## Background/Summary

CROSS-REFERENCE TO RELATED APPLICATION [0001] This application claims priority to U.S. Provisional Application No. 63/303,451, filed on Jan. 26, 2022, which is incorporated by reference herein in its entirety and for all purposes.

### FIELD

[0002] Provided herein are compounds, and compositions and methods thereof. In some embodiments, provided are compounds for inhibiting protein arginine methyltransferase 5 (PRMT5). In some embodiments, provided are methods for treatment of diseases or disorders, such as cancer.

### BACKGROUND

[0003] Protein arginine methyltransferase 5 (PRMT5) is a type II arginine methyltransferase that regulates essential cellular functions, including the regulation of cell cycle progression, apoptosis and the DNA-damage response (Koh, C. et al., *Curr Mol Bio Rep* 2015; Wu et al., *Nat Rev Drug Discovery* 2021). MTAP is a critical enzyme in the methionine salvage pathway, a six-step process that recycles methionine from the product of polyamine synthesis, methylthioadenosine (MTA). Loss of MTAP causes the accumulation of its substrate, MTA, which has been described to function as a SAM-competitive PRMT5 inhibitor (Kruykov et al., 2016; Marjon et al., 2016 and Markarov et al., 2016). Data from genome-wide genetic perturbation screens using shRNA suggests a selective requirement for PRMT5 activity particularly in MTAP-deleted cancer cell lines (Kruykov et al., 2016; Marjon et al., 2016 and Markarov et al., 2016). It is proposed that the accumulation of MTA caused by MTAP-deletion in these cell lines partially inhibits PRMT5, rendering those cells selectively sensitive to additional PRMT5 inhibition.

[0004] A PRMT5 inhibitor that leverages the accumulation of MTA by binding in an MTA-uncompetitive, non-competitive or mixed mode manner or in a MTA-cooperative binding manner may demonstrate selectivity for MTAP-deleted tumor cells. Some PRMT5 inhibitors are currently being explored for therapeutic uses (e.g., for treating cancer), however there are currently no such PRMT5 therapies approved by the United States Food and Drug Administration that demonstrate selectivity for MTAP-deleted cancer cell lines.

[0005] Accordingly, there is a need for PRMT5 inhibitors for treating diseases, such as cancers.

### SUMMARY

[0006] In one embodiment, provided herein are compounds of Formula (I):

## Description

### DETAILED DESCRIPTION

[0024] The disclosure herein sets forth exemplary methods, parameters and the like. It should be recognized, however, that such description is not intended as a limitation on the scope of the present disclosure but is instead provided as a description of exemplary embodiments.

[0025] As generally described herein, provided are compounds (e.g., compounds of Formula (I) or compounds of Table 1, or pharmaceutically acceptable salts thereof) that are MTA-uncompetitive PRMT5 inhibitors useful for treating proliferating disorders (e.g., cancers) associated with MTAP deficiencies and/or MTA accumulation.

[0026] In some embodiments, provided are compounds (e.g., compounds of Formula (I) or compounds of Table 1, or pharmaceutically acceptable salts thereof) that are MTA-uncompetitive, non-competitive or mixed mode PRMT5 inhibitor or an MTA cooperative binding agent useful for treating proliferating disorders (e.g., cancers) associated with MTAP deficiencies and/or MTA accumulation.

### Definitions

[0027] As used in the present disclosure, the following words and phrases are generally intended to have the meanings as set forth below unless expressly indicated otherwise or the context in which they are used indicates otherwise.

### Mtap

[0028] “MTAP” as used herein refers to methylthioadenosine phosphorylase, an enzyme in the methionine salvage pathway, also known as S-methyl-5'-thioadenosine phosphorylase; also known as BDMF; DMSFH; DMSMFH; LGMBF; MSAP; and c86fus. External IDs: OMIM: 156540 MGI:

1914152 HomoloGene:1838 chEMBL: 4941 GeneCards: MTAP Gene; Entrez 4507; RefSeq (mRNA): NM—002451; location: Chr 9: 21.8-21.93 Mb. By “wild-type” MTAP is meant that encoded by NM—002451 or having the same amino acid sequence (NP—002442). (Schmid et al. *Oncogene* 2000, 19, pp 5747-54).

As used herein, the term “MTAP-deficient”, “MTAP-deficiency”, “MTAP-null” and the like refer to cells (including, but not limited to, cancer cells, cell lines, tissues, tissue types, tumors, etc.) that have a significant reduction in post-translational modification, production, expression, level, stability and/or activity of MTAP relative to that in a control, e.g., reference or normal or non-cancerous cells. The reduction can be at least about 20%, 30%, 40%, 50%, 60%, 70%, 80% or 90%. In some embodiments, the reduction is at least 20%. In some embodiments, the reduction is at least 50%. The terms “MTAP-deficient and/or MTA accumulating”, “MTAP-deficient and/or MTA-accumulating”, “MTAP deficient and/or MTA upregulated” and the like, regarding a cell or cells, etc., indicate that the cell or cells, etc., either are deficient in MTAP and/or overproduce or accumulate MTA. MTAP-deficient cells include those wherein the MTAP gene has been mutated, deleted, or transcriptionally silenced. As a non-limiting example, MTAP-deficient cells can have a homozygous deletion. MTAP knockdown is not lethal. In some embodiments, the MTAP-deficient cells are also CDKN2A-deficient. The MTAP deficiency can be detected using any reagent or technique known in the art, for example: immunohistochemistry utilizing an antibody to MTAP, and/or genomic sequencing, and/or nucleic acid hybridization and/or amplification utilizing at least one probe or primer comprising a sequence of at least 12 contiguous nucleotides (nt) of the sequence of MTAP, wherein the primer is no longer than about 30 nt.

[0029] An “MTAP-deficiency-related” or “MTAP-deficiency” or “MTAP deficient” disease (for example, a proliferating disease, e.g., a cancer) or a disease (for example, a proliferating disease, e.g., a cancer) “associated with MTAP deficiency” or a disease (for example, a proliferating disease, e.g., a cancer) “characterized by MTAP deficiency” and the like refer to an ailment (for example, a proliferating disease, e.g., a cancer) wherein a significant number of cells are MTAP-deficient. For example, in a MTAP-deficiency-related disease, one or more disease cells can have a significantly reduced post-translational modification, production, expression, level, stability and/or activity of MTAP. Examples of MTAP-deficiency-related diseases include, but are not limited to, cancers, including but not limited to: glioma, glioblastoma, malignant peripheral nerve sheath tumors (MPNST), esophageal cancer (e.g., esophageal squamous cell carcinoma or esophageal adenocarcinoma), bladder cancer (e.g., bladder urothelial carcinoma), pancreatic cancer (e.g., pancreatic adenocarcinoma), mesothelioma, melanoma, non-small cell lung cancer (NSCLC; e.g., lung squamous or lung adenocarcinoma), astrocytoma, undifferentiated pleiomorphic sarcoma, diffuse large B-cell lymphoma (DLBCL), leukemia, head and neck cancer, stomach adenocarcinoma, myxofibrosarcoma, cholangiosarcoma, cancer of the brain, stomach, kidney, breast, endometrium, urinary tract, liver, soft tissue, pleura and large intestine or sarcoma (See FIG. 1). In a patient afflicted with a MTAP-deficiency-related disease, it is possible that some disease cells (e.g., cancer cells) can be MTAP-deficient while others are not. Similarly, some disease cells may be MTA-accumulating while others are not. Thus, the present disclosure encompasses methods of treatment involving diseases of these tissues, or any other tissues, wherein the proliferation of MTAP-deficient and/or MTA-accumulating cells can be inhibited by administration of a PRMT5 inhibitor. Some cancer cells which are MTAP-deficient are also deficient in CDKN2A; the post-translational modification, production, expression, level, stability and/or activity of the CDKN2A gene or its product are decreased in these cells. The genes for MTAP and CDKN2A are in close proximity on chromosome 9p21; MTAP is located approximately 100 kb telomeric to CDKN2A. Many cancer cell types harbor CDKN2A/MTAP loss (loss of both genes). Thus, in some embodiments, a MTAP-deficient cell is also deficient in CDKN2A.

#### MTA and MTA Accumulation

[0030] By “MTA” is meant the PRMT5 inhibitor also known as methyl-thioadenosine, S-methyl-

5'-thioadenosine, [5'-deoxy-5'-(methylthio)-fl-D-ribofuranosyl]adenine, 5'-methyl-thioadenosine, 5'-deoxy, 5'-methyl thioadenosine, and the like. MTA selectively inhibits PRMT5 methyltransferase activity. MTA is the sole known catabolic substrate for MTAP. The terms "MTA accumulating", "MTA overproducing", "MTA upregulated" and the like refer to cells (including, but not limited to, cancer cells, cell lines, tissues, tissue types, tumors, etc.) that have a significantly increased production, level and/or stability of MTA. MTA-accumulating cells include those wherein the cells comprise at least about 20%, 30%, 40%, 50%, 60%, 70%, 80%, 90%, 100%, or greater than 100%, higher production, level and/or stability of MTA than that in normal or non-cancerous cells. In some embodiments, MTA-accumulating cells include those wherein the cells comprise at least 20% higher production, level and/or stability of MTA than that in normal or non-cancerous cells. In some embodiments, MTA-accumulating cells include those wherein the cells comprise at least 50% higher production, level and/or stability of MTA than that in normal or non-cancerous cells. Determination of MTA accumulation in test samples (e.g., cells such as cancer cells being tested for MTA accumulation) and reference samples, and other cells, tissues, samples, etc., can be performed using any method known in the art. Such methods for detecting MTA include, as a non-limiting example, liquid chromatography-electrospray ionization-tandem mass spectrometry (LC-ESI-MS/MS), as described in Stevens et al. *J. Chromatogr. A.* 2010, 1217, pp 3282-3288; and Kirovski et al. *Am. J. Pathol.* 2011, 178, pp 1145-1152; and references cited therein. Loss of MTAP is associated with accumulation of MTA (Williams-Ashman et al. *Biochem. Pharm.* 1982, 31, pp 277-288; and Limm et al. *Eur. J Cancer.* 2013, 49, Issue 6).

[0031] An "MTA-accumulation-related", "MTA-accumulation", "MTA-accumulating", "MTA overproducing", "MTA upregulated" disease (for example, a proliferating disease, e.g., a cancer) or a disease (for example, a proliferating disease, e.g., a cancer) "associated with MTA accumulation" or a disease (for example, a proliferating disease, e.g., a cancer) "characterized by MTA accumulation" and the like refer to an ailment (for example, a proliferating disease, e.g., a cancer) wherein a significant number of cells are MTA accumulating. Examples of MTA-accumulating diseases include, but are not limited to, cancers, including but not limited to: glioma, glioblastoma, malignant peripheral nerve sheath tumors (MPNST), esophageal cancer (e.g., esophageal squamous cell carcinoma or esophageal adenocarcinoma), bladder cancer (e.g., bladder urothelial carcinoma), pancreatic cancer (e.g., pancreatic adenocarcinoma), mesothelioma, melanoma, non-small cell lung cancer (NSCLC; e.g., lung squamous or lung adenocarcinoma), astrocytoma, undifferentiated pleomorphic sarcoma, diffuse large B-cell lymphoma (DLBCL), leukemia, head and neck cancer, stomach adenocarcinoma, myxofibrosarcoma, cholangiosarcoma, cancer of the brain, stomach, kidney, breast, endometrium, urinary tract, liver, soft tissue, pleura and large intestine or sarcoma (See FIG. 1). In a patient afflicted with a MTAP-deficiency-related disease, it is possible that some disease cells (e.g., cancer cells) can be MTAP-deficient while others are not.

