(57) **ABSTRACT**

A method and system for playing a player reactive game at a golf entertainment venue are disclosed herein. The system includes golf ball tracking sensors, hitting bays and a server. The golf ball tracking sensors are positioned at a golf driving range. The hitting bays are also at the golf driving range, and each hitting bay has a video display. The server is configured to modify gameplay based on the shot types detected.

200

Shot Type	Description	Key Flight Characteristics	Detect-able?
Drive	The first shot on a hole, typically made from the tee box with a driver to cover as much distance as possible.	High launch angle, long carry distance, and typically low curve.	Yes
Approach	Usually the second shot on a hole with the goal of landing the ball on the green.	Medium launch angle, targeted distance (depending on hole distance), and minor curve (if aiming for a draw or fade).	Maybe
Tee Shot	Any shot taken from the tee box to start a new hole.	Depends on the club used, could vary from high launch and distance (driver) to lower launch and distance (iron or wood).	No*
Chip	A less powerful, short game shot where the ball spends more time on the ground than in the air.	Low launch angle, short carry distance, and the ball spends more time rolling on the ground.	Yes
Pitch	Similar to a chip but hit with a higher trajectory; the ball spends more time in the air than on the ground.	Higher launch angle than chip shot, short carry distance, and the ball spends more time in the air.	Yes
Putt	A precise shot performed on the green with a putter, aimed at getting the ball into the hole.	Very low launch angle (almost zero), very short carry distance, and ball spends almost all its time rolling.	Yes
Bunker (Sand) Shot	A shot hit from a sand bunker using a sand wedge to hit the sand behind the ball.	High launch angle, short distance, typically a lot of backspin.	Yes
Flop Shot	A high trajectory shot usually hit over a hazard or bunker, designed to stop quickly once it lands.	Very high launch angle, short distance, maximum height, and often high backspin.	Yes
Punch (Knockdown) Shot	A low trajectory shot designed to avoid wind or go under tree branches.	Very low launch angle, less carry distance than a normal shot with the same club.	Yes

FIG. 12

*all shots
are Tee Shots

200

Draw	A shot that, for a right-handed golfer, curves gently from right to left.	Starts right of the target and gently curves left (for a right-handed golfer), has topspin.	Yes
Fade	The opposite of a draw; for a right-handed golfer, it curves gently from left to right.	Starts left of the target and gently curves right (for a right-handed golfer), has backspin.	Yes
Hook	A shot that curves sharply from right to left (for a right-handed golfer).	Starts right of the target and curves sharply left (for a right-handed golfer), increased topspin.	Yes
Slice	A shot that curves sharply from left to right (for a right-handed golfer).	Starts left of the target and curves sharply right (for a right-handed golfer), increased backspin.	Yes
Lay-up Shot	This shot is hit with the aim of positioning the ball for the next shot, often played when reaching the green or target in one shot is not possible or practical.	Controlled distance, often less than the full potential of the club used.	No
Recovery (or Escape) Shot	This shot is played to get the ball back into a good position when it has ended up in a difficult spot, like deep rough, bushes, or trees.	Variable flight characteristics depending on the situation. Often lower than normal launch angle if escaping from under trees.	No
Pitch-and-Run	A shot hit from a sand bunker using a sand wedge to hit the sand behind the ball.	Combination of a pitch's launch angle with the ground roll of a chip shot.	Yes
Hole-In-One	Shot straight from Tee into a target		Yes

