Background/Summary

CROSS REFERENCE TO RELATED APPLICATIONS

(1) This application is the National Stage Entry under 35 U.S.C. § 371 of International Application No. PCT/EP2020/072197 filed Aug. 6, 2020, which claims priority to International Application No. PCT/EP2019/071399 filed Aug. 9, 2019, the contents of each of which are hereby incorporated by reference in their entireties.

(2) The present invention relates to compounds of formula (I) which are galectin-3 inhibitors and their use in the prevention/prophylaxis or treatment of diseases and disorders that are related to galectin-3 binding to natural ligands. The invention also concerns related aspects including processes for the preparation of the compounds, pharmaceutical compositions containing one or more compounds of formula (I), and their medical use as Galectin-3 inhibitors. The compounds of formula (I) may especially be used as single agents or in combination with one or more therapeutic agents.

(3) Galectins are defined as a protein family based on conserved 3-galactoside-binding sites found within their characteristic ~130 amino acid (aa) carbohydrate recognition domains (CRDs) (Barondes S H et al., Cell 1994; 76, 597-598). Human, mouse and rat genome sequences reveal the existence of at least 16 conserved galectins and galectin-like proteins in one mammalian genome

(Leffler H. et al., *Glycoconj. J.* 2002, 19, 433-440). So far, three galectin subclasses were identified, the prototypical galectins containing one carbohydrate-recognition domain (CRD); the chimaera galectin consisting of unusual tandem repeats of proline- and glycine-rich short stretches fused onto the CRD; and the tandem-repeat-type galectins, containing two distinct CRDs in tandem connected by a linker (Zhong X., *Clin Exp Pharmacol Physiol.* 2019; 46:197-203). As galectins can bind either bivalently or multivalently, they can e.g. cross-link cell surface glycoconjugates to trigger cellular signaling events. Through this mechanism, galectins modulate a wide variety of biological processes (Sundblad V. et al., *Histol Histopathol* 2011; 26: 247-265).

(4) Galectin-3 (Gal-3), the only chimaera type in the galectin family, has a molecular weight of 32-35 kDa and consists of 250 amino acid residues in humans, a highly conserved CRD and an atypical N-terminal domain (ND). Galectin-3 is monomeric up to high concentrations (100 μ M), but can aggregate with ligands at much lower concentrations, which is promoted by its N-terminal non-CRD region via an oligomerisation mechanism that is not yet completely understood (Johannes, L. et al., *Journal of Cell Science* 2018; 131, jcs208884).

(5) Gal-3 is widely distributed in the body, but the expression level varies among different organs. Depending on its extracellular or intracellular localization, it can display a broad diversity of biological functions, including immunomodulation, host-pathogen interactions, angiogenesis, cell migration, wound healing and apoptosis (Sundblad V. et al., *Histol Histopathol* 2011; 26: 247-265). Gal-3 is highly expressed in many human tumours and cell types, such as myeloid cells, inflammatory cells (macrophages, mast cells, neutrophils, T cells, eosinophils, etc.), fibroblasts and cardiomyocytes (Zhong X. et al., *Clin Exp Pharmacol Physiol.* 2019; 46:197-203), indicating that Gal-3 is involved in the regulation of inflammatory and fibrotic processes (Henderson N C. Et al., *Immunological Reviews* 2009; 230: 160-171; Sano H. et al., *J Immunol.* 2000; 165(4):2156-64). Furthermore, Gal-3 protein expression levels are up-regulated under certain pathological conditions, such as neoplasms and inflammation (Chiariotti L. et al., *Glycoconjugate Journal* 2004 19, 441-449; Farhad M. et al., *Oncolimmunology* 2018, 7:6, e1434467).