[0032] In a patient having or having been diagnosed with an MTA-accumulating disease, some cells may be MTA-accumulating while others are not.

[0033] An increase in therapeutic window between normal cells and MTAP-deleted/MTA accumulating cells could be achieved by using an inhibitor that binds PRMT5 uncompetitively with MTA. As used herein, "uncompetitive binding" and "uncompetitive inhibition" and "cooperative binding" and "cooperative inhibition" (e.g., MTA-uncompetitive binding, MTA-uncompetitive inhibition, MTA-cooperative binding, MTA-cooperative inhibition) refers to binding of an inhibitor to a protein (e.g., PRMT5) that is increased in the presence of a co-factor (e.g., MTA) over the binding of the same inhibitor in the absence of the co-factor. The PRMT5 inhibitors known in the art are generally either SAM (S-adenosylmethionine) uncompetitive or SAM competitive. As the concentration of SAM in wild-type and MTAP-null cells is similar, these inhibitors are expected to bind with similar potency to both cell types. By contrast, an MTA-cooperative (and either SAM competitive or showing enhanced cooperativity with MTA relative to SAM) inhibitor would bind with apparent greater potency in the presence of high concentrations of MTA and would therefore

result in preferential inhibition of PRMT5 in MTA-accumulating cells relative to normal cells.

[0034] As described further herein, a cancer cell, a cancer type, or a subject with cancer, is “PRMT5 inhibitor sensitive,” sensitive to treatment with PRMT5 inhibitors,” sensitive to PRMT5 therapeutic inhibition,” or described in similar terms if it is amenable to treatment with a PRMT5 inhibitor, e.g., due to its MTAP deficiency and/or MTA accumulation character.

## PRMT5

[0035] “PRMT5” as used herein is the gene or protein Protein Arginine Methyltransferase 5, also known as HRMT1L5; IBP72; JBP1; SKB1; or SKB1Hs External IDs: OMIM: 604045, MGI: 1351645, HomoloGene: 4454, ChEMBL: 1795116, GeneCards: PRMT5 Gene; EC number 2.1.1.125. Ensembl ENSG00000100462; UniProt 014744; Entrez Gene ID: 10419; RefSeq (mRNA): NM—001039619. The mouse homolog is NM—013768.

[0036] Methyltransferases such as PRMT5 catalyze the transfer of one to three methyl groups from the co-factor S-adenosylmethionine (also known as SAM or AdoMet) to lysine or arginine residues of histone proteins. Arginine methylation is carried out by 9 different protein arginine methyltransferases (PRMT) in humans. Three types of methylarginine species exist: (1) Monomethylarginine (MMA); (2) Asymmetric dimethyl arginine (ADMA), which is produced by Type I methyl transferases (PRMT1, PRMT2, PRMT3, CARM1, PRMT6 and PRMT8); and (3) Symmetrical dimethylarginine (SDMA), which is produced by Type II methyl transferases (PRMT5 and PRMT7). PRMT1 and PRMT5 are the major asymmetric and symmetric arginine methyltransferases, respectively. PRMT5 promotes symmetric dimethylation on histones at H3R8 and H4R3 (H4R3me<sub>2</sub>). Symmetric methylation of H4R3 is associated with transcriptional repression and can act as a binding site for DNMT3A. Loss of PRMT5 results in reduced DNMT3A binding and gene activation. Tumor suppressor gene ST7 and chemokines RNATES, IP10, CXCL11 are targeted and silenced by PRMT5. WO 2011/079236.

[0037] Additional substrates include E2F1, p53, EGFR and CRAF. PRMT5 is part of a multi-protein complex comprising the co-regulatory factor WDR77 (also known as MEP50, a CDK4 substrate) during GUS transition. Phosphorylation increases PRMT5/WDR77 activity. WDR77 is the non-catalytic component of the complex and mediates interactions with binding partners and substrates. PRMT5 can also interact with pICln or RioK1 adaptor proteins in a mutually exclusive fashion to modulate complex composition and substrate specificity.

[0038] PRMT5 has either a positive or negative effect on its substrates by arginine methylation when interacting with a number of complexes and is involved in a variety of cellular processes, including RNA processing, signal transduction, transcriptional regulation, and germ cell development. PRMT5 is a major pro-survival factor regulating eIF4E expression and p53 translation. PRMT5 triggers p53-dependent apoptosis and sensitized various cancer cells to Tumor necrosis factor (TNF)-related apoptosis-inducing ligand (TRAIL) without affecting TRAIL resistance in non-transformed cells.

[0039] The term “PRMT5 inhibitor” refers to any compound capable of inhibiting the production, level, activity, expression or presence of PRMT5. These include, as non-limiting examples, any compound inhibiting the transcription of the gene, the maturation of RNA, the translation of mRNA, the posttranslational modification of the protein, the enzymatic activity of the protein, the interaction of same with a substrate, etc. The term also refers to any agent that inhibits the cellular function of the PRMT5 protein, either by ATP-competitive inhibition of the active site, allosteric modulation of the protein structure, disruption of protein-protein interactions, or by inhibiting the transcription, translation, post-translational modification, or stability of PRMT5 protein.

[0040] In some embodiments, a PRMT5 inhibitor competes with another compound, protein or other molecule which interacts with PRMT5 and is necessary for PRMT5 function. As a non-limiting example, a PRMT5 inhibitor can compete with the co-factor S-adenosylmethionine (also known as SAM or AdoMet).

#### Chemical Definitions

[0041] Definitions of specific functional groups and chemical terms are described in more detail below. The chemical elements are identified in accordance with the Periodic Table of the Elements, CAS version, *Handbook of Chemistry and Physics*, 75<sup>sup</sup>.th Ed., inside cover, and specific functional groups are generally defined as described therein. Additionally, general principles of organic chemistry, as well as specific functional moieties and reactivity, are described in Thomas Sorrell, *Organic Chemistry*, University Science Books, Sausalito, 1999; Smith and March, *March's Advanced Organic Chemistry*, 5<sup>sup</sup>.th Edition, John Wiley & Sons, Inc., New York, 2001; Larock, *Comprehensive Organic Transformations*, VCH Publishers, Inc., New York, 1989; and Carruthers, *Some Modern Methods of Organic Synthesis*, 3<sup>sup</sup>.rd Edition, Cambridge University Press, Cambridge, 1987.

[0042] Compounds described herein can comprise one or more asymmetric centers, and thus can exist in various isomeric forms, e.g., enantiomers and/or diastereomers. For example, the compounds described herein can be in the form of an individual enantiomer, diastereomer or geometric isomer, or can be in the form of a mixture of stereoisomers, including racemic mixtures and mixtures enriched in one or more stereoisomer. Isomers can be isolated from mixtures by methods known to those skilled in the art, including chiral high-pressure liquid chromatography (HPLC) and the formation and crystallization of chiral salts; or preferred isomers can be prepared by asymmetric syntheses. See, for example, Jacques et al., *Enantiomers, Racemates and Resolutions* (Wiley Interscience, New York, 1981); Wilen et al., *Tetrahedron* 33:2725 (1977); Eliel, *Stereochemistry of Carbon Compounds* (McGraw-Hill, NY, 1962); and Wilen, *Tables of Resolving Agents and Optical Resolutions* p. 268 (E.L.

[0043] Eliel, Ed., Univ. of Notre Dame Press, Notre Dame, IN 1972). Additionally encompassed are compounds described herein as individual isomers substantially free of other isomers, and alternatively, as mixtures of various isomers.

[0044] The “enantiomeric excess” (“e.e.”) or “% enantiomeric excess” (“% e.e.”) of a composition as used herein refers to an excess of one enantiomer relative to the other enantiomer present in the composition. For example, a composition can contain 90% of one enantiomer, e.g., the S enantiomer, and 10% of the other enantiomer, i.e., the R enantiomer.

[00001]  $e.e. = (90 - 10) / 100 = 80\%$ .

[0045] Thus, a composition containing 90% of one enantiomer and 10% of the other enantiomer is said to have an enantiomeric excess of 80%.

[0046] The “diastereomeric excess” (“d.e.”) or “% diastereomeric excess” (“% d.e.”) of a composition as used herein refers to an excess of one diastereomer relative to one or more different diastereomers present in the composition. For example, a composition can contain 90% of one diastereomer, and 10% of one or more different diastereomers.

[00002]  $d.e. = (90 - 10) / 100 = 80\%$ .

[0047] Thus, a composition containing 90% of one diastereomers and 10% of one or more different diastereomers is said to have a diastereomeric excess of 80%.

In an alternative embodiment, compounds described herein may also comprise one or more isotopic substitutions. For example, hydrogen may be <sup>2</sup>H (D or deuterium) or <sup>3</sup>H (T or tritium); carbon may be, for example, <sup>13</sup>C or <sup>14</sup>C; oxygen may be, for example, <sup>18</sup>O; nitrogen may be, for example, <sup>15</sup>N, and the like. In other embodiments, a particular isotope (e.g., <sup>3</sup>H, <sup>13</sup>C, <sup>14</sup>C, <sup>18</sup>O, or <sup>15</sup>N) can represent at least 1%, at least 5%, at least 10%, at least 15%, at least 20%, at least 25%, at least 30%, at least 35%, at least 40%, at least 45%, at least 50%, at least 60%, at least 65%, at least 70%, at least 75%, at least 80%, at least 85%, at least 90%, at least 95%, at least 99%, or at least 99.9% of the total isotopic abundance of an

element that occupies a specific site of the compound.

[0092] “Oxo group” refers to  $\text{—C(=O)—}$ .

