METHODS OF IMPROVING STRESS TOLERANCE, GROWTH AND YIELD IN PLANTS

FIELD OF THE INVENTION

The present invention relates to methods of improving growth and yield in plants by applying an effective amount of a mixture of (S)-abscisic acid and one or more cytokinins to the plant. The present invention further relates to methods of improving stress tolerance in plants by applying an effective amount of a mixture of (S)-abscisic acid and one or more cytokinins to the plant.

BACKGROUND OF THE INVENTION

Growers continually attempt to grow the most productive crops possible in order to maximize yields. Plant growth regulators are among the best tools that growers can use to influence the growth of plants based on the restrictions of water and temperature. The effects of plant growth regulators on plants under different conditions can vary widely. Furthermore, it is difficult to predict the effect of simultaneously applying more than one plant growth regulator to the plant.

(S)-abscisic acid ("ABA") is an endogenous plant growth regulator with many roles in growth and development. For example, ABA inhibits seed germination by antagonizing gibberellins that stimulate the germination of seeds. ABA promotes stress tolerance and maintains growth under stress conditions (see Sharp R E et al. *J Exp Bot*, 2004 55:2343-2351). Interestingly, several studies have shown that maintaining 'normal' ABA levels in well-watered plants is required to maintain shoot growth in tomato (Sharp R E et al., *J Exp Bot*, 2000 51:1575-1584) and *Arabidopsis thaliana* (LeNoble M E et al. *J Exp Bot*, 2004 55:237-245). Moreover, ABA is responsible for the development and maintenance of dormancy in seeds and woody plants, which when deficient in ABA often demonstrate pre-harvest sprouting of seeds due to a lack of dormancy induction.

Further, applications of ABA have also been shown to provide protection from chilling and drought, as well as to increase the red color of seedless table grapes. Examples of effective commercially available ABA formulations include ProTone™ and Contego™ (available from Valent BioSciences LLC).

Cytokinins are plant growth regulators that regulate cell division in plant shoots and organs. Exogenous cytokinins are applied in agricultural settings to increase yield of plants.

Cytokinins have also been shown to increase production in cotton under drought conditions. Yao S (March 2010). "Plant Hormone Increases Cotton Yields in Drought Conditions". *News & Events*. Agricultural Research Service (ARS), U.S. Department of Agriculture.

Previous applications have suggested that ABA and benzyladenine could be used to enhance fruit quality by reducing the number of fruits on a plant by thinning. See, U.S. Pat. No. 8,173,577 demonstrating that application of ABA and benzyladenine during flowering or fruiting stage of the plant reduced the number of developed fruits on the plant.

However, it is unclear if plant growth would benefit from the co-application of ABA and cytokinins. Accordingly, there is a need in the art for new methods to improve the growth of plants, including under abiotic stress conditions.

SUMMARY OF THE INVENTION

In another aspect, the present invention is directed to methods of improving plant growth comprising applying an

2

effective amount of a mixture of (S)-abscisic acid ("ABA") and one or more cytokinins to the plant, wherein the weight ratio of ABA to the one or more cytokinins is from about 10:1 to about 1:10 and wherein the plant is a cereal crop.

In one aspect, the present invention is directed to methods of improving stress tolerance in a plant comprising applying an effective amount of a mixture of (S)-abscisic acid ("ABA") and one or more cytokinins to the plant, wherein the weight ratio of ABA to the one or more cytokinins is from about 10:1 to about 1:10 and wherein the plant is a cereal crop.

DETAILED DESCRIPTION OF THE INVENTION

Applicant unexpectedly discovered that a mixture of (S)-abscisic acid ("ABA") and cytokinins improved plant growth. Applicant further discovered that a mixture of ABA and cytokinins improved drought stress tolerance and plant growth under drought stress conditions.

In one embodiment, the present invention is directed to a method of improving plant growth comprising applying an effective amount of a mixture of ABA and one or more cytokinins to the plant, wherein the weight ratio of ABA to the one or more cytokinins is from about 10:1 to about 1:10 and wherein the plant is a cereal crop.

In another embodiment, the present invention is directed to a method of improving stress tolerance in a plant comprising applying an effective amount of a mixture of ABA and one or more cytokinins to the plant, wherein the weight ratio of ABA to the one or more cytokinins is from about 10:1 to about 1:10 and wherein the plant is a cereal crop.

In one embodiment, the present invention is directed to a method of improving plant growth comprising applying an effective amount of a mixture of ABA and one or more cytokinins to the plant, wherein the weight ratio of ABA to the one or more cytokinins is from about 10:1 to about 1:10, wherein the plant is a cereal crop and wherein the one or more cytokinins are 6-benzyladenine or forchlorfenuron.

In a preferred embodiment, ABA and one or more cytokinins are applied at a weight ratio from about 6:1 to about 1:1.5, more preferably from about 4:1 to about 1:1, even more preferably from 4:1 to 1:1.1 and yet even more preferably at about 6:1, about 4:1, 4:1, about 3:1, about 1:1 or about 1:1.5.

