Kind Code	B2
Date of Patent	August 12, 2025
Inventor(s)	Ma; Wen Jennifer

Collapsible artistic sculpture and method of making the same

Abstract

Disclosed is a method of making an extensible sculpture including providing a plurality of flexible material sheets; cutting each of the plurality of flexible material sheets to form a plurality of at least three sculptural pieces; arranging the sculptural pieces in a predetermined order; defining a first set of connection columns on the top face of the first sculptural piece; using a first connector to fixedly connect the bottom face of the second sculptural piece to the top face of the first sculptural piece at the first set of connection columns; defining a second set of connection columns on the top face of the second sculptural piece; and using a second connector to fixedly connect the bottom face of the third sculptural piece to the top face of the second sculptural piece at the second set of connection columns.

Background/Summary

PRIORITY (1) This application claims priority to, and is a continuation-in-part of, U.S. patent application Ser. No. 16/942,910, filed on Jul. 30, 2020, the disclosure of which is hereby fully incorporated by reference.

FIELD OF THE INVENTION

(1) The present disclosure is generally related to an artistic sculpture and a method for making an artistic sculpture, more particularly, this disclosure is related to apparatuses and methods of making an extensible sculpture from a plurality of flexible material sheets.

BACKGROUND OF INVENTION

(2) Extensible sculptures have a variety of uses including, but not limited to aesthetic sculptures such as artistic sculptures.

(3) It remains desirable to develop extensible sculptures that are cheaper to manufacture, simpler to manufacture, quicker to manufacture, less prone to important quality problems during manufacture, or some combination thereof.

(4) Accordingly, those skilled in the art continue with research and development efforts directed to extensible sculptures.

SUMMARY OF THE INVENTION

(5) The following presents a simplified summary in order to provide a basic understanding of some aspects of the disclosed innovation. This summary is not an extensive overview, and it is not intended to identify key/critical elements or to delineate the scope thereof. Its sole purpose is to present some concepts in a simplified form as a prelude to the more detailed description that is presented later.

(6) Disclosed is a method of making an extensible sculpture. In one aspect the method comprises providing a plurality of flexible material sheets; cutting each of the plurality of flexible material sheets to form a plurality of at least three sculptural pieces wherein each of the sculptural pieces has a top face and a bottom face opposite the top face; arranging the sculptural pieces in a predetermined order to define at least a first sculptural piece, a second sculptural piece, and a third sculptural piece; defining a first set of connection columns on the top face of the first sculptural piece, each of the connection columns of the first set of connection columns being elongated and each being offset from one another; using a first connector to fixedly connect the bottom face of the second sculptural piece to the top face of the first sculptural piece at the first set of connection columns; defining a second set of connection columns on the top face of the second sculptural piece, each of the connection columns of the second set of connection columns being elongated and each being offset from one another and each being offset from each of the connection columns of the first set of connection columns; and using a second connector to fixedly connect the bottom face of the third sculptural piece to the top face of the second sculptural piece at the second set of connection columns.

(7) Also disclosed is an extensible sculpture. In one aspect, the extensible sculpture comprises a plurality of a number N of sculptural pieces where the number N is at least 4; where each of the sculptural pieces has a top face and a bottom face opposite the top face; where the plurality of sculptural pieces are arranged in a predetermined order from a first sculptural piece, to a second sculptural piece, to at least one intermediate sculptural piece, to a last sculptural piece; wherein the top face of the first sculptural piece comprises a first set of connection columns with each of the connection columns of the first set of connection columns being elongated and each being offset from one another. In this latter aspect the extensible sculpture further comprises a first connector fixedly connecting the bottom face of the second sculptural piece to the top face of the first sculptural piece at the first set of connection columns; wherein the top face of the second sculptural piece comprises a second set of connection columns with each of the connection columns of the second set of connection columns being elongated, being offset from one another, and being offset from each of the connection columns of the first set of connection columns; and a second connector fixedly connecting the bottom face of the at least one intermediate sculptural piece to the top face of the second sculptural piece at the second set of connection columns.

