Background/Summary

RELATED APPLICATIONS (1) This application is a continuation-in-part of U.S. application Ser. No. 17/479,669, filed Sep. 20, 2021, which claims the benefit of U.S. Provisional Application No. 63/187,138, filed May 11, 2021. This application also claims priority to U.S. Provisional Application No. 63/321,255, filed Mar. 18, 2022. The entire teachings of the above applications are incorporated herein by reference.

TECHNICAL FIELD

(1) The invention relates to compounds and methods of inhibiting coronavirus replication activity by contacting the 3C-Like protease (sometimes referred to as "3CLpro", "Main protease", or "Mpro") with a therapeutically effective amount of a 3C-Like protease inhibitor. The invention further relates to pharmaceutical compositions containing the coronavirus 3C-Like protease inhibitor in a mammal by administering effective amounts of such coronavirus 3C-Like protease inhibitor.

BACKGROUND OF THE INVENTION

(2) Coronaviruses are enveloped, positive-sense, single-stranded RNA viruses. The genomic RNA of CoVs has a 5'-cap structure and 3'-poly-A tail and contains at least 6 open reading frames (ORFs). The first ORF (ORF 1a/b) directly translates two polyproteins: pp1a and pp1ab. These polyproteins are processed by a 3C-Like protease (3CLpro), also known as the main protease (Mpro), into 16 non-structural proteins. These non-structural proteins engage in the production of subgenomic RNAs that encode four structural proteins, namely envelope, membrane, spike, and nucleocapsid proteins, among other accessory proteins. As a result, it is understood that 3C-Like protease has a critical role in the coronavirus life cycle.

(3) 3CLpro is a cysteine protease involved in most cleavage events within the precursor polyprotein. Active 3CLpro is a homodimer containing two protomers and features a Cys-His dyad located in between domains I and II. 3CLpro is conserved among coronaviruses and several common features are shared among the substrates of 3CLpro in different coronaviruses. As there is no human homolog of 3CLpro, it is an ideal antiviral target. Although compounds have been reported to inhibit 3CLpro activity, they have not been approved as coronavirus therapies. (Refer to WO2018/042343, WO2018/023054, WO2005/113580, and WO2006/061714).

(4) More effective therapies for coronavirus infections are needed due to this high unmet clinical need. This invention describes the methods to prepare and methods for use of compounds that are believed to inhibit the coronavirus lifecycle. Compounds of this type might be used to treat coronavirus infections and decrease occurrence of disease complications such as organ failure or death.

(5) There is a need in the art for novel therapeutic agents that treat, ameliorate or prevent coronavirus infection. Administration of these therapeutic agents to a coronavirus infected patient, either as monotherapy or in combination with other coronavirus treatments or ancillary treatments, will lead to significantly improved prognosis, diminished progression of the disease, and enhanced seroconversion rates.

SUMMARY OF THE INVENTION

(6) The present invention relates to novel antiviral compounds, pharmaceutical compositions comprising such compounds, as well as methods to treat or prevent viral (particularly coronavirus) infection in a subject in need of such therapy with said compounds. Compounds of the present invention inhibit the protein(s) encoded by a coronavirus or interfere with the life cycle of a coronavirus and are also useful as antiviral agents. In addition, the present invention provides processes for the preparation of said compounds.

(7) The present invention provides compounds represented by Formula (I), and pharmaceutically acceptable salts, esters and prodrugs thereof,

Larock, *Comprehensive Organic Transformations*, 2.sup.nd Ed. Wiley-VCH (1999); T. W. Greene and P. G. M. Wuts, *Protective Groups in Organic Synthesis*, 3rd Ed., John Wiley and Sons (1999); L. Fieser and M. Fieser, *Fieser and Fieser's Reagents for Organic Synthesis*, John Wiley and Sons (1994); and L. Optical isomers may be prepared from their respective optically active precursors by the procedures described above, or by resolving the racemic mixtures. The resolution can be carried out in the presence of a resolving agent, by chromatography or by repeated crystallization or by some combination of these techniques which are known to those skilled in the art. Further details regarding resolutions can be found in Jacques, et al., *Enantiomers, Racemates, and Resolutions* (John Wiley & Sons, 1981). When the compounds described herein contain olefinic double bonds, other unsaturation, or other centers of geometric asymmetry, and unless specified otherwise, it is intended that the compounds include both E and Z geometric isomers or cis- and trans-isomers. Likewise, all tautomeric forms are also intended to be included. Tautomers may be in cyclic or acyclic. Further pharmaceutically acceptable salts include, when appropriate, nontoxic ammonium, quaternary ammonium, and amine cations formed using counterions such as halide, hydroxide, carboxylate, sulfate, phosphate, nitrate, alkyl having from 1 to 6 carbon atoms, sulfonate and aryl sulfonate.