Cytokinins suitable for use in the present invention include, but are not limited to, adenine and its salts, derivatives and conjugates such as adenine hydrochloride, adenine hemisulfate, adenosine, N⁶-benzyladenine (6-benzyladenine), N⁶-benzyladenine hydrochloride, N⁶-benzyladenosine, N⁶-benzyladenine-3-glucoside, N⁶-benzyladenine-7-glucoside, N⁶-benzyladenine-9-glucoside, N⁶-benzyl-9-(2-tetrahydropyranyl)adenine, N⁶-benzyladenosine-5'-monophosphate sodium salt, N⁶-(3-fluorobenzyl)adenine, N⁶-(3-fluorobenzyl)adenosine, N⁶-isopentenyladenine, N⁶-isopentenyladenine hydrochloride, N⁶-isopentenyladenosine, N⁶-(2-isopentenyl)adenine, 2-benzylthio-N⁶-isopentenyladenine, 2-methylthio-N⁶-isopentenyladenine, 2-methylthio-N⁶-isopentenyladenosine, 2-mercapto-N⁶-isopentenyladenine, N⁶-isopentenyladenine-3-glucuronide, N⁶-isopentenyladenine-3-glucuronide amide, N⁶-isopentenyladenosine-5'-monophosphate sodium salt, N⁶-isopentenyladenine-7-glucoside, N⁶-isopentenyladenine-9-glucoside, N⁶-cyclopentyladenosine-5'-monophosphate sodium salt and phenyladenine;

zeatin and its salts, derivatives and conjugates such as dihydrozeatin, dihydrozeatin hydrochloride, dihy-

drozeatin riboside, dihydrozeatin-7-glucoside, dihydrozeatin-9-glucoside, dihydrozeatin-o-glucoside, dihydrozeatin-o-glucoside riboside, dihydrozeatin riboside-5'-monophosphate sodium salt, dihydrozeatin-o-acetyl, trans-zeatin, trans-zeatin hydrochloride, trans-zeatin riboside, zeatin riboside, trans-zeatin-7-glucoside, trans-zeatin-9-glucoside, trans-zeatin-9-glucuronide, trans-zeatin-o-glucoside, trans-zeatin-o-glucuronide, trans-zeatin-o-glucoside riboside, trans-zeatin riboside-5'-monophosphate sodium salt, trans-zeatin-9-glucoside-o-glucoside, trans-zeatin-o-acetyl, 2-chloro-trans-zeatin, rs (+/-)-trans-methylzeatin, 2-methylthio-trans-zeatin, 2-methylthio-trans-zeatin riboside, cis-zeatin, cis-zeatin riboside, cis-zeatin-9-glucoside, cis-zeatin-7-glucoside, cis-zeatin-o-glucoside, cis-zeatin-o-glucoside riboside, cis-zeatin riboside-5'-monophosphate sodium salt, 2-methylthio-cis-zeatin, and 2-methylthio-cis-zeatin riboside;

kinetin and its salts, derivatives and conjugates such as kinetin hydrochloride, kinetin riboside, kinetin-3-glucoside, kinetin-9-glucoside, and kinetin riboside-5'-monophosphate sodium salt; topolin and its salts, derivatives and conjugates such as meta-topolin, meta-topolin riboside, meta-topolin-9-glucoside, meta-topolin-7-glucoside, meta-topolin riboside-5'-monophosphate sodium salt, meta-topolin-9-tetrahydropyranlyl, ortho-topolin, ortho-topolin riboside, ortho-topolin-9-glucoside, ortho-topolin-7-glucoside, ortho-topolin riboside-5'-monophosphate sodium salt, para-topolin, para-topolin riboside, para-topolin-9-glucoside, para-topolin-7-glucoside, para-topolin riboside-5'-monophosphate sodium salt, ortho-methoxytopolin, ortho-methoxytopolin riboside, ortho-methoxytopolin-9-glucoside, meta-methoxytopolin, meta-methoxytopolin riboside, meta-methoxytopolin-9-glucoside, meta-methoxytopolin-9-tetrahydropyranlyl, para-methoxytopolin riboside, and para-methoxytopolin-9-glucoside; and

others such as n-(2-chloro-4-pyridyl)-n'-phenylurea (forchlorfenuron), fusatine, 2-chloro-fusatine, hypoxanthine, nebularine, thidiazuron, 2-chloro-6-(3-methoxybenzylamino)purine.

In a preferred embodiment, the one or more cytokinins are selected from the group consisting of 6-benzyladenine ("6BA"), forchlorfenuron ("CPPU"), thidiazuron, trans-zeatin, 2-isopentyl adenine, meta topolin, trans topolin, kinetin and salts thereof and sugar conjugates thereof. In a more preferred embodiment, the one or more cytokinins is 6BA or CPPU. Examples of effective commercially available 6BA formulations include MaxCel® (MaxCel is a registered trademark and available from Valent BioSciences LLC). Examples of effective commercially available CPPU formulations include Prestige® (Prestige is a registered trademark of and available from Valent BioSciences LLC).

In another embodiment, the plant is a monocotyledonous plant or a dicotyledonous plant. In a preferred embodiment the plant is selected from the group consisting of root, corm and tuber vegetable plants, bulb vegetable plants, leafy non-brassica vegetable plants, leafy brassica vegetable plants, succulent or dried legume plants, fruiting vegetable plants, cucurbit vegetable plants, citrus fruit plants, pome fruit plants, stone fruit plants, berry and small fruit plants, tree nut plants, cereal crops, forage and fodder grasses and hay, tall perennial grasses, non-grass animal feed plants, herb plants, spice plants, flower plants, bedding plants, ornamental flower plants, artichoke, asparagus, tropical fruit plants, hops, malanga, peanut, pomegranate plants, oil seed

vegetable plants, tobacco plants, turf grass and watercress plant. In a more preferred embodiment, the plant is wheat, rice or barley and yet more preferably the cereal crop is wheat or rice.

In a preferred embodiment, the root, corm and tuber vegetable plants are selected from the group consisting of *arracacha*, arrowroot, Chinese artichoke, Jerusalem artichoke, garden beet, sugar beet, edible burdock, edible *canna*, carrot, bitter cassava, sweet cassava, celeriac, root chayote, turnip-rooted chervil, chicory, chufa, dasheen (taro), ginger, *ginseng*, horseradish, leren, turnip-rooted parsley, parsnip, potato, radish, oriental radish, rutabaga, salsify, black salsify, Spanish salsify, skirret, sweet potato, tanager, turmeric, turnip, yam bean, true yam, and cultivars, varieties and hybrids thereof.