(8) Also disclosed is a method of making an extensible sculpture. In certain aspects the method includes providing a plurality M of flexible material sheets; cutting each of the plurality of flexible material sheets to form a plurality N of sculptural pieces where N is greater than M and where N is at least 3, wherein each of the sculptural pieces has a top face and a bottom face opposite the top face; arranging the sculptural pieces in a predetermined order to define at least a first sculptural piece, a second sculptural piece, and a third sculptural piece; defining a first set of connection columns on the top face of the first sculptural piece, each of the connection columns of the first set of connection columns being elongated, each being offset from one another, and each being within 5 degrees of parallel to each other; using an adhesive to fixedly connect the bottom face of the second sculptural piece to the top face of the first sculptural piece at the first set of connection columns; defining a second set of connection columns on the top face of the second sculptural piece, each of the connection columns of the second set of connection columns being elongated, each being offset from one another, each being offset from each of the connection columns of the first set of connection columns, and each being within 5 degrees of parallel to each other; and using the adhesive to fixedly connect the bottom face of the third sculptural piece to the top face of the

second sculptural piece at the second set of connection columns.

(9) Still other embodiments of the present invention will become readily apparent to those skilled in this art from the following description wherein there is shown and described the embodiments of this invention, simply by way of illustration of the best modes suited to carry out the invention. As it will be realized, the invention is capable of other different embodiments and its several details are capable of modifications in various obvious aspects all without departing from the scope of the invention. Accordingly, the drawing and descriptions will be regarded as illustrative in nature and not as restrictive.

Description

BRIEF DESCRIPTION OF THE DRAWINGS

(1) Various exemplary embodiments of this invention will be described in detail, wherein like reference numerals refer to identical or similar components, with reference to the following figures, wherein:

(2) FIG. 1 is a view of a first aspect of a flexible material sheet;

(3) FIG. 2 is a view of a first aspect of a first sculptural piece, a second sculptural piece, and a third sculptural piece;

(4) FIG. 3 is a close up view of a second aspect of a first sculptural piece with a first set of connection columns;

(5) FIG. 4 is a close up view of the second aspect of a first sculptural piece with a second aspect of a second sculptural piece overlaid thereon;

(6) FIG. 5 is a close up view of a first sculptural piece with a second aspect of a second sculptural piece overlaid thereon and a third sculptural piece overlaid over the second sculptural piece;

(7) FIG. 6 is a view of a plurality of sculptural pieces being stacked in a predetermined order;

(8) FIG. 7 is a view of a plurality of sculptural pieces stacked in a predetermined order to form a first aspect of an extensible sculpture in a closed configuration;

(9) FIG. 8 is a bottom view of the first aspect of an extensible sculpture in an opened configuration;

(10) FIG. 9 is a first top view of the first aspect of an extensible sculpture in an opened configuration;

(11) FIG. 10 is another top view of the first aspect of an extensible sculpture in another opened configuration;

(12) FIG. 11 is another top view of the first aspect of an extensible sculpture in another opened configuration;

(13) FIG. 12 is a plan view of an alternative embodiment of a flexible material sheet;

(14) FIG. 13 is a plan view of a plurality of an alternative embodiment of flexible material sheets; and

(15) FIG. 14 is a plan view of a plurality of an alternative embodiment of flexible material sheets.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT

(16) The claimed subject matter is now described with reference to the drawings. In the following description, for purposes of explanation, numerous specific details are set forth in order to provide a thorough understanding of the claimed subject matter. It may be evident, however, that the claimed subject matter may be practiced with or without any combination of these specific details, without departing from the spirit and scope of this invention and the claims.

