. It will be understood, however, that the total daily usage of the compounds and compositions of the present invention will be decided by the attending physician within the scope of sound medical judgment. The specific effective dose level for any particular patient or organism will depend upon a variety of factors including the disorder being treated and the severity of the disorder; the activity of the specific compound employed; the specific composition employed; the age, body weight, general health, sex and diet of the patient; the time of administration, route of administration, and rate of excretion of the specific compound employed; the duration of the treatment; drugs used in combination or coincidental with the specific compound employed, and like factors well known in the medical arts.

[0960] Pharmaceutically acceptable compositions of this invention can be administered to humans and other animals orally, rectally, parenterally, intracisternally, intravaginally, intraperitoneally, topically (as by powders, ointments, or drops), buccally, as an oral or nasal spray, or the like, depending on the severity of the infection being treated. In certain embodiments, the compounds of the invention may be administered orally or parenterally at dosage levels of about 0.01 mg/kg to about 50 mg/kg and preferably from about 1 mg/kg to about 25 mg/kg, of subject body weight per day, one or more times a day, to obtain the desired therapeutic effect.

[0961] Liquid dosage forms for oral administration include, but are not limited to, pharmaceutically acceptable emulsions, microemulsions, solutions, suspensions, syrups and elixirs. In addition to the active compounds, the liquid dosage forms may contain inert diluents commonly used in the art such as, for example, water or other solvents, solubilizing agents and emulsifiers such as ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate, benzyl alcohol, benzyl benzoate, propylene glycol, 1,3-butylene glycol, dimethylformamide, oils (in particular, cottonseed, groundnut, corn, germ, olive, castor, and sesame oils), glycerol, tetrahydrofurfuryl alcohol, polyethylene glycols and fatty acid esters of sorbitan, and mixtures thereof. Besides inert diluents, the oral compositions can also include adjuvants such as wetting agents, emulsifying and suspending agents, sweetening, flavoring, and perfuming agents.

[0962] Injectable preparations, for example, sterile injectable aqueous or oleaginous suspensions may be formulated according to the known art using suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation may also be a sterile injectable solution, suspension or emulsion in a nontoxic parenterally acceptable diluent or solvent, for example, as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution, U.S.P. and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil can be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid are used in the preparation of injectables.

[0963] Injectable formulations can be sterilized, for example, by filtration through a bacterial-retaining filter, or by incorporating sterilizing agents in the form of sterile solid

compositions which can be dissolved or dispersed in sterile water or other sterile injectable medium prior to use.

[0964] In order to prolong the effect of a compound of the present invention, it is often desirable to slow the absorption of the compound from subcutaneous or intramuscular injection. This may be accomplished by the use of a liquid suspension of crystalline or amorphous material with poor water solubility. The rate of absorption of the compound then depends upon its rate of dissolution that, in turn, may depend upon crystal size and crystalline form. Alternatively, delayed absorption of a parenterally administered compound form is accomplished by dissolving or suspending the compound in an oil vehicle. Injectable depot forms are made by forming microencapsule matrices of the compound in biodegradable polymers such as polylactide-polyglycolide. Depending upon the ratio of compound to polymer and the nature of the particular polymer employed, the rate of compound release can be controlled. Examples of other biodegradable polymers include poly(orthoesters) and poly(anhydrides). Depot injectable formulations are also prepared by entrapping the compound in liposomes or micro-emulsions that are compatible with body tissues.

[0965] Compositions for rectal or vaginal administration are preferably suppositories which can be prepared by mixing the compounds of this invention with suitable non-irritating excipients or carriers such as cocoa butter, polyethylene glycol or a suppository wax which are solid at ambient temperature but liquid at body temperature and therefore melt in the rectum or vaginal cavity and release the active compound.