In another preferred embodiment, the bulb vegetable plants are selected from the group consisting of fresh chive leaves, fresh Chinese chive leaves, bulb daylily, *Elegans hosta*, bulb *fritillaria*, *fritillaria* leaves, bulb garlic, great-headed bulb garlic, serpent bulb garlic, kurrat, lady's leek, leek, wild leek, bulb lily, Beltsville bunching onion, bulb onion, Chinese bulb onion, fresh onion, green onion, macrostem onion, pearl onion, potato bulb onion, potato bulb, tree onion tops, Welsh onion tops, bulb shallot, fresh shallot leaves, and cultivars, varieties and hybrids thereof.

In a further embodiment, the leafy non-brassica vegetable plants are selected from the group consisting of Chinese spinach *Amaranth*, leafy *Amaranth*, arugula (roquette), cardoon, celery, Chinese celery, celtuce, chervil, Chinese spinach, edible-leaved *chrysanthemum*, garland *chrysanthemum*, corn salad, garden cress, upland cress, dandelion, dandelion leaves, sorrels (dock), endive (escarole), Florence fennel, head lettuce, leaf lettuce, orach, parsley, garden purslane, winter purslane, radicchio (red chicory), rhubarb, spinach, New Zealand spinach, vine spinach, Swiss chard, Tampala, and cultivars, varieties and hybrids thereof.

In another embodiment, the leafy brassica vegetable plants are selected from the group consisting of broccoli, Chinese broccoli (gai lon), broccoli raab (rapini), Brussels sprouts, cabbage, Chinese cabbage (bok choy), Chinese napa cabbage, Chinese mustard cabbage (gai choy), cauliflower, cavalo broccoli, collards, kale, kohlrabi, mizuna, mustard greens, mustard spinach, rape greens, turnip greens and cultivars, varieties and hybrids thereof. In yet another embodiment, the succulent or dried vegetable legumes are selected from the group consisting of *Lupinus* beans, *Phaseolus* beans, *Vigna* beans, broad beans (fava), chickpea (garbanzo), guar, jackbean, lablab bean, lentil, *Pisum* peas, pigeon pea, sword bean, peanut, and cultivars, varieties and hybrids thereof. In a preferred embodiment, the *Lupinus* beans include grain lupin, sweet lupin, white lupin, white sweet lupin, and hybrids thereof. In another preferred embodiment, the *Phaseolus* beans include field bean, kidney bean, lima bean, navy bean, pinto bean, runner bean, snap bean, tepary bean, wax bean, and hybrids thereof. In yet another preferred embodiment, the *Vigna* beans include adzuki bean, asparagus bean, blackeye bean, catjang, Chinese longbean, cowpea, Crowder pea, moth bean, mung bean, rice bean, southern pea, urd bean, yardlong bean, and hybrids thereof. In another embodiment, the *Pisum* peas include dwarf pea, edible-podded pea, English pea, field pea, garden pea, green pea, snow pea, sugar snap pea, and hybrids thereof. In a preferred embodiment, the dried vegetable legume is soybean. In a more preferred embodiment, the dried vegetable legume is genetically modified soybean.

In a further embodiment, the fruiting vegetable plants are selected from the group consisting of bush tomato, cocona,

5

currant tomato, garden huckleberry, goji berry, ground-cherry, martynia, naranjilla, okra, pea eggplant, pepino, bell peppers, non-bell peppers, roselle, eggplant, scarlet eggplant, African eggplant, sunberry, tomatillo, tomato, tree tomato, and cultivars, varieties and hybrids thereof. In a preferred embodiment, the peppers include bell peppers, chili pepper, cooking pepper, pimento, sweet peppers, and hybrids thereof.

In an embodiment, the cucurbit vegetable plants are selected from the group consisting of Chayote, Chayote fruit, waxgourd (Chinese preserving melon), citron melon, cucumber, gherkin, edible gourds, *Momordica* species, muskmelons, pumpkins, summer squashes, winter squashes, watermelon, and cultivars, varieties and hybrids thereof. In a preferred embodiment, edible gourds include hyotan, cucurza, hechima, Chinese okra, and hybrids thereof. In another preferred embodiment, the *Momordica* vegetables include balsam apple, balsam pear, bittermelon, Chinese cucumber, and hybrids thereof. In another preferred embodiment, the muskmelon include true cantaloupe, cantaloupe, casaba, crenshaw melon, golden pershaw melon, honeydew melon, honey balls, mango melon, Persian melon, pineapple melon, Santa Claus melon, snake melon, and hybrids thereof. In yet another preferred embodiment, the summer squash include crookneck squash, scallop squash, straight-neck squash, vegetable marrow, zucchini, and hybrids thereof. In a further preferred embodiment, the winter squash includes butternut squash, calabaza, hubbard squash, acorn squash, spaghetti squash, and hybrids thereof.

In another embodiment, the citrus fruit plants are selected from the group consisting of limes, calamondin, citron, grapefruit, Japanese summer grapefruit, kumquat, lemons, Mediterranean mandarin, sour orange, sweet orange, pummelo, Satsuma mandarin, tachibana orange, tangelo, mandarin tangerine, tangor, trifoliate orange, uni fruit, and cultivars, varieties and hybrids thereof. In a preferred embodiment, the limes are selected from the group consisting of Australian desert lime, Australian finger lime, Australian round lime, Brown River finger lime, mount white lime, New Guinea wild lime, sweet lime, Russell River lime, Tahiti lime, and hybrids thereof.

In an embodiment, the pome fruit plants are selected from the group consisting of apple, azarole, crabapple, loquat, mayhaw, medlar, pear, Asian pear, quince, Chinese quince, Japanese quince, tejocote, and cultivars, varieties and hybrids thereof.