(127) As used herein, the term “pharmaceutically acceptable ester” refers to esters which hydrolyze in vivo and include those that break down readily in the human body to leave the parent compound or a salt thereof. Suitable ester groups include, for example, those derived from pharmaceutically acceptable aliphatic carboxylic acids, particularly alkanolic, alkenolic, cycloalkanoic and alkanedioic acids, in which each alkyl or alkenyl moiety advantageously has not more than 6 carbon atoms. Examples of particular esters include, but are not limited to, formates, acetates, propionates, butyrates, acrylates and ethylsuccinates.

(128) Pharmaceutical Compositions

(129) The pharmaceutical compositions of the present invention comprise a therapeutically effective amount of a compound of the present invention formulated together with one or more pharmaceutically acceptable carriers or excipients.

(130) As used herein, the term “pharmaceutically acceptable carrier or excipient” means a non-toxic, inert solid, semi-solid or liquid filler, diluent, encapsulating material or formulation auxiliary of any type. Some examples of materials which can serve as pharmaceutically acceptable carriers are sugars such as lactose, glucose and sucrose; starches such as corn starch and potato starch; cellulose and its derivatives such as sodium carboxymethyl cellulose, ethyl cellulose and cellulose acetate; powdered tragacanth; malt; gelatin; talc; excipients such as cocoa butter and suppository waxes; oils such as peanut oil, cottonseed oil, safflower oil, sesame oil, olive oil, corn oil and soybean oil; glycols such as propylene glycol; esters such as ethyl oleate and ethyl laurate; agar; buffering agents such as magnesium hydroxide and aluminum hydroxide; alginic acid; pyrogen-free water; isotonic saline; Ringer's solution; ethyl alcohol, and phosphate buffer solutions, as well as other non-toxic compatible lubricants such as sodium lauryl sulfate and magnesium stearate, as well as coloring agents, releasing agents, coating agents, sweetening, flavoring and perfuming agents, preservatives and antioxidants can also be present in the composition, according to the judgment of the formulator.

(131) The pharmaceutical compositions of this invention may be administered orally, parenterally, by inhalation spray, topically, rectally, nasally, buccally, vaginally or via an implanted reservoir, preferably by oral administration or administration by injection. The pharmaceutical compositions of this invention may contain any conventional non-toxic pharmaceutically-acceptable carriers, adjuvants or vehicles. In some cases, the pH of the formulation may be adjusted with pharmaceutically acceptable acids, bases or buffers to enhance the stability of the formulated compound or its delivery form. The term parenteral as used herein includes subcutaneous, intracutaneous, intravenous, intramuscular, intraarticular, intra-arterial, intrasynovial, intrasternal, intrathecal, intralesional and intracranial injection or infusion techniques.

(132) Liquid dosage forms for oral administration include pharmaceutically acceptable emulsions, microemulsions, solutions, suspensions, syrups and elixirs. In addition to the active compounds, the liquid dosage forms may contain inert diluents commonly used in the art such as, for example, water or other solvents, solubilizing agents and emulsifiers such as ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate, benzyl alcohol, benzyl benzoate, propylene glycol, 1,3-butylene glycol, dimethylformamide, oils (in particular, cottonseed, groundnut, corn, germ, olive, castor, and sesame oils), glycerol, tetrahydrofurfuryl alcohol, polyethylene glycols and fatty acid esters of sorbitan, and mixtures thereof. Besides inert diluents, the oral compositions can also include adjuvants such as wetting agents, emulsifying and suspending agents, sweetening, flavoring, and perfuming agents.

(133) Injectable preparations, for example, sterile injectable aqueous or oleaginous suspensions,

may be formulated according to the known art using suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation may also be a sterile injectable solution, suspension or emulsion in a nontoxic parenterally acceptable diluent or solvent, for example, as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution, U.S.P. and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose, any bland fixed oil can be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid are used in the preparation of injectable.

(134) The injectable formulations can be sterilized, for example, by filtration through a bacterial-retaining filter, or by incorporating sterilizing agents in the form of sterile solid compositions which can be dissolved or dispersed in sterile water or other sterile injectable medium prior to use.

(135) In order to prolong the effect of a drug, it is often desirable to slow the absorption of the drug from subcutaneous or intramuscular injection. This may be accomplished by the use of a liquid suspension of crystalline or amorphous material with poor water solubility. The rate of absorption of the drug then depends upon its rate of dissolution, which, in turn, may depend upon crystal size and crystalline form. Alternatively, delayed absorption of a parenterally administered drug form is accomplished by dissolving or suspending the drug in an oil vehicle. Injectable depot forms are made by forming microencapsule matrices of the drug in biodegradable polymers such as polylactide-polyglycolide. Depending upon the ratio of drug to polymer and the nature of the particular polymer employed, the rate of drug release can be controlled. Examples of other biodegradable polymers include poly(orthoesters) and poly(anhydrides). Depot injectable formulations are also prepared by entrapping the drug in liposomes or microemulsions that are compatible with body tissues.

(136) Compositions for rectal or vaginal administration are preferably suppositories which can be prepared by mixing the compounds of this invention with suitable non-irritating excipients or carriers such as cocoa butter, polyethylene glycol or a suppository wax which are solid at ambient temperature but liquid at body temperature and therefore melt in the rectum or vaginal cavity and release the active compound.