[0966] Solid dosage forms for oral administration include capsules, tablets, pills, powders, and granules. In such solid dosage forms, the active compound is mixed with at least one inert, pharmaceutically acceptable excipient or carrier such as sodium citrate or dicalcium phosphate and/or a) fillers or extenders such as starches, lactose, sucrose, glucose, mannitol, and silicic acid, b) binders such as, for example, carboxymethylcellulose, alginates, gelatin, polyvinylpyrrolidone, sucrose, and acacia, c) humectants such as glycerol, d) disintegrating agents such as agar, calcium carbonate, potato or tapioca starch, alginic acid, certain silicates, and sodium carbonate, e) solution retarding agents such as paraffin, f) absorption accelerators such as quaternary ammonium compounds, g) wetting agents such as, for example, cetyl alcohol and glycerol monostearate, h) absorbents such as kaolin and bentonite clay, and i) lubricants such as talc, calcium stearate, magnesium stearate, solid polyethylene glycols, sodium lauryl sulfate, and mixtures thereof. In the case of capsules, tablets and pills, the dosage form may also comprise buffering agents.

[0967] Solid compositions of a similar type may also be employed as fillers in soft and hard-filled gelatin capsules using such excipients as lactose or milk sugar as well as high molecular weight polyethylene glycols and the like. The solid dosage forms of tablets, dragees, capsules, pills, and granules can be prepared with coatings and shells such as enteric coatings and other coatings well known in the pharmaceutical formulating art. They may optionally contain opacifying agents and can also be of a composition that they release the active ingredient(s) only, or preferentially, in a certain part of the intestinal tract, optionally, in a delayed manner. Examples of embedding compositions that can be used include polymeric substances and waxes. Solid compositions of a similar type may also be employed as fillers

in soft and hard-filled gelatin capsules using such excipients as lactose or milk sugar as well as high molecular weight polyethylene glycols and the like.

[0968] The active compounds can also be in micro-encapsulated form with one or more excipients as noted above. The solid dosage forms of tablets, dragees, capsules, pills, and granules can be prepared with coatings and shells such as enteric coatings, release controlling coatings and other coatings well known in the pharmaceutical formulating art. In such solid dosage forms the active compound may be admixed with at least one inert diluent such as sucrose, lactose or starch. Such dosage forms may also comprise, as is normal practice, additional substances other than inert diluents, e.g., tableting lubricants and other tableting aids such as magnesium stearate and microcrystalline cellulose. In the case of capsules, tablets and pills, the dosage forms may also comprise buffering agents. They may optionally contain opacifying agents and can also be of a composition that they release the active ingredient(s) only, or preferentially, in a certain part of the intestinal tract, optionally, in a delayed manner. Examples of embedding compositions that can be used include polymeric substances and waxes.

[0969] Dosage forms for topical or transdermal administration of a compound of this invention include ointments, pastes, creams, lotions, gels, powders, solutions, sprays, inhalants or patches. The active component is admixed under sterile conditions with a pharmaceutically acceptable carrier and any needed preservatives or buffers as may be required. Ophthalmic formulation, ear drops, and eye drops are also contemplated as being within the scope of this invention. Additionally, the present invention contemplates the use of transdermal patches, which have the added advantage of providing controlled delivery of a compound to the body. Such dosage forms can be made by dissolving or dispensing the compound in the proper medium. Absorption enhancers can also be used to increase the flux of the compound across the skin. The rate can be controlled by either providing a rate controlling membrane or by dispersing the compound in a polymer matrix or gel.

[1032] As used herein, the term "combination," "combined," and related terms refers to the simultaneous or sequential administration of therapeutic agents in accordance with this invention. For example, a compound of the present invention may be administered with another therapeutic agent simultaneously or sequentially in separate unit dosage forms or together in a single unit dosage form. Accordingly, the present invention provides a single unit dosage form comprising a compound of the current invention, an additional therapeutic agent, and a pharmaceutically acceptable carrier, adjuvant, or vehicle.

[1033] The amount of both an inventive compound and additional therapeutic agent (in those compositions which comprise an additional therapeutic agent as described above) that may be combined with the carrier materials to produce a single dosage form will vary depending upon the host treated and the particular mode of administration. Preferably, compositions of this invention should be formulated so

that a dosage of between 0.01-100 mg/kg body weight/day of an inventive compound can be administered.