(17) Referring to FIGS. 1, 2 and 9-11, in some aspects the disclosed extensible sculpture **100** includes a sculptural piece **120** that may be cut from a flexible material sheet **110**. In some aspects a flexible material sheet **110** comprises paper, cloth, a polymer sheet, metal foil, or some combination thereof. In the aspect shown in FIG. 1, a single flexible material sheet **110** may be cut to form more than one sculptural piece **120**. This latter example is not limiting and it is also

contemplated that a flexible material sheet **110** may be cut to form a single sculptural piece **120** or more than two sculptural pieces **120**. Generally, a single flexible material sheet **110** may be cut to form 1 sculptural piece **120**, or 2 sculptural pieces, or 3 sculptural pieces, or some plural number N sculptural pieces, where N is an integer greater than 1. In some aspects, N will be greater than 4. In some aspects, N will be 10 or greater.

(18) In general, a plural number M of flexible material sheets **110** may be provided and these same M flexible material sheets **110** may be cut to form a plural number N of sculptural pieces **120** where N is at least 3 and where N is equal to or greater than M.

(19) The operation to cut a sculptural piece **120** from a flexible material sheet **110** may be performed with a knife, a razor, scissors, or other blade. In some aspects, the operation to cut a sculptural piece **120** from a flexible material sheet **110** may be performed by die cutting or laser cutting. The cutting may be a manual process, an automated process, or a combination thereof.

(20) Referring now to FIGS. 2 and 8, in some aspects each sculptural piece **120** has a top face **124** and a bottom face **126** opposite the top face **124**. A sculptural piece **120** will have some thickness separating the top face **124** from the bottom face **126**, but in some aspects this thickness may be very small. In some non-limiting aspects, the thickness of a sculptural piece **120** is less than 5 mm, less than 1 mm, or less than 0.5 mm, or less than 0.2 mm.

(21) Referring to FIGS. 2-6, in some aspects the disclosed extensible sculpture **100** is assembled from a plurality of N number of sculptural pieces **120**. In this latter aspect, the sculptural pieces **120** are arranged in a predetermined order from a first sculptural piece **131**, to a second sculptural piece **141**, to one or more optional intermediate sculptural pieces **151**, to a last sculptural piece **171**. In this latter aspect, the second sculptural piece **141** is an intermediate sculptural piece **151**. In this latter aspect, there is a third sculptural piece **161** that is also an intermediate sculptural piece **151**. In this latter aspect, the top face **132** of the first sculptural piece **131** comprises a first set **134** of connection columns **135**, **136**, **137** with each of the connection columns **135**, **136**, **137** of the first set **134** of connection columns being elongated and each being offset from one another.

(22) The connection columns of the first set **134** of connection columns, or any other set of connection columns, may be substantially parallel to one another. As used herein “substantially parallel” to one another means that the columns are within 10 degrees of parallel to each other. Columns that are “substantially parallel” to one another may also be within 5 degrees of parallel to each other, or within 1 degree of parallel to one another.

(23) With continued reference to FIGS. 2-6, in this latter aspect these connection columns **135**, **136**, **137** each comprise a connector. Here, and in general throughout this disclosure unless otherwise noted, a connector may be an adhesive, or an adhesive strip or tape, or stitching, or mechanical fastener, such as, but without limitation, a grommet. The connector on the first sculptural piece **131** may be referred to herein as the first connector **138**. In the aspect shown, the first connector **138** is an adhesive strip.

(24) With continued reference to FIGS. 3-6, in the latter aspect the first connector **138** is used to fixedly connect the bottom face **143** of the second sculptural piece **141** to the top face **132** of the first sculptural piece **131** at the first set **134** of connection columns **135**, **136**, **137**.

(25) With continued reference to FIGS. 3-6, in the latter aspect the second sculptural piece **141** is assembled and used in a fashion similar to that of the first sculptural piece **131**. The top face **142** of the second sculptural piece **141** comprises a second set **144** of connection columns **145**, **146**. Each of the connection columns **145**, **146** of the second set **144** of connection columns **145**, **146** is elongated and is offset from one another. As assembled in the latter aspect of the extensible sculpture **100**, each of the connection columns **145**, **146** of the second set **144** of connection columns **145**, **146** is offset from each of the connection columns **135**, **136**, **137** of the first set **134** of connection columns **135**, **136**, **137**. In this latter aspect, the second set **144** of connection columns **145**, **146** comprises a second connector **148**. In the aspect shown, the second connector **148** is an adhesive strip. In other aspects the second connector **148** may be an adhesive, or

stitching, or mechanical fastener.