(6) There are multiple lines of evidence supporting functional involvement of Gal-3 in the development of inflammatory/autoimmune diseases, such as asthma (Gao P. et al. *Respir Res.* 2013, 14:136; Rao S P et al. *Front Med (Lausanne)* 2017; 4:68), rheumatoid arthritis, multiple sclerosis, diabetes, plaque psoriasis (Lacina L. et al. *Folia Biol (Praha)* 2006; 52(1-2):10-5) atopic dermatitis (Saegusa J. et al. *Am J Pathol.* 2009, 174(3):922-31), endometriosis (Noel J C et al. *Appl Immunohistochem Mol Morphol.* 2011 19(3):253-7), or viral encephalitis (Liu F T et al., *Ann N Y Acad Sci.* 2012; 1253:80-91; Henderson N C, et al., *Immunol Rev.* 2009; 230(1):160-71; Li P et al., *Cell* 2016; 167:973-984). Recently Gal-3 has emerged as a key player of chronic inflammation and organ fibrogenesis development e.g. liver (Henderson N C et al., *PNAS* 2006; 103: 5060-5065; Hsu D K et al. *Int J Cancer.* 1999, 81(4):519-26), kidney (Henderson N C et al., *Am. J. Pathol.* 2008; 172:288-298; Dang Z. et al. *Transplantation.* 2012, 93(5):477-84), lung (Mackinnon A C et al., *Am. J. Respir. Crit. Care Med* 2012, 185: 537-546; Nishi Y. et al. *Allergol Int.* 2007, 56(1):57-65), heart (Thandavarayan R A et al. *Biochem Pharmacol.* 2008, 75(9):1797-806; Sharma U. et al. *Am J Physiol Heart Circ Physiol.* 2008; 294(3):H1226-32), as well as the nervous system (Burguillos M A et al. *Cell Rep.* 2015, 10(9):1626-1638), and in corneal neovascularization (Chen W S. Et al., *Investigative Ophthalmology & Visual Science* 2017, Vol. 58, 9-20). Additionally, Gal-3 was found to be associated with dermal thickening of keloid tissues (Arciniegas E. et al., *The American Journal of dermatopathology* 2019; 41(3):193-204) and systemic sclerosis (SSc) especially with skin fibrosis and proliferative vasculopathy observed in such condition (Taniguchi T. et al. *J Rheumatol.* 2012, 39(3):539-44). Gal-3 was found to be up-regulated in patient suffering chronic kidney disease (CKD) associated-kidney failure, and especially in those affected by diabetes. Interestingly, data obtained from this patient population showed correlation between Gal-3 upregulation in glomeruli and the observed urinary protein excretion (Kikuchi Y. et al. *Nephrol Dial Transplant.* 2004, 19(3):602-7). Additionally, a recent prospective study from 2018

demonstrated that higher Gal-3 plasma levels are associated with an elevated risk of developing incident CKD, particularly among hypertension-suffering population (Rebholz C M. et al. *Kidney Int.* 2018 January; 93(1): 252-259). Gal-3 is highly elevated in cardiovascular diseases (Zhong X. et al. *Clin Exp Pharmacol Physiol.* 2019, 46(3):197-203), such as atherosclerosis (Nachtigal M. et al. *Am J Pathol.* 1998; 152(5):1199-208), coronary artery disease (Falcone C. et al. *Int J Immunopathol Pharmacol* 2011, 24(4):905-13), heart failure and thrombosis (Nachtigal M. et al., *Am J Pathol.* 1998; 152(5):1199-208; Gehlken C. et al., *Heart Fail Clin.* 2018, 14(1):75-92; DeRoo E P. et al., *Blood.* 2015, 125(11):1813-21). Gal-3 blood concentration is elevated in obese and diabetic patients and is associated with a higher risk for micro- and macro-vascular complication (such as heart failure, nephropathy/retinopathy, peripheral arterial disease, cerebrovascular event, or myocardial infarction) (Qi-hui-Jin et al. *Chin Med J (Engl).* 2013,126(11):2109-15). Gal-3 influences oncogenesis, cancer progression, and metastasis (Vuong L. et al., *Cancer Res* 2019 (79) (7) 1480-1492), and was shown to exert a role as a pro-tumor factor by acting within the micro tumor environment to suppress immune surveillance (Ruvolo P P. et al. *Biochim Biophys Acta.* 2016 March, 1863(3):427-437; Farhad M. et al. *Oncoimmunology* 2018 Feb. 20; 7(6):e1434467). Among the cancers that express high level of Gal-3 are found those affecting the thyroid gland, the central nervous system, the tongue, the breast, the gastric cancer, the head and neck squamous cell, the pancreas, the bladder, the kidney, the liver, the parathyroid, the salivary glands, but also lymphoma, carcinoma, non-small cell lung cancer, melanoma and neuroblastoma (Sciacchitano S. et al. *Int J Mol Sci* 2018 Jan. 26, 19(2): 379).