[1034] In those compositions which comprise an additional therapeutic agent, that additional therapeutic agent and the compound of this invention may act synergistically. Therefore, the amount of additional therapeutic agent in such compositions will be less than that required in a monotherapy utilizing only that therapeutic agent. In such compositions a dosage of between 0.01-1,000 µg/kg body weight/day of the additional therapeutic agent can be administered.

[1035] The amount of one or more other therapeutic agent present in the compositions of this invention may be no more than the amount that would normally be administered in a composition comprising that therapeutic agent as the only active agent. Preferably the amount of one or more other therapeutic agent in the presently disclosed compositions will range from about 50% to 100% of the amount normally present in a composition comprising that agent as the only therapeutically active agent. In some embodiments, one or more other therapeutic agent is administered at a dosage of about 50%, about 55%, about 60%, about 65%, about 70%, about 75%, about 80%, about 85%, about 90%, or about 95% of the amount normally administered for that agent. Vascular stents, for example, have been used to overcome restenosis (re-narrowing of the vessel wall after injury). However, patients using stents or other implantable devices risk clot formation or platelet activation. These unwanted effects may be prevented or mitigated by pre-coating the device with a pharmaceutically acceptable composition comprising a kinase inhibitor. Implantable devices coated with a compound of this invention are another embodiment of the present invention.

[1064] CARs have been constructed that consist of binding domains, which may be derived from natural ligands, single chain variable fragments (scFv) derived from monoclonal antibodies specific for cell-surface antigens, fused to endodomains that are the functional end of the T-cell receptor (TCR), such as the CD3-zeta signaling domain from TCRs, which is capable of generating an activation signal in T lymphocytes. Upon antigen binding, such CARs link to endogenous signaling pathways in the effector cell and generate activating signals similar to those initiated by the TCR complex.

[1065] For example, in some embodiments the CAR-T cell is one of those described in U.S. Pat. No. 8,906,682 (June; hereby incorporated by reference in its entirety), which discloses CAR-T cells engineered to comprise an extracellular domain having an antigen binding domain (such as a domain that binds to CD19), fused to an intracellular signaling domain of the T cell antigen receptor complex zeta chain (such as CD3 zeta). When expressed in the T cell, the CAR is able to redirect antigen recognition based on the antigen binding specificity. In the case of CD19, the antigen is expressed on malignant B cells. Over 200 clinical trials are currently in progress employing CAR-T in a wide range of indications. [<https://clinicaltrials.gov/ct2/results?term=chimeric+antigen+receptors&pg=1>].

Exemplary Immune Checkpoint Inhibitors

[1074] In some embodiments, an immuno-oncology agent is an immune checkpoint inhibitor as described herein.

[1075] The term “checkpoint inhibitor” as used herein relates to agents useful in preventing cancer cells from avoiding the immune system of the patient. One of the major mechanisms of anti-tumor immunity subversion is known as “T-cell exhaustion,” which results from chronic exposure to antigens that has led to up-regulation of inhibitory receptors. These inhibitory receptors serve as immune checkpoints in order to prevent uncontrolled immune reactions.

[1076] PD-1 and co-inhibitory receptors such as cytotoxic T-lymphocyte antigen 4 (CTLA-4, B and T Lymphocyte Attenuator (BTLA; CD272), T cell Immunoglobulin and Mucin domain-3 (Tim-3), Lymphocyte Activation Gene-3 (Lag-3; CD223), and others are often referred to as a checkpoint regulators. They act as molecular “gatekeepers” that allow extracellular information to dictate whether cell cycle progression and other intracellular signaling processes should proceed.

[1077] In some embodiments, an immune checkpoint inhibitor is an antibody to PD-1. PD-1 binds to the programmed cell death 1 receptor (PD-1) to prevent the recep-

tor from binding to the inhibitory ligand PDL-1, thus overriding the ability of tumors to suppress the host anti-tumor immune response.