(26) It should be understood that the current subject matter covers both aspects where the connector on any given sculptural piece is the same as that on another sculptural piece, as well as aspects where the connector on any given sculptural piece differs from that on another sculptural piece. In the non-limiting aspect shown in FIGS. 3-5, the first connector **138** is the same as the second connector **148**. In other aspects, the first connector **138** differs from the second connector **148**. Similarly, the first connector **138** may be the same as the connector on any other sculptural piece **120**.

(27) With continued reference to FIGS. 4-6, in the latter aspect the second connector **148** is used to fixedly connect the bottom face **163** of the third sculptural piece **161** to the top face **142** of the second sculptural piece **141** at the second set **144** of connection columns **145, 146**.

(28) With continued reference to FIGS. 3-6, in the latter aspect the third sculptural piece **161** is assembled and used in a fashion similar to that of the first sculptural piece **131** and the second sculptural piece **141**. The top face **162** of the third sculptural piece **161** comprises a third set **164** of connection columns **165, 166, 167**. Each of the connection columns **165, 166, 167** of the third set **164** of connection columns **165, 166, 167** is elongated and is offset from one another. As assembled in the latter aspect of the extensible sculpture **100**, each of the connection columns **165, 166, 167** of the third set **164** of connection columns **165, 166, 167** is offset from each of the connection columns **145, 146** of the second set **144** of connection columns **145, 146**. As assembled in the latter aspect of the extensible sculpture **100**, each of the connection columns **165, 166, 167** of the third set **164** of connection columns **165, 166, 167** is aligned with a corresponding connection column **135, 136, 137** of the first set **134** of connection columns **135, 136, 137**, although this is merely exemplary of one optional aspect and is not limiting.

(29) In some aspects, assembly of the extensible sculpture **100** continues in the fashion described above until each of the desired sculptural pieces **120** after the first sculptural piece **131** has been fixedly connected to the prior sculptural pieces **120**.

(30) In a sculpture consisting of an arbitrary number N of sculptural pieces **120**, where N is 3 or greater, each of the sculptural pieces **120** may be referred to by a number from 1 to N , such that there is the first (1st) sculptural piece **131** and the last (N th) sculptural piece **171** and at least one intermediate ($N-1$ th) sculptural piece **151**. In aspects with a plurality of intermediate sculptural pieces **151**, there are $N-2$ intermediate pieces **151** which may be numbered from 2 to $N-1$. Each intermediate sculptural piece **151** is fixedly connected to exactly two other sculptural pieces **120** with the 2nd piece fixedly connected to the 1st and 3rd sculptural pieces **120**; and generally for each intermediate sculptural piece **151** the $N-1$ th sculptural piece **151** is fixedly connected to the $N-2$ th and N th sculptural pieces **120**.

(31) Referring now to FIGS. 1-6, it can be seen that in some aspects one or more of the sculptural pieces **120** differ from one or more other sculptural pieces **120** in shape, thickness, material, or some combination thereof. In the non limiting aspect shown, the first sculptural piece **131** differs from the second sculptural piece **141**. With particular reference to FIGS. 3 and 4, it should be understood that the shape of the first sculptural piece **131** differs from the shape of the second sculptural piece **141**. It should also be understood that this latter difference is non-limiting and that there are also acceptable aspects where the first sculptural piece **131** is substantially the same in shape, thickness, material, etc. as the second sculptural piece **141**. Similarly, in the non limiting aspect shown, the first sculptural piece **131** differs from the third sculptural piece **161**. With particular reference to FIGS. 3 and 5, it should be understood that the shape of the first sculptural piece **131** differs from the shape of the third sculptural piece **161**. Again, it should also be understood that this latter difference is non-limiting and that there are also acceptable aspects where any given sculptural piece **120** is substantially the same in shape, thickness, material, etc. as one or more other sculptural pieces **120**.