(137) Solid dosage forms for oral administration include capsules, tablets, pills, powders, and granules. In such solid dosage forms, the active compound is mixed with at least one inert, pharmaceutically acceptable excipient or carrier such as sodium citrate or dicalcium phosphate and/or: a) fillers or extenders such as starches, lactose, sucrose, glucose, mannitol, and silicic acid, b) binders such as, for example, carboxymethylcellulose, alginates, gelatin, polyvinylpyrrolidone, sucrose, and acacia, c) humectants such as glycerol, d) disintegrating agents such as agar-agar, calcium carbonate, potato or tapioca starch, alginic acid, certain silicates, and sodium carbonate, e) solution retarding agents such as paraffin, f) absorption accelerators such as quaternary ammonium compounds, g) wetting agents such as, for example, cetyl alcohol and glycerol monostearate, h) absorbents such as kaolin and bentonite clay, and i) lubricants such as talc, calcium stearate, magnesium stearate, solid polyethylene glycols, sodium lauryl sulfate, and mixtures thereof. In the case of capsules, tablets and pills, the dosage form may also comprise buffering agents.

(138) Solid compositions of a similar type may also be employed as fillers in soft and hard-filled gelatin capsules using such excipients as lactose or milk sugar as well as high molecular weight polyethylene glycols and the like.

(139) The solid dosage forms of tablets, dragees, capsules, pills, and granules can be prepared with coatings and shells such as enteric coatings and other coatings well known in the pharmaceutical formulating art. They may optionally contain opacifying agents and can also be of a composition that they release the active ingredient(s) only, or preferentially, in a certain part of the intestinal tract, optionally, in a delayed manner. Examples of embedding compositions that can be used include polymeric substances and waxes.

(140) Dosage forms for topical or transdermal administration of a compound of this invention

include ointments, pastes, creams, lotions, gels, powders, solutions, sprays, inhalants or patches. The active component is admixed under sterile conditions with a pharmaceutically acceptable carrier and any needed preservatives or buffers as may be required. Ophthalmic formulation, ear drops, eye ointments, powders and solutions are also contemplated as being within the scope of this invention.

(141) The ointments, pastes, creams and gels may contain, in addition to an active compound of this invention, excipients such as animal and vegetable fats, oils, waxes, paraffins, starch, tragacanth, cellulose derivatives, polyethylene glycols, silicones, bentonites, silicic acid, talc and zinc oxide, or mixtures thereof.

(142) Powders and sprays can contain, in addition to the compounds of this invention, excipients such as lactose, talc, silicic acid, aluminum hydroxide, calcium silicates and polyamide powder, or mixtures of these substances. Sprays can additionally contain customary propellants such as chlorofluorohydrocarbons.

(143) Transdermal patches have the added advantage of providing controlled delivery of a compound to the body. Such dosage forms can be made by dissolving or dispensing the compound in the proper medium. Absorption enhancers can also be used to increase the flux of the compound across the skin. The rate can be controlled by either providing a rate controlling membrane or by dispersing the compound in a polymer matrix or gel.

(144) For pulmonary delivery, a therapeutic composition of the invention is formulated and administered to the patient in solid or liquid particulate form by direct administration e.g., inhalation into the respiratory system. Solid or liquid particulate forms of the active compound prepared for practicing the present invention include particles of respirable size: that is, particles of a size sufficiently small to pass through the mouth and larynx upon inhalation and into the bronchi and alveoli of the lungs. Delivery of aerosolized therapeutics, particularly aerosolized antibiotics, is known in the art (see, for example U.S. Pat. No. 5,767,068 to Van Deventer et al., U.S. Pat. No. 5,508,269 to Smith et al., and WO 98/43650 by Montgomery, all of which are incorporated herein by reference).

(145) Combination and Alternation Therapy

(146) The compounds of the present invention may be used in combination with one or more antiviral therapeutic agents or anti-inflammatory agents useful in the prevention or treatment of viral diseases or associated pathophysiology. Thus, the compounds of the present invention and their salts, solvates, or other pharmaceutically acceptable derivatives thereof, may be employed alone or in combination with other antiviral or anti-inflammatory therapeutic agents. The compounds herein and pharmaceutically acceptable salts thereof may be used in combination with one or more other agents which may be useful in the prevention or treatment of respiratory disease, inflammatory disease, autoimmune disease, for example; anti-histamines, corticosteroids, (e.g., fluticasone propionate, fluticasone furoate, beclomethasone dipropionate, budesonide, ciclesonide, mometasone furoate, triamcinolone, flunisolide), NSAIDs, Leukotriene modulators (e.g., montelukast, zafirlukast, pranlukast), tryptase inhibitors, IKK2 inhibitors, p38 inhibitors, Syk inhibitors, protease inhibitors such as elastase inhibitors, integrin antagonists (e.g., beta-2 integrin antagonists), adenosine A2a agonists, mediator release inhibitors such as sodium chromoglycate, 5-lipoxygenase inhibitors (zyflo), DP1 antagonists, DP2 antagonists, PI3K delta inhibitors, ITK inhibitors, LP (Lysophosphatidic) inhibitors or FLAP (5-lipoxygenase activating protein) inhibitors (e.g., sodium 3-(3-(tert-butylthio)-1-(4-(6-ethoxypyridin-3-yl)benzyl)-5-((5-ethylpyridin-2-yl)methoxy)-1H-indol-2-yl)-2,2-dimethylpropanoate), bronchodilators (e.g., muscarinic antagonists, beta-2 agonists), methotrexate, and similar agents; monoclonal antibody therapy such as anti-IgE, anti-TNF, anti-IL-5, anti-IL-6, anti-IL-12, anti-IL-1 and similar agents; cytokine receptor therapies e.g. etanercept and similar agents; antigen non-specific immunotherapies (e.g. interferon or other cytokines/chemokines, chemokine receptor modulators such as CCR3, CCR4 or CXCR2 antagonists, other cytokine/chemokine agonists or antagonists, TLR agonists and similar

