Kind Code	B2
Date of Patent	August 12, 2025
Inventor(s)	Teranishi; Takaaki et al.

Camera optical lens

Abstract

The present invention discloses a camera optical lens with seven-piece lenses including, from an object side to an image side in sequence, a first lens, a second lens, a third lens, a fourth lens, a fifth lens, a sixth lens and a seventh lens. The camera optical lens satisfies the following conditions: $-1.00 \leq f_6/f \leq 10.00$, $1.00 \leq d_5/d_6 \leq 5.00$, and $1.00 \leq R_3/R_4 \leq 5.00$. The camera optical lens according to the present invention has excellent optical characteristics, such as large aperture, wide-angle, and ultra-thin.

Background/Summary

FIELD OF THE PRESENT INVENTION

(1) The present invention relates to the field of optical lens, and more particularly, to a camera optical lens suitable for handheld terminal devices, such as smart phones and digital cameras, monitors or PC lenses.

DESCRIPTION OF RELATED ART

(2) In recent years, with the rise of various smart devices, the demand for miniaturized camera optics has been increasing, and the pixel size of photosensitive devices has shrunk, coupled with the development trend of electronic products with good functions, thin and portable appearance, Therefore, miniaturized imaging optical lenses with good image quality have become the mainstream in the current market. In order to obtain better imaging quality, a multi-piece lens structure is often used. Moreover, with the development of technology and the increase of diversified needs of users, as the pixel area of the photosensitive device continues to shrink and the system's requirements for image quality continue to increase, the seven-piece lens structure gradually appears in the lens design. There is an urgent need for a wide-angle imaging lens with excellent optical characteristics, small size, and fully corrected aberration.

SUMMARY

(3) In the present invention, a camera optical lens has excellent optical characteristics with large aperture, ultra-thin characteristic and wide-angle.

(4) According to one aspect of the present invention, a camera optical lens comprises, from an object side to an image side in sequence, a first lens, a second lens, a third lens, a fourth lens, a fifth lens, a sixth lens and a seventh lens. The camera optical lens satisfies the following conditions: $-1.00 \leq f_6/f \leq 10.00$, $1.00 \leq d_5/d_6 \leq 5.00$, and $1.00 \leq R_3/R_4 \leq 5.00$. f denotes a focal length of the camera optical lens, f_6 denotes a focal length of the sixth lens, d_5 denotes an on-axis thickness of the third lens, d_6 denotes an on-axis distance from an image side surface of the third lens to an object side surface of the fourth lens, R_3 denotes a central curvature radius of an object side surface of the second lens, and R_4 denotes a central curvature radius of an image side surface of the second lens.

(5) As an improvement, the first lens has a positive refractive power and has an object side surface being convex in a paraxial region, the camera optical lens further satisfies the following conditions: $0.37 \leq f_1/f_6 \leq 1.21$, $-3.22 \leq (R_1+R_2)/(R_1-R_2) \leq -0.61$, and $0.04 \leq d_1/TTL \leq 0.15$. f_1 denotes a focal length of the first lens, R_1 denotes a central curvature radius of the object side surface of the first lens, R_2 denotes a central curvature radius of an image side surface of the first lens, d_1 denotes an on-axis thickness of the first lens, and TTL denotes a total optical length from the object side surface of the first lens of the camera optical lens to an image surface of the camera optical lens along an optical axis.

(6) As an improvement, the camera optical lens further satisfies the following conditions: $0.60 \leq f_1/f \leq 0.97$, $-2.01 \leq (R_1+R_2)/(R_1-R_2) \leq -0.77$, and $0.07 \leq d_1/TTL \leq 0.12$.

(7) As an improvement, the second lens has a positive refractive power, the object side surface of the second lens is concave in a paraxial region and the image side surface of the second lens is convex in the paraxial region. The camera optical lens further satisfies the following conditions: $1.66 \leq f_2/f \leq 44.41$, $0.75 \leq (R_3+R_4)/(R_3-R_4) \leq 61.50$, and $0.02 \leq d_3/TTL \leq 0.08$. f_2 denotes a focal length of the second lens, d_3 denotes an on-axis thickness of the second lens, and TTL denotes a total optical length from an object side surface of the first lens of the camera optical lens to an image surface of the camera optical lens along an optical axis.

(8) As an improvement, the camera optical lens further satisfies the following conditions: $2.66 \leq f_2/f \leq 35.53$, $1.21 \leq (R_3+R_4)/(R_3-R_4) \leq 49.20$, and $0.04 \leq d_3/TTL \leq 0.07$.

(9) As an improvement, the third lens has a negative refractive power, the camera optical lens further satisfies the following conditions: $-3.41 \leq f_3/f \leq -0.62$, $-3.79 \leq (R_5+R_6)/(R_5-R_6) \leq 2.08$, and $0.02 \leq d_5/TTL \leq 0.06$. f_3 denotes a focal length of the third lens, R_5 denotes a central curvature radius of an object side surface of the third lens, R_6 denotes a central curvature radius of the image side surface of the third lens, and TTL denotes a total optical length from an object side surface of the first lens of the camera optical lens to an image surface of the camera optical lens along an optical axis.

(10) As an improvement, the camera optical lens further satisfies the following conditions: $-2.13 \leq f_3/f \leq -0.78$, $-2.37 \leq (R_5+R_6)/(R_5-R_6) \leq 1.66$, and $0.03 \leq d_5/TTL \leq 0.05$.