In another embodiment, the stone fruit plants are selected from the group consisting of apricot, sweet cherry, tart cherry, nectarine, peach, plum, Chicksaw plum, Damson plum, Japanese plum, plumcot, fresh prune, and cultivars, varieties and hybrids thereof.

In a further embodiment, the berries and small fruit plants are selected from the group consisting of Amur river grape, *aronia* berry, bayberry, bearberry, bilberry, blackberry, blueberry, lowbush blueberry, highbush blueberry, buffalo currant, buffaloberry, che, Chilean guava, chokecherry, cloudberry, cranberry, highbush cranberry, black currant, red currant, elderberry, European barberry, gooseberry, grape including wine and table grapes, edible honeysuckle, huckleberry, jostaberry, Juneberry (Saskatoon berry), lingonberry, maypop, mountain pepper berries, mulberry, muntries, native currant, partridgeberry, phalsa, pincherry, black raspberry, red raspberry, riberry, salal, sea buckthorn, serviceberry, strawberry, wild raspberry, and cultivars, varieties and hybrids thereof. In a preferred embodiment, the blackberries include Andean blackberry, arctic blackberry, bingleberry, black satin berry, boysenberry, brombeere, California

6

blackberry, Chesterberry, Cherokee blackberry, Cheyenne blackberry, common blackberry, coryberry, darrowberry, dewberry, Dirksen thornless berry, evergreen blackberry, Himalayaberry, hullberry, lavacaberry, loganberry, lowberry, Lucrelia berry, mammoth blackberry, marionberry, mora, mures deronce, nectarberry, Northern dewberry, olallieberry, Oregon evergreen berry, phenomenalberry, rangeberry, ravenberry, rossberry, cane berry, Shawnee blackberry, Southern dewberry, tayberry, youngberry, zarzamora, and hybrids thereof.

In another embodiment, the tree nut plants are selected from the group consisting of almond, beech nut, Brazil nut, Brazilian pine, bunya, butternut, bur oak, Cajou nut, candle-nut, cashew, chestnut, chinquapin, coconut, coquito nut, dika nut, ginkgo, Guiana chestnut, hazelnut (filbert), heartnut, hickory nut, Japanese horse-chestnut, macadamia nut, mon-gongo nut, monkey-pot, monkey puzzule nut, Okari nut, Pachira nut, peach palm nut, pecan, Pili nut, pistachio, Sapucaia nut, tropical almond, black walnut, English walnut, yellowhorn, and cultivars, varieties and hybrids thereof.

As used herein, the term "cereal crops" refers to barley, buckwheat, pearl millet, proso millet, oats, rice, rye, sorghum (milo), sorghum species, grain sorghum, sudangrass (seed), teosinte, triticale, wheat, wild rice, and cultivars, varieties and hybrids thereof. In a more preferred embodiment, the cereal crop is selected from rice, oats, wheat, triticale, barley and rye. In an even more preferred embodiment, the cereal crop is wheat, rice or barley and yet more preferably the cereal crop is wheat or rice.

In yet another embodiment, the grass forage, fodder and hay are selected from the group consisting of grasses that are members of the Gramineae family except sugarcane and those species included in the cereal crops group, pasture and range grasses, and grasses grown for hay or silage. In further embodiments, the Gramineae grasses may be green or cured.

In yet another embodiment, the tall perennial grasses are those of the genus *Saccharum*, including sugarcane and ornamental grasses.

In an embodiment, the non-grass animal feeds are selected from the group consisting of alfalfa, velvet bean, *trifolium* clover, melilotus clover, kudzu, *lespedeza*, lupin, sainfoin, trefoil, vetch, crown vetch, milk vetch, and cultivars, varieties and hybrids thereof.

In another embodiment, the herbs and spice plants are selected from the group consisting of allspice, *angelica*, anise, anise seed, star anise, annatto seed, balm, basil, borage, burnet, chamomile, caper buds, caraway, black caraway, cardamom, *cassia* bark, *cassia* buds, catnip, celery seed, chervil, chive, Chinese chive, cinnamon, clary, clove buds, coriander leaf, coriander seed, costmary, culantro leaves, culantro seed, cilantro leaves, cilantro seed, cumin, dillweed, dill seed, fennel, common fennel, Florence fennel seed, fenugreek, grains of paradise, horehound, hyssop, juniper berry, lavender, lemongrass, leaf lovage, seed lovage, mace, marigold, marjoram, mint, mustard seed, nasturtium, nutmeg, parsley, pennyroyal, black pepper, white pepper, poppy seed, rosemary, rue, saffron, sage, summer savory, winter savory, sweet bay, tansy, tarragon, thyme, vanilla, wintergreen, woodruff, wormwood, and cultivars, varieties and hybrids thereof. In a preferred embodiment, the mints are selected from the group consisting of spearmint, peppermint, and hybrids thereof.

In yet another embodiment, artichokes are selected from the group consisting of Chinese artichoke, Jerusalem artichoke, and cultivars, varieties and hybrids thereof.

In an embodiment, the tropical fruit plants are selected from the group consisting of anonna, avocado, fuzzy kiwi-

fruit, hardy kiwifruit, banana, plantain, caimito, carambola (star fruit), guava, longan, sapodilla, *papaya*, passion fruit, mango, lychee, jackfruit, dragon fruit, mamey sapote, coconut cherimoya, canistel, monstera, wax jambu, pomegranate, rambutan, pulasan, Pakistani mulberry, langsung, chempedak, durian, fig pineapple, jaboticaba, mountain apples, and cultivars, varieties and hybrids thereof.