In general, combination therapy is typically preferred over alternation therapy because it induces multiple simultaneous stresses on the virus.

(147) Although the invention has been described with respect to various preferred embodiments, it is not intended to be limited thereto, but rather those skilled in the art will recognize that variations and modifications may be made therein which are within the spirit of the invention and the scope of the appended claims.

(148) Antiviral Activity

(149) An inhibitory amount or dose of the compounds of the present invention may range from about 0.01 mg/Kg to about 500 mg/Kg, alternatively from about 1 to about 50 mg/Kg. Inhibitory amounts or doses will also vary depending on route of administration, as well as the possibility of co-usage with other agents.

(150) According to the methods of treatment of the present invention, viral infections are treated or prevented in a patient such as a human or another animal by administering to the patient a therapeutically effective amount of a compound of the invention, in such amounts and for such time as is necessary to achieve the desired result.

(151) By a “therapeutically effective amount” of a compound of the invention is meant an amount of the compound which confers a therapeutic effect on the treated subject, at a reasonable benefit/risk ratio applicable to any medical treatment. The therapeutic effect may be objective (i.e., measurable by some test or marker) or subjective (i.e., subject gives an indication of or feels an effect). An effective amount of the compound described above may range from about 0.1 mg/Kg to about 500 mg/Kg, preferably from about 1 to about 50 mg/Kg. Effective doses will also vary depending on route of administration, as well as the possibility of co-usage with other agents. It will be understood, however, that the total daily usage of the compounds and compositions of the present invention will be decided by the attending physician within the scope of sound medical judgment. The specific therapeutically effective dose level for any particular patient will depend upon a variety of factors including the disorder being treated and the severity of the disorder; the activity of the specific compound employed; the specific composition employed; the age, body weight, general health, sex and diet of the patient; the time of administration, route of administration, and rate of excretion of the specific compound employed; the duration of the treatment; drugs used in combination or contemporaneously with the specific compound employed; and like factors well known in the medical arts.

(152) The total daily dose of the compounds of this invention administered to a human or other animal in single or in divided doses can be in amounts, for example, from 0.01 to 50 mg/kg body weight or more usually from 0.1 to 25 mg/kg body weight. Single dose compositions may contain such amounts or submultiples thereof to make up the daily dose. In general, treatment regimens according to the present invention comprise administration to a patient in need of such treatment from about 10 mg to about 1000 mg of the compound(s) of this invention per day in single or multiple doses.

(153) The compounds of the present invention described herein can, for example, be administered by injection, intravenously, intra-arterial, subdermally, intraperitoneally, intramuscularly, or subcutaneously; or orally, buccally, nasally, transmucosally, topically, in an ophthalmic preparation, or by inhalation, with a dosage ranging from about 0.1 to about 500 mg/kg of body weight, alternatively dosages between 1 mg and 1000 mg/dose, every 4 to 120 hours, or according to the requirements of the particular drug. The methods herein contemplate administration of an effective amount of compound or compound composition to achieve the desired or stated effect. Typically, the pharmaceutical compositions of this invention will be administered from about 1 to about 6 times per day or alternatively, as a continuous infusion. Such administration can be used as a

chronic or acute therapy. The amount of active ingredient that may be combined with pharmaceutically excipients or carriers to produce a single dosage form will vary depending upon the host treated and the particular mode of administration. A typical preparation will contain from about 5% to about 95% active compound (w/w). Alternatively, such preparations may contain from about 20% to about 80% active compound.

(154) Lower or higher doses than those recited above may be required. Specific dosage and treatment regimens for any particular patient will depend upon a variety of factors, including the activity of the specific compound employed, the age, body weight, general health status, sex, diet, time of administration, rate of excretion, drug combination, the severity and course of the disease, condition or symptoms, the patient's disposition to the disease, condition or symptoms, and the judgment of the treating physician.

(155) Upon improvement of a patient's condition, a maintenance dose of a compound, composition or combination of this invention may be administered, if necessary. Subsequently, the dosage or frequency of administration, or both, may be reduced, as a function of the symptoms, to a level at which the improved condition is retained when the symptoms have been alleviated to the desired level. Patients may, however, require intermittent treatment on a long-term basis upon any recurrence of disease symptoms.