[1078] In one aspect, the checkpoint inhibitor is a biologic therapeutic or a small molecule. In another aspect, the checkpoint inhibitor is a monoclonal antibody, a humanized antibody, a fully human antibody, a fusion protein or a combination thereof. In a further aspect, the checkpoint inhibitor inhibits a checkpoint protein selected from CTLA-4, PDL1, PDL2, PD1, B7-H3, B7-H4, BTLA, HVEM, TIM3, GAL9, LAG3, VISTA, KIR, 2B4, CD160, CGEN-15049, CHK 1, CHK2, A2aR, B-7 family ligands or a combination thereof. In an additional aspect, the checkpoint inhibitor interacts with a ligand of a checkpoint protein selected from CTLA-4, PDL1, PDL2, PD1, B7-H3, B7-H4, BTLA, HVEM, TIM3, GAL9, LAG3, VISTA, KIR, 2B4, CD160, CGEN-15049, CHK 1, CHK2, A2aR, B-7 family ligands or a combination thereof. In an aspect, the checkpoint inhibitor is an immunostimulatory agent, a T cell growth factor, an interleukin, an antibody, a vaccine or a combination thereof. In a further aspect, the interleukin is IL-7 or IL-15. In a specific aspect, the interleukin is glycosylated IL-7. In an additional aspect, the vaccine is a dendritic cell (DC) vaccine.

[1079] Checkpoint inhibitors include any agent that blocks or inhibits in a statistically significant manner, the inhibitory pathways of the immune system. Such inhibitors may include small molecule inhibitors or may include antibodies, or antigen binding fragments thereof, that bind to and block or inhibit immune checkpoint receptors or antibodies that bind to and block or inhibit immune checkpoint receptor ligands. Illustrative checkpoint molecules that may be targeted for blocking or inhibition include, but are not limited to, CTLA-4, PDL1, PDL2, PD1, B7-H3, B7-H4, BTLA, HVEM, GAL9, LAG3, TIM3, VISTA, KIR, 2B4 (belongs to the CD2 family of molecules and is expressed on all NK, $\gamma\delta$, and memory CD8⁺ ($\alpha\beta$) T cells), CD160 (also referred to as BY55), CGEN-15049, CHK 1 and CHK2 kinases, A2aR, and various B-7 family ligands. B7 family ligands include, but are not limited to, B7-1, B7-2, B7-DC, B7-H1, B7-H2, B7-H3, B7-H4, B7-H5, B7-H6 and B7-H7. Checkpoint inhibitors include antibodies, or antigen binding fragments thereof, other binding proteins, biologic therapeutics, or small molecules, that bind to and block or inhibit the activity of one or more of CTLA-4, PDL1, PDL2, PD1, BTLA, HVEM, TIM3, GAL9, LAG3, VISTA, KIR, 2B4, CD 160 and CGEN-15049. The mixture was stirred at 80° C. for 12 hours. On the completion, the reaction mixture was partitioned between H₂O (20 mL) and Ethyl acetate (20 mL*3). The organic phase was separated, washed with brine (30 mL) and dried over Na₂SO₄, filtered and concentrated under reduced pressure to give a residue. Then the residue was purified by column chromatography (SiO₂, Petroleum ether/Ethyl acetate=1/0 to 5/1) to get the title compound (7 g, 66.3% yield, 94% purity) as a yellow solid. LC-MS (ESI, m/z): [M-55]⁺=239.9

[1218] Step 2: tert-butyl 4-(2-chloropyrimidin-4-yl)piperidine-1-carboxylate. To a solution of tert-butyl 4-(2-chloropyrimidin-4-yl)-5,6-dihydropyridine-1 (2H)-carboxylate (2 g, 6.76 mmol) in THF (60 mL) was added PtO₂ (1.54 g, 6.76 mmol) under N₂. The suspension was degassed under

vacuum and purged with H₂ three times. The mixture was stirred under H₂ (15 psi) at 25° C. for 12 hours. On the completion, the reaction mixture was filtered and concentrated under reduced pressure to give a residue, then the residue was purified by column chromatography (SiO₂, Petroleum ether/Ethyl acetate=10/1 to 3/1) to get the title compound (1.5 g, 73.6% yield, 98.8% purity) as a colorless oil. LC-MS (ESI, m/z): [M-55]⁺=242.2.