FIG. 13

300
↓

Shot Type	Description	Key Flight Characteristics	Detect-able?
Wormburner	This is a shot that travels very low to the ground, almost as if it's "burning worms."	Extremely low launch angle, the ball skims along the ground.	Yes
Skull	A shot where the club hits the top half of the ball, causing it to shoot forward with a low trajectory.	Low launch angle, potentially high speed, ball is hit with the leading edge of the club.	Maybe
Shank	A dreaded type of shot where the ball is struck with the hosel (part of the club where the head and shaft connect), causing it to veer off at a sharp angle.	Ball flies sharply to the right (for right-handed golfers), as it's struck with the hosel of the club.	Yes
Duff	A poorly hit shot where the golfer hits the ground before the ball, often causing the ball to travel a much shorter distance than intended.	Very short carry distance, club hits ground before the ball.	Maybe
Chunk	A shot occurs when the club hits the ground before the ball, causing the ball to come up short of the target.	Very short carry distance, club digs into turf before striking ball.	No
Thin (or Bladed) Shot	This shot happens when the ball is hit with the bottom edge or "blade" of the club.	Low launch angle, ball is struck with the bottom edge of the clubface.	No
Fat Shot	When the club hits the ground before making contact with the ball.	Very short carry distance, club hits ground well before the ball.	No
Pop Shot	This shot occurs when the club strikes the ball too high, causing it to pop up into the air and not travel very far.	Extremely high launch angle but short carry distance, ball is struck too high on the clubface.	Yes

FIG. 14

300

Flush	This refers to a well-struck shot where the ball is hit squarely with the center of the clubface.	Optimal launch angle and carry distance, ball is struck in the center of the clubface.	Yes
Snap Hook	This shot starts right of the target (for a right-handed golfer) and then curves violently to the left.	Starts right of the target and then curves violently to the left (for a right-handed golfer).	Yes
Pull	This is a shot that flies straight but to the left of the target (for a right-handed golfer).	Ball flies straight but to the left of the target (for a right-handed golfer).	Yes
Push	This is a shot that flies straight but to the right of the target (for a right-handed golfer).	Ball flies straight but to the right of the target (for a right-handed golfer).	Yes
Blocked Shot	This is a shot that goes directly to the right (for a right-handed golfer), often caused by an outside-to-inside swing path that "blocks" the clubface from turning and squaring to the target.	Ball goes directly to the right (for a right-handed golfer), caused by an outside-to-inside swing path and squaring to the target.	Yes

FIG. 15

REACTIVE GAME PLAY**CROSS REFERENCES TO RELATED APPLICATIONS**

The Present Application is a continuation application of U.S. patent application Ser. No. 18/935,203, filed on Nov. 1, 2024, which claims priority to U.S. Patent Application No. 63/603,022, filed on Nov. 27, 2023, each of which is hereby incorporated by reference in its entirety.

STATEMENT REGARDING FEDERALLY SPONSORED RESEARCH OR DEVELOPMENT

Not Applicable

BACKGROUND OF THE INVENTION**Field of the Invention**

The present invention relates to games utilizing physical and virtual elements.

Description of the Related Art

To score points in current TOPGOLF games, players are required to drive a golf ball from their bay and hit either a real-world target or a virtual target provided by the game. This causes problems for some players who cannot hit those targets. When this occurs, the player doesn't score any points and is unable to compete with others in their bay who can hit the targets. This results in a negative experience for the player, which should be resolved.

At the present time, the current TOPGOLF games only allow one difficulty level for the whole bay. When groups of mixed skillsets arrive to play, this can mean that there's disparity between how difficult a player finds the game, with some finding it too easy while others find it too hard. In turn, this creates frustration among players, resulting in a negative experience.

Outside of tracer stats, TOPGOLF games currently do not detect the type of shot a player hits and do not provide shot-type-related feedback to the player. A more positive experience for the player can be created by detecting their types of shots and using that data to provide reactions and feedback in-game.

BRIEF SUMMARY OF THE INVENTION

The solution should ensure players who are unable to hit their golf ball into a target in the outfield can still obtain points and feel like they can still compete with other players.

The present invention detects the type of golf shot the player has hit and provides feedback to the player in a way that creates an overall more positive experience. Implementing a system that detects shots will allow the games to: give enhanced feedback—provide players with immediate feedback on swing mechanics to understand what they're doing right/wrong; track progress of different shot types; tailor the game to the player by modifying gameplay based on shot types detected; and boost confidence by celebrating shot types in different ways.

The present invention provides the following benefits: greater inclusivity; a sense of fairness among groups of mixed skill level; enhanced social experience—groups with mixed skill levels can enjoy playing together with less embarrassment for lower skilled players or feeling like

2

players of higher skill have an advantage; overall retention—if players feel like they were able to contribute/compete they are more likely to return; and improvements to the venue's reputation as a place where players of all skill level can have fun.