(156) When the compositions of this invention comprise a combination of a compound of the Formula described herein and one or more additional therapeutic or prophylactic agents, both the compound and the additional agent should be present at dosage levels of between about 1 to 100%, and more preferably between about 5 to 95% of the dosage normally administered in a monotherapy regimen. The additional agents may be administered separately, as part of a multiple dose regimen, from the compounds of this invention. Alternatively, those agents may be part of a single dosage form, mixed together with the compounds of this invention in a single composition.

(157) The "additional therapeutic or prophylactic agents" include but are not limited to, immune therapies (e.g. interferon), therapeutic vaccines, antifibrotic agents, anti-inflammatory agents such as corticosteroids or NSAIDs, bronchodilators such as beta-2 adrenergic agonists and xanthines (e.g. theophylline), mucolytic agents, anti-muscarinics, anti-leukotrienes, inhibitors of cell adhesion (e.g. ICAM antagonists), anti-oxidants (e.g. N-acetylcysteine), cytokine agonists, cytokine antagonists, lung surfactants and/or antimicrobial and anti-viral agents (e.g. ribavirin and amantadine). The compositions according to the invention may also be used in combination with gene replacement therapy.

(161) The compounds and processes of the present invention will be better understood in connection with the following synthetic schemes that illustrate the methods by which the compounds of the invention may be prepared, which are intended as an illustration only and not to limit the scope of the invention. Various changes and modifications to the disclosed embodiments will be apparent to those skilled in the art and such changes and modifications including, without limitation, those relating to the chemical structures, substituents, derivatives, and/or methods of the invention may be made without departing from the spirit of the invention and the scope of the appended claims.

Scheme 1 illustrates a general method to prepare the nitrile compound (X-16) of formula I from the amino ester compound (X-1), wherein B is as previously defined and PG.sub.1 is C.sub.1-C.sub.4 alkyl or Bn. Treatment of amine (X-1) with formaldehyde affords the cyclized amine (X-2), which was converted to (X-3) by using appropriate protecting group PG.sub.2 (e.g. Boc). Treatment of (X-3) with NBS in solvents containing AcOH at low temperature provides the rearranged spiro-proline derivative (X-4). Examples of this sequence of transformation has been reported in literature (Pellegrini C. et al. "Synthesis of the Oxindole Alkaloid (–)-Horsfiline" *Tetrahedron Asymmetry*, 1994, vol. 5, No. 10, pp 1979-1992; Efremov, I. V. et al. "Discovery and Optimization of a Novel Spiropyrrolidine Inhibitor of β -Secretase (BACE1) through Fragment-Based Drug

Design” Journal of Medicinal Chemistry, 2012, 55, 9069-9088). Direct functionalization of B ring in (X-4) (e.g. halogenation, Suzuki coupling, Heck reaction, transition-metal-catalyzed C—H functionalization, Friedel Crafts reaction, Minisci reaction, etc.) introduces the L.sub.1 functional group to (X-5), wherein L.sub.1 is the corresponding functionality to form the macrocycle linkage L that is as previously defined. Deprotonation of (X-5) using NaH followed by N-alkylation with (X-6), wherein R.sub.3 is as previously defined, provided the ester (X-7). Treatment of ester (X-7) with NH.sub.3 (e. g. ammonia in MeOH, NH.sub.4OH, etc.) affords the amide compound (X-8), which is converted to amine compound (X-9) by removal of protecting group PG.sub.2 (e.g. TFA, HCl, etc). Condensation of the amine (X-9) with acid (X-10) wherein R.sub.1, and R.sub.2 are as previously defined, PG.sub.3 is the appropriate protecting group (e.g. Cbz or Boc.) and L.sub.2 is the other corresponding functionality to form the macrocycle linkage L that is as previously defined, under amide coupling conditions (e.g. HATU, EDC, DCC, T.sub.3P, etc) provides amide compound (X-11). Macrocyclization of (X-11) (e.g. ring closing metathesis, intramolecular Suzuki coupling, intramolecular click chemistry, macrolactamization, intramolecular Mitsunobu reaction, intramolecular Heck reaction, intramolecular S.sub.NAr, intramolecular alkylation, etc.) ties up L.sub.1 and L.sub.2 functionality together to form macrocyclic compound (X-12), wherein L is as previously defined. These widely-used macrocyclization approaches have been reviewed in the literature (Marsault, E. et al. “Macrocycles Are Great Cycles: Applications, Opportunities, and Challenges of Synthetic Macrocycles in Drug Discovery” J. Med. Chem. 2011, 54, 7, 1961-2004). For example, the application of ring closing metathesis in synthesis of macrocyclic compounds has been reported in the literature (Yu, M. et al. “Ring-Closing Metathesis in Pharmaceutical Development: Fundamentals, Applications, and Future Directions” Org. Process Res. Dev. 2018, 22, 8, 918-946; Damalanka, V. C. et al. “Design, synthesis, and evaluation of a novel series of macrocyclic inhibitors of norovirus 3CL protease” European Journal of Medicinal Chemistry, Volume 127, 15 Feb. 2017, Pages 41-61). The application of intramolecular Suzuki coupling in synthesis of macrocyclic compounds has been reported in the literature (Li, H. et al. “Synthesis of Bis-Macrocyclic HCV Protease Inhibitor MK-6325 via Intramolecular sp.sup.2-sp.sup.3 Suzuki-Miyaura Coupling and Ring Closing Metathesis” Org. Lett. 2015, 17, 6, 1533-1536). The application of intramolecular click chemistry in synthesis of macrocyclic compounds has been reported in the literature (Weerawarna, P. M. et al. “Structure-based design and synthesis of triazole-based macrocyclic inhibitors of norovirus protease: Structural, biochemical, spectroscopic, and antiviral studies” European Journal of Medicinal Chemistry, Volume 119, 25 Aug. 2016, Pages 300-318). The application of macrolactamization in synthesis of macrocyclic compounds has been reported in the literature (Li, B. et al. “Exploratory Process Development of Lorlatinib” Org. Process Res. Dev. 2018, 22, 1289-1293). PG.sub.3 of (X-12) is cleaved by using the appropriate conditions (e.g. hydrogenation or HCl) to afford amine compound (X-13), which is further coupled with acid chloride (X-14) to form the compound (X-15), where A is as previously defined. Amide (X-15) is converted to the nitrile compound (X-16) under dehydration conditions (e.g. TFAA/Et.sub.3N, Pd(TFA).sub.2/Cl.sub.2CHCN or T.sub.3P).