(7) Also, Gal-3 inhibition has been proposed to be beneficial in the treatment of COVID-19 (Caniglia J L et al. *PeerJ* 2020, 8:e9392) and influenza H5N1 (Chen Y J et al. *Am. J. Pathol.* 2018, 188(4), 1031-1042) possibly due to anti-inflammatory effects.

(8) Recently, Gal-3 inhibitors have shown to have positive effects when used in combination immunotherapy (Galectin Therapeutics. Press Release, Feb. 7, 2017) and idiopathic pulmonary fibrosis (Galecto Biotech. Press Release, Mar. 10, 2017) and in NASH cirrhosis (Dec. 5, 2017). WO20180209276, WO2018209255 and WO20190890080 disclose compounds having binding affinity with galectin proteins for the treatment of systemic insulin resistance disorders. Thus, Gal-3 inhibitors, alone or in combination with other therapies, may be useful for the prevention or treatment of diseases or disorders such as fibrosis of organs, cardiovascular diseases and disorders, acute kidney injury and chronic kidney disease, liver diseases and disorders, interstitial lung diseases and disorders, ocular diseases and disorders, cell proliferative diseases and cancers, inflammatory and autoimmune diseases and disorders, gastrointestinal tract diseases and disorders, pancreatic diseases and disorders, abnormal angiogenesis-associated diseases and disorders, brain-associated diseases and disorders, neuropathic pain and peripheral neuropathy, and/or transplant rejection.

(9) Several publications and patent applications describe synthetic inhibitors of Gal-3 that are being explored as antifibrotic agents (see for example WO2005113568, WO2005113569, WO2014067986, WO2016120403, US20140099319, WO2019067702, WO2019075045, WO2014078655, WO2020078807 and WO2020078808).

(10) Verteramo et al. (*J. Am. Chem. Soc.* 2019, 141, 5, 2012) discloses a comparative analysis of ligand binding to galectin-3C using two diastereomeric 3-D-galactopyranoside ligands, which however are different from the present compounds by at least the absence of present mandatory substituent R_{sup.1}. The same ligand was used by Caldararu et al. (*Phys. Chem. Chem. Phys.* 2019, 21, 18149) to study whether it is possible to obtain reliable entropies from crystallographic B-factors.

(11) The present invention provides novel compounds of formula (I) which are Galectin-3 inhibitors. The present compounds may, thus, be useful for the prevention/prophylaxis or treatment of diseases and disorders where modulation of Gal-3 binding to its natural carbohydrate ligands is indicated.

(23) The compounds of Formula (I) contain five stereogenic or asymmetric centers, which are situated on the tetrahydropyran moiety and which are in the absolute configuration as drawn for Formula (I). In addition, the compounds of Formula (I) contain at least one, and possibly more, further stereogenic or asymmetric centers, such as one or more additional asymmetric carbon atoms. The compounds of Formula (I) may thus be present as mixtures of stereoisomers or preferably as pure stereoisomers. Mixtures of stereoisomers may be separated in a manner known to a person skilled in the art.

(24) In case a particular compound (or generic structure) is designated as being in a certain absolute configuration, e.g. as (R)- or (S)-enantiomer, such designation is to be understood as referring to the respective compound (or generic structure) in enriched, especially essentially pure, enantiomeric form. Likewise, in case a specific asymmetric center in a compound is designated as being in (R)- or (S)-configuration or as being in a certain relative configuration, such designation is to be understood as referring to the compound that is in enriched, especially essentially pure, form with regard to the respective configuration of said asymmetric center.