One aspect of the present invention is a system for playing a player reactive game at a golf entertainment venue. The system includes golf ball tracking sensors, hitting bays and a server. The golf ball tracking sensors are positioned at a golf driving range. The hitting bays are also at the golf driving range, and each hitting bay has a video display. The server is in communication with each of the golf ball tracking sensors and each video display. The server is configured to detect a type of golf shot the player has hit. The server is configured to transmit feedback to the player in a way that creates an overall more positive experience. The server is configured to track a progress of different shot types. The server is configured to modify gameplay based on the shot types detected. The server is configured to celebrate shot types in different ways.

The player reactive game preferably comprises a plurality of tiles covering an entire virtual outfield of the golf driving range. A golf ball hit by a player at a hitting bay while playing the game is tracked by at least a pair of the golf ball tracking sensors and the player is awarded with points for virtually hitting tiles.

Another aspect of the present invention is a method playing a player reactive game at a golf entertainment venue. The method includes generating a game on a video display in a hitting bay of a plurality of hitting bays of a golf driving range, wherein the game comprises a plurality of tiles covering an entire virtual outfield of the golf driving range. The method also includes hitting, by a player, a plurality of shots of golf balls toward the outfield of the golf driving range from the hitting bay of the plurality of hitting bays of the golf driving range. The method also includes tracking a flight of each shot of golf balls using a plurality of golf ball tracking sensors positioned at a golf driving range. The method also includes detecting a type of golf shot the player has hit. The method also includes transmitting feedback to the player in a way that creates an overall more positive experience. The method also includes tracking a player progress of different shot types. The method also includes modifying gameplay based on the shot types detected. The method also includes celebrating shot types in different ways.

Having briefly described the present invention, the above and further objects, features and advantages thereof will be recognized by those skilled in the pertinent art from the following detailed description of the invention when taken in conjunction with the accompanying drawings.

DETAILED DESCRIPTION OF THE INVENTION

At a golf entertainment venue, a player or group of players are assigned a hitting bay. The hitting bay has various screens and graphical user interfaces for inputting player information and selecting a game to play. The hitting bay also has a golf ball dispenser with a screen such as disclosed in Burdette et al., U.S. Patent Publication Number 20220203178 (U.S. patent application Ser. No. 17/699,020 filed on Mar. 18, 2022) for a Golf Ball Dispenser With Embedded Display Device, Separate Front Waterfall Panel And/Or Blower Assembly, which is hereby incorporated by reference in its entirety. When a game with a reactive function is selected by a player, the game begins to track the players performance for each shot. This involves obtaining golf ball tracking data and utilizing a game engine with a virtual game. The golf ball tracking data is combined with the virtual game data to generate an output displayed on the various screens in the hitting bay and on devices. When a ball is hit, a camera system tracks the ball flights and produces a trace data for the struck golf ball. Such a system is disclosed in Hugmark et al., U.S. patent Ser. No. 12/121,771 for a Trajectory Extrapolation And Origin Determination For Objects Tracked in Flight, which is hereby incorporated by reference in its entirety. The virtual environment for a game is provided for combining the data with the golf ball tracking data. One such mechanism for providing data to generate a virtual environment for a driving range of a golf entertainment venue is disclosed in Medcalf, U.S. patent application Ser. No. 18/751,522, filed on Jun. 24, 2024, for Data Generated Outfields, is hereby incorporated by reference in its entirety. Generating a virtual image of a driving range of golf entertainment venue is also disclosed in Cheng et al., U.S. Pat. No. 7,847,808 for Photographic Mapping In A Simulation, which is hereby incorporated by reference in its entirety. Thus the playing field for a game is constructed in a virtual environment creating a virtual driving range that matches the X-Y coordinates of the physical driving range. Further, use of virtual golf equipment is disclosed in Cheng, U.S. Pat. No. 7,806,777 for Automatically Adapting Virtual Equipment Model, which is hereby incorporated by reference in its entirety. Further, the bounce and the roll of a golf ball in a virtual environment is disclosed in Medcalf, U.S. patent application Ser. No. 18/750,251, filed on Jun. 21, 2024, for a Bounce & Roll Engine, is hereby incorporated by reference in its entirety.