(11) As an improvement, the fourth lens has a positive refractive power, the object side surface of the fourth lens is convex in a paraxial region and the fourth lens further has an image side surface being concave in the paraxial region. The camera optical lens further satisfies the following conditions: $0.97 \leq f_4/f \leq 10.79$, $-5.90 \leq (R_7+R_8)/(R_7-R_8) \leq -1.34$, and $0.02 \leq d_7/TTL \leq 0.09$. f_4 denotes a focal length of the fourth lens, R_7 denotes a central curvature radius of the object side surface of the fourth lens, R_8 denotes a central curvature radius of the image side surface of the fourth lens, d_7 denotes an on-axis thickness of the fourth lens, and TTL denotes a total optical length from an object side surface of the first lens of the camera optical lens to an image surface of the camera optical lens along an optical axis.

(12) As an improvement, the camera optical lens further satisfies the following conditions: $1.56 \leq f_4/f \leq 8.63$, $-3.69 \leq (R_7+R_8)/(R_7-R_8) \leq -1.67$, and $0.04 \leq d_7/TTL \leq 0.07$.

(13) As an improvement, the fifth lens has a positive refractive power, the fifth lens further has an object side surface being concave in a paraxial region and an image side surface being convex in the paraxial region. The camera optical lens further satisfies the following conditions: $1.11 \leq f_5/f \leq 5.98$, $1.35 \leq (R_9+R_{10})/(R_9-R_{10}) \leq 12.33$, and $0.04 \leq d_9/TTL \leq 0.14$. f_5 denotes a focal length of the fifth lens, R_9 denotes a central curvature radius of the object side surface of the fifth lens, R_{10} denotes a central curvature radius of

the image side surface of the fifth lens, d_9 denotes an on-axis thickness of the fifth lens, and TTL denotes a total optical length from an object side surface of the first lens of the camera optical lens to an image surface of the camera optical lens along an optical axis.

(14) As an improvement, the camera optical lens further satisfies the following conditions: $1.78 \leq f_5/f \leq 4.78$, $2.17 \leq (R_9+R_{10})/(R_9-R_{10}) \leq 9.86$, and $0.07 \leq d_9/TTL \leq 0.11$.

(15) As an improvement, the sixth lens has an object side surface being convex in a paraxial region. The camera optical lens further satisfies the following conditions: $-5.75 \leq (R_{11}+R_{12})/(R_{11}-R_{12}) \leq 1.67$, and $0.05 \leq d_{11}/TTL \leq 0.25$. R_{11} denotes a central curvature radius of the object side surface of the sixth lens, R_{12} denotes a central curvature radius of an image side surface of the sixth lens, d_{11} denotes an on-axis thickness of the sixth lens, and TTL denotes a total optical length from an object side surface of the first lens of the camera optical lens to an image surface of the camera optical lens along an optical axis.

(16) As an improvement, the camera optical lens further satisfies the following conditions: $-3.59 \leq (R_{11}+R_{12})/(R_{11}-R_{12}) \leq 1.34$, and $0.08 \leq d_{11}/TTL \leq 0.20$.

(17) As an improvement, the seventh lens has an image side surface being concave in a paraxial region and the seventh lens has a negative refractive power, the camera optical lens further satisfies the following conditions: $-9.50 \leq f_7/f \leq -0.50$, $0.11 \leq (R_{13}+R_{14})/(R_{13}-R_{14}) \leq 9.03$, and $0.04 \leq d_{13}/TTL \leq 0.16$. f_7 denotes a focal length of the seventh lens, R_{13} denotes a central curvature radius of an object side surface of the seventh lens, R_{14} denotes a central curvature radius of the image side surface of the seventh lens, d_{13} denotes an on-axis thickness of the seventh lens, and TTL denotes a total optical length from an object side surface of the first lens of the camera optical lens to an image surface of the camera optical lens along an optical axis.

(18) As an improvement, the camera optical lens further satisfies the following conditions: $-5.94 \leq f_7/f \leq -0.63$, $0.17 \leq (R_{13}+R_{14})/(R_{13}-R_{14}) \leq 7.22$, and $0.066 \leq d_{13}/TTL \leq 0.13$.

(19) As an improvement, the camera optical lens further satisfies the following conditions: $0.34 \leq f_{12}/f \leq 1.13$. f_{12} denotes a combined focal length of the first lens and the second lens.

(20) As an improvement, an FNO of the camera optical lens is less than or equal to 2.34. FNO denotes a ratio of an effective focal length of the camera optical lens to an entrance pupil diameter.

(21) As an improvement, an FOV of the camera optical lens is greater than or equal to 81.34° . FOV denotes a field of view of the camera optical lens in a diagonal direction.

(22) As an improvement, the camera optical lens further satisfies the following conditions: $TTL/IH \leq 1.34$. IH denotes an image height of the camera optical lens, and TTL denotes a total optical length from an object side surface of the first lens of the camera optical lens to an image surface of the camera optical lens along an optical axis.

(23) Beneficial effects of the present invention are that: the camera optical lens according to the present invention has excellent optical characteristics, such as large aperture, wide-angle, and ultra-thin, and is especially suitable for a mobile camera lens component and a WEB camera lens composed of high pixel CCD, CMOS.