In a further embodiment, the oil seed vegetable plants are selected from the group consisting of borage, calendula, castor oil plant, tallowtree, cottonseed, *crambe*, *cuphea*, echium, *euphorbia*, evening primrose, flax seed, gold of pleasure, hare's ear, mustard, jojoba, *lesquerella*, lunaria, meadowfoam, milkweed, *niger* seed, oil radish, poppy seed, rosehip, sesame, stokes aster, sweet rocket, tallowwood, tea oil plant, vermonia, canola, or oil rapeseed, safflower, sunflower, and cultivars, varieties and hybrids thereof.

In a further preferred embodiment, the plant is selected from the group consisting of corn, sorghum, millet and soybean. In a more preferred embodiment, the plant is corn or soybean, even more preferably the corn is selected from field corn, sweet corn, seed corn and popcorn. In a more preferred embodiment, the crop is genetically modified corn.

In another embodiment, the plant in which plant growth is improved is subject to an abiotic stress.

In another embodiment, the plant is subjected to drought stress. As used herein, "drought stress" refers to watering conditions wherein plant growth is significantly slowed as compared to those where water availability is sufficient to support optimal growth and development.

In a preferred embodiment, the mixture of ABA and one or more cytokinins is applied prior to or during the advent of abiotic stress. When the intended stress is drought, application of ABA and one or more cytokinins occurs prior to or during drought stress.

In another preferred embodiment, from about 1 to 1,000 parts per million ("ppm") of ABA are applied to the plant, more preferably from about 10 to about 1,000 ppm, even more preferably from about 10 to about 100 ppm and yet even more preferably from about 10 to about 30 ppm and yet even more preferably at about 30 ppm.

In another preferred embodiment, from about 1 to 1,000 ppm of one or more cytokinins are applied to the plant, more preferably from about 5 to 1,000 ppm, even more preferably from about 5 to about 100 ppm and yet even more preferably from about 5 to about 45 ppm or from about 5 to about 10 ppm or from about 30 to about 45 ppm and yet even more preferably at about 10 ppm or about 30 ppm.

In another preferred embodiment, ABA is applied to the plant at a rate from about 0.1 to about 100 grams per hectare ("g/HA"), more preferably from about 1 to about 20 g/HA and most preferably from about 2 to about 12 g/HA.

In another preferred embodiment, one or more cytokinins are applied to the plant at a rate from about 0.1 to about 100 g/HA, more preferably from about 0.5 to about 10 g/HA and most preferably from about 1 to about 6 g/HA.

The ABA and cytokinins mixture can be applied by any convenient means. Those skilled in the art are familiar with the modes of application that include foliar applications such as spraying, dusting, and granular applications; soil applications including spraying, in-furrow treatments, or sidedressing. In a preferred embodiment, ABA and the one or more cytokinins are applied to the plant as a spray and even more preferably as a foliar spray. In another preferred embodiment, ABA and the one or more cytokinins are applied to the plant as a granular application.

In another preferred embodiment, the mixture of ABA and one or more cytokinins are applied to the plant during the

development stage selected from the group consisting of growth stage, reproductive stage, ripening stage and a combination thereof. More preferably the mixture of ABA and one or more cytokinins are applied to:

wheat at Feekes stage 10 to 11.4, most preferably at Feekes stage 11;

rice at development stages R4 to R7, most preferably at development stages R5 to R6;

corn at development stages R1 to R4, most preferably at development stages R2 to R3;

soybean at development stages R3 to R6, most preferably at development stages R4 to R5;

barley at Zadoks stage 6 to 8, most preferably at Zadoks stage 7.2.

In a preferred embodiment, the grain weight of the plant is improved following application of ABA and one or more cytokinins.

As used herein, "sugar conjugates" refers to riboside and glucoside modified compounds.

As used herein, "effective amount" refers to the amount of the ABA and/or cytokinins that will improve growth, drought stress tolerance, and/or yield. The "effective amount" will vary depending on the ABA and cytokinin concentrations, the plant species or variety being treated, the severity of the stress, the result desired, and the life stage of the plants, among other factors. Thus, it is not always possible to specify an exact "effective amount." However, an appropriate "effective amount" in any individual case may be determined by one of ordinary skill in the art.

As used herein, "improving" means that the plant has more of the quality than the plant would have had it if it had not been treated by methods of the present invention.

As used herein, all numerical values relating to amounts, weight percentages and the like are defined as "about" or "approximately" each particular value, namely, plus or minus 10% ($\pm 10\%$). For example, the phrase "at least 5% by weight" is to be understood as "at least 4.5% to 5.5% by weight." Therefore, amounts within 10% of the claimed values are encompassed by the scope of the claims.

The articles "a," "an" and "the" are intended to include the plural as well as the singular, unless the context clearly indicates otherwise.

The disclosed embodiments are simply exemplary embodiments of the inventive concepts disclosed herein and should not be considered as limiting, unless the claims expressly state otherwise.

The following examples are intended to illustrate the present invention and to teach one of ordinary skill in the art how to use the formulations of the invention. They are not intended to be limiting in any way.

EXAMPLES

Example 1—Increasing Grain Yield in Wheat Under Water Stress Conditions

Method

42 pots of Apogee wheat were grown in a greenhouse under ideal growing conditions. Specifically, wheat was planted in ProMix® growth media and grown for about seven weeks in a growth cabinet at 24/18° C. day/night temperature under a 16/8 hour light/dark photoperiod. Next, spray applications of 0.025% v/v Latron B-1956® in water, 30 ppm ABA, 30 ppm 6BA, 10 ppm CPPU, a mixture of 30 ppm ABA and 30 ppm 6BA and a mixture of 30 ppm ABA and 10 ppm CPPU (n=7) were made using a tank sprayer at Feekes stage 11.0. Plants were then grown with no addi-

tional water for next 3-5 days until drought stress conditions and water-deficit stress-related phenotypes were apparent. Specifically, drought stress conditions are determined as when pots have lost 60-70% of stored soil water, as determined by determined gravimetrically by weighing pots, through evapotranspiration and water-deficit stress-related phenotypes include wilting and leaf-rolling. Plants were re-watered to bring soil moisture to saturation and subsequently grown under optimal conditions until physiological maturity. Plants were then destructively harvested and measured for spike weight, grain weight, yield per spike and harvest index. Harvest index is calculated by dividing pounds of grain by the total pounds of above ground biomass. Results can be seen in Table 1, below.