(32) Referring to FIGS. 12-14, an alternative embodiment of the flexible material sheet **110** is

illustrated. In this embodiment the flexible material sheet **110** is reinforced with a reinforcing sheet **210**. The reinforcing sheet **210** may be any size and shape. The reinforcing sheet **210** may be made from any material. The reinforcing sheet **210** is attached to the flexible material sheet **110** by any number of methods, such as stitching, pinning, grommets, or adhesive.

(33) Once the reinforcing sheet **210** is attached to the flexible material sheet **110**, then one or more apertures **220** are placed in the bottom of the sheets. The apertures **220** may be any size and shape. The apertures **220** are utilized to permit one or more cables **300** to be attached to the sheets. The cables **300** may be attached to one or more sheets when passing through a plurality of sheets. In other embodiments the cables are not attached to the sheets. The cables **300** may then be anchored to any substrate or surface, such as a wall, floor, or ceiling. In this manner the sculptural piece may be arranged vertically or placed in other positions than on the floor. The cables **300** may be made of any material. In the preferred embodiment, the cables **300** are made of a wound metal strands, such as aircraft cable.

(34) The reinforcing sheet **210** may be made of any material. Preferably, the reinforcing sheet **210** is sturdier and a more resilient material than the flexible material sheet **110**. In the preferred embodiment, the reinforcing sheet **210** is a high-density polyethylene, such as Tyvek®. The reinforcing sheet **210** is also preferably formed by spunbound fibers, permitting the reinforcing sheet **210** to be lightweight, durable, and breathable while also being resistant to water. In other embodiments the reinforcing sheet **210** is an extruded film or woven material.

(35) The reinforcing sheet **210** may have any type of specifications. The reinforcing sheet **210** preferably has the properties in the following table:

(36) TABLE-US-00001 Preferred Property Range Value Test Method Unit Weight 102-109 g/m2 105 g/m2 DIN EN ISO 536 Delamination 1.2-2.2 N/in 1.7 N/in ASTM D 2724-87 Thickness 190-350 µm 275 µm DIN EN 20534 Tensile Strength 260-320 N/in 290 N/in DIN EN ISO (Machine Direction) 1924-2 Tensile Strength 290-370 N/in 330 N/in DIN EN ISO (Cross Direction) 1924-2 Mullenburst 1450-1950 kPa 1700 kPa ISO 2758

(37) The reinforcing sheet **210** may extend along the entire surface of the flexible material sheet **110**. Alternatively, in the preferred embodiment, the reinforcing sheet **210** extends only along a short section of the flexible material sheet **110**. The reinforcing sheet **210** is beneficial because it assists with strengthening the base of the flexible material sheet **110** so that the end sculpture can be made larger.

(38) In some embodiments the distance between the respective connection columns **135**, **136**, **137** varies depending on the height of the end sculpture. When the flexible material sheet **110** is made only of paper, the resulting sculpture is limited in how tall it can be made because the paper will fall over when stood on end. Variation in the distance between the connection columns **135**, **136**, **137** and connectors can assist with ensuring that the resulting sculpture can be made taller. When the connection columns **135**, **136**, **137** are spaced further apart, and the individual flexible material sheets **110** are separated, the flexible material sheets **110** create a larger honeycomb column structure. The further apart the connection columns **135**, **136**, **137** are located from each other, the larger the resulting columns of the honeycomb. The larger columns creates a greater stability in the resulting sculpture structure, permitting the total height of the sculpture structure to be increased.

(39) For instance, there may be a small sculpture with a height between 20 to 50 cm and a width of 150 cm. In this version there may be eleven total connection columns spaced approximately 12.5 cm apart from each other. In a larger version, the sculpture may have a height between 50 to 100 cm and a width of 150 cm. In this version there may be only nine connection columns spaced approximately 17 cm apart. As can be appreciated, as the height or width of the end sculpture increases, the spacing of the connection columns can be increased to ensure the end stability of the resulting sculpture. The variations in the spacing between connection columns **135**, **136**, **137** can be all in a single sculpture and constant spacing between all connection columns in a sculpture is not required.