Description

BRIEF DESCRIPTION OF THE DRAWINGS

(1) In order to explain the technical solutions in the embodiments of the present invention more clearly, the following will briefly introduce the drawings that need to be used in the description of the embodiments. Obviously, the drawings in the following description are only some embodiments of the present invention. For those of ordinary skill in the art, without creative work, other drawings can be obtained based on these drawings, among which:

(2) FIG. 1 is a schematic diagram of a structure of a camera optical lens in accordance with Embodiment 1 of the present invention;

(3) FIG. 2 is a schematic diagram of a longitudinal aberration of the camera optical lens shown in FIG. 1;

(4) FIG. 3 is a schematic diagram of a lateral color of the camera optical lens shown in FIG. 1;

(5) FIG. 4 is a schematic diagram of a field curvature and a distortion of the camera optical lens shown in FIG. 1;

(6) FIG. 5 is a schematic diagram of a structure of a camera optical lens in accordance with Embodiment 2 of the present invention;

(7) FIG. 6 is a schematic diagram of a longitudinal aberration of the camera optical lens shown in FIG. 5;

(8) FIG. 7 is a schematic diagram of a lateral color of the camera optical lens shown in FIG. 5;

(9) FIG. 8 is a schematic diagram of a field curvature and a distortion of the camera optical lens shown in FIG. 5;

(10) FIG. 9 is a schematic diagram of a structure of a camera optical lens in accordance with Embodiment 3 of the present invention;

(11) FIG. 10 is a schematic diagram of a longitudinal aberration of the camera optical lens shown in FIG. 9;

(12) FIG. 11 is a schematic diagram of a lateral color of the camera optical lens shown in FIG. 9; and

(13) FIG. 12 is a schematic diagram of a field curvature and a distortion of the camera optical lens shown in FIG. 9.

DETAILED DESCRIPTION OF THE EXEMPLARY EMBODIMENTS

(14) In order to make the objects, technical solutions, and advantages of the present invention more apparent, the embodiments of the present invention will be described in detail below. However, it will be apparent to the one skilled in the art that, in the various embodiments of the present invention, a number of technical details are presented in order to provide the reader with a better understanding of the invention. However, the technical solutions claimed in the present invention can be implemented without these technical details and various changes and modifications based on the following embodiments.

Embodiment 1

(15) As referring to the accompanying drawings, the present invention provides a camera optical lens 10. FIG. 1 shows the camera optical lens 10 according to embodiment 1 of the present invention. The camera optical lens 10 comprises seven lenses. Specifically, from an object side to an image side, the camera optical lens 10 comprises in sequence: an aperture S1, a first lens L1, a second lens L2, a third lens L3, a fourth lens L4, a fifth lens L5, a sixth lens L6 and a seventh lens L7. Optical elements like optical filter GF can be arranged between the seventh lens L7 and an image surface Si.

(16) The first lens L1 is made of plastic material, the second lens L2 is made of plastic material, the third lens L3 is made of plastic material, the fourth lens L4 is made of plastic material, the fifth lens L5 is made of plastic material, the sixth lens L6 is made of plastic material, and the seventh lens L7 is made of plastic material. In other optional embodiments, each lens may also be made of other materials.

(17) A focal length of the camera optical lens **10** is defined as f , and a focal length of the sixth lens **L6** is defined as f_6 . The camera optical lens **10** further satisfies the following condition: $-1.00 \leq f_6/f \leq 10.00$. By a reasonable distribution of the refractive power, which makes it is possible that the camera optical lens **10** has an excellent imaging quality and a lower sensitivity.

(18) An on-axis thickness of the third lens **L3** is defined as d_5 , and an on-axis distance from an image side surface of the third lens **L3** to an object side surface of the fourth lens **L4** is defined as d_6 . The camera optical lens **10** further satisfies the following condition: $1.00 \leq d_5/d_6 \leq 5.00$, which specifies a ratio of the on-axis thickness of the third lens **L3** to the on-axis distance from the image side surface of the third lens **L3** to the object side surface of the fourth lens **L4**. When the condition is satisfied, it is beneficial for producing the lenses and assembling the camera optical lens **10**.

(19) A central curvature radius of an object side surface of the second lens **L2** is defined as R_3 , and a central curvature radius of an image side surface of the second lens **L2** is defined as R_4 . The camera optical lens **10** further satisfies the following condition: $1.00 \leq R_3/R_4 \leq 5.00$, which specifies a shape of the second lens **L2**. When the condition is satisfied, as the camera optical lens **10** develops towards ultra-thin and wide-angle, it is beneficial for correcting an on-axis chromatic aberration.

(20) In the present embodiment, an object side surface of the first lens **L1** is convex in a paraxial region, an image side surface of the first lens **L1** is concave in the paraxial region, and the first lens **L1** has a positive refractive power. In other optional embodiments, the first lens **L1** may also have a negative refractive power. The object side surface and the image side surface of the first lens **L1** can also be arranged as other concave side surface or convex side surface, such as, concave object side surface and convex image side surface and so on.

(21) A focal length of the camera optical lens **10** is defined as f , and a focal length of the first lens **L1** is defined as f_1 . The camera optical lens **10** further satisfies the following condition: $0.37 \leq f_1/f \leq 1.21$. By controlling the positive refractive power of the first lens **L1** being within reasonable range, it is beneficial for developing towards ultra-thin and wide-angle and reducing an aberration of the camera optical lens **10**. Preferably, the following condition shall be satisfied, $0.60 \leq f_1/f \leq 0.97$.

(22) The central curvature radius of the object side surface of the first lens **L1** is defined as R_1 , and a central curvature radius of the image side surface of the first lens **L1** is defined as R_2 . The camera optical lens **10** further satisfies the following condition: $-3.22 \leq (R_1+R_2)/(R_1-R_2) \leq -0.61$. This condition reasonably controls a shape of the first lens **L1**, so that the first lens **L1** can effectively correct a spherical aberration of the camera optical lens **10**. Preferably, the following condition shall be satisfied, $-2.01 \leq (R_1+R_2)/(R_1-R_2) \leq -0.77$.

(23) An on-axis thickness of the first lens **L1** is defined as d_1 . A total optical length from the object side surface of the first lens **L1** to the image surface S_i of the camera optical lens **10** along an optical axis is defined as TTL. The camera optical lens **10** further satisfies the following condition: $0.04 \leq d_1/\text{TTL} \leq 0.15$. When the condition is satisfied, it benefits for realizing an ultra-thin effect. Preferably, the following condition shall be satisfied, $0.076 \leq d_1/\text{TTL} \leq 0.12$.