To determine if the mixtures provided unexpected results, the observed combined efficacy ("OCE") was divided by the expected combined efficacy ("ECE") to give an OCE/ECE ratio wherein the expected ECE is calculated by a variation of the Abbott method:

$$ECE = X - F(X * (((A - X)/X) + ((B - X)/X)) - (((A - X)/X) * ((B - X)/X)/100)),$$

wherein ECE is the expected combined efficacy and in which X is the control efficacy and A and B are the efficacy provided by the single active ingredients. If the ratio between the OCE of the mixture and the ECE of the mixture is greater than 1, then greater than expected interactions are present in the mixture. (Gisi, *The American Phytopathological Society*, 86:11, 1273-1279, 1996).

TABLE 1

n = 7	AI conc. (ppm)	Spike Weight (grams)	Grain Yield (grams)	Yield/Spike (grams)	Harvest Index
Control	0	12.33	9.13	1.36	0.54
ABA	30	14.06	10.24	1.40	0.55
6BA	30	11.29	7.84	1.14	0.49
CPPU	10	12.99	9.69	1.34	0.56
ABA	30	14.22	10.81	1.47	0.58
6BA	30				
ABA	30	14.70	11.53	1.64	0.61
CPPU	10				
OCE:ECE Ratio					
ABA	30	1.09	1.21	1.25	1.16
6BA	30				
ABA	30	1.00	1.07	1.19	1.07
CPPU	10				

Results

As seen in Table 1, above, the mixture of ABA and 6BA provided unexpected gain in spike weight, grain yield, yield per spike and harvest index at a ratio of 1:1. Further, ABA and CPPU provided unexpected gain in grain yield, yield per spike and harvest index at a ratio of 3:1. Thus, mixtures of ABA and cytokinins provide unexpected yield in plants undergoing drought stress.

Example 2—Increasing Grain Yield in Wheat Under Water Stress Conditions

Method

Thirty-two pots of Apogee wheat were grown in a greenhouse under ideal growing conditions. Specifically, wheat was planted in ProMix® growth media and grown for about seven weeks in a growth cabinet at 24/18° C. day/night temperature under a 16/8 hour light/dark photoperiod. Next, spray applications of 0.025% v/v Latron B-1956® in water,

30 ppm ABA, 30 ppm 6BA, and a mixture of 30 ppm ABA and 30 ppm 6BA (n=8) were made using a tank sprayer at Feekes stage 11.0. Plants were then grown with no additional water for the next 3-5 days until drought stress conditions and water-deficit stress-related phenotypes were apparent. Plants were re-watered to bring soil moisture to saturation and grown under optimal conditions until physiological maturity. Plants were then destructively harvested and measured for shoot weight, spike weight, grain yield, yield per spike and total above ground biomass. Results can be seen in Table 2, below.

TABLE 2

n = 8	AI conc. (ppm)	Shoot Weight (grams)	Spike Weight (grams)	Grain Yield (grams)	Yield/Spike (grams)	Total Above Ground Biomass (grams)
Control	0	4.97	15.66	11.65	1.17	20.63
ABA	30	5.04	15.66	12.12	1.33	20.70
6BA	30	5.00	14.97	11.22	1.21	19.98
ABA	30	5.65	16.96	12.66	1.38	22.60
6BA	30					
OCE:ECE Ratio						
ABA	30	1.11	1.13	1.08	1.01	1.13
6BA	30					

Results

As seen in Table 2, above, the mixture of ABA and 6BA provided unexpected gain in shoot weight, spike weight, grain yield, and total above ground biomass at a ratio of 1:1. Thus, mixtures of ABA and cytokinins provide unexpected yield in plants undergoing drought stress.

Example 3—Increasing Grain Yield in Wheat Under Well-Watered Conditions

Method

32 pots of Apogee wheat were grown in a greenhouse under ideal growing conditions. Specifically, wheat was planted in ProMix® growth media and grown for about seven weeks in a growth cabinet at 24/18° C. day/night temperature under a 16/8 hour light/dark photoperiod. Next, spray applications of 0.025% v/v Latron B-1956® in water, 30 ppm ABA, 10 ppm CPPU, and a mixture of 30 ppm ABA and 10 ppm CPPU (n=8) were made using a tank sprayer at Feekes stage 11.0. A second chemical spray application was made seven days after first spray. Plants were then grown under ideal conditions for an additional 5-6 weeks until they reached physiological maturity. Plants were then destructively harvested and measured for spike weight, grain yield, yield per spike and total above ground biomass. Results can be seen in Table 3, below.

TABLE 3

AI (ppm)	AI conc. (ppm)	Spike Weight (grams)	Grain Yield (grams)	Yield/Spike (grams)	Total Above Ground Biomass (grams)
Control	0	12.22	8.66	1.04	16.37
ABA	30	11.60	8.49	1.04	15.38
CPPU	10	11.86	8.28	0.95	15.98
ABA	30	12.58	9.17	1.18	16.74
CPPU	10				

TABLE 3-continued

AI (ppm)	AI conc. (ppm)	Spike Weight (grams)	Grain Yield (grams)	Yield/ Spike (grams)	Total Above Ground Biomass (grams)
OCE:ECE Ratio					
ABA	30	1.12	1.13	1.23	1.12
CPPU	10				

Results

As seen in Table 3, above, the mixture of ABA and CPPU provided unexpected gain in spike weight, grain yield, yield per spike and total above ground biomass at a ratio of 3:1. Thus, mixtures of ABA and cytokinins provide unexpected yield in plants.