[1219] Step 3: tert-butyl 4-(2-(3-(2-(methoxymethoxy)phenyl)-5-methyl-7,8-dihydro-5H-pyrido[3',4':4,5]pyrrolo[2,3-c]pyridazin-6 (9H)-yl)pyrimidin-4-yl)piperidine-1-carboxylate. The mixture was stirred at 100° C. for 12 hours. On completion, the mixture was filtered by disposable needle filter. Then the mixture was purified by reversed-phase HPLC (0.1% FA condition) to get the title compound (500 mg, 49.1% yield, 88.6% purity) as a white solid. LC-MS (ESI, m/z): [M+1]⁺=586.3

Cell Culture: Cells are Cultured in Exponential Growth Phase.

[1239] Compound Preparation and Treatment: NCI-H1299 cells are seeded into the 96-well plate at 4.0*10⁴ cells per 100 ul per well. Incubate the plate in the incubator overnight. The next day, compounds are diluted to designed stock concentration by TECAN, then perform a 3 fold, 9-point dilution via transferring 15 uL compound into 30 uL DMSO using Apricot. 200 nL diluted compound from compound source plate are transferred into the 96-intermediate plate as designated by using Echo550, followed with 100 ul culture medium to make the 2X compound solution.

Cell plate are changed with 80 ul of fresh culture medium and 80 ul of 2X compound solution is added into the well to achieve the final designed concentration. Cell plate is then shaken at 720 rpm for 5 min and incubated for 24 hours in the incubator.

[1240] Sample Preparation: Media was aspirated from the cultures and the plate is washed with PBS twice. 60 μ L of pre-chilled PIPA lysis buffer (Boston BioProducts BP-115D) with protease inhibitor are directly added into the well to lyse the cells for 20 minutes at 4° C. Cell lysates were collected.

[1241] MSD Procedure: The MSD plate is coated with 40 ul cell lysate and incubated at 4° C. overnight. The next day, the MSD coated bare plate is washed 3 times with 150 ul 1x TBST per well, blocked with 150 ul of blocking buffer per well, and shaken for 1 hour at RT, 600 rpm. Blocking buffer is 3% Blocker A in TBST. MSD plate is then washed 3 times with 150 ul 1x TBST per well and Primary Detection antibody (Rabbit anti-SMARCA2/BRM antibody, 100 μ g/ml, ab223735) is added to a final [conc.]: 0.3 ug/ml, 25 ul/well and shaken for 1 hour at RT, 600 rpm. Antibody is prepared in Antibody Detection buffer (1% Blocker A in 1x TBST). The MSD plate is then washed 3 times with 150 ul 1x TBST per well and Secondary Detection antibody (SULFO-TAG anti-species antibody) is then added to a final [conc.]: 1 μ g/ml, 25 ul/well, and shaken for 1 hour at RT, 600 rpm. Antibodies are prepared in Antibody Detection buffer (1% Blocker A in 1x TBST). MSD plate is washed 3 times with 150 ul 1x TBST per well and 2X MSD reading buffer is added, 150 ul per well, and diluted from 4X with water. MSD instrument is then read.

[1242] Data Analysis: The percentage of relative level of SMARCA2 level is calculated following equation below.

$$\% \text{ Relative Level} = 100\% \times \frac{\text{MSD Signal}_{\text{Sample}} - \text{MSD Signal}_{\text{LC}}}{\text{MSD Signal}_{\text{HC}} - \text{MSD Signal}_{\text{LC}}}$$

[1243] LC: A2780, SMARCA2 negative cells. HC: NCI-H1299 cells treated with DMSO.