(24) In the present embodiment, the object side surface of the second lens **L2** is concave in the paraxial region, the image side surface of the second lens **L2** is convex in the paraxial region, and the second lens **L2** has a positive refractive power. In other optional embodiments, the second lens **L2** may also have a negative refractive power. The object side surface and the image side surface of the second lens **L2** can also be arranged as other concave side surface or convex side surface, such as, convex object side surface and concave image side surface and so on.

(25) The focal length of the camera optical lens **10** is defined as f , and a focal length of the second lens **L2** is defined as f_2 . The camera optical lens **10** further satisfies the following condition: $1.66 \leq f_2/f \leq 44.41$. It is beneficial for correcting the aberration of the camera optical lens **10** by controlling the positive refractive power of the second lens **L2** being within reasonable range. Preferably, the following condition shall be satisfied, $2.66 \leq f_2/f \leq 35.53$.

(26) The central curvature radius of the object side surface of the second lens **L2** is defined as R_3 , and the central curvature radius of the image side surface of the second lens **L2** is defined as R_4 . The camera optical lens **10** further satisfies the following condition: $0.75 \leq (R_3+R_4)/(R_3-R_4) \leq 61.50$, which specifies a shape of the second lens **L2**. When the condition is satisfied, as the camera optical lens **10** develops towards ultra-thin and wide-angle, it is beneficial for correcting the on-axis chromatic aberration. Preferably, the following condition shall be satisfied, $1.21 \leq (R_3+R_4)/(R_3-R_4) \leq 49.20$.

(27) An on-axis thickness of the second lens **L2** is defined as d_3 . The total optical length from the object side surface of the first lens **L1** to the image surface S_i of the camera optical lens **10** along the optical axis is defined as TTL. The camera optical lens **10** further satisfies the following condition: $0.02 \leq d_3/\text{TTL} \leq 0.08$. When the condition is satisfied, it is beneficial for producing ultra-thin lenses. Preferably, the following condition shall be satisfied, $0.046 \leq d_3/\text{TTL} \leq 0.07$.

(28) In the present embodiment, an object side surface of the third lens **L3** is concave in the paraxial region, the image side surface of the third lens **L3** is convex in the paraxial region, and the third lens **L3** has a negative refractive power. In other optional embodiments, the third lens **L3** may also have a positive refractive power. The object side surface and the image side surface of the third lens **L3** can also be arranged as other concave side surface or convex side surface, such as, convex object side surface and concave image side surface and so on.

(29) The focal length of the camera optical lens **10** is defined as f , and a focal length of the third lens **L3** is defined as f_3 . The camera optical lens **10** further satisfies the following condition: $-3.41 \leq f_3/f \leq -0.62$. By a reasonable distribution of the refractive power, which makes it is possible that the camera optical lens **10** has the excellent imaging quality and the lower sensitivity. Preferably, the following condition shall be satisfied, $-2.13 \leq f_3/f \leq -0.78$.

(30) A central curvature radius of the object side surface of the third lens **L3** is defined as R_5 , and a central curvature radius of the image side surface of the third lens **L3** is defined as R_6 . The camera optical lens **10** further satisfies the following condition: $-3.79 \leq (R_5+R_6)/(R_5-R_6) \leq 2.08$, which specifies a shape of the third lens **L3**. It is beneficial for molding the third lens **L3**. When the condition is satisfied, a degree of deflection of light passing through the lens can be alleviated, and the aberration can be reduced effectively. Preferably, the following condition shall be satisfied, $-2.376 \leq (R_5+R_6)/(R_5-R_6) \leq 1.66$.

(31) An on-axis thickness of the third lens **L3** is defined as d_5 . The total optical length from the object side surface of the first lens **L1** to the image surface S_i of the camera optical lens **10** along the optical axis is defined as TTL. The camera optical lens **10** further satisfies the following condition: $0.02 \leq d_5/\text{TTL} \leq 0.06$, which benefits for realizing the ultra-thin effect. Preferably, the following condition shall be satisfied, $0.036 \leq d_5/\text{TTL} \leq 0.05$.

(32) In the present embodiment, the object side surface of the fourth lens **L4** is convex in the paraxial region, an image side surface of

the fourth lens L4 is concave in the paraxial region, and the fourth lens L4 has a positive refractive power. In other optional embodiments, the fourth lens L4 may also have a negative refractive power. The object side surface and the image side surface of the fourth lens L4 can also be arranged as other convex side surface or concave side surface, such as, concave object side surface and convex image side surface and so on.

(33) The focal length of the camera optical lens 10 is defined as f , and a focal length of the fourth lens L4 is defined as f_4 . The camera optical lens 10 further satisfies the following condition: $0.97 \leq f_4/f \leq 10.79$. By a reasonable distribution of the refractive power, which makes it is possible that the camera optical lens 10 has the excellent imaging quality and the lower sensitivity. Preferably, the following condition shall be satisfied, $1.56 \leq f_4/f \leq 48.63$.

(34) A curvature radius of the object side surface of the fourth lens L4 is defined as R_7 , and a central curvature radius of the image side surface of the fourth lens L4 is defined as R_8 . The camera optical lens further satisfies the following condition: $-5.90 \leq (R_7+R_8)/(R_7-R_8) \leq -1.34$, which specifies a shape of the fourth lens L4. When the condition is satisfied, as the development of ultra-thin and wide-angle lens, it is beneficial for solving the problems, such as correcting an off-axis aberration. Preferably, the following condition shall be satisfied, $-3.69 \leq (R_7+R_8)/(R_7-R_8) \leq -1.67$.