(164) Scheme 2 illustrates a general method to synthesize the aldehyde compound (XI-9) of formula (I), wherein A, R.sub.1, R.sub.2, R.sub.3, L and B are as previously defined. The ester compound of formula (X-7), wherein R.sub.3, B, L.sub.1, PG.sub.1 and PG.sub.2 are as previously defined, is reduced to the alcohol compound (XI-1) by employing reducing reagents such as, but not limited to, LiBH.sub.4, NaBH.sub.4, or DIBAL-H. The primary alcohol (XI-1) is protected by the protecting group PG.sub.4 (e.g. TBS, Bn, etc.) to yield the compound (XI-2). The protecting group PG.sub.2 (e.g. Boc) of (XI-1) is removed under acidic conditions (e.g. TFA, HCl, formic acid, TMSOTf/lutidine, etc). Coupling of the amine compound (XI-3) with the acid compound (X-8) wherein PG.sub.3, L.sub.2, R.sub.1, and R.sub.2 are as previously defined, under amide coupling conditions (e.g. HATU, EDC, DCC, or T.sub.3P) provides compound (XI-4). Similar to

the approaches in Scheme 1, macrocyclization of (XI-4) (e.g. ring closing metathesis, intramolecular Suzuki coupling, intramolecular click chemistry, macrolactamization, intramolecular Mitsunobu reaction, intramolecular Heck reaction, intramolecular S.sub.NAr, intramolecular alkylation, etc.) ties up L.sub.1 and L.sub.2 functionality together to form macrocyclic compound (XI-5), wherein L is as previously defined. PG.sub.3 is cleaved under the appropriate conditions (e.g. hydrogenation or HCl) to afford amine compound (XI-6), which is further coupled with acid chloride (X-12) to form the compound (XI-7), where A is as previously defined. PG.sub.4 was removed (e.g. HCl, TBAF, hydrogenation, etc.) to give primary alcohol compound (XI-8). Oxidation of the alcohol compound (XI-8) (e.g. Dess-Martin periodinane, IBX, SO.sub.3-pyridine/DMSO/Et.sub.3N, etc.) produces the aldehyde compound (XI-9).

(270) ##STR00088##

(271) Step 26-1: A solution of the compound from Step 1-10 (65 mg, 0.119 mmol) in THF (0.6 ml) was treated with Co(acac).sub.2 (14 mg, 0.054 mmol) and phenylsilane (50 μ l, 0.405 mmol) under 02 (1 atm). The reaction was stirred at room temperature for 3 d. The mixture was concentrated in vacuo to give a crude product that was redissolved in MeOH (1 mL). The solution was treated with NaBH.sub.4 (30 mg, 0.793 mmol) at 0° C. and the reaction was stirred for 1 h. The reaction was quenched with a saturated solution of ammonium chloride. The aqueous layer was extracted with ethyl acetate over 3 times. The combined organic layer was dried over sodium bicarbonate, filtered and concentrated in vacuo. The crude was added to a 4 g silica gel column and eluted by acetone/cyclohexane from 0% to 100% to give the desired product (48 mg, 0.085 mmol, 71% yield) as a white solid. ESI MS m/z=561.28 [M-H].sup.-.