[0093] “Substituted amino” refers to an amino group of the formula  $\text{—N(R.sup.38).sub.2}$  wherein R.sup.38 is hydrogen, substituted or unsubstituted alkyl, substituted or unsubstituted alkenyl, substituted or unsubstituted alkynyl, substituted or unsubstituted carbocyclyl, substituted or unsubstituted heterocyclyl, substituted or unsubstituted aryl, substituted or unsubstituted heteroaryl, or an amino protecting group, wherein at least one of R.sup.38 is not a hydrogen. In certain embodiments, each R.sup.38 is independently selected from hydrogen, C.sub.1-C.sub.8 alkyl, C.sub.3-C.sub.8 alkenyl, C.sub.3-C.sub.8 alkynyl, C.sub.6-C.sub.10 aryl, 5-10 membered heteroaryl, 4-10 membered heterocyclyl, or C.sub.3-C.sub.10 cycloalkyl; or C.sub.1-C.sub.8 alkyl, substituted with halo or hydroxy; C.sub.3-C.sub.8 alkenyl, substituted with halo or hydroxy; C.sub.3-C.sub.8 alkynyl, substituted with halo or hydroxy, or  $\text{—(CH.sub.2).sub.t(C.sub.6-C.sub.10 aryl)}$ ,  $\text{—(CH.sub.2).sub.t(5-10 membered heteroaryl)}$ ,  $\text{—(CH.sub.2).sub.t(C.sub.3-C.sub.10 cycloalkyl)}$ , or  $\text{—(CH.sub.2).sub.t(4-10 membered heterocyclyl)}$ , wherein t is an integer between 0 and 8, each of which is substituted by unsubstituted C.sub.1-C.sub.4 alkyl, halo, unsubstituted C.sub.1-C.sub.4 alkoxy, unsubstituted C.sub.1-C.sub.4 haloalkyl, unsubstituted C.sub.1-C.sub.4 hydroxyalkyl, or unsubstituted C.sub.1-C.sub.4 haloalkoxy or hydroxy; or both R.sup.38 groups are joined to form an alkylene group.

[0094] Exemplary “substituted amino” groups include, but are not limited to,  $\text{—NR.sup.39—}$  C.sub.1-C.sub.8 alkyl,  $\text{—NR.sup.39—(CH.sub.2).sub.t(C.sub.6-C.sub.10 aryl)}$ ,  $\text{—NR.sup.39—(CH.sub.2).sub.t(5-10 membered heteroaryl)}$ ,  $\text{—NR.sup.39—(CH.sub.2).sub.t(C.sub.3-C.sub.10 cycloalkyl)}$ , and  $\text{—NR.sup.39—(CH.sub.2).sub.t(4-10 membered heterocyclyl)}$ , wherein t is an integer from 0 to 4, for instance 1 or 2, each R.sup.39 independently represents H or C.sub.1-C.sub.8 alkyl; and any alkyl groups present, may themselves be substituted by halo, substituted or unsubstituted amino, or hydroxy; and any aryl, heteroaryl, cycloalkyl, or heterocyclyl groups present, may themselves be substituted by unsubstituted C.sub.1-C.sub.4 alkyl, halo, unsubstituted C.sub.1-C.sub.4 alkoxy, unsubstituted C.sub.1-C.sub.4 haloalkyl, unsubstituted C.sub.1-C.sub.4 hydroxyalkyl, or unsubstituted C.sub.1-C.sub.4 haloalkoxy or hydroxy. For the avoidance of doubt the term ‘substituted amino’ includes the groups alkylamino, substituted alkylamino, alkylarylamino, substituted alkylarylamino, arylamino, substituted arylamino, dialkylamino, and substituted dialkylamino as defined below. Substituted amino encompasses both monosubstituted amino and disubstituted amino groups.

[0110] “Haloalkyl” refers to an alkyl radical in which the alkyl group is substituted with one or more halogens. Typical haloalkyl groups include, but are not limited to, trifluoromethyl (—CF.sub.3), difluoromethyl (—CHF.sub.2), fluoromethyl (—CH.sub.2F), chloromethyl (—CH.sub.2Cl), dichloromethyl (—CHCl.sub.2), tribromomethyl (—CH.sub.2Br), and the like.

[0114] Alkyl, alkenyl, alkynyl, carbocyclyl, heterocyclyl, aryl, and heteroaryl groups, as defined herein, are optionally substituted (e.g., “substituted” or “unsubstituted” alkyl, “substituted” or “unsubstituted” alkenyl, “substituted” or “unsubstituted” alkynyl, “substituted” or “unsubstituted” carbocyclyl, “substituted” or “unsubstituted” heterocyclyl, “substituted” or “unsubstituted” aryl or “substituted” or “unsubstituted” heteroaryl group). In general, the term “substituted”, whether preceded by the term “optionally” or not, means that at least one hydrogen present on a group (e.g., a carbon or nitrogen atom) is replaced with a permissible substituent, e.g., a substituent which upon substitution results in a stable compound, e.g., a compound which does not spontaneously undergo transformation such as by rearrangement, cyclization, elimination, or other reaction. Unless otherwise indicated, a “substituted” group has a substituent at one or more substitutable positions of the group, and when more than one position in any given structure is substituted, the substituent is either the same or different at each position. The term “substituted” is contemplated to include substitution with all permissible substituents of organic compounds, any of the substituents described herein that results in the formation of a stable compound. Any and all such combinations are contemplated in order to arrive at a stable compound. For purposes of this disclosure, heteroatoms such as nitrogen may have hydrogen substituents and/or any suitable substituent as described herein which satisfy the valencies of the heteroatoms and results in the formation of a stable moiety.

#### Other Definitions

[0123] As used herein, the term “salt” refers to any and all salts and encompasses pharmaceutically acceptable salts.

[0124] The term “pharmaceutically acceptable salt” refers to those salts which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of humans and lower animals without undue toxicity, irritation, allergic response and the like, and are commensurate with a reasonable benefit/risk ratio. Pharmaceutically acceptable salts are well known in the art. For example, Berge et al., describes pharmaceutically acceptable salts in detail in *J. Pharmaceutical Sciences* (1977) 66:1-19. Pharmaceutically acceptable salts of the compounds of this disclosure include those derived from suitable inorganic and organic acids and bases. Examples of pharmaceutically acceptable, nontoxic acid addition salts are salts of an amino group formed with inorganic acids such as hydrochloric acid, hydrobromic acid, phosphoric acid, sulfuric acid and

perchloric acid or with organic acids such as acetic acid, oxalic acid, maleic acid, tartaric acid, citric acid, succinic acid or malonic acid or by using other methods used in the art such as ion exchange. Other pharmaceutically acceptable salts include adipate, alginate, ascorbate, aspartate, benzenesulfonate, benzoate, bisulfate, borate, butyrate, camphorate, camphorsulfonate, citrate, cyclopentanepropionate, digluconate, dodecylsulfate, ethanesulfonate, formate, fumarate, glucoheptonate, glycerophosphate, gluconate, hemisulfate, heptanoate, hexanoate, hydroiodide, 2-hydroxy-ethanesulfonate, lactobionate, lactate, laurate, lauryl sulfate, malate, maleate, malonate, methanesulfonate, 2-naphthalenesulfonate, nicotinate, nitrate, oleate, oxalate, palmitate, pamoate, pectinate, persulfate, 3-phenylpropionate, phosphate, picrate, pivalate, propionate, stearate, succinate, sulfate, tartrate, thiocyanate, p-toluenesulfonate, undecanoate, valerate salts, and the like. Pharmaceutically acceptable salts derived from appropriate bases include alkali metal, alkaline earth metal, ammonium and N.sup.+(C.sub.1-4alkyl).sub.4 salts. Representative alkali or alkaline earth metal salts include sodium, lithium, potassium, calcium, magnesium, and the like. Further pharmaceutically acceptable salts include, when appropriate, nontoxic ammonium, quaternary ammonium, and amine cations formed using counterions such as halide, hydroxide, carboxylate, sulfate, phosphate, nitrate, lower alkyl sulfonate, and aryl sulfonate.

[0125] A “subject” to which administration is contemplated includes, but is not limited to, humans (i.e., a male or female of any age group, e.g., a pediatric subject (e.g., infant, child, adolescent) or adult subject (e.g., young adult, middle-aged adult or senior adult)) and/or a non-human animal, e.g., a mammal such as primates (e.g., cynomolgus monkeys, rhesus monkeys), cattle, pigs, horses, sheep, goats, rodents, cats, and/or dogs. In certain embodiments, the subject is a human. In certain embodiments, the subject is a non-human animal. The terms “human,” “patient,” and “subject” are used interchangeably herein.

[0126] Disease, disorder, and condition are used interchangeably herein.

[0127] As used herein, and unless otherwise specified, the terms “treat,” “treating” and “treatment” contemplate an action that occurs while a subject is suffering from the specified disease, disorder or condition, which reduces the severity of the disease, disorder or condition, or retards or slows the progression of the disease, disorder or condition (“therapeutic treatment”), and also contemplates an action that occurs before a subject begins to suffer from the specified disease, disorder or condition (“prophylactic treatment”). In one embodiment, the compounds provided herein are contemplated to be used in methods of therapeutic treatment wherein the action occurs while a subject is suffering from the specified disease, disorder or condition and results in a reduction in the severity of the disease, disorder or condition, or retardation or slowing of the progression of the disease, disorder or condition. In an alternate embodiment, the compounds provided herein are contemplated to be used in methods of prophylactic treatment wherein the action occurs before a subject begins to suffer from the specified disease, disorder or condition and results in preventing a disease, disorder or condition, or one or more symptoms associated with the disease, disorder or condition, or preventing the recurrence of the disease, disorder or condition.

[0128] In general, the “effective amount” of a compound refers to an amount sufficient to elicit the desired biological response e.g., to treat a disease or disorder described herein. As will be appreciated by those of ordinary skill in this art, the effective amount of a compound of the disclosure may vary depending on such factors as the desired biological endpoint, the pharmacokinetics of the compound, the disease being treated, the mode of administration, and the age, health, and condition of the subject. An effective amount encompasses therapeutic and prophylactic treatment (i.e., encompasses a “therapeutically effective amount” and a “prophylactically effective amount”).

[0129] As used herein, and unless otherwise specified, a “therapeutically effective amount” of a compound is an amount sufficient to provide a therapeutic benefit in the therapeutic treatment of a disease, disorder or condition, or to delay or minimize one or more symptoms associated with the disease, disorder or condition. A therapeutically effective amount of a compound means an amount

of therapeutic agent, alone or in combination with other therapies, which provides a therapeutic benefit in the therapeutic treatment of the disease, disorder or condition. The term “therapeutically effective amount” can encompass an amount that improves overall therapy, reduces or avoids symptoms or causes of disease or condition, or enhances the therapeutic efficacy of another therapeutic agent.

[0130] As used herein, and unless otherwise specified, a “prophylactically effective amount” of a compound is an amount sufficient to prevent a disease, disorder or condition, or one or more symptoms associated with the disease, disorder or condition, or prevent its recurrence. A prophylactically effective amount of a compound means an amount of a therapeutic agent, alone or in combination with other agents, which provides a prophylactic benefit in the prevention of the disease, disorder or condition. The term “prophylactically effective amount” can encompass an amount that improves overall prophylaxis or enhances the prophylactic efficacy of another prophylactic agent.

[0730] In one embodiment, provided is a compound selected from the group consisting of the compounds of Table 1, or pharmaceutically acceptable salts thereof.

[0731] Compounds described herein (e.g., a compound of Formula (I) to (1117a) or a compound of Table 1, or pharmaceutically acceptable salts thereof) are useful as inhibitors of PRMT5 (e.g., MTA uncompetitive PRMT5 inhibitors).

[0732] In one embodiment, provided is a compound selected from the compounds of Table 1, or pharmaceutically acceptable salts thereof.