(35) An on-axis thickness of the fourth lens L4 is defined as d_7 . The total optical length from the object side surface of the first lens L1 to the image surface Si of the camera optical lens 10 along the optical axis is defined as TTL. The camera optical lens 10 further satisfies the following condition: $0.02 \leq d_7/TTL \leq 0.09$, which is beneficial for realizing the ultra-thin effect. Preferably, the following condition shall be satisfied, $0.046 \leq d_7/TTL \leq 0.07$.

(36) In the present embodiment, an object side surface of the fifth lens L5 is concave in the paraxial region, an image side surface of the fifth lens L5 is convex in the paraxial region, and the fifth lens L5 has a positive refractive power. In other optional embodiments, the fifth lens L5 may also have a negative refractive power. The object side surface and the image side surface of the fifth lens L5 can also be arranged as other convex side surface or concave side surface, such as, convex object side surface and concave image side surface and so on.

(37) The focal length of the camera optical lens 10 is defined as f , and a focal length of the fifth lens L5 is defined as f_5 . The camera optical lens 10 further satisfies the following condition: $1.11 \leq f_5/f \leq 5.98$. When the condition is satisfied, a light angle of the camera optical lens 10 can be smoothed effectively and a sensitivity of the tolerance can be reduced. Preferably, the following condition shall be satisfied, $1.78 \leq f_5/f \leq 4.78$.

(38) A central curvature radius of the object side surface of the fifth lens L5 is defined as R_9 , and a central curvature radius of the image side surface of the fifth lens L5 is defined as R_{10} . The camera optical lens further satisfies the following condition: $1.35 \leq (R_9+R_{10})/(R_9-R_{10}) \leq 12.33$, which specifies a shape of the fifth lens L5. When the condition is satisfied, as the development of ultra-thin and wide-angle lens, it is beneficial for correcting the off-axis aberration. Preferably, the following condition shall be satisfied, $2.17 \leq (R_9+R_{10})/(R_9-R_{10}) \leq 9.86$.

(39) An on-axis thickness of the fifth lens L5 is defined as d_9 . The total optical length from the object side surface of the first lens L1 to the image surface Si of the camera optical lens 10 along the optical axis is defined as TTL. The camera optical lens 10 further satisfies the following condition: $0.04 \leq d_9/TTL \leq 0.14$. When the condition is satisfied, it is beneficial for realizing the ultra-thin effect. Preferably, the following condition shall be satisfied, $0.076 \leq d_9/TTL \leq 0.11$.

(40) In the present embodiment, an object side surface of the sixth lens L6 is convex in the paraxial region, an image side surface of the sixth lens L6 is concave in the paraxial region, and the sixth lens L6 has a negative refractive power. In other optional embodiments, the sixth lens L6 may also have a positive refractive power. The object side surface and the image side surface of the sixth lens L6 can be arranged as other convex side surface or concave side surface, such as, concave object side surface and convex image side surface and so on.

(41) A central curvature radius of the object side surface of the sixth lens L6 is defined as R_{11} , and a central curvature radius of the image side surface of the sixth lens L6 is defined as R_{12} . The camera optical lens further satisfies the following condition: $-5.75 \leq (R_{11}+R_{12})/(R_{11}-R_{12}) \leq 1.67$, which specifies a shape of the sixth lens L6. When the condition is satisfied, as the development of ultra-thin and wide-angle lens, it is beneficial for solving the problems, such as correcting the off-axis aberration. Preferably, the following condition shall be satisfied, $-3.59 \leq (R_{11}+R_{12})/(R_{11}-R_{12}) \leq 1.34$.

(42) An on-axis thickness of the sixth lens L6 is defined as d_{11} . The total optical length from the object side surface of the first lens L1 to the image surface Si of the camera optical lens 10 along the optical axis is defined as TTL. The camera optical lens further satisfies the following condition: $0.05 \leq d_{11}/TTL \leq 0.25$, which is beneficial for realizing the ultra-thin effect. Preferably, the following condition shall be satisfied, $0.08 \leq d_{11}/TTL \leq 0.20$.

(43) In the present embodiment, an object side surface of the seventh lens L7 is convex in the paraxial region, an image side surface of the seventh lens L7 is concave in the paraxial region, and the seventh lens L7 has a negative refractive power. In other optional embodiments, the seventh lens L7 may also have a positive refractive power. The object side surface and the image side surface of the seventh lens L7 can be arranged as other convex side surface or concave side surface, such as, concave object side surface and convex image side surface and so on.

(44) The focal length of the camera optical lens 10 is defined as f , and a focal length of the seventh lens L7 is defined as f_7 . The camera optical lens 10 further satisfies the following condition: $-9.50 \leq f_7/f \leq -0.50$. By a reasonable distribution of the refractive power, which makes it is possible that the camera optical lens 10 has the excellent imaging quality and the lower sensitivity. Preferably, the following condition shall be satisfied, $-5.94 \leq f_7/f \leq -0.63$.

(45) A central curvature radius of the object side surface of the seventh lens L7 is defined as R_{13} , and a central curvature radius of the image side surface of the seventh lens L7 is defined as R_{14} . The camera optical lens 10 further satisfies the following condition: $0.11 \leq (R_{13}+R_{14})/(R_{13}-R_{14}) \leq 9.03$, which specifies a shape of the seventh lens L7. When the condition is satisfied, as the development of ultra-thin and wide-angle lens, it is beneficial for correcting the off-axis aberration. Preferably, the following condition shall be satisfied, $0.17 \leq (R_{13}+R_{14})/(R_{13}-R_{14}) \leq 7.22$.