(272) Step 26-2: A solution of the compound from Step 26-1 (76 mg, 0.135 mmol) in THF (2 ml) was treated with TEA (100 μ L, 0.717 mmol) and triethylsilyl trifluoromethanesulfonate (100 μ L, 0.442 mmol) dropwise at 0° C. The reaction was warmed to room temperature and stirred overnight. The reaction was quenched with a saturated solution of sodium bicarbonate. The aqueous layer was extracted with ethyl acetate over 3 times. The combined organic layer was dried over sodium sulfate, filtered and concentrated in vacuo. The crude was added to a 4 g silica gel column and eluted by acetone/cyclohexane from 0% to 100% to give the desired product (55 mg, 0.081 mmol, 60% yield) as a white solid. ESI MS m/z=675.52 [M-H].sup.-.

(273) Step 26-3: A solution of the compound from Step 26-2 (55 mg, 0.081 mmol) in MeOH (0.4 ml) was treated with Pd—C (10 mg, 9.40 μ mol) under H.sub.2 (0.164 mg, 0.081 mmol) (1 atm). The mixture was bubbled with H.sub.2 (0.164 mg, 0.081 mmol) over 3 min. The reaction was

stirred at room temperature for 4 h. The mixture was filtered through celite and rinsed with methanol. The filtrate was concentrated in vacuo to give the desired product (42 mg, 0.077 mmol, 95% yield) as a white solid. ESI MS m/z =543.48 [M+H].sup.+.

(274) Step 26-4: A suspension of 4,6-difluoro-1H-indole-2-carboxylic acid (79 mg, 0.401 mmol) in CH₂Cl₂ (0.8 ml) was treated with 1-chloro-N,N,2-trimethylprop-1-en-1-amine (60 μ l, 0.454 mmol) dropwise. The reaction was stirred at room temperature for 1 h to give a orange solution (0.501 molar) of 4,6-difluoro-1H-indole-2-carbonyl chloride in DCM that was freshly used. A solution of the compound from Step 26-3 (23 mg, 0.042 mmol) in DMF (0.1 ml) was treated with TEA (40 μ l, 0.287 mmol) and a stock solution (0.5 M) of 4,6-difluoro-1H-indole-2-carbonyl chloride (250 μ l, 0.125 mmol) in DCM dropwise. The reaction was stirred at room temperature overnight. The reaction was quenched with ammonium hydroxide and stirred for additional 30 min. The aqueous layer was extracted with ethyl acetate over 3 times. The combined organic layer was dried over sodium sulfate, filtered and concentrated in vacuo. The crude was added to a 4 g silica gel column and eluted by acetone/cyclohexane from 0% to 100% to give the desired product (18 mg, 0.025 mmol, 59% yield) as an off-white solid. ESI MS m/z =722.68 [M-H].sup.-.

(275) Step 26-5: A solution of the compound from Step 26-4 (18 mg, 0.025 mmol) in THE (0.4 ml) was treated with hydrogen fluoride-pyridine (20 μ l, 0.155 mmol) dropwise at 0° C. The reaction was stirred at 0° C. for 1 h. The mixture was concentrated, added to a 4 g silica gel column and eluted by acetone/cyclohexane from 0% to 100% to give the desired product (14 mg, 0.023 mmol, 92% yield) as a white solid. ESI MS m/z =606.41 [M-H].sup.-.

(276) Step 26-6: A solution of the compound from Step 26-5 (14 mg, 0.023 mmol) in DCM (0.4 ml) was treated with TEA (30 μ l, 0.215 mmol) and TFAA (13 μ l, 0.092 mmol) dropwise at 0° C. The reaction was stirred at 0° C. for 30 min, and then quenched with ammonium hydroxide. The mixture was stirred for additional 30 min. The aqueous layer was extracted with dichloromethane over 3 times. The combined organic layer was dried over sodium sulfate, filtered and concentrated in vacuo. The crude was added to a 4 g silica gel column and eluted by ethyl acetate/cyclohexane from 0% to 100% to give Example 26 (7 mg, 0.012 mmol, 52% yield) as a white solid. (294) Biological Activity

(295) SARS-CoV-2 3CL-like (3CL) protease fluorescence assay (FRET): Recombinant SARS-CoV-2 3CL-protease was expressed and purified. TAMRA-SITSAVLQSGFRKMK-Dabcyl-OH peptide 3CLpro substrate was synthesized. Black, low volume, round-bottom, 384 well microplates were used. In a typical assay, 0.85 μ L of test compound was dissolved in DMSO then incubated with SARS-CoV-2 3CL-protease (10 nM) in 10 μ L assay buffer (50 mM HEPES [pH 7.5], 1 mM DTT, 0.01% BSA, 0.01% Triton-X 100) for 30 min at RT. Next, 10 μ L of 3CL-protease substrate (40 μ M) in assay buffer was added and the assays were monitored continuously for 1 h in an Envision multimode plate reader operating in fluorescence kinetics mode with excitation at 540 nm and emission at 580 nm at RT. No compound (DMSO only) and no enzyme controls were routinely included in each plate. All experiments were run in duplicate. Data Analysis: SARS-CoV-2 3CL-protease enzyme activity was measured as initial velocity of the linear phase (RFU/s) and normalized to controlled samples DMSO (100% activity) and no enzyme (0% activity) to determine percent residual activity at various concentrations of test compounds (0-10 μ M). Data were fitted to normalized activity (variable slope) versus concentration fit in GraphPad Prism 7 to determine IC_{sub}.50. All experiments were run in duplicate, and IC_{sub}.50 ranges are reported as follows: A<0.1 μ M; B 0.1-1 μ M; C>1 μ M.