(25) The term “enriched”, when used in the context of stereoisomers, is to be understood in the context of the present invention to mean that the respective stereoisomer is present in a ratio of at least 70:30, especially of at least 90:10 (i.e., in a purity of at least 70% by weight, especially of at least 90% by weight), with regard to the respective other stereoisomer/the entirety of the respective other stereoisomers.

(26) The term “essentially pure”, when used in the context of stereoisomers, is to be understood in the context of the present invention to mean that the respective stereoisomer is present in a purity of at least 95% by weight, especially of at least 99% by weight, with regard to the respective other stereoisomer/the entirety of the respective other stereoisomers.

(27) The present invention also includes isotopically labelled, especially .sup.2H (deuterium) labelled compounds of Formula (I) according to embodiments 1) to 25), which compounds are identical to the compounds of Formula (I) except that one or more atoms have each been replaced by an atom having the same atomic number but an atomic mass different from the atomic mass usually found in nature. Isotopically labelled, especially .sup.2H (deuterium) labelled compounds of formulae (I), (II) and (III) and salts thereof are within the scope of the present invention. Substitution of hydrogen with the heavier isotope .sup.2H (deuterium) may lead to greater metabolic stability, resulting e.g. in increased in-vivo half-life or reduced dosage requirements, or may lead to reduced inhibition of cytochrome P450 enzymes, resulting e.g. in an improved safety profile. In one embodiment of the invention, the compounds of Formula (I) are not isotopically labelled, or they are labelled only with one or more deuterium atoms. In a sub-embodiment, the compounds of Formula (I) are not isotopically labelled at all. Isotopically labelled compounds of Formula (I) may be prepared in analogy to the methods described hereinafter, but using the appropriate isotopic variation of suitable reagents or starting materials.

(28) In this patent application, a bond drawn as a dotted line shows the point of attachment of the radical drawn. For example, the radical drawn below

(29) ##STR00006##

is an azetidine-1-carbonyl group.

(30) Where the plural form is used for compounds, salts, pharmaceutical compositions, diseases and the like, this is intended to mean also a single compound, salt, or the like.

(32) The term “pharmaceutically acceptable salts” refers to salts that retain the desired biological activity of the subject compound and exhibit minimal undesired toxicological effects. Such salts include inorganic or organic acid and/or base addition salts depending on the presence of basic and/or acidic groups in the subject compound. For reference see for example “Handbook of Pharmaceutical Salts. Properties, Selection and Use.”, P. Heinrich Stahl, Camille G. Wermuth (Eds.), Wiley-VCH, 2008; and “Pharmaceutical Salts and Co-crystals”, Johan Wouters and Luc Quere (Eds.), RSC Publishing, 2012.

(33) Definitions provided herein are intended to apply uniformly to the compounds of Formula (I), as defined in any one of embodiments 1) to 19), and, *mutatis mutandis*, throughout the description and the claims unless an otherwise expressly set out definition provides a broader or narrower definition. It is well understood that a definition or preferred definition of a term defines and may replace the respective term independently of (and in combination with) any definition or preferred definition of any or all other terms as defined herein.

(34) In this patent application, the compounds are named using IUPAC nomenclature, but can also be named using carbohydrate nomenclature. Thus, the moiety:

(35) ##STR00007##

(56) Whenever the word “between” is used to describe a numerical range, it is to be understood that the end points of the indicated range are explicitly included in the range. For example: if a temperature range is described to be between 40° C. and 80° C., this means that the end points 40° C. and 80° C. are included in the range; or if a variable is defined as being an integer between 1 and 4, this means that the variable is the integer 1,2,3, or 4.

(57) Unless used regarding temperatures, the term “about” placed before a numerical value “X” refers in the current application to an interval extending from X minus 10% of X to X plus 10% of X, and preferably to an interval extending from X minus 5% of X to X plus 5% of X. In the particular case of temperatures, the term “about” placed before a temperature “Y” refers in the current application to an interval extending from the temperature Y minus 10° C. to Y plus 10° C., and preferably to an interval extending from Y minus 5° C. to Y plus 5° C. Besides, the term “room temperature” as used herein refers to a temperature of about 25° C.