(46) An on-axis thickness of the seventh lens L7 is defined as d_{13} . The total optical length from the object side surface of the first lens L1 to the image surface Si of the camera optical lens 10 along the optical axis is defined as TTL. The camera optical lens further satisfies the following condition: $0.04 \leq d_{13}/TTL \leq 0.16$, which is beneficial for realizing the ultra-thin effect. Preferably, the following condition shall be satisfied, $0.066 \leq d_{13}/TTL \leq 0.13$.

(47) In the present embodiment, the focal length of the camera optical lens **10** is f , and a combined focal length of the first lens **L1** and the second lens **L2** is defined as f_{12} . The camera optical lens **10** further satisfies the following condition: $0.34 \leq f_{12}/f \leq 1.13$. This condition can eliminate aberration and distortion of the camera optical lens **10**, reduce a back focal length of the camera optical lens **10**, and maintain the miniaturization of the camera lens system group. Preferably, the following condition shall be satisfied, $0.546 \leq f_{12}/f \leq 0.91$.

(48) In the present embodiment, an F number (FNO) of the camera optical lens **10** is smaller than or equal to 2.34, thereby achieving a large aperture and good imaging performance. Preferably, the FNO of the camera optical lens **10** is smaller than or equal to 2.29.

(49) In the present embodiment, a field of view of the camera optical lens **10** in a diagonal direction is defined as FOV. The FOV is greater than or equal to 81.34° , thereby achieving the wide-angle performance. Preferably, the FOV is greater than or equal to 82.17° .

(50) In the present embodiment, an image height of the camera optical lens **10** is defined as IH. The total optical length from the object side surface of the first lens **L1** to the image surface Si of the camera optical lens **10** along an optical axis is defined as TTL. The camera optical lens **10** further satisfies the following condition: $TTL/IH \leq 1.34$, thereby achieving the ultra-thin performance. Preferably, the following condition shall be satisfied, $TTL/IH \leq 1.30$.

(51) When the above conditions are satisfied, which makes it is possible that the camera optical lens has excellent optical performances, and meanwhile can meet design requirements of ultra-thin, wide-angle and large aperture. According the characteristics of the camera optical lens **10**, it is particularly suitable for a mobile camera lens component and a WEB camera lens composed of high pixel CCD, CMOS.

(52) The following examples will be used to describe the camera optical lens **10** of the present invention. The symbols recorded in each example will be described as follows. The focal length, on-axis distance, central curvature radius, on-axis thickness, inflexion point position, and arrest point position are all in units of mm.

(53) TTL: the total optical length from the object side surface of the first lens **L1** to the image surface Si of the camera optical lens **10** along the optical axis, the unit of TTL is mm.

(54) F number (FNO): refers to a ratio of an effective focal length of the camera optical lens **10** to an entrance pupil diameter (ENPD).

(55) Preferably, inflexion points and/or arrest points can also be arranged on the object side surface and/or image side surface of the lens, so that the demand for high quality imaging can be satisfied, the description below can be referred for specific implementable scheme.

(56) The design information of the camera optical lens **10** in Embodiment 1 of the present invention is shown in the tables 1 and 2.

(60) For convenience, an aspheric surface of each lens surface uses the aspheric surfaces shown in the below condition (1). However, the present invention is not limited to the aspherical polynomials form shown in the condition (1).

$$z=(cr.\sup.2)/\{1+[1-(k+1)$$

$$(c.\sup.2r^2)].\sup.1/2\}+A4r.\sup.4+A6r.\sup.6+A8r.\sup.8+A10r.\sup.10+A12r.\sup.12+A14r.\sup.14+A16r.\sup.16+A18r.\sup.18+A20r.\sup.20$$

(61) Where, K is a conic coefficient, A4, A6, A8, A10, A12, A14, A16, A18, A20 are aspheric surface coefficients. c is the curvature at the center of the optical surface. r is a vertical distance between a point on an aspherical curve and the optic axis, and z is an aspherical depth (a vertical distance between a point on an aspherical surface, having a distance of r from the optic axis, and a surface tangent to a vertex of the aspherical surface on the optic axis).

(62) Table 3 and Table 4 show design data of inflexion points and arrest points of respective lens in the camera optical lens **10** according to Embodiment 1 of the present invention. P1R1 and P1R2 represent the object side surface and the image side surface of the first lens **L1**, P2R1 and P2R2 represent the object side surface and the image side surface of the second lens **L2**, P3R1 and P3R2 represent the object side surface and the image side surface of the third lens **L3**, P4R1 and P4R2 represent the object side surface and the image side surface of the fourth lens **L4**, P5R1 and P5R2 represent the object side surface and the image side surface of the fifth lens **L5**, P6R1 and P6R2 represent the object side surface and the image side surface of the sixth lens **L6**, and P7R1 and P7R2 represent the object side surface and the image side surface of the seventh lens **L7**. The data in the column named “inflexion point position” refers to vertical distances from inflexion points arranged on each lens surface to the optical axis of the camera optical lens **10**. The data in the column named “arrest point position” refers to vertical distances from arrest points arranged on each lens surface to the optical axis of the camera optical lens **10**.

(65) FIG. 2 and FIG. 3 respectively illustrate a longitudinal aberration and a lateral color of light with wavelengths of 650 nm, 555 nm and 470 nm after passing the camera optical lens **10** according to Embodiment 1. FIG. 4 illustrates a field curvature and a distortion of light with a wavelength of 555 nm after passing the camera optical lens **10** according to Embodiment 1, in which a field curvature S is a field curvature in a sagittal direction and T is a field curvature in a tangential direction.

(66) Table 13 shows various values of Embodiments 1, 2 and 3 and values corresponding to parameters which are specified in the above conditions.