[0733] Compounds described herein (e.g., a compound of Formula (I) or a compound of Table 1, or pharmaceutically acceptable salts thereof) are useful as inhibitors of PRMT5 (e.g., MTA uncompetitive PRMT5 inhibitors).

[0734] Table 1 indicates IC<sub>50</sub> and IC<sub>90</sub> values in an MTAP-isogenic cell line pair for exemplary compounds in an SDMA in-cell western assay (described in Example 119) (columns 4-6). HAP1 MTAP-intact is a cell line in which endogenous levels of MTAP are expressed, and HAP1 MTAP-deleted is an MTAP-null cell line. For Table 1, “a” and “aa” indicates an IC<sub>50</sub> of <5 nM, “b” and “bb” indicates an IC<sub>50</sub> equal to or greater than 5 nM but less than 50 nM, and “c” and “cc” indicates an IC<sub>50</sub> of greater than or equal to 50 nM in the HAP1 MTAP-intact (column 4) and the HAP1 MTAP-deleted (column 5) assays, respectively. Similarly, “aaa” indicates an IC<sub>90</sub> of <75 nM, “bbb” indicates an IC<sub>90</sub> equal to or greater than 75 nM but less than 125 nM, and “ccc” indicates an IC<sub>90</sub> of greater than or equal to 125 nM in the HAP1 MTAP-deleted (column 6) assay.

[0735] In column 7, “A” indicates an IC<sub>50</sub> ratio greater than or equal to 30 fold between the IC<sub>50</sub> in the HAP1 MTAP-intact cell line and the HAP1 MTAP-deleted cell line; “B” indicates an IC<sub>50</sub> ratio greater than or equal to 15 fold but lower than 30 fold between the IC<sub>50</sub> in the HAP1 MTAP-intact cell line and the HAP1 MTAP-deleted cell line; “C” indicates an IC<sub>50</sub> ratio of less than 15 fold between the IC<sub>50</sub> in the HAP1 MTAP-intact cell line and the HAP1 MTAP-deleted cell line. Compounds with a ratio in the SDMA in-cell western assay of equal to or greater than 3 fold are considered MTAP-selective.

[0736] Table 1 additionally indicates IC<sub>50</sub> values in a viability assay for the MTAP-deleted cell line (described in Example 120) (column 8), indicating the effect of treatment with compound on cell survival. In column 8, a value of A\* indicates an IC<sub>50</sub> of less than 100 nM, a value of B\* indicates an IC<sub>50</sub> equal to or greater than 100 nM but less than 1 μM, and a value of C\* indicates an IC<sub>50</sub> greater than or equal to 1 μM.

[0737] Unless otherwise indicated, the absolute stereochemistry of all chiral atoms is as depicted. Compounds marked with (or) or (rel) are single enantiomers wherein the absolute stereochemistry was arbitrarily assigned (e.g., based on chiral SFC elution as described in the Examples section). Compounds marked with (and) or (rac) are mixtures of enantiomers wherein the relative stereochemistry is as shown. Compounds that have a stereogenic center where the configuration is not indicated in the structure as depicted and that are not marked in the “stereochemistry” column are mixtures of enantiomers. Compounds marked with (abs) are single enantiomers wherein the absolute stereochemistry is as indicated. In some instances, different indicators selected from (abs) (or) and (and) apply to different portions of the molecule. A person of skill in the art would be able to separate racemic compounds into the respective enantiomers using methods known in the art, such as chiral chromatography, chiral recrystallization and the like. References to compounds that are racemic mixtures are meant to also include the individual enantiomers contained in the mixture.

[0747] Generally, the compounds provided herein are administered in an effective amount (e.g., a therapeutically effective amount). The amount of the compound actually administered will typically be determined by a physician, in the light of the relevant circumstances, including the condition to be treated, the chosen route of administration, the actual compound administered, the age, weight, and response of the individual patient, the severity of the patient's symptoms, and the like.

[0748] The pharmaceutical compositions provided herewith may be administered orally, parenterally, by inhalation spray, topically, rectally, nasally, buccally, vaginally or via an implanted reservoir, preferably by oral administration or administration by injection. The pharmaceutical compositions provided herewith may contain any conventional nontoxic pharmaceutically acceptable carriers, adjuvants or vehicles. In some cases, the pH of the formulation may be adjusted with pharmaceutically acceptable acids, bases or buffers to enhance the stability of the formulated compound or its delivery form. The term parenteral as used herein includes subcutaneous, intracutaneous, intravenous, intramuscular, intraarticular, intraarterial, intrasynovial, intrastenal, intrathecal, intralesional and intracranial injection or infusion techniques.

[0749] The compositions for oral administration can take the form of bulk liquid solutions or suspensions, or bulk powders. More commonly, however, the compositions are presented in unit dosage forms to facilitate accurate dosing. The term "unit dosage forms" refers to physically discrete units suitable as unitary dosages for human subjects and other mammals, each unit containing a predetermined quantity of active material calculated to produce the desired therapeutic effect, in association with a suitable pharmaceutical excipient. Typical unit dosage forms include prefilled, premeasured ampules or syringes of the liquid compositions or pills, tablets, capsules or the like in the case of solid compositions. In such compositions, the compound is usually a minor component (from about 0.1 to about 50% by weight or preferably from about 1 to about 40% by weight) with the remainder being various vehicles or carriers and processing aids helpful for forming the desired dosing form.

[0750] Liquid forms suitable for oral administration may include a suitable aqueous or nonaqueous vehicle with buffers, suspending and dispensing agents, colorants, flavors and the like. Solid forms may include, for example, any of the following ingredients, or compounds of a similar nature: a binder such as microcrystalline cellulose, gum tragacanth or gelatin; an excipient such as starch or lactose, a disintegrating agent such as alginic acid, Primogel, or corn starch; a lubricant such as magnesium stearate; a glidant such as colloidal silicon dioxide; a sweetening agent such as sucrose or saccharin; or a flavoring agent such as peppermint, methyl salicylate, or orange flavoring.

[0751] Injectable compositions are typically based upon injectable sterile saline or phosphate-buffered saline or other injectable carriers known in the art. As before, the active compound in such compositions is typically a minor component, often being from about 0.05 to 10% by weight with the remainder being the injectable carrier and the like. The pharmaceutical compositions may be in

the form of a sterile injectable preparation, for example, as a sterile injectable aqueous or oleaginous suspension. This suspension may be formulated according to techniques known in the art using suitable dispersing or wetting agents (such as, for example, Tween 80) and suspending agents. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally acceptable diluent or solvent, for example, as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are mannitol, water, Ringer's solution and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose, any bland fixed oil may be employed including synthetic mono- or diglycerides. Fatty acids, such as oleic acid and its glyceride derivatives are useful in the preparation of injectables, as are natural pharmaceutically acceptable oils, such as olive oil or castor oil, especially in their polyoxyethylated versions. These oil solutions or suspensions may also contain a long chain alcohol diluent or dispersant, or carboxymethyl cellulose or similar dispersing agents which are commonly used in the formulation of pharmaceutically acceptable dosage forms such as emulsions and or suspensions. Other commonly used surfactants such as Tweens or Spans and/or other similar emulsifying agents or bioavailability enhancers which are commonly used in the manufacture of pharmaceutically acceptable solid, liquid, or other dosage forms may also be used for the purposes of formulation.

[0752] Transdermal compositions are typically formulated as a topical ointment or cream containing the active ingredient(s), generally in an amount ranging from about 0.01 to about 20% by weight, preferably from about 0.1 to about 20% by weight, preferably from about 0.1 to about 10% by weight, and more preferably from about 0.5 to about 15% by weight. When formulated as an ointment, the active ingredients will typically be combined with either a paraffinic or a water-miscible ointment base. Alternatively, the active ingredients may be formulated in a cream with, for example an oil-in-water cream base. Such transdermal formulations are well-known in the art and generally include additional ingredients to enhance the dermal penetration of stability of the active ingredients or the formulation. All such known transdermal formulations and ingredients are included within the scope provided herein.

[0753] The compounds provided herein can also be administered by a transdermal device. Accordingly, transdermal administration can be accomplished using a patch either of the reservoir or porous membrane type, or of a solid matrix variety.

[0754] The pharmaceutical compositions provided herewith may also be administered in the form of suppositories for rectal administration. These compositions can be prepared by mixing a compound provided herewith with a suitable non irritating excipient which is solid at room temperature but liquid at the rectal temperature and therefore will melt in the rectum to release the active components. Such materials include, but are not limited to, cocoa butter, beeswax and polyethylene glycols.

[0755] The pharmaceutical compositions provided herewith may be administered by nasal aerosol or inhalation. Such compositions are prepared according to techniques well known in the art of pharmaceutical formulation and may be prepared as solutions in saline, employing benzyl alcohol or other suitable preservatives, absorption promoters to enhance bioavailability, fluorocarbons, and/or other solubilizing or dispersing agents known in the art.

[0756] The above-described components for orally administrable, injectable or topically administrable, rectally administrable and nasally administrable compositions are merely representative. Other materials as well as processing techniques and the like are set forth in Part 8 of *Remington's Pharmaceutical Sciences*, 17th edition, 1985, Mack Publishing Company, Easton, Pennsylvania, which is incorporated herein by reference.

[0757] The compounds described herein can also be administered in sustained release forms or from sustained release drug delivery systems. A description of representative sustained release materials can be found in *Remington's Pharmaceutical Sciences*.

[0758] When the compositions provided herewith comprise a combination of a compound of the

formulae described herein and one or more additional therapeutic or prophylactic agents, both the compound and the additional agent should be present at dosage levels of between about 1 to 100%, and more preferably between about 5 to 95% of the dosage normally administered in a monotherapy regimen. The additional agents may be administered separately, as part of a multiple dose regimen, from the compounds provided herewith. Alternatively, those agents may be part of a single dosage form, mixed together with the compounds provided herewith in a single composition. [0759] Also provided is the pharmaceutically acceptable acid addition salt of a compound described herein (e.g., compound of Formula (I) or a compound of Table 1).

[0760] The acid which may be used to prepare the pharmaceutically acceptable salt is that which forms a non-toxic acid addition salt, i.e., a salt containing pharmacologically acceptable anions such as the hydrochloride, hydroiodide, hydrobromide, nitrate, sulfate, bisulfate, phosphate, acetate, lactate, citrate, tartrate, succinate, maleate, fumarate, benzoate, para-toluenesulfonate, and the like.

[0761] The compounds described herein can, for example, be administered by injection, intravenously, intraarterially, subdermally, intraperitoneally, intramuscularly, or subcutaneously; or orally, buccally, nasally, transmucosally, topically, in an ophthalmic preparation, or by inhalation, with a dosage ranging from about 0.5 to about 100 mg/kg of body weight, alternatively dosages between 1 mg and 1000 mg/dose, every 4 to 120 hours, or according to the requirements of the particular drug. The methods herein contemplate administration of an effective amount of compound or compound composition to achieve the desired or stated effect. Typically, the pharmaceutical compositions provided herewith will be administered from about 1 to about 6 times per day or alternatively, as a continuous infusion. Such administration can be used as a chronic or acute therapy. The amount of active ingredient that may be combined with the carrier materials to produce a single dosage form will vary depending upon the host treated and the particular mode of administration. A typical preparation will contain from about 5% to about 95% active compound (w/w). Alternatively, such preparations contain from about 20% to about 80% active compound.