4

The shot type are detected by the camera system at a venue. Detecting shot types has four separate factors: determining what shot types should be detected; gathering the shot characteristics (launch vector, curve amount, ball speed, etc.) that make up the shot types determined; developing a system that compares the determined shot types with the player's shot and informing the game; and reacting to the detected shot type in-game.

In a preferred embodiment of a reactive game, tiles are created in the virtual driving range with each tile matching a location of the physical driving range. The trace data from the camera sensors direct the flight of a golf ball in the virtual environment of the reactive game. The bounce and roll engine assist with the bounce and roll in the virtual environment. Based on the trace data (matching the actual flight of the struck golf ball from the hitting bay to the driving range), tiles are "hit" in the virtual environment. As play progresses, bonus tiles **25**, shown in FIGS. 6-8, appear in the outfield **10**, glowing and highlighted so that the player knows something great will happen if the player hits one.

Hitting a bonus tile **25** activates surrounding tiles and awards the player with extra points.

The placement of bonus tiles **25** adjusts to how the player has been hitting their shots. To achieve this, the player's shot history during the game is used to determine the placement of bonus tiles **25**. This means that the more skilled golfers who are hitting the ball further down the outfield **10** will have more difficult bonus tiles **25** to hit. Players hitting the ball closer to the hitting bays **118** will get much easier bonus tiles to hit, making it easier for them to score points. FIG. 7 shows a short shot player's bonus tile **25a-25c** placement versus a long shot player's bonus tile **25x-25z** placement in FIG. 6.

The bespoke software component (BSC) determines where the golf ball has impacted the outfield and awards points, whether the ball hits a target or not.

This will allow for the following benefits to the game: allows scoring for a wider range of skill levels; variety—not always having to aim for the regular targets; different golf strategies—players have more opportunities to either play it safe or take bigger risks, utilizing the entire outfield for scoring.

Covering the outfield in hexagonal tiles allows for giving the player points based on where the ball lands and rolls with the need to hit a target. However, each tile can alternatively be a square, circle, diamond, triangle, rectangle or polygon.

Each tile is preferably the same size. Each tile has a representative width ranging from 0.1 meter to 10 meters in the virtual outfield.

On game load, the data for the current venue in which the game is being played is pulled into the game and the regular outfield **10** is generated from it.

The BSC then creates a grid of hexagonal tiles **15**, overlaying them on the generated outfield. A tile-covered outfield **10** can be seen in FIGS. 1-3. In FIGS. 4-5 and FIG. 8 the outfield have the same tile layout, however, only a patch of tiles is shown as an example.

Preferably, the number of tiles the grid is comprised of is between 1,000 to 50,000 tiles. More preferably, the number of tiles the grid is comprised of is between 10,000 to 20,000 tiles.

A player's golf ball **5** is tracked by sensors and when the players golf ball **5** impacts with the outfield **10**, the BSC checks the impact position and finds the nearest tile in the grid created. Then that tile is activated and points are awarded to the player for virtually hitting that tile.

The BSC allows for custom point values to be assigned to a tile to award more/less points depending on where the ball lands.

FIG. 9 is an illustration of the different player interfaces and venue screens. The play experience screens show the same content in the hitting bay. The player view screen 41 is front of the player as the player addresses the golf ball. The game panel 45 allows the player to make adjusts to the player order and to input additional information. The bay view screen 42 displays the same content as the player view screen. A bayboard TV 44 provides additional content to the players in the hitting bay, and bayboard ads 43 displays various advertising content to the players in the hitting bay. The game can be also viewed through a mobile app 46 or through a website 47 of the venue.

FIG. 10 is a table 100 of shot types and their details relating to the game. The shot types are: drive, stinger, chip, pitch, putt, and bunker. The top table data is mainly used for determining the shot type. The Effect, Scoring and Superlatives are reactions to the shot type and used in-game to award and celebrate the shots and to make game playing more positive.