(67) As shown in Table 13, Embodiment 1 satisfies the above conditions.

(68) In the present embodiment, the entrance pupil diameter (ENPD) of the camera optical lens **10** is 3.129 mm. The image height of 1.0H is 6.247 mm. The FOV is 83.19°. Thus, the camera optical lens **10** satisfies design requirements of large aperture, ultra-thin and wide-angle while the on-axis and off-axis aberrations are sufficiently corrected, thereby achieving excellent optical characteristics. Embodiment 2

(69) Embodiment 2 is basically the same as Embodiment 1, the meaning of its symbols is the same as that of Embodiment 1, in the following, only the differences are listed.

(70) An object side surface of the third lens **L3** is convex in a paraxial region, and an image side surface of the third lens **L3** is concave in the paraxial region. An image side surface of the sixth lens **L6** is convex in the paraxial region. An object side surface of the seventh lens **L7** is concave in the paraxial region. A sixth lens **L6** has a positive refractive power.

(71) FIG. 5 shows a schematic diagram of a structure of a camera optical lens **20** according to Embodiment 2 of the present invention. Table 5 and table 6 show the design data of a camera optical lens **20** in Embodiment 2 of the present invention.

(78) FIG. **6** and FIG. **7** respectively illustrate a longitudinal aberration and a lateral color of light with wavelengths of 650 nm, 555 nm and 470 nm after passing the camera optical lens **20** according to Embodiment 2. FIG. **8** illustrates a field curvature and a distortion of light with a wavelength of 555 nm after passing the camera optical lens **10** according to Embodiment 2, in which a field curvature S is a field curvature in a sagittal direction and T is a field curvature in a tangential direction.

(79) As shown in Table 13, Embodiment 2 satisfies the above conditions.

(80) In the present embodiment, an entrance pupil diameter (ENPD) of the camera optical lens **20** is 3.291 mm. An image height of 1.01 is 6.247 mm. An FOV is 83.00°. Thus, the camera optical lens **20** satisfies design requirements of large aperture, ultra-thin and wide-angle while the on-axis and off-axis aberrations are sufficiently corrected, thereby achieving excellent optical characteristics.

Embodiment 3

(81) Embodiment 3 is basically the same as Embodiment 1 and involves symbols having the same meanings as Embodiment 1, and only differences therebetween will be described in the following.

(82) An image side surface of the first lens L1 is convex in a paraxial region. An object side surface of the third lens L3 is convex in the paraxial region, and an image side surface of the third lens L3 is concave in the paraxial region. An object side surface of the seventh lens L7 is concave in the paraxial region. A sixth lens L6 has a positive refractive power.

(83) FIG. **9** shows a schematic diagram of a structure of a camera optical lens **30** according to Embodiment 3 of the present invention.

(84) Tables 9 and 10 show design data of a camera optical lens **30** in Embodiment 3 of the present invention.

 (91) FIG. 10 and FIG. 11 respectively illustrate a longitudinal aberration and a lateral color of light with wavelengths of 650 nm, 555 nm and 470 nm after passing the camera optical lens 30 according to Embodiment 3. FIG. 12 illustrates a field curvature and a distortion of light with a wavelength of 555 nm after passing the camera optical lens 30 according to Embodiment 3, in which a field curvature S is a field curvature in a sagittal direction and T is a field curvature in a tangential direction.
 (92) Table 13 in the following lists values corresponding to the respective conditions. In the present Embodiment 3 in order to satisfy the above conditions.
 (93) In the present embodiment, an entrance pupil diameter (ENPD) of the camera optical lens 30 is 2.976 mm. An image height of 1.0H is 6.247 mm. An FOV is 83.99°. Thus, the camera optical lens 30 satisfies design requirements of large aperture, ultra-thin and wide-angle while the on-axis and off-axis aberrations are sufficiently corrected, thereby achieving excellent optical characteristics.

 (95) It is to be understood, however, that even though numerous characteristics and advantages of the present exemplary embodiments have been set forth in the foregoing description, together with details of the structures and functions of the embodiments, the disclosure is illustrative only, and changes may be made in detail, especially in matters of shape, size, and arrangement of parts within the principles of the invention to the full extent indicated by the broad general meaning of the terms where the appended claims are expressed.