[0762] Lower or higher doses than those recited above may be required. Specific dosage and treatment regimens for any particular patient will depend upon a variety of factors, including the activity of the specific compound employed, the age, body weight, general health status, sex, diet, time of administration, rate of excretion, drug combination, the severity and course of the disease, condition or symptoms, the patient's disposition to the disease, condition or symptoms, and the judgment of the treating physician.

[0763] Upon improvement of a patient's condition, a maintenance dose of a compound, composition or combination provided herewith may be administered, if necessary. Subsequently, the dosage or frequency of administration, or both, may be reduced, as a function of the symptoms, to a level at which the improved condition is retained when the symptoms have been alleviated to the desired level. Patients may, however, require intermittent treatment on a long term basis upon any recurrence of disease symptoms.

#### Methods of Treatment and Use

##### Treatment of MTAP-Deficient and/or MTA-Accumulating Proliferation Disorders

[0764] 5-Methylthioadenosine phosphorylase (MTAP) catalyzes the reversible phosphorylation of S-methyl-5'-thioadenosine (MTA) to adenine and 5-methylthioribose-1-phosphate. MTAP-deletion is a common genetic event in human cancer. MTAP deletion frequency in a subset of human cancers is described in Cerami et al., *Cancer Discov.* (2012); 2(5):401-4; Gao et al., *Sci Signal.* (2013); 6(269):pl1; and Lee et al., *Nat. Gen.* (2014) 46(11):1227-32. For example, more than 50% of malignant peripheral nerve sheath tumor (MPNST) have deletions in MTAP (Lee et al., *Nat. Gen.* (2014)). Other cancers with high MTAP deletion frequencies are glioblastoma (GBM), mesothelioma, bladder cancer, pancreatic cancer, esophageal cancer, squamous lung cancer, melanoma, diffuse large B cell lymphoma (DLBCL), head and neck cancer, cholangiocarcinoma, lung adenoma, sarcoma, stomach cancer, glioma, adrenal carcinoma, thymoma, breast cancer, liver

cancer, ovarian cancer, renal papillary cancer, uterine cancer, prostate cancer, and renal clear cell cancer. MTAP deletion in cells is one of the mechanisms that leads to MTAP-deficiency, increased intracellular MTA accumulation, and confers enhanced dependency on the protein arginine methyltransferase 5 (PRMT5) in cancer cells. Other mechanisms leading to MTAP deficiency include, inter alia, MTAP translocations and MTAP epigenetic silencing which could also lead to MTAP-null and/or MTAP deficient tumors. PRMT5 mediates the formation of symmetric dimethylarginine (SDMA); thus, the PRMT5 activity can be assessed by measuring the SDMA levels using the antibody against an SDMA or SDMA modified polypeptide.

#### Sample Preparation

[0864] Further provided are assays for the detection of MTAP deficiency and/or MTA accumulation. They can include detecting a mutation related to MTAP deficiency and/or MTA accumulation, e.g., in a body fluid such as blood (e.g., serum or plasma) bone marrow, cerebral spinal fluid, peritoneal/pleural fluid, lymph fluid, ascites, serous fluid, sputum, lacrimal fluid, stool, and urine, or in a tissue such as a tumor tissue. The tumor tissue can be fresh tissue or preserved tissue (e.g., formalin fixed tissue, e.g., paraffin-embedded tissue).

[0865] Body fluid samples can be obtained from a subject using any of the methods known in the art. Methods for extracting cellular DNA from body fluid samples are well known in the art. Typically, cells are lysed with detergents. After cell lysis, proteins are removed from DNA using various proteases. DNA is then extracted with phenol, precipitated in alcohol, and dissolved in an aqueous solution. Methods for extracting acellular DNA from body fluid samples are also known in the art. Commonly, a cellular DNA in a body fluid sample is separated from cells, precipitated in alcohol, and dissolved in an aqueous solution.

#### Detection of PRMT5 Selectivity

[0866] Samples, once prepared, can be tested for MTAP deficiency and/or MTA accumulation, either or both of which indicates that the sample is sensitive to treatment with a PRMT5 inhibitor. Cells can be determined to be MTA accumulating by techniques known in the art; methods for detecting MTA include, as a non-limiting example, liquid chromatography-electrospray ionization-tandem mass spectrometry (LC-ESI-MS/MS), as described in Stevens et al. 2010. J. Chromatogr. A. 1217: 3282-3288; and Kirovski et al. 2011 Am. J. Pathol. 178: 1145-1152; and references cited therein. The detection of MTAP deficiency can be done by any number of ways, for example: DNA sequencing, PCR based methods, including RT-PCR, microarray analysis, Southern blotting, Northern blotting, Next Generation Sequencing, and dip stick analysis. In some embodiments, MTAP deficiency is evaluated by any technique known in the art, for example, immunohistochemistry utilizing an anti-MTAP antibody or derivative thereof, and/or genomic sequencing, or nucleic acid hybridization, or amplification utilizing at least one probe or primer comprising a sequence of at least 12 contiguous nucleotides (nt) of the sequence of MTAP wherein the primer is no longer than about 30 nt.

[0867] The polymerase chain reaction (PCR) can be used to amplify and identify MTAP deficiency from either genomic DNA or RNA extracted from tumor tissue. PCR is well known in the art and is described in detail in Saiki et al., Science 1988, 239:487.

[0868] Methods of detecting MTAP deficiency by hybridization are provided. The method comprises identifying MTAP deficiency in a sample by its inability to hybridize to MTAP nucleic acid. The nucleic acid probe is detectably labeled with a label such as a radioisotope, a fluorescent agent or a chromogenic agent. Radioisotopes can include without limitation; <sup>3</sup>H, <sup>32</sup>P, <sup>33</sup>P and <sup>35</sup>S etc. Fluorescent agents can include without limitation: FITC, texas red, rhodamine, etc.

[0869] The probe used in detection that is capable of hybridizing to MTAP nucleic acid can be from about 8 nucleotides to about 100 nucleotides, from about 10 nucleotides to about 75 nucleotides, from about 15 nucleotides to about 50 nucleotides, or about 20 to about 30 nucleotides. The kit can also provide instructions for analysis of patient cancer samples, wherein the presence or absence of MTAP deficiency indicates if the subject is sensitive or insensitive to treatment with a PRMT5 inhibitor.

[0870] Single stranded conformational polymorphism (SSCP) can also be used to detect MTAP deficiency. This technique is well described in Orita et al., PNAS 1989, 86:2766-2770.

#### Measurement of Gene Expression

[0871] Evaluation of MTAP deficiency and measurement of MTAP gene expression, and measurement of PRMT5 gene expression can be performed using any method or reagent known in the art.

[0872] Detection of gene expression can be by any appropriate method, including for example, detecting the quantity of mRNA transcribed from the gene or the quantity of cDNA produced from the reverse transcription of the mRNA transcribed from the gene or the quantity of the polypeptide or protein encoded by the gene. These methods can be performed on a sample by sample basis or modified for high throughput analysis. For example, using Affymetrix™ U133 microarray chips.

[0873] In one embodiment, gene expression is detected and quantitated by hybridization to a probe that specifically hybridizes to the appropriate probe for that biomarker. The probes also can be attached to a solid support for use in high throughput screening assays using methods known in the art.

[0874] In one embodiment, the expression level of a gene is determined through exposure of a nucleic acid sample to the probe-modified chip. Extracted nucleic acid is labeled, for example, with a fluorescent tag, preferably during an amplification step.

[0875] Hybridization of the labeled sample is performed at an appropriate stringency level. The degree of probe-nucleic acid hybridization is quantitatively measured using a detection device.

[0876] Alternatively, any one of gene copy number, transcription, or translation can be determined using known techniques. For example, an amplification method such as PCR may be useful.

General procedures for PCR are taught in MacPherson et al., PCR: A Practical Approach, (IRL Press at Oxford University Press (1991)). However, PCR conditions used for each application reaction are empirically determined. A number of parameters influence the success of a reaction. Among them are annealing temperature and time, extension time, Mg<sup>2+</sup> and/or ATP concentration, pH, and the relative concentration of primers, templates, and deoxyribonucleotides. After amplification, the resulting DNA fragments can be detected by agarose gel electrophoresis followed by visualization with ethidium bromide staining and ultraviolet illumination. In one embodiment, the hybridized nucleic acids are detected by detecting one or more labels attached to the sample nucleic acids. The labels can be incorporated by any of a number of means well known to those of skill in the art. However, in one embodiment, the label is simultaneously incorporated during the amplification step in the preparation of the sample nucleic acid. Thus, for example, polymerase chain reaction (PCR) with labeled primers or labeled nucleotides will provide a labeled amplification product. In a separate embodiment, transcription amplification, as described above, using a labeled nucleotide (e.g., fluorescein-labeled UTP and/or CTP) incorporates a label in to the transcribed nucleic acids.

[0877] Alternatively, a label may be added directly to the original nucleic acid sample (e.g., mRNA, polyA, mRNA, cDNA, etc.) or to the amplification product after the amplification is completed. Means of attaching labels to nucleic acids are well known to those of skill in the art and include, for example nick translation or end-labeling (e.g., with a labeled RNA) by kinasing of the nucleic acid and subsequent attachment (ligation) of a nucleic acid linker joining the sample nucleic acid to a label (e.g., a fluorophore).

[0878] In one example, the gene expression can be measured through an in-situ hybridization protocol that can detect RNA molecules on a slide containing tissue sections or cells (e.g., through RNAscope®).

[0879] Detectable labels suitable for use in the methods disclosed herein include any composition detectable by spectroscopic, photochemical, biochemical, immunochemical, electrical, optical or chemical means. Useful labels include biotin for staining with labeled streptavidin conjugate, magnetic beads (e.g., Dynabeads™), fluorescent dyes (e.g., fluorescein, texas red, rhodamine, green fluorescent protein, and the like), radiolabels (e.g., <sup>3</sup>H, <sup>125</sup>I, <sup>35</sup>S, <sup>14</sup>C, or <sup>32</sup>P) enzymes (e.g., horse radish peroxidase, alkaline phosphatase and others commonly used in an ELISA), and calorimetric labels such as colloidal gold or colored glass or plastic (e.g., polystyrene,

polypropylene, latex, etc.) beads.