An example of a shot type and the resulting details is shown in FIG. 1. A player hit a ball 5 onto a bonus tile 25. From the shot characteristics gathered by the system, it was determined that it was a pitch shot. For the pitch shot, in the bottom table 100, the Effect is an impact explosion and the Scoring is a radius ++ of rings activated on outfield impact 26.

FIG. 11A is a continuation of the table 100 of shot types and their details. The shot types here are draw, fade, power fade, hook, slice, hole-in-one, target-in-one, roll/bounce into target, wormburner, shank and near miss. FIG. 11B is a continuation of the details of the shot types in FIG. 11A. For the roll/bounce shot the skipping stone and rays from below 27 are shown in FIG. 2. The extra tiles were 5 points each, thereby awarding a bonus of 25 total points.

FIGS. 12-13 show a table 200 of formal shots describing their characteristics and their detectability. The formal shots are: drive; approach; tee shot (all shots are considered tee shots); chip; pitch; putt; bunker (sand) shot; flop shot; and punch (knockdown) shot; draw; fade; hook; slice; layup shot; recovery/escape shot; pitch-and-run; and a hole-in-one.

FIGS. 14-15 show a table 300 of informal shots describing their characteristics and their detectability. The unformal shots are wormburner; skull; shank; duff; chunk; thin/bladed shot; fat shot; pop shot; flush; snap hook; pull; push; and blocked shot.

A system 400 for playing a player reactive game at a golf entertainment venue 90 is shown in FIG. 16. The system includes golf ball tracking sensors 55a-55f positioned at the driving range, hitting bays 118 with a video display 125 in each bay 118, and a server 88. The server 88 communicates with each of the golf ball tracking sensors 55a-55f and with each video display 125a-125e of the hitting bays 118a-118f. The server 88 detects the type of golf shot the player hit and tracks the progress of different shot types. The server 88 modifies the gameplay based on the shot types detected, and then celebrates the shot types in different ways.

The server 88 transmits feedback, such as effects of the shot type, to the player in a way that creates an overall more positive experience. The server 88 also generates bonus tiles corresponding to the tile previously virtually hit, and awards points if a bonus tile is hit.

The golf ball tracking sensors 55 are preferably camera sensors. Alternatively, they can be radar sensors.

A golf entertainment venue 90 is shown in FIG. 17. In reference to FIG. 16, the hitting bays 118 are in the building 115 portion of the venue 90, facing the outfield 10. Within each hitting bay 118, there is a video display 125 from which a player plays the game. A ball 5 hit by a player 8 while playing the game is tracked by golf ball tracking sensors 55. Preferably, at least two or more sensors. The player 8 is awarded with points for hitting virtual tiles, shown on the display 125.

A flow chart 500 for a method for playing a player reactive game at a golf entertainment venue is shown in FIG. 18. In step 501, a game, created by tiles covering an entire virtual outfield of the golf driving range, is generated on a video display in a hitting bay. A player, from the hitting bay, hits shots of golf balls toward the outfield of the driving range in step 502. The flight of each golf ball shot is tracked by the tracking sensors in step 503. The type of golf shot hit by the player is detected in step 504. In step 505, feedback is transmitted to the player in a way that creates an overall more positive experience. In step 506, player progress of different shot types is tracked. In step 507, the gameplay is modified based on the shot types detected. Step 508 is celebrating the shot types in different ways.

From the foregoing it is believed that those skilled in the pertinent art will recognize the meritorious advancement of this invention and will readily understand that while the present invention has been described in association with a preferred embodiment thereof, and other embodiments illustrated in the accompanying drawings, numerous changes, modifications and substitutions of equivalents may be made therein without departing from the spirit and scope of this invention which is intended to be unlimited by the foregoing except as may appear in the following appended claims. Therefore, the embodiments of the invention in which an exclusive property or privilege is claimed are defined in the following appended claims.