(101) The compounds of Formula (I) according to embodiments 1) to 25) and their pharmaceutically acceptable salts can be used as medicaments, e.g. in the form of pharmaceutical compositions for enteral (such especially oral e.g. in form of a tablet or a capsule) or parenteral administration (including topical application or inhalation).

(102) The production of the pharmaceutical compositions can be effected in a manner which will be familiar to any person skilled in the art (see for example Remington, *The Science and Practice of Pharmacy*, 21st Edition (2005), Part 5, "Pharmaceutical Manufacturing" [published by Lippincott Williams & Wilkins]) by bringing the described compounds of Formula (I) or their pharmaceutically acceptable salts, optionally in combination with other therapeutically valuable substances, into a galenical administration form together with suitable, non-toxic, inert, therapeutically compatible solid or liquid carrier materials and, if desired, usual pharmaceutical adjuvants.

(103) The present invention also relates to a method for the prevention/prophylaxis or treatment of a disease or disorder mentioned herein comprising administering to a subject a pharmaceutically active amount of a compound of Formula (I) according to embodiments 1) to 25). In a sub-embodiment of the invention, the administered amount is comprised between 1 mg and 1000 mg per day.

(104) For avoidance of any doubt, if compounds are described as useful for the prevention/prophylaxis or treatment of certain diseases, such compounds are likewise suitable for use in the preparation of a medicament for the prevention/prophylaxis or treatment of said diseases. Likewise, such compounds are also suitable in a method for the prevention/prophylaxis or treatment of such diseases, comprising administering to a subject (mammal, especially human) in need thereof, an effective amount of such compound.

(105) 26) Another embodiment relates to the compounds of formula (I) as defined in any one of embodiments 1) to 25) which are useful for the prevention/prophylaxis or treatment of diseases and disorders that are related to galectin-3 binding to natural ligands.

(122) Preparation of Compounds of Formula (I):

(123) The compounds of Formula (I) can be prepared by well-known literature methods, by the methods given below, by the methods given in the experimental part below or by analogous methods. Optimum reaction conditions may vary with the particular reactants or solvents used, but such conditions can be determined by a person skilled in the art by routine optimization procedures. In some cases, the order of carrying out the following reaction schemes, and/or reaction steps, may be varied to facilitate the reaction or to avoid unwanted reaction products. In the general sequence of reactions outlined below, the generic groups R^{sup.1}, R^{sup.2a}, R^{sup.2b}, R^{sup.3} and Ar^{sup.1} are as defined for Formula (I). Other abbreviations used herein are explicitly defined or are as defined in the experimental section. In some instances, the generic groups R^{sup.1}, R^{sup.2a}, R^{sup.2b}, R^{sup.3} and Ar^{sup.1} might be incompatible with the assembly illustrated in the schemes

below and so will require the use of protecting groups (Pg). The use of protecting groups is well known in the art (see for example "Protective Groups in Organic Synthesis", T. W. Greene, P. G. M. Wuts, Wiley-Interscience, 1999). For the purposes of this discussion, it will be assumed that such protecting groups as necessary are in place. In some cases, the final product may be further modified, for example, by manipulation of substituents to give a new final product. These manipulations may include, but are not limited to, reduction, oxidation, alkylation, acylation, hydrolysis and transition-metal catalyzed cross-coupling reactions which are commonly known to those skilled in the art. The compounds obtained may also be converted into salts, especially pharmaceutically acceptable salts, in a manner known per se.

(124) Compounds of Formula (I) of the present invention can be prepared according to the general sequence of reactions outlined below. Only a few of the synthetic possibilities leading to compounds of Formula (I) are described.