[0880] Detection of labels is well known to those of skill in the art. Thus, for example, radiolabels may be detected using photographic film or scintillation counters, fluorescent markers may be detected using a photodetector to detect emitted light. Enzymatic labels are typically detected by providing the enzyme with a substrate and detecting the reaction product produced by the action of the enzyme on the substrate, and calorimetric labels are detected by simply visualizing the colored label. The detectable label may be added to the target (sample) nucleic acid(s) prior to, or after the hybridization, such as described in WO 97/10365. These detectable labels are directly attached to or incorporated into the target (sample) nucleic acid prior to hybridization. In contrast, “indirect labels” are joined to the hybrid duplex after hybridization. Generally, the indirect label is attached to a binding moiety that has been attached to the target nucleic acid prior to the hybridization. For example, the target nucleic acid may be biotinylated before the hybridization. After hybridization, an avidin-conjugated fluorophore will bind the biotin bearing hybrid duplexes providing a label that is easily detected. For a detailed review of methods of labeling nucleic acids and detecting labeled hybridized nucleic acids see *Laboratory Techniques in Biochemistry and Molecular Biology*, Vol. 24: Hybridization with Nucleic Acid Probes, P. Tijssen, ed. Elsevier, N.Y. (1993).

#### Detection of Polypeptides

[0881] Protein levels of MTAP can be determined by examining protein expression or the protein product. Determining the protein level involves measuring the amount of any immunospecific binding that occurs between an antibody that selectively recognizes and binds to the polypeptide of the biomarker in a sample obtained from a subject and comparing this to the amount of immunospecific binding of at least one biomarker in a control sample.

[0882] A variety of techniques are available in the art for protein analysis. They include but are not limited to radioimmunoassays, ELISA (enzyme linked immunosorbent assays), “sandwich” immunoassays, immunoradiometric assays, in situ immunoassays (using e.g., colloidal gold, enzyme or radioisotope labels), Western blot analysis, immunoprecipitation assays, immunofluorescent assays, flow cytometry, immunohistochemistry, HPLC, mass spectrometry, confocal microscopy, enzymatic assays, surface plasmon resonance and PAGE-SDS.

#### Adjacent Biomarkers

[0883] Near or adjacent to MTAP on chromosome 9 are several other biomarkers. CDKN2A is often, if not usually, deleted along with MTAP. Additional genes or pseudogenes in this region include: C9orf53, ERVFRD-3, TUBB8P1, KHSRPP1, MIR31, and MIR31HG.

[0884] In some embodiments of the methods, the cell that is MTAP-deficient is also deficient in CDKN2A. In some embodiments, the cell that is MTAP-deficient is also deficient in one or more of: CDKN2A, C9orf53, ERVFRD-3, TUBB8P1, KHSRPP1, MIR31, and MIR31HG.

[0885] Thus, in various methods involving a step of evaluating a cell for MTAP deficiency or determining if a cell is MTAP-deficient, this step can comprise the step of determining if the cell is deficient for one or more of these markers: CDKN2A, C9orf53, ERVFRD-3, TUBB8P1, KHSRPP1, MIR31, and MIR31HG.

[0886] Thus, in some embodiments, the disclosure encompasses: A method of determining if a subject having or having been diagnosed with a cancer will respond to therapeutic treatment with a PRMT5 inhibitor (e.g., an MTA-uncompetitive, non-competitive, or mixed mode PRMT5 inhibitor or an MTA-cooperative binding agent), comprising the steps of: [0887] a) evaluating a test sample obtained from said subject for MTAP deficiency, and evaluating a reference sample from a non-cancerous or normal control subject for MTAP deficiency, wherein MTAP deficiency in the test sample relative to the reference sample indicates that the subject will respond to therapeutic treatment with a PRMT5 inhibitor (e.g., an MTA-uncompetitive PRMT5 inhibitor, e.g., a compound of Formula (I) or a compound of Table 1, or pharmaceutically acceptable salts thereof); wherein MTAP deficiency is evaluated by evaluating the deficiency of one or more of the following biomarkers: CDKN2A, C9orf53, ERVFRD-3, TUBB8P1, KHSRPP1, MIR31, and

MIR31HG, and wherein the method can further comprise the following steps: [0888] b) determining the level of MTAP in the subject, wherein steps a) and b) can be performed in any order; [0889] c) administering a therapeutically effective amount of a PRMT5 inhibitor (e.g., an MTA-uncompetitive, non-competitive, or mixed mode PRMT5 inhibitor or an MTA-cooperative binding agent, e.g., a compound of Formula (I) or a compound of Table 1, or pharmaceutically acceptable salts thereof) to the subject; and d) determining the level of PRMT5 activity in the subject following step c), wherein a decrease in the level of PRMT5 activity is correlated with the inhibition of the proliferation of the cancer, and wherein steps c) and d) are performed after steps a) and b).

[0890] In some embodiments, the disclosure encompasses: A method of determining if a cancer will respond to therapeutic treatment with a PRMT5 inhibitor (e.g., an MTA-uncompetitive, non-competitive, or mixed mode PRMT5 inhibitor or an MTA-cooperative binding agent), comprising the steps of: [0891] a) evaluating a test sample obtained from a subject having or having been diagnosed with said cancer for MTAP deficiency, and evaluating a reference sample from a non-cancerous or normal control subject for MTAP deficiency, wherein MTAP deficiency in the test sample relative to the reference sample indicates that the cancer will respond to therapeutic treatment with a PRMT5 inhibitor (e.g., an MTA-uncompetitive, non-competitive, or mixed mode PRMT5 inhibitor or an MTA-cooperative binding agent, e.g., a compound of Formula (I) or a compound of Table 1, or pharmaceutically acceptable salts thereof); wherein MTAP deficiency is evaluated by evaluating the deficiency of one or more of the following biomarkers: CDKN2A, C9orf53, ERVFRD-3, TUBB8P1, KHSRPP1, MIR31, and MIR31HG, and wherein the method can further comprise the following steps: [0892] b) determining the level of MTAP in the subject, wherein steps a) and b) can be performed in any order; [0893] c) administering a therapeutically effective amount of a PRMT5 inhibitor (e.g., an MTA-uncompetitive PRMT5 inhibitor, e.g., a compound of Formula (I) or a compound of Table 1, or pharmaceutically acceptable salts thereof) to the subject; and [0894] d) determining the level of PRMT5 activity in the subject following step c), wherein a decrease in the level of PRMT5 activity is correlated with the inhibition of the proliferation of the cancer, and wherein steps c) and d) are performed after steps a) and b).

#### Assaying for Biomarkers and PRMT5 Inhibitor Treatment

[0895] A number of patient stratification strategies could be employed to find patients likely to be sensitive to PRMT5 inhibition with an MTA-uncompetitive, non-competitive, or mixed mode PRMT5 inhibitor or an MTA-cooperative binding agent (e.g., a PRMT5 inhibitor of the present disclosure, e.g., a compound of Formula (I) or a compound of Table 1, or pharmaceutically acceptable salts thereof), including but not limited to, testing for MTAP deficiency and/or MTA accumulation.

[0896] Once a patient has been assayed for MTAP deficiency and/or MTA accumulation and predicted to be sensitive to treatment with a PRMT5 inhibitor, administration of any PRMT5 inhibitor (e.g., an MTA-uncompetitive, non-competitive, or mixed mode PRMT5 inhibitor or an MTA-cooperative binding agent, e.g., a compound of Formula (I) or a compound of Table 1, or pharmaceutically acceptable salts thereof) to a patient can be effected in one dose, continuously or intermittently throughout the course of treatment. Methods of determining the most effective means and dosage of administration are well known to those of skill in the art and will vary with the composition used for therapy, the purpose of the therapy, the target cell being treated, and the subject being treated. Single or multiple administrations can be carried out with the dose level and pattern being selected by the treating physician. Suitable dosage formulations and methods of administering the agents may be empirically adjusted.

#### General Experimental Notes:

[1009] In the following examples, the chemical reagents were purchased from commercial sources (such as Alfa, Acros, Sigma Aldrich, TCI and Shanghai Chemical Reagent Company), and used without further purification.

[1010] In some examples, purification of intermediates and final compounds was performed using HPLC (H.sub.2O - MeOH; Agilent 1260 Infinity systems equipped with DAD and mass-detectors. Waters Sunfire C18 OBD Prep Column, 100A, 5  $\mu$ m, 19 mm $\times$ 100 mm with SunFire C18 Prep Guard Cartridge, 100A, 10  $\mu$ m, 19 mm $\times$ 10 mm) The material was dissolved in 0.7 mL DMSO. Flow: 30 mL/min. Purity of the obtained fractions was checked via the analytical LCMS. Spectra were recorded for each fraction as it was obtained straight after chromatography in the solution form. The solvent was evaporated under the N.sub.2 flow upon heating to 80° C. On the basis of post-chromatography LCMS analysis fractions were united. Solid fractions were dissolved in 0.5 mL MeOH and transferred into pre-weighted marked vials. Obtained solutions were again evaporated under the N.sub.2 flow upon heating to 80° C. After drying, products were subjected to lyophilization using acetonitrile-water mixtures and finally characterized by LCMS and .sup.1H NMR.

[1011] Nuclear magnetic resonance (NMR) spectra were recorded using Bruker AVANCE DRX 500, Bruker 400 spectrometer or Varian UNITYplus 400. Chemical shifts for protons were reported as parts per million in  $\delta$  scale using solvent residual peak (CHCl<sub>3</sub>: 7.27 ppm) (methanol-d<sub>4</sub>: 3.31 ppm) (DMSO-d<sub>6</sub>: 2.50 ppm) or tetramethylsilane (0.00 ppm) as internal standards. Chemical shifts of .sup.13C NMR spectra were reported in ppm from the central peak of CDCl<sub>3</sub> (77.00 ppm) (methanol-d<sub>4</sub>: 49.15 ppm) (DMSO-d<sub>6</sub>: 39.51 ppm) on the  $\delta$  scale. Data are represented as follows: chemical shift, multiplicity (s=singlet, d=doublet, t=triplet, q=quartet, qn=quintuplet, sx=sextet, sp=septuplet, m=multiplet, br=broad), coupling constant (J, Hz) and integration.

[1012] In certain examples, mass spectra were recorded on an Agilent 1100 Series LC/MSD system with DADELSD and Agilent LCMSD VL (G1956A), SL (G1956B) mass-spectrometer or an Agilent 1200 Series LC/MSD system with DADELSD and Agilent LCMSD SL (G6130A), SL (G6140A) mass-spectrometer.

All the LC/MS data were obtained using positive/negative mode switching.

#### Exemplary TLC, Concentration and Normal Phase Chromatography.

[1055] Analytical thin layer chromatography (TLC) was performed with silica gel 60 F254 aluminum plates. Visualization was done under a UV lamp (254 nm) and by iodine or immersion in ethanolic phosphomolybdic acid (PMA) or potassium permanganate (KMnO<sub>4</sub>), followed by heating using a heat gun. Organic solutions were concentrated by rotary evaporation at 20-40° C. Purification of reaction products were generally done by flash column chromatography with 230-400 mesh silica gel or Agela flash silica column.

#### Materials and Methods

[1066] The compounds provided herein can be prepared from readily available starting materials

using the following general methods and procedures. It will be appreciated that where typical or preferred process conditions (i.e., reaction temperatures, times, mole ratios of reactants, solvents, pressures, etc.) are given, other process conditions can also be used unless otherwise stated. Optimum reaction conditions may vary with the particular reactants or solvent used, but such conditions can be determined by one skilled in the art by routine optimization.