Example 4—Increasing Grain Yield in Wheat
Under Water Stress Conditions

Method

72 pots of Apogee wheat were grown in a greenhouse under ideal growing conditions. Specifically, wheat was planted in ProMix® growth media and grown for about seven weeks in a growth cabinet at 24/18° C. day/night temperature under a 16/8 hour light/dark photoperiod. Next, spray applications of 0.025% v/v Latron B-1956® in water, 10 ppm ABA, 30 ppm ABA, 5 ppm CPPU, 10 ppm CPPU, a mixture of 10 ppm ABA and 5 ppm CPPU, a mixture of 30 ppm ABA and 5 ppm CPPU, a mixture of 10 ppm ABA and 10 ppm CPPU and a mixture of 30 ppm ABA and 10 ppm CPPU (n=8) were made using a tank sprayer at Feekes stage 11.0. Plants were then grown with no additional water for next 3-5 until drought stress conditions and water-deficit stress related phenotype was apparent. Plants were re-watered to bring soil moisture to saturation and grown under optimal conditions until physiological maturity. Plants were then destructively harvested and measured for spike weight, grain yield, yield per spike and total above ground biomass. Results can be seen in Table 4, below.

TABLE 4

n = 8	AI conc. (ppm)	Spike Weight (grams)	Grain Yield (grams)	Yield/ Spike (grams)	Total Above Ground Biomass (grams)
Control	0	8.92	6.56	1.01	11.71
ABA	10	9.22	6.95	1.08	12.11
ABA	30	8.90	6.72	1.06	11.47
CPPU	5	8.57	6.20	0.98	11.34
CPPU	10	8.12	6.32	1.00	10.94
ABA	10	9.46	7.07	1.12	12.41
CPPU	5				
ABA	30	9.37	7.07	1.07	11.92
CPPU	5				
ABA	10	8.79	6.52	1.06	11.24
CPPU	10				
ABA	30	9.26	6.97	1.15	12.22
CPPU	10				
OCE:ECE Ratio					
ABA	10	1.07	1.07	1.07	1.06
CPPU	5				
ABA	30	1.10	1.11	1.04	1.07
CPPU	5				
ABA	10	1.04	0.97	0.99	0.99
CPPU	10				
ABA	30	1.14	1.08	1.10	1.14
CPPU	10				

Results

As seen in Table 4, above, the mixture of ABA and CPPU provided unexpected gain in spike weight, grain yield, and total above ground biomass at ratios of 2:1, 6:1, and 3:1. Further, the mixture of ABA and CPPU at a ratio of 1:1 provided unexpected gain in spike weight. Thus, mixtures of ABA and cytokinins provide unexpected yield in plants undergoing drought stress.

Example 5—Increasing Grain Yield in Rice

Method

32 pots of rice were grown in a greenhouse under ideal growing conditions. Specifically, rice was planted in growth media comprising sand and Pro-Mix® BX and grown for about 3-4 weeks in a growth cabinet at 24/18° C. day/night temperature under a 18/6 hour light/dark photoperiod. Next, spray applications of 0.025% v/v Latron B-1956® in water, 30 ppm ABA, 10 ppm CPPU, and a mixture of 30 ppm ABA and 10 ppm CPPU (n=8) were made using a tank sprayer at early grain filling stage (growth stage R6). Plants were then grown under ideal conditions for an additional 5-7 weeks. Plants were then destructively harvested and measured for yield of top six panicles, yield from other panicles (not top six panicles), yield of all panicles, yield per panicle and yield per top six panicles. Results can be seen in Table 5, below.

TABLE 5

N = 8	AI conc. (ppm)	Yield of Top 6 (grams)	Yield of Others (grams)	Yield of All (grams)	Yield per Panicle (grams)	Yield per Top 6 (grams)
Control	0	15.00	10.90	25.90	2.17	2.50
ABA	30	15.75	12.72	28.47	2.34	2.63
CPPU	10	15.17	11.16	26.33	2.22	2.53
ABA	30	16.30	14.04	30.34	2.48	2.72
CPPU	10					
OCE:ECE Ratio						
ABA	30	1.02	1.08	1.05	1.04	1.02
CPPU	10					

Results

As seen in Table 5, above, the mixture of ABA and CPPU provided unexpected gain in yield of top six panicles, yield from other panicles, yield of all panicles, yield per panicle and yield per top six panicles, at a ratio of 3:1. Thus, mixtures of ABA and cytokinins provide unexpected yield in plants.

Example 6—Increasing Grain Yield in Rice

Method

48 pots of rice were grown in a greenhouse under ideal growing conditions. Specifically, rice was planted in growth media comprising sand and Pro-Mix® BX and grown for about 3-4 weeks in a growth cabinet at 24/18° C. day/night temperature under a 18/6 hour light/dark photoperiod. Next, spray applications of 0.025% v/v Latron B-1956® in water, 30 ppm ABA, 30 ppm 6BA, 45 ppm 6BA, a mixture of 30 ppm ABA and 30 ppm 6BA, and a mixture of 30 ppm ABA and 45 ppm 6BA (n=8) were made using a tank sprayer at early grain filling stage (growth stage R5 to R6). Plants were then grown under ideal conditions for an additional 5-7 weeks. Plants were then destructively harvested and measured for yield of top six panicles, yield from other panicles (not top six panicles), yield of all panicles, yield per panicle and yield per top six panicles. Results can be seen in Table 6, below.