(40) The installation of the resulting sculpture can be done in any manner. In the preferred embodiment the cables **300** are strung across an open space and are anchored to the walls, floors, or ceiling, using the preferred cable anchoring system. Next a fabric is draped over the cables **300** and secured to the surface using staples or other means. Then the cables **300** are threaded through the apertures **220** in each flexible material sheet **110**. The flexible material sheets **110** are then separated and the sculpture is opened and stretched across the cables.

(41) As used herein, the phrase “at least one of”, when used with a list of items, means different combinations of one or more of the listed items may be used and only one of the items in the list may be needed. The item may be a particular object, thing, or category. In other words, “at least one of” means any combination of items or number of items may be used from the list, but not all of the items in the list may be required. For example, “at least one of item A, item B, and item C” may mean item A; item A and item B; item B; item A, item B, and item C; or item B and item C. In some cases, “at least one of item A, item B, and item C” may mean, for example and without limitation, two of item A, one of item B, and ten of item C; four of item B and seven of item C; or some other suitable combination.

(42) As used herein, the terms “approximately” and “about” represent an amount close to the stated amount that still performs the desired function or achieves the desired result. For example, the terms “approximately” and “about” may refer to an amount that is within less than 10% of, within less than 5% of, within less than 1% of, within less than 0.1% of, and within less than 0.01% of the stated amount.

(43) What has been described above includes examples of the claimed subject matter. It is, of course, not possible to describe every conceivable combination of components or methodologies for purposes of describing the claimed subject matter, but one of ordinary skill in the art can recognize that many further combinations and permutations of such matter are possible. Accordingly, the claimed subject matter is intended to embrace all such alterations, modifications and variations that fall within the spirit and scope of the appended claims. Furthermore, to the extent that the term “includes” is used in either the detailed description or the claims, such term is intended to be inclusive in a manner similar to the term “comprising” as “comprising” is interpreted when employed as a transitional word in a claim.

(44) The foregoing method descriptions and the process flow diagrams are provided merely as illustrative examples and are not intended to require or imply that the steps of the various embodiments must be performed in the order presented. As will be appreciated by one of skill in the art the order of steps in the foregoing embodiments may be performed in any order. Words such as “thereafter,” “then,” “next,” etc. are not intended to limit the order of the steps; these words are simply used to guide the reader through the description of the methods. Further, any reference to claim elements in the singular, for example, using the articles “a,” “an” or “the” is not to be construed as limiting the element to the singular.

(45) The preceding description of the disclosed embodiments is provided to enable any person skilled in the art to make or use the present invention. Various modifications to these embodiments will be readily apparent to those skilled in the art, and the generic principles defined herein may be applied to other embodiments without departing from the spirit or scope of the invention. Thus, the present invention is not intended to be limited to the embodiments shown herein but is to be accorded the widest scope consistent with the following claims and the principles and novel features disclosed herein.

Claims

1. A method of making an extensible sculpture comprising: providing a plurality of flexible material sheets; providing a plurality of reinforcing sheets comprising high-density polyethylene; adhering a respective one of the plurality of reinforcing sheets to a portion of one of each of said