[1067] Additionally, as will be apparent to those skilled in the art, conventional protecting groups may be necessary to prevent certain functional groups from undergoing undesired reactions. The choice of a suitable protecting group for a particular functional group as well as suitable conditions for protection and deprotection are well known in the art. For example, numerous protecting groups, and their introduction and removal, are described in T. W. Greene and P. G. M. Wuts, *Protecting Groups in Organic Synthesis*, Second Edition, Wiley, New York, 1991, and references cited therein.

[1068] The compounds provided herein may be isolated and purified by known standard procedures. Such procedures include (but are not limited to) recrystallization, column chromatography, HPLC, or supercritical fluid chromatography (SFC). The following schemes are presented with details as to the preparation of representative pyrazoles that have been listed herein. The compounds provided herein may be prepared from known or commercially available starting materials and reagents by one skilled in the art of organic synthesis.

Intermediates

##STR00377##

[1071] Intermediates Pyr-I, Pyr-II, and Pyr-III were synthesized according to conventional procedures from patent and non-patent literature.

Intermediate 1. 2-oxo-2-[[1-(2-trimethylsilylethoxymethyl)pyrazolo[4,3-c]pyridin-7-yl]aminolacetic acid

##STR00378##

Step 1: Synthesis of 5-bromo-4-chloro-pyridine-3-carbaldehyde

[1072] To a mixture of 2M LDA/THF (35 mL, 70.0 mmol) in THF (20 mL) was added 3-bromo-4-chloro-pyridine (11 g, 57.2 mmol) dropwise at -65° C. under N<sub>2</sub>. The resulting mixture was stirred at -65° C. for 2 hours. N,N-dimethylformamide (5.4 mL, 69.7 mmol) was added at -65° C. and the reaction was stirred at 20° C. for 2 hours. The resulting mixture was quenched by addition of NH<sub>4</sub>Cl aqueous solution (100 mL) and extracted with EtOAc (100 mL\*3). The combined organic layer was washed with saturated NH<sub>4</sub>Cl aqueous solution (100 mL), brine (100 mL), dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, filtered and concentrated under reduced pressure. The residue was purified by flash chromatography (ISCO®; 80 g AgelaFlash® Silica Flash Column, petroleum ether/EtOAc with EtOAc from 0~30%, flow rate=30 mL/min, 254 nm) to afford 5-bromo-4-chloro-pyridine-3-carbaldehyde (8 g, 63.5% yield) as yellow solid. <sup>1</sup>H NMR (400 MHz, DMSO-d<sub>6</sub>) δ ppm 10.22-10.40 (m, 1H), 9.02-9.18 (m, 1H), 8.83-8.95 (m, 1H); LCMS (ESI) [M+H]<sup>+</sup> m/z: calcd 221.9, found 221.9.

Step 2: Synthesis of 7-bromo-1H-pyrazolo[4,3-c]pyridine

[1073] A mixture of 5-bromo-4-chloro-pyridine-3-carbaldehyde (6.1 g, 27.7 mmol) in hydrazine (10 mL, 17.0 mol) and DME (40 mL) was stirred at 110° C. for 12 hours. The resulting mixture was filtered and concentrated under reduced pressure to give 7-bromo-1H-pyrazolo[4,3-c]pyridine (5.6 g, crude) as yellow solid. <sup>1</sup>H NMR (400 MHz, methanol-d<sub>4</sub>) δ ppm 9.05 (s, 1H), 8.42 (d, J=13.1 Hz, 2H).

Step 3: Synthesis of 2-[(7-bromopyrazolo[4,3-c]pyridin-1-yl)methoxy]ethyl-trimethyl-silane and 2-[(7-bromopyrazolo[4,3-c]pyridin-2-yl)methoxy]ethyl-trimethyl-silane  
[1074] To a mixture of 7-bromo-1H-pyrazolo[4,3-c]pyridine (5.6 g, 28.3 mmol) in DMF (60 mL) was added NaH (2 g, 50.0 mmol, 60 wt % in mineral oil) slowly at 0° C., the mixture was stirred at 0° C. for 10 minutes. [1501] The synthesis of (2S,5R)-1-benzyl-2-(4-fluorophenyl)-5-methylpiperazine is given by the following procedure. Borane dimethyl sulfide complex (2.66 g, 35.06 mmol, 3.33 mL) was added dropwise to the solution of (3S,6R)-4-benzoyl-3-(4-fluorophenyl)-6-methyl-piperazin-2-one (2.19 g, 7.01 mmol) in THF (30 mL). Resulting mixture was stirred at 65° C. for 18 hr. Then, it was cooled to rt and excess of borane was destroyed by dropwise addition of MeOH (10 ml). After H.sub.2 evolution ceased, volatiles were removed under reduced pressure and residue was taken up in 2M aq. HCl (40 ml) and stirred at 50° C. for 40 minutes. Resulting cloudy solution was filtered and extracted with DCM (2×10 ml). DCM layers were discarded and aqueous layer was basified to pH $\approx$ 11 with solid potassium hydroxide. Precipitated amine was extracted with DCM (2×25 ml). Organic layers were separated, dried over K.sub.2CO.sub.3 and concentrated in vacuum, affording (2S,5R)-1-benzyl-2-(4-fluorophenyl)-5-methyl-piperazine (1.31 g, 4.61 mmol, 65.70% yield).

[1588] The synthesis of (2S,5R)-1-benzyl-2-(4-fluorophenyl)-5-methylpiperazine is given by the following procedure. Borane dimethyl sulfide complex (2.66 g, 35.06 mmol, 3.33 mL) was added dropwise to the solution of (3S,6R)-4-benzoyl-3-(4-fluorophenyl)-6-methyl-piperazin-2-one (2.19 g, 7.01 mmol) in THF (30 mL). Resulting mixture was stirred at 65° C. for 18 hr. Then, it was cooled to rt and excess of borane was destroyed by dropwise addition of MeOH (10 ml). After H.sub.2 evolution ceased, volatiles were removed under reduced pressure and residue was taken up in 2M aq. HCl (40 ml) and stirred at 50° C. for 40 minutes. Resulting cloudy solution was filtered and extracted with DCM (2 $\times$ 10 ml). DCM layers were discarded and aqueous layer was basified to pH $\approx$ 11 with solid potassium hydroxide. Precipitated amine was extracted with DCM (2 $\times$ 25 ml). Organic layers were separated, dried over K.sub.2CO.sub.3 and concentrated in vacuum, affording (2S,5R)-1-benzyl-2-(4-fluorophenyl)-5-methyl-piperazine (1.31 g, 4.61 mmol, 65.70% yield).

The reaction mixture was evacuated and backfilled three times with hydrogen and was hydrogenated at 1 atm (balloon) overnight. #### Scheme 1.4 General Procedures

##### Step 1.4.3: Synthesis of 10.4-D

[1815] 1.1-C(1 eq) was added dropwise to the solution of tert-butyl N-[(1R)-2-amino-1-methylethyl]carbamate (1 eq) and TEA (2 eq) in MeCN. Resulting reaction mixture was stirred at 20° C. for 14 hr. Then, volatiles were removed under reduced pressure and residue was partitioned between 10% aq. K<sub>2</sub>CO<sub>3</sub> solution and MTBE. Organic layer was separated, dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated under reduced pressure to obtain 1.1-D which was used further without purification.

##### Step 1.4.4: Synthesis of 1.4-E

[1816] Hydrogen chloride solution 4.0 M in dioxane (4 eq) was added portion wise to a solution of 1.4-D (1 eq) in MeOH. Resulting mixture was stirred at 20° C. for 14 hr. Then, volatiles were removed under reduced pressure and residue was partitioned between 25% aq. K<sub>2</sub>CO<sub>3</sub> solution and DCM. Organic layer was separated, and aqueous layer was extracted with DCM twice. Combined DCM layers were dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated in vacuum. After solvent was distilled off, residue was heated to 80° C. under reduced pressure (approx. 15 torr) for 1 hour. Then, it was dissolved in boiling toluene. Resulting solution was leaved for crystallization at 20° C. for 6 hours. Obtained white crystals were filtered on and dried, affording 1.4-E.

##### Step 1.4.5: Synthesis of 1.4-F

[1817] Boc<sub>2</sub>O (1.15 eq) was added dropwise to the solution of 1.4-E and TEA (1.2 eq) in DCM. After addition was complete, resulting mixture was stirred at 20° C. for 4 hr. Then, volatiles were removed under reduced pressure and residue was triturated with cold hexane (60 ml). Resulting precipitate was filtered on and dried, affording 1.4-F.

##### Step 1.4.6: Synthesis of 1.4-G

[1818] Solution of 1.4-F (1 eq) and acetic acid (10 eq) in dioxane was added dropwise to a refluxed solution of NaBH<sub>4</sub> (10 eq) in dioxane. Reaction mixture was refluxed for 3 hr. After then it was cooled to rt, quenched with water and extracted with EtOAc. Organic layer was separated, dried over Na<sub>2</sub>SO<sub>4</sub> and evaporated to give a crude. It was purified by flash chromatography to afford 1.4-G.

##### Step 1.4.7A: Synthesis of 1.4-H

[1819] (R<sub>5</sub>)<sub>2</sub>O (1 eq) or R<sub>5</sub>Cl (1.3 eq) was added dropwise to a solution of 1.4-G (1 eq) and TEA (3 eq) in DCM. After addition was complete, resulting mixture was stirred at 20° C. for 3 hr. Then, 15% aq. K<sub>2</sub>CO<sub>3</sub> solution was added and stirring was continued for 10 min. After that, organic layer was separated, dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and evaporated to obtain 1.4-H.

##### Step 1.4.8: Synthesis of 1.4—I

[1820] 1.4-H (1 eq) was dissolved in DCM and TFA (7 eq) was added thereto. The resulting mixture was stirred at 25° C. for 15 hr, and then evaporated in vacuum to afford 1.4—I (TFA-salt).

##### Step 1.4.9A: Synthesis of IIIa

[1821] 1.4—I (1 eq), Pyr-I (1 eq) and TEA (2.5 eq+1.0 eq per each acid eq, if amine salt used) were mixed together in DMF. HATU (1.5 eq) was added thereto and the resulting mixture was stirred overnight. The reaction mixture was concentrated in vacuum and the residue was purified by HPLC to obtain the product.

Step 2: Synthesis of methyl 2-bromo-2-(p-tolyl)acetate

[2075] In a nitrogen gas atmosphere, a n-butyllithium (6.90 g, 107.88 mmol, 43.16 mL) was dropwise added to a dehydrated tetrahydrofuran (100 mL) solution of hexamethyldisilazane (18.22 g, 113.01 mmol, 23.55 mL) at about -30° C. over a period of 10 minutes, followed by stirring at about -40° C. for 30 minutes. Then, to the reaction solution, a dehydrated tetrahydrofuran (20 mL) solution of methyl 2-(p-tolyl)acetate (16.87 g, 102.74 mmol) was dropwise added over a period of 20 minutes. This reaction solution was dropwise added to a dehydrated tetrahydrofuran (30 mL) solution of bromine (17.24 g, 107.88 mmol, 5.40 mL) in a nitrogen gas atmosphere at about -35° C. over a period of 1 hr. After stirring at about -35° C. for 1 hr, the temperature was raised to 0° C., and a mixed liquid of water-sodium thiosulfate aqueous solution (1:1, (v/v)) was added to the reaction solution, and extracted with ethyl acetate. Then, the extract was washed with a saturated ammonium chloride aqueous solution and a saturated salt solution and dried over anhydrous magnesium sulfate. The drying agent was removed by filtration, and the solvent was distilled off to give methyl 2-bromo-2-(p-tolyl)acetate (22.67 g, 93.26 mmol, 90.77% yield).