(125) ##STR00023##

(126) Compounds of Formula (I) are prepared e.g. by reacting a compound of Structure 1 where R is either hydrogen, a suitable protective group (Pg) or R^{sup.1} (as defined in Formula (I)) with a compound of Structure 2 in a solvent such as EA/water under phase transfer catalytic conditions in presence of tetrabutyl ammonium bromide or tetrabutyl ammonium hydrogensulfate and a base such as Na₂CO₃ (*Chem. Comm.* 2006, 2379). Alternatively compound of Structure 1 can react with a compound of Structure 2 under anhydrous conditions in THF or DMF in presence of NaH to give a compound of Structure 3. In Structures 1 and 3, the term Pg represents a protective group such as an acetyl, a chloro-acetyl, a benzoyl, or a benzyl group or a 4-chlorobenzyl, which are well known to the person skilled in the art. The hydroxy groups in position 4 and 6 of Structure 1 can be protected with cyclic protective groups such as isopropylidene, benzylidene or bis-tert-butyl silyl groups. R is either hydrogen, a suitable protective group (Pg) or R^{sup.1} (as defined in Formula (I)). In the case wherein Pg represents an acyl protective group, such a protective group can be cleaved following the reaction of a compound of Structure 1 with a compound of Structure 2 under standard conditions, e.g. by water or an alcohol in the presence or absence of additional solvents such as THF, dioxane, etc. and in the presence of a base such as NaOH, or LiOH. In the case wherein such a protective group represents a benzyl group, the protective group can be cleaved e.g. by hydrogen in the presence of a catalyst such as Pd/C, PtO in methanol, ethyl acetate, THF, etc. or mixtures thereof, or by BBr₃ in a solvent such as DCM. In the case where Pg is a cyclic protective group such as isopropylidene, benzylidene or bis-tert-butyl silyl groups and R is either hydrogen, a suitable protective group (Pg) or R^{sup.1} (as defined in Formula (I)), the compounds of Structure 3 can be deprotected under acidic conditions using aqueous acetic acid or TFA.

(127) ##STR00024##

(128) The compounds of Structure 1 can be prepared e.g. by reacting a compound of Structure 4 with a compound of Structure 5 in the presence of CuI and DIPEA in solvents such as THF or DMF (*Click Chemistry in Glycoscience: New Development and Strategies*, 1st Edition, 2013, John Wiley & Sons), alternatively the reaction can be run on a commercial continuous-flow reactor (Vapourtec) using a copper coil in a solvent such as THF. Compound of Structure 5 are either commercially available or can be prepared according to procedures known to a person skilled in the art (*Synthesis* 2011, 22, 3604-3611). Compounds of Structure 4 can be prepared in 3 steps from gluco furanose through methods well known to a person skilled in the art (*Carbohydrate Research* 1994, 251, 33-67).

(129) ##STR00025##

(130) The compounds of Structure 2 can be prepared by reacting a compound of Structure 6 in presence of a strong base such as LDA or n-BuLi in solvents such as THF, diethylether, toluene, with a compound of Structure 7 at low temperatures. (*Chem Lett* 1977, 471-474). In Structure 6, the term Pg represents a suited protective group for the thiol, such as an acyl or a tetrahydropyrane.

In the case wherein such a protective group represents an acyl protective group, such a protective group can be cleaved following the reaction of compound of Structure 6 with a compound of Structure 7 under standard conditions, e.g. by water or an alcohol in the presence or absence of additional solvents such as THF, dioxane, etc. and in the presence of a base such as NaOH, LiOH, or 25% NH₄OH. In the case wherein such a protective group represents a tetrahydropyrane group, the protective group can be cleaved following the reaction of a compound of Structure 6 with a compound of Structure 7 e.g. by AgNO₃ in a solvent mixture such as THF/water, followed by treatment of the silver salt with NaSH in a solvent mixture such as THF/DCM/water (*Tetrahedron* 59 2003,3853-3861), alternatively a combination of boron trifluoride, 2-mercaptoethanol in a solvent such as DCM can be used (*Chem Lett* 1996, 999-1000).

(131) ##STR00026##

(132) In case R_c is an ester group the compound of Structure 2 can be also prepared from a compound of Structure 6A whereby no protecting group for the thiol is needed (*Chem Lett* 1977, 471-474). Compounds of Structure 7 and compounds of Structure 6A are commercially available.