Claims

1. A camera optical lens comprising, from an object side to an image side in sequence, a first lens, a second lens, a third lens, a fourth lens, a fifth lens, a sixth lens and a seventh lens; the second lens has a positive refractive power, the object side surface of the second lens is concave in a paraxial region and the image side surface of the second lens is convex in the paraxial region; the sixth lens has an object side surface being convex in a paraxial region; wherein the camera optical lens satisfies the following conditions:
 $3.38 \leq f_6/f \leq 10.00$;
 $-3.59 \leq (R_{11}+R_{12})/(R_{11}-R_{12}) \leq 1.34$;
 $0.08 \leq d_{11}/TTL \leq 0.20$;
 $1.00 \leq d_5/d_6 \leq 5.00$;
 $1.00 \leq R_3/R_4 \leq 5.00$;
 $2.66 \leq f_2/f \leq 35.53$;
 $1.21 \leq (R_3+R_4)/(R_3-R_4) \leq 49.20$; and
 $0.04 \leq d_3/TTL \leq 0.07$; where, f: a focal length of the camera optical lens; f6: a focal length of the sixth lens; R11: a central curvature radius of the object side surface of the sixth lens; R12: a central curvature radius of an image side surface of the sixth lens; d11: an on-axis thickness of the sixth lens d5: an on-axis thickness of the third lens; d6: an on-axis distance from an image side surface of the third lens to an object side surface of the fourth lens; R3: a central curvature radius of an object side surface of the second lens; R4: a central curvature radius of an image side surface of the second lens; f2: a focal length of the second lens; d3: an on-axis thickness of the second lens; and TTL: a total optical length from an object side surface of the first lens of the camera optical lens to an image surface of the camera optical lens along an optical axis.
2. The camera optical lens according to claim 1, wherein, the first lens has a positive refractive power and has an object side surface being convex in a paraxial region; the camera optical lens further satisfies the following conditions:
 $0.37 \leq f_1/f \leq 1.21$;
 $-3.22 \leq (R_1+R_2)/(R_1-R_2) \leq -0.61$; and
 $0.04 \leq d_1/TTL \leq 0.15$; where, f1: a focal length of the first lens; R1: a central curvature radius of the object side surface of the first lens; R2: a central curvature radius of an image side surface of the first lens; d1: an on-axis thickness of the first lens.
3. The camera optical lens according to claim 2 further satisfying the following conditions:
 $0.60 \leq f_1/f \leq 0.97$;
 $-2.01 \leq (R_1+R_2)/(R_1-R_2) \leq -0.77$; and
 $0.07 \leq d_1/TTL \leq 0.12$.
4. The camera optical lens according to claim 1, wherein, the third lens has a negative refractive power; the camera optical lens further satisfies the following conditions:
 $-3.41 \leq f_3/f \leq -0.62$;
 $-3.79 \leq (R_5+R_6)/(R_5-R_6) \leq 2.08$; and
 $0.02 \leq d_5/TTL \leq 0.06$; where, f3: a focal length of the third lens; R5: a central curvature radius of an object side surface of the third lens; R6: a central curvature radius of the image side surface of the third lens.
5. The camera optical lens according to claim 4 further satisfying the following conditions:
 $-2.13 \leq f_3/f \leq -0.78$;
 $-2.37 \leq (R_5+R_6)/(R_5-R_6) \leq 1.66$; and
 $0.03 \leq d_5/TTL \leq 0.05$.
6. The camera optical lens according to claim 1, wherein, the fourth lens has a positive refractive power, the object side surface of the fourth lens is convex in a paraxial region and the fourth lens further has an image side surface being concave in the paraxial region; the camera optical lens further satisfies the following conditions:

$0.97 \leq f_4/f \leq 10.79$;
 $-5.90 \leq (R_7+R_8)/(R_7-R_8) \leq -1.34$; and
 $0.02 \leq d_7/TTL \leq 0.09$; where, f_4 : a focal length of the fourth lens; R_7 : a central curvature radius of the object side surface of the fourth lens; R_8 : a central curvature radius of the image side surface of the fourth lens; d_7 : an on-axis thickness of the fourth lens.

7. The camera optical lens according to claim 6 further satisfying the following conditions:
 $1.56 \leq f_4/f \leq 8.63$;
 $-3.69 \leq (R_7+R_8)/(R_7-R_8) \leq -1.67$; and
 $0.04 \leq d_7/TTL \leq 0.07$.

8. The camera optical lens according to claim 1, wherein, the fifth lens has a positive refractive power, the fifth lens further has an object side surface being concave in a paraxial region and an image side surface being convex in the paraxial region; the camera optical lens further satisfies the following conditions:
 $1.11 \leq f_5/f \leq 5.98$;
 $1.35 \leq (R_9+R_{10})/(R_9-R_{10}) \leq 12.33$; and
 $0.04 \leq d_9/TTL \leq 0.14$; where, f_5 : a focal length of the fifth lens; R_9 : a central curvature radius of the object side surface of the fifth lens; R_{10} : a central curvature radius of the image side surface of the fifth lens; d_9 : an on-axis thickness of the fifth lens.

9. The camera optical lens according to claim 8 further satisfying the following conditions:
 $1.78 \leq f_5/f \leq 4.78$;
 $2.17 \leq (R_9+R_{10})/(R_9-R_{10}) \leq 9.86$; and
 $0.07 \leq d_9/TTL \leq 0.11$.

10. The camera optical lens according to claim 1, wherein, the seventh lens has an image side surface being concave in a paraxial region and the seventh lens has a negative refractive power; the camera optical lens further satisfies the following conditions:
 $-9.50 \leq f_7/f \leq -0.50$;
 $0.11 \leq (R_{13}+R_{14})/(R_{13}-R_{14}) \leq 9.03$; and
 $0.04 \leq d_{13}/TTL \leq 0.16$; where, f_7 : a focal length of the seventh lens; R_{13} : a central curvature radius of an object side surface of the seventh lens; R_{14} : a central curvature radius of the image side surface of the seventh lens d_{13} : an on-axis thickness of the seventh lens.

11. The camera optical lens according to claim 10 further satisfying the following conditions:
 $-5.94 \leq f_7/f \leq -0.63$;
 $0.17 \leq (R_{13}+R_{14})/(R_{13}-R_{14}) \leq 7.22$; and
 $0.06 \leq d_{13}/TTL \leq 0.13$.

12. The camera optical lens according to claim 1 further satisfying the following condition: $0.34 \leq f_{12}/f \leq 1.13$; where, f_{12} : a combined focal length of the first lens and the second lens.

13. The camera optical lens according to claim 1, wherein an FNO of the camera optical lens is less than or equal to 2.34, where, FNO: a ratio of an effective focal length of the camera optical lens to an entrance pupil diameter.

14. The camera optical lens according to claim 1, wherein an FOV of the camera optical lens is greater than or equal to 81.34° , where, FOV: a field of view of the camera optical lens in a diagonal direction.

15. The camera optical lens according to claim 1 further satisfying the following conditions: $TTL/IH \leq 1.34$; where, IH : an image height of the camera optical lens.