(296) SARS-CoV-2 Cellular Assay (Vero 76): Test compounds are serially diluted using eight half-log dilutions in test medium (MEM supplemented with 2% FBS and 50 pg/mL gentamicin).

(297) Each dilution is added to 5 wells of a 96-well plate with 80-100% confluent Vero 76 cells. Three wells of each dilution are infected with virus (SARS-CoV-2 USA-WA1/2020), and two wells remain uninfected as toxicity controls. Six wells are infected and untreated as virus controls, and six wells are uninfected and untreated as cell controls. Viruses are prepared to achieve the lowest possible multiplicity of infection (MOI~0.002) that would yield >80% cytopathic effect (CPE) at 6 days. Plates are incubated at 37 $\pm$ 2° C., 5% CO_{sub}.2. For neutral red assay, on day 6 post-infection, once untreated virus control wells reach maximum CPE, plates are stained with neutral red dye for approximately 2 hours ($\pm$ 15 minutes). Supernatant dye is removed, and wells are rinsed with PBS, and the incorporated dye is extracted in 50:50 Sorensen citrate buffer/ethanol for >30 minutes and the optical density is read on a spectrophotometer at 540 nm. Optical densities are converted to percent of cell controls and normalized to the virus control, then the concentration of test compound required to inhibit CPE by 50% (EC_{sub}.50) is calculated by regression analysis. The concentration of compound that would cause 50% cell death in the absence of virus was similarly calculated (CC_{sub}.50). EC_{sub}.50 ranges are reported as follows: A<1 μ M; B 1-10 μ M; C>10 μ M. CC_{sub}.50 ranges are reported as follows: A<1 μ M; B 1-50 μ M; C>50 μ M.

(298) 229E Cellular Assay (MRC5): EC_{sub}.50 ranges are reported as follows: A<0.1 μ M; B 0.1-1 μ M; C>1 μ M.

(299) Viral stock preparation: MRC-5 cells, (a diploid cell culture line composed of fibroblasts, originally developed from the lung tissue of a 14-week-old aborted Caucasian male fetus), were used for the culturing of 229E human corona virus (hCoV). Flasks were inoculated with hCoV-229E and viral stocks were collected once cytopathic effect (CPE) was greater than 70%. Viral stocks in Growth Media (EMEM, 1% Penn/Strep, 1% nonessential amino acids, 10% heat-inactivated FBS) plus 5% glycerol were snap frozen using liquid nitrogen and stored at -80° C. Viral stock titers were quantified by a TCID_{sub}.50 (50% median tissue culture infectious dose) assay, as described elsewhere.

(300) 229E live virus assay: 384-well black cell-culture-treated plastic clear-bottom plates are used in this assay. See FIG. 1 below for plate layout. Using an ECHO liquid dispenser, 3-fold serial dilutions of control and test compounds suspended in DMSO are added to the plate wells in duplicate in a total volume of 125 nL per well. MRC-5 cells below passage 17 are seeded into the inner 240 wells of the 384-well plate at 1,500 cells per well in a volume of 12.5 μ L using Growth Media. Viral stock is then added to the wells at a multiplicity of infection (MOI) of 0.05 in a volume of 12.5 μ L per well, bringing the total volume of each well to ~25 μ L. Each plate has a

control row of 20 wells with cells plus DMSO and virus but no compound (positive control, max CPE, minimum ATPlite signal), and a row with cells plus DMSO but no compound or virus (negative control, minimum CPE, maximum ATPlite signal), and a row with no cells or virus or compound (background plate/reagent control). The control wells with cells but no virus are given an additional 12.5 μ L of growth media containing an equal quantity of glycerol as those wells receiving the viral stock in order to keep consistent in media and volume conditions. The outer 2 rows/columns of wells are filled with 30 μ L of moat media (DMEM, 10 Penn/Strep) to act as a thermal and evaporative barrier around the test wells. Following addition of all components, the sides of the plates are gently tapped by hand to promote even cell distribution across the wells. Upon confirmation of cell distribution, plates are incubated at 34° C. in a CO.sub.2 humidity-controlled incubator for 6 days. Following the 6-day incubation period, the plates are read using ATPlite (12.5 μ L added per well), which quantifies the amount of ATP (a measure of cell health) present in each well. Assay plates are read using an Envision luminometer. These data are used to calculate the percent cell health per well relative to the negative control wells and the EC.sub.50 of each compound is calculated using ExcelFit software and 4-parameter logistical curve fitting analysis. EC.sub.50 ranges are reported as follows: A<0.1 μ M; B 0.1-1 μ M; C>1 μ M.