(133) ##STR00027##

(134) Compounds of Structure 3 can be obtained by reacting compounds of Structure 8 and compounds of Structure 7 in presence of a strong base such as LDA or n-BuLi in solvents such as THF, diethylether, toluene, at low temperatures such as -78° C. (*Chem Lett* 1977, 471-474).

(135) ##STR00028##

(136) Compounds of Structure 8 can be synthesized by reacting compounds of Structure 1 with compounds of Structure 9 under the conditions described earlier for reaction of compound of Structure 2 and Structure 3, eg under phase transfer catalytic conditions in presence of tetrabutyl ammonium bromide or tetrabutyl ammonium hydrogensulfate and a base such as Na₂CO₃ (*Chem. Comm.* 2006, 2379) or under anhydrous conditions, in THF or DMF in presence of NaH. Compounds of Structure 9 are commercially available.

(137) Whenever the compounds of Formula (I) are obtained in the form of mixtures of stereoisomers, the stereoisomers can be sometimes separated by preparative HPLC or more often by HPLC over a chiral stationary phase such as a Daicel ChiralCel OJ-H (5-10 µm) column, or a Daicel ChiralPak IH (5 µm) or AS-H (5 µm) or IB (5 µm) column. Typical conditions of chiral HPLC are an isocratic mixture of eluent A (CO₂) and eluent B (DCM/MeOH, 0.1% Et₂NH in EtOH, MeOH, EtOH), at a flow rate of 0.8 to 160 mL/min.

Unless otherwise indicated, the reactions take place at rt under a nitrogen atmosphere and are run in a flame dried round-bottomed flask equipped with a magnetic stir bar. Compounds are purified by flash chromatography on silica gel (Kieselgel 60, 60 Å, 35-70 µm), by prep TLC (TLC-plates from Merck, Silica gel 60 F₂₅₄) or by preparative HPLC/MS or Flashmaster (Büchi or ISCO). Compounds described in the invention are characterized by ¹H-NMR (Bruker Avance II, 400 MHz Ultra Shield™ or Bruker Avance III HD, Ascend 500 MHz; chemical shifts are given in ppm relative to the solvent used; multiplicities: s=singlet, d=doublet, t=triplet, q=quadruplet, quint=quintuplet, hex=hexet, hept=heptet, m=multiplet, br=broad, coupling constants are given in Hz) and/or by LCMS (retention time t_R is given in min; molecular weight obtained for the mass spectrum is given in g/mol) or chiral HPLC (retention time t_R is given in min) using the conditions listed below.

Biological Assay

Evaluation of Compound Inhibitory Activity (IC.sub.50)

(81) The inhibitory activity of compounds is determined in competitive binding assays. This spectrophotometric assay measures the binding of biotinylated human Gal-3 (hGal-3) or human Gal-1 (hGal-1), respectively, to a microplate-adsorbed glycoprotein, asialofetuin (ASF) (Proc Natl

(82) Briefly, compounds are serially diluted in DMSO (working dilutions). ASF-coated 384well plates are supplemented with 22.8 μL /well of biotinylated hGal-3 or hGal-1 in assay buffer (i.e. 300-1000 ng/mL biotinylated hGal-3 or hGal-1) to which 1.2 μL of compound working dilutions are added and mixed.

(83) Plates are incubated for 3 hours at 4° C., then washed with cold assay buffer (3 $\times$ 50 μL), incubated for 1 hour with 25 μL /well of a streptavidin-peroxidase solution (diluted in assay buffer to 80 ng/mL) at 4° C., followed by further washing steps with assay buffer (3 $\times$ 50 μL). Finally, 25 μL /well of ABTS substrate is added. OD (410 nm) is recorded after 30 to 45 min and IC.sub.50 values are calculated.

(84) The calculated IC.sub.50 values may fluctuate depending on the daily assay performance. Fluctuations of this kind are known to those skilled in the art. IC.sub.50 values from several measurements are given as mean values.