13

TABLE 6

n = 8	AI conc. (ppm)	Yield of Top 6 (grams)	Yield of Others (grams)	Yield of All (grams)	Yield per Top 6 (grams)	Yield per Panicle (grams)
Control	0	17.70	6.54	23.42	2.95	2.88
ABA	30	19.14	5.22	23.70	3.19	2.95
6BA	30	18.51	5.77	22.84	3.09	3.06
6BA	45	18.63	5.49	24.12	3.11	2.94
ABA	30	20.47	6.41	26.08	3.41	3.44
6BA	30					
ABA	30	19.27	6.04	25.31	3.21	3.18
6BA	45					
OCE:ECE Ratio						
ABA	30	1.03	1.44	1.13	1.03	1.10
6BA	30					
ABA	30	0.96	1.45	1.04	0.96	1.06
6BA	45					

Results

As seen in Table 6, above, the mixture of ABA and 6BA provided unexpected gain in yield of top six panicles, yield from other panicles, yield of all panicles, yield per panicle and yield per top six panicles, at a ratio of 1:1. Further the mixture of ABA and 6BA provided unexpected gain in yield from other panicles, yield of all panicles and yield per panicle, at a ratio of 1:1.5. Thus, mixtures of ABA and cytokinins provide unexpected yield in plants.

Example 7—Increasing Grain Yield in Corn

Method

Corn was grown in the field in Seymour, IL in 2020. Spray applications of water, 2 g/HA ABA, 6 g/HA ABA and a mixture of 2 g/HA ABA and 2 g/HA 6BA (n=8) were made using a tank sprayer at the blister to milk stage (growth stage R2-R3). Plants were then grown until mature. Plants were then destructively harvested and measured for grain yield. Results can be seen in Table 7, below.

TABLE 7

n = 8	AI conc. (g/HA)	Grain Yield (bushels/acre)
Control	0	241
ABA	2	225
ABA	6	234
ABA	2	251
6BA	2	

Results

As seen in Table 7, above, the mixture of ABA and 6BA at total rate of 4 g/HA provided greater gain in grain yield in corn than application of ABA at 6 g/HA. Further, the addition of 6BA overcame the grain yield deficit caused by the application of ABA alone.

Example 8—Increasing Grain Yield in Soybean

Method

Soybean was grown in the field in Seymour, IL in 2020. Spray applications of water, 2 g/HA ABA, 6 g/HA ABA and a mixture of 2 g/HA ABA and 2 g/HA 6BA (n=8) were made using a tank sprayer at the beginning of seeding (growth stage R4 to R5). Plants were then grown until mature. Plants were then destructively harvested and measured for grain yield. Results can be seen in Table 8, below.

14

TABLE 8

n = 8	AI conc. (g/HA)	Grain Yield (bushels/acre)
Control	0	97.31
ABA	2	96.57
ABA	6	93.80
ABA	2	103.84
6BA	2	

Results

As seen in Table 8, above, the mixture of ABA and 6BA at total rate of 4 g/HA provided greater gain in grain yield in soybean than application of ABA at 6 g/HA. Further, the addition of 6BA overcame the grain yield deficit caused by the application of ABA alone.

Example 9—Increasing Grain Yield in Barley

Method

Barley was grown in the field in Pieres, Buenos Aires Province, Argentina from June 15 to Dec. 30, 2020. 2 g/HA ABA, 6 g/HA ABA and mixtures of 2 g/HA ABA and 2 g/HA 6BA and 4 g/HA ABA and 2 g/HA 6BA (n=8) were made using a tank sprayer at the beginning of milk grains (growth stage Zadoks 7.2). Plants were then grown until mature. Plants were then destructively harvested and measured for grain yield. Results can be seen in Table 9, below.

TABLE 9

n = 8	AI conc. (g/HA)	Grain Yield
Control	0	5165
ABA	2	5319
ABA	6	5114
ABA	2	6222
6BA	2	
ABA	4	6284
6BA	4	

Results

As seen in Table 9, above, the mixture of ABA and 6BA at total rate of 4 g/HA and 8 g/HA provided greater gain in grain yield in barley than application of ABA at 2 or 6 g/HA. Further, the addition of 6BA overcame the grain yield deficit caused by the application of ABA alone.

What is claimed is:

1. A method of improving plant growth comprising applying an effective amount of a mixture of (S)-abscisic acid (ABA) and a cytokinin to the plant, wherein the weight ratio of ABA to the cytokinin is from 4:1 to about 1:10 and wherein the plant is a cereal crop and wherein the mixture is applied to the plant following seed germination.

2. The method of claim 1, wherein the cereal crop is selected from the group consisting of wheat, rice, oats, rye, triticale and barley.

3. The method of claim 2, wherein the cereal crop is wheat.

4. The method of claim 2, wherein the cereal crop is rice.

5. The method of claim 2, wherein the cereal crop is barley.

6. The method of claim 1, wherein the ratio of ABA to the cytokinin is from 4:1 to 1:1:1.

7. The method of claim 1, wherein the cytokinin is selected from the group consisting of 6-benzyladenine, forchlorfenuron, thidiazuron, trans-zeatin, 2-isopentyl adenine, meta topolin, trans topolin, kinetin and salts thereof and sugar conjugates thereof.

15

8. The method of claim **1**, wherein the plant is subject to an abiotic stress.

9. The method of claim **8**, wherein the abiotic stress is drought stress.

10. The method of claim **1**, wherein the grain weight of the plant is improved.

11. A method of improving sugar beet plant growth comprising applying an effective amount of a mixture of (S)-abscisic acid (ABA) and 6-benzyladenine cytokinins to the plant, wherein the weight ratio of ABA to 6-benzyladenine is from about 6:1 to about 1:10.

* * * * *