plurality of flexible material sheets; cutting each of the plurality of flexible material sheets to form a plurality of at least three sculptural pieces wherein each of the sculptural pieces has a top face and a bottom face opposite the top face; cutting a top edge of a first sculptural piece to define a first sculptural piece profile shape; cutting a top edge of a second sculptural piece to define a second sculptural piece profile shape; cutting a top edge of a third sculptural piece to define a third sculptural piece profile shape; wherein the first sculptural piece profile shape is different from the second sculptural piece profile shape and the third sculptural piece profile shape; wherein the second sculptural piece profile shape is different from the third sculptural piece profile shape; arranging the first sculptural piece, the second sculptural piece, and the third sculptural piece in a predetermined order; defining a first set of connection columns on the top face of the first sculptural piece, each of the connection columns of the first set of connection columns being elongated and each being offset from one another; using a first connector to fixedly connect the bottom face of the second sculptural piece to the top face of the first sculptural piece at the first set of connection columns; defining a second set of connection columns on the top face of the second sculptural piece, each of the connection columns of the second set of connection columns being elongated and each being offset from one another and each being offset from each of the connection columns of the first set of connection columns; and using a second connector to fixedly connect the bottom face of the third sculptural piece to the top face of the second sculptural piece at the second set of connection columns.

2. The method of claim 1 wherein the first connector comprises an adhesive or an adhesive strip or tape, or stitching, or mechanical fastener.

3. The method of claim 1 wherein the second connector comprises an adhesive or an adhesive strip or tape, or stitching, or mechanical fastener.

4. The method of claim 1 wherein the first connector is the same as the second connector.

5. The method of claim 1 wherein each of the connection columns of the first set of connection columns is within 5 degrees of parallel to each other.

6. The method of claim 1 wherein each of the connection columns of the second set of connection columns is within 5 degrees of parallel to each other.

7. The method of claim 6 wherein each of the connection columns of the second set of connection columns is within 5 degrees of parallel to each of the connection columns of the first set of connection columns.

8. The method of claim 1 wherein the plurality of at least three sculptural pieces comprises at least ten sculptural pieces.

9. The method of claim 1 wherein the cutting each of the plurality of flexible material sheets to form a plurality of sculptural pieces is performed using a computer program to draw out a design for each of the plurality of sculptural pieces.

10. The method of claim 1 further comprising cutting multiple sculptural pieces from a single flexible material sheet.

11. The method as in claim 1 further comprising cutting one or more apertures in each of said flexible material sheets; providing one or more sections of cable; respectively threading each of said one or more sections of cable through said one or more apertures.

12. The method as in claim 11 further comprising securing a first portion of said one or more sections of cable to one or more of the plurality of flexible material sheets.

13. The method as in claim 12 further comprising securing a second portion of said one or more sections of cable to a surface.

14. The method as in claim 13 wherein said surface is a ceiling.

15. The method as in claim 1 further comprising defining a first distance between said first set of connection columns; defining a second distance between said second set of connection columns; wherein said first distance is not equal to said second distance.

16. A method of making an extensible sculpture comprising: providing a plurality M of flexible

material sheets; providing a plurality M of reinforcement sheets; adhering each reinforcement sheet to a portion of a respective one of the plurality M of flexible material sheets; cutting each of the plurality of flexible material sheets to form a plurality N of sculptural pieces where N is greater than M and where N is at least 3; cutting a top edge on each of the plurality of sculptural pieces to define a respective sculptural piece profile shape; wherein the sculptural piece profile shape of one sculptural piece is different than the sculptural piece profile shape of at least two other sculptural pieces; wherein each sculptural piece profile shape of the at least two other sculptural pieces are different from each other; wherein each of the sculptural pieces has a top face and a bottom face opposite the top face; arranging the sculptural pieces in a predetermined order to define at least a first sculptural piece, a second sculptural piece, and a third sculptural piece; defining a first set of connection columns on the top face of the first sculptural piece, each of the connection columns of the first set of connection columns being elongated, each being offset from one another, and each being within 5 degrees of parallel to each other; using an adhesive to fixedly connect the bottom face of the second sculptural piece to the top face of the first sculptural piece at the first set of connection columns; defining a second set of connection columns on the top face of the second sculptural piece, each of the connection columns of the second set of connection columns being elongated, each being offset from one another, each being offset from each of the connection columns of the first set of connection columns, and each being within 5 degrees of parallel to each other; and using the adhesive to fixedly connect the bottom face of the third sculptural piece to the top face of the second sculptural piece at the second set of connection columns.