I claim as my invention the following:

1. A system for playing a player reactive game at a golf entertainment venue, the system comprising:

a plurality of golf ball tracking sensors positioned at a golf driving range;

a plurality of hitting bays at the golf driving range, each of the plurality of hitting bays having a video display; and

a server in communication with each of the plurality of golf ball tracking sensors and each video display of the plurality of hitting bays;

wherein the server is configured to generate a virtual game on the video display, wherein the game comprises a plurality of tiles covering an entire virtual outfield of the golf driving range;

wherein the server is configured to detect golf ball hit by a player at a hitting bay while playing the game

wherein the server is configured to generate a flight and landing of the golf ball based on tracking by the plurality of golf ball tracking sensors;

wherein the server is configured to display the flight and landing of the golf ball on the virtual outfield of the golf driving range; and

wherein the server is configured to award the player with at least one point for virtually hitting a tile of the plurality of tiles.

2. The system according to claim 1 wherein the server is configured to determine a type of golf shot by the player.

3. The system according to claim 1 wherein the server is configured to generate a plurality of bonus tiles for a subsequent hit corresponding to the tile previously virtually hit by the player.

4. The system according to claim 1 wherein the plurality of tiles comprises from 10,000 to 20,000 tiles.

5. The system according to claim 3 wherein the server is configured to award the player with extra points if a bonus tile is hit in the virtual game.

6. The system according to claim 1 wherein each of the plurality of golf ball tracking sensors is a camera sensor.

7. The system according to claim 1 wherein each of the plurality of golf ball tracking sensors is a radar sensor.

8. The system according to claim 1 wherein each tile is a hexagon, square, circle, diamond, triangle, rectangle or polygon.

9. The system according to claim 1 wherein each of the tiles is the same size.

10. The system according to claim 1 wherein each tile has a representative width ranging from 0.1 meter to 10 meters in the virtual outfield.

11. A method for playing a player reactive game at a golf entertainment venue, the method comprising:

generating a game on a video display in a hitting bay of a plurality of hitting bays of a golf driving range,

wherein the game comprises a plurality of tiles covering an entire virtual outfield of the golf driving range;

hitting, by a player, a plurality of shots of golf balls toward the outfield of the golf driving range from the hitting bay of the plurality of hitting bays of the golf driving range;

tracking a flight of each shot of golf balls using a plurality of golf ball tracking sensors positioned at a golf driving range;

communicating the data for the tracking of the golf ball from the plurality of golf ball tracking sensors to the server;

generating a bounce and roll prediction at the server for the tracked golf ball;

9

combining, at the server, a trace of the flight of the golf ball and the bounce and roll of the golf ball to generate a complete shot of the golf ball in the game;
 displaying, on a video display in the hitting bay, the full shot of the golf ball in the virtual outfield of the game; 5
 and
 awarding points to the player for tiles of the plurality of tiles impacted by the full shot of the golf ball in the virtual outfield of the game;
 wherein the game comprises a plurality of tiles covering 10
 an entire virtual outfield of the golf driving range,
 wherein a golf ball hit by a player at a hitting bay while playing the game is tracked by at least a pair of the plurality of golf ball tracking sensors and the player is awarded with points for virtually hitting tiles of the plurality of tiles, and the method further comprises 15
 generating a bounce and roll prediction at the server for the tracked golf ball; and combining, at the server, a trace of the flight of the golf ball and the bounce and roll of the golf ball to generate a complete shot of the golf ball in the game.

10

12. The method according to claim 11 further comprising determining the type of golf shot hit by the player.

13. The method according to claim 11 wherein the plurality of tiles comprises from 1000 to 50,000 tiles.

14. The method according to claim 11 wherein the plurality of tiles comprises from 10,000 to 20,000 tiles.

15. The method according to claim 11 wherein each tile is each tile is a hexagon.

16. The method according to claim 11 wherein each of the plurality of golf ball tracking sensors is a camera sensor.

17. The method according to claim 11 wherein each of the plurality of golf ball tracking sensors is a radar sensor.

18. The method according to claim 11 wherein each tile is a square, circle, diamond, triangle, rectangle or polygon.

19. The method according to claim 11 wherein each of the tiles is the same size.

20. The method according to claim 11 wherein each tile has a representative width ranging from 0.1 meter to 10 meters in the virtual outfield.