[2242] General Procedures for Scheme 2.3

Step 2.3.1: Synthesis of 2.3-B

[2243] Compound 2.3-B was prepared from 2.3-A according to common literature procedures.

Step 2.3.2: Synthesis of 2.3-D

[2244] A mixture of 2.3-B (1 eq), pyrazine 2.3—C(1.5 eq) and Sodium carbonate (2 eq) in Dioxane and Water was evacuated and then backfilled with argon. This operation was repeated three times, then Pd(dppf)Cl.sub.2DCM (0.05 eq) was added in an inert atmosphere. After stirring at 90° C. for 48 hr, the reaction mixture was cooled down and filtered. The filter cake was washed with 1,4-dioxane and discarded. The filtrate was concentrated under reduced pressure to afford crude product. The residue was purified by column chromatography (SiO.sub.2; chloroform/acetonitrile gradient (0-100% acetonitrile)) to afford 2.3-D.

Step 2.3.3: Synthesis of 2.3-E

[2245] To a solution of 2.3-D (1 eq) in a mixture of methanol and acetic acid Palladium, 10% on carbon (1 eq) was added. The reaction mixture was hydrogenated at 50° C. for 48 hr, then cooled down and filtered. Hydrogen chloride solution 4.0M in dioxane (1 eq) was added to the filtrate and the resulting solution was concentrated in vacuo. The residue was diluted with MTBE, stirred for 0.5 hr and filtered. The filter cake was washed with MTBE and dried in vacuo to afford crude 2.3-E.

Step 2.3.4A: Synthesis of 2.3-F

[2246] To a stirring solution of 2.3-E (1 eq) in THF, anhydride (1.175 eq), TEA (1.5 eq) was added at 0° C. After stirring for 8 hr at 0° C., the reaction mixture was concentrated under reduced pressure to give 2.3-F.

Step 2.3.4B: Synthesis of 2.3-F

[2247] RCOCl (1,4 eq) was added slowly to a stirred mixture of 2,3-E (1 eq) and Triethylamine (6 eq) in DCM at -40° C. The reaction mixture was stirred at -40° C. for 1 hr, and then allowed to warm to 25° C. and stirred at the temperature for 12 hr. The obtained mixture was concentrated in vacuo and the residue was purified by gradient chromatography (MTBE-MeOH) to afford 2.3-F.

[2248] To a solution of 2.3-F (1 eq), 2.3-G (1 eq) and Triethylamine (5 eq) in DMF HATU (1.2 eq) was added portionwise. After stirring at 25° C. for 4 hr, the reaction mixture was diluted with water and extracted with EtOAc. The combined organic layer was washed with brine, dried over Na.sub.2SO.sub.4 and concentrated in vacuo to give racemic product.

Step 2.3.6: Synthesis of Enantiopure Products

Example 119. Cellular assay—SDMA in-cell western protocol

[2343] A HAP1 MTAP-isogenic cell line pair was acquired from Horizon Discovery (HZGHC004894c005) and maintained in DMEM (ThermoFisher 11965)+10% FBS (Gemini 100-500) in a humidified, 10% CO.sub.2 tissue culture incubator. The SAM-cooperative PRMT5 inhibitor, GSK3326595, was sourced from SelleckChem and maintained as a 10 mM DMSO stock. All test compounds are maintained as 10 mM DMSO stocks

[2344] On Day 0, MTAP-intact or MTAP-deleted cells are seeded in a 384-well plate, and incubated in a humidified, 5% CO.sub.2 tissue culture incubator for 16-24 hours. On Day 1, the test compounds are dispensed to wells at defined concentrations using a Tecan D300e digital dispenser (n=4), and the volume of DMSO is normalized to highest class volume. Each plate includes wells dosed with defined concentrations of GSK3326595 as a plate control. The compounds are incubated with cells for 24 hours in a humidified, 5% CO.sub.2 tissue culture incubator.

[2345] On Day 2, the compound-treated cells are fixed with a final concentration of 4% formaldehyde. The cells are then washed/permeabilized with 1×PBS+0.1% Triton X.sub.100, and then blocked with 5% goat serum/1×TBS. The fixed cells are then incubated overnight at 4° C. with a primary SDMA antibody cocktail (Cell Signaling 13222).

[2346] On Day 3, the cells are washed with 1×PBS+0.1% Triton X.sub.100, and then incubated at room temperature for 1 hour with a NIR fluorescent secondary antibody cocktail that also contains DRAQ5 (LiCor 926-32211 and VWR 10761-508). The cells are washed with 1×PBS+0.1% Triton X-100, and then washed again with ddH.sub.2O. The plates are then imaged using a NIR fluorescent imager (LiCor Odyssey).

[2347] For data analysis, the SDMA signal is normalized to the DRAQ5 signal. Assay background is determined by the signal from wells treated with 1 µM GSK3326595, and subtracted from every well. The data are plotted as % of the DMSO control wells for the MTAP-intact and the MTAP-

deleted cell lines independently, and fitted to the 4-parameter logistic (4-PL) Hill equation with maximal effect constrained to 0. The fit was performed using GraphPad Prism or the default IC.sub.50 fitting procedure in Dotmatics Studies 5.4 as part of a customized data analysis protocol. [2348] The data obtained in this experiment is presented in Table 1, columns 4-6.

#### Example 120. Viability assay protocol

[2349] A HAP1 MTAP-isogenic cell line pair was acquired from Horizon Discovery (HZGHC004894c005) and maintained in DMEM (ThermoFisher 11965)+10% FBS (Gemini 100-500) in a humidified, 5 or 10% CO.sub.2 tissue culture incubator. All test compounds are maintained as 10 mM DMSO stocks.

[2350] On Day 0, MTAP-intact and MTAP-deleted cells are seeded in a 96-well plate, and incubated in a humidified, 5 or 10% CO.sub.2 tissue culture incubator for 16-24 hours. On Day 1, the test compounds are dispensed to wells at defined concentrations using a Tecan D300e digital dispenser (n=3), and the volume of DMSO is normalized to highest class volume (0.2%). The compound-treated plates are incubated for 7 days in a humidified, 5 or 10% CO.sub.2 tissue culture incubator.

[2351] On Day 7, the plates are removed from the tissue culture incubator and allowed to equilibrate to room temperature. Then either a ½ volume CellTiter-Glo Luminescent Cell Viability Assay reagent (Promega G7572) is added to each well, or the media is removed from every well and a 1:3 dilution of CellTiter-Glo 2.0 Cell Viability Assay reagent (Promega G9241) in 1×PBS is added. Ten minutes after addition, the luminescent signal is detected by an Envision plate reader. The data are plotted as % of the DMSO control wells for the MTAP-intact and the MTAP-deleted cell lines independently, and fitted to the 4-parameter logistic (4-PL) Hill equation with maximal effect constrained to 0. The fit was performed using GraphPad Prism or the default IC.sub.50 fitting procedure in Dotmatics Studies 5.4 as part of a customized data analysis protocol.

[2352] The data obtained in this experiment is presented in Table 1, column 8.

#### Example 121. Combination Viability Assay Protocol

[2353] A SW1573 MTAP-isogenic cell line pair can be generated by either reconstituting MTAP gene expression, or by introducing an empty control vector, in the MTAP-deleted SW1573 parental cell line. The cell lines can be maintained in DMEM+10% FBS in a humidified, 5% CO.sub.2 tissue culture incubator. All test compounds can be maintained as 10 mM DMSO stocks.

[2354] On Day 0, MTAP-intact and MTAP-deleted cells can be seeded in a 384-well plate, and incubated in a humidified, 5% CO.sub.2 tissue culture incubator for 16-24 hours. On Day 1, the test compounds can be dispensed to wells at defined concentrations (n=2), and the volume of DMSO can be normalized to highest class volume. The compound-treated plates can be incubated for 7 days in a humidified, 5% CO.sub.2 tissue culture incubator.

[2355] On Day 7, the plates can be removed from the tissue culture incubator and allowed to equilibrate to room temperature. Relative viability can be assessed by addition of CellTiter-Glo reagent, and data can be plotted as % of DMSO control for each compound in each cell line, with a 4-parameter fit non-linear regression model (GraphPad Prism). Synergy can be determined according to the HSA model by the Combenefit software package (Version 2.021).

#### Prmt5 Inhibitors and MAT2A Inhibitors Represents a Potential Clinical Combination in MTAP-Deleted Tumors

[2356] Marjon et al (Cell Reports 2016) and Kalev et al (Cancer Cell 2021) identify MAT2A as a therapeutic target in MTAP-deleted tumors. The combination of a MAT2A inhibitor with an inhibitor that selectively targets PRMT5 in MTAP-null cells can be assessed to determine whether this would present a rational therapeutic strategy. Combination of a MAT2A inhibitor (e.g., AG-270) with an exemplar MTAPnu-selective PRMT5 inhibitor in a 7-day viability assay in the MTAP-null SW1573 cancer cell line can demonstrate enhanced cellular viability defects.

#### Prmt5 Inhibitors and MAPK or KRASG12C Inhibitors Represent a Potential Clinical Combination in MTAP-Deleted, KRAS-Mutated Tumors

[2357] MTAP-deletion can co-occur with mutations in the KRAS gene (e.g., KRASG12C). Therapies targeting KRAS or other members of the MAPK pathway (eg, MAPK3, MAPK1, MEK1 and MEK2) exist. The combination of these inhibitors with an inhibitor that selectively targets PRMT5 in MTAP-null cells can be assessed to determine whether this would present a therapeutic strategy.

[2358] Combination of a KRASG12C inhibitor (e.g., AMG-510), with an exemplar MTAP.sup.null-selective PRMT5 inhibitor in a 7-day viability assay in the MTAP-null SW1573 cancer cell line can demonstrate enhanced cellular viability defects.

[2359] Combination of MAPK1/MAPK3 inhibitors (e.g., ulixertinib and SCH772984), with an exemplar MTAP.sup.null-selective PRMT5 inhibitor in a 7-day viability assay in the MTAP-null SW1573 cancer cell line can demonstrate enhanced cellular viability defects.

[2360] Combination of MEK inhibitors (e.g., trametinib) with an exemplar MTAP<sup>null</sup>—<sup>sup.1</sup> selective PRMT5 inhibitor in a 7-day viability assay in the MTAP-null SW1573 cancer cell line can demonstrate enhanced cellular viability defects.
