United States Patent	12415649
Kind Code	B2
Date of Patent	September 16, 2025
Inventor(s)	Sollie; Greg et al.

Telescoping insulated boxes

Abstract

A telescoping box assembly including an outer box including a plurality of outer side walls and an outer bottom, the plurality of outer side walls defining an outer top edge positioned opposite from the outer bottom, the outer box defining an interior cavity extending from the outer top edge to the outer bottom; an inner box including a plurality of inner side walls and an inner bottom, the plurality of inner side walls defining an inner top edge positioned opposite from the inner bottom, the inner box positioned upside down within the interior cavity with the inner top edge facing the outer bottom; and an access tab covering a corner of the inside bottom and a portion of the outer top edge, the access tab securing the inner box within the interior cavity.

Inventors: Sollie; Greg (Sharpsburg, GA), Waltermire; Jamie (Peachtree City, GA), Chen; Shifeng (Newport News, VA)

Applicant: Pratt Retail Specialties, LLC (Brookhaven, GA)

Family ID: 1000008819142

Assignee: Pratt Retail Specialties, LLC (Brookhaven, GA)

Appl. No.: 17/536878

Filed: November 29, 2021

Attorney, Agent or Firm: Taylor Duma LLP

Background/Summary

CROSS-REFERENCE TO RELATED APPLICATION (1) This application is a continuation of U.S. application Ser. No. 17/187,239, filed Feb. 26, 2021, which issued into U.S. Pat. No. 11,247,806 on Feb. 15, 2022, which is a continuation of U.S. application Ser. No. 16/401,607, filed May 2, 2019, which issued into U.S. Pat. No. 11,027,875 on Jun. 8, 2021, which are all hereby incorporated by reference herein in their entireties.

JOINT RESEARCH AGREEMENT

(1) The subject matter disclosed was developed and the claimed invention was made by, or on behalf of, one or more parties to a joint research agreement between MP Global Products LLC of Norfolk, NE and Pratt Retail Specialties, LLC of Conyers, GA, that was in effect on or before the effective filing date of the claimed invention, and the claimed invention was made as a result of activities undertaken within the scope of the joint research agreement.

TECHNICAL FIELD

(2) This disclosure relates to foldable boxes. More specifically, this disclosure relates to telescoping insulated boxes.

BACKGROUND

(3) Home delivery of food is becoming more common as the process becomes more efficient and costs go down. Delivery boxes may alternatively need to keep the food hot or cold enough to, for example, prevent bacterial growth, prevent melting or congealing of the food, or simply maintain the edibility, texture, and flavor of the food. Another consideration for the type of box to use is its impact on the environment, as it relates to the reusability and recyclability of the boxes. Polystyrene foam boxes are prevalent in the food-delivery industry because of their low cost, but they are not commonly recycled. Thus, they take up a disproportionate volume of landfill space.

SUMMARY

- (4) It is to be understood that this summary is not an extensive overview of the disclosure. This summary is exemplary and not restrictive, and it is intended neither to identify key or critical elements of the disclosure nor delineate the scope thereof. The sole purpose of this summary is to explain and exemplify certain concepts of the disclosure as an introduction to the following complete and extensive detailed description.
- (5) Disclosed is a telescoping box assembly, comprising an outer box comprising a plurality of outer side walls and an outer bottom, the plurality of outer side walls defining an outer top edge positioned opposite from the outer bottom, the outer box defining an interior cavity extending from the outer top edge to the outer bottom; an inner box comprising a plurality of inner side walls and an inner bottom, the plurality of inner side walls defining an inner top edge positioned opposite from the inner bottom, the inner box positioned upside down within the interior cavity with the inner top edge facing the outer bottom; and an access tab covering a corner of the inner bottom and a portion of the outer top edge, the access tab securing the inner box within the interior cavity.
- (6) Also disclosed is a method for opening a telescoping insulated box assembly, the method comprising grasping a portion of an access tab, the access tab securing an inner box within an interior cavity of an outer box, an outer top edge of the outer box defining an opening to the interior cavity, the inner box positioned upside down within the interior cavity, the access tab covering a portion of the outer top edge of the outer box and a corner of an inner bottom of the inner box; folding the portion of the access tab upwards to expose the corner; and removing the inner box from the interior cavity of the outer box to expose the interior cavity.
- (7) Various implementations described in the present disclosure may include additional systems, methods, features, and advantages, which may not necessarily be expressly disclosed herein but will be apparent to one of ordinary skill in the art upon examination of the following detailed description and accompanying drawings. It is intended that all such systems, methods, features, and advantages be included within the present disclosure and protected by the accompanying claims.
-

Description

BRIEF DESCRIPTION OF THE DRAWINGS

- (1) The features and components of the following figures are illustrated to emphasize the general principles of the present disclosure. Corresponding features and components throughout the figures may be designated by matching reference characters for the sake of consistency and clarity.
- (2) FIG. 1A shows a box comprising walls defining insulation cavities therein.
- (3) FIG. 1B shows a cross-section of the box of FIG. 1A taken along line 110 of FIG. 1A.
- (4) FIG. 2 shows a blank configured to form the box of FIG. 1.
- (5) FIG. 3 shows a side view of the blank of FIG. 2.
- (6) FIG. 4 shows a blank configured to form a box, in accordance with another aspect of the current disclosure.
- (7) FIG. 5A shows the box corresponding to the blank of FIG. 4, in a partially assembled configuration.
- (8) FIG. 5B is a detail view of the box, in accordance with another aspect of the current disclosure.
- (9) FIG. 6 shows the box comprising insulator pads, wherein an inner side panel is folded into the box.
- (10) FIG. 7 shows a plurality of insulator pads, in accordance with another aspect of the current disclosure.
- (11) FIG. 8 shows the insulator pads, in accordance with another aspect of the current disclosure.
- (12) FIG. 9 is a perspective view of a telescoping insulated box.
- (13) FIG. 10 is a perspective view of an inner portion of the telescoping box partially inserted in an outer portion.
- (14) FIG. 11 is a perspective view of the inner portion side-by-side with the outer portion.
- (15) FIG. 12 is a perspective view of the telescoping box comprising access tabs.

DETAILED DESCRIPTION

- (16) The present disclosure can be understood more readily by reference to the following detailed description, examples, drawings, and claims, and the previous and following description. However, before the present devices, systems, and/or methods are disclosed and described, it is to be understood that this disclosure is not limited to the specific devices, systems, and/or methods disclosed unless otherwise specified, and, as such, can, of course, vary. It is also to be understood that the terminology used herein is for the purpose of describing particular aspects only and is not intended to be limiting.
- (17) The following description is provided as an enabling teaching of the present devices, systems, and/or methods in its best, currently known aspect. To this end, those skilled in the relevant art will recognize and appreciate that many changes can be made to the various aspects of the present devices, systems, and/or methods described herein, while still obtaining the beneficial results of the present disclosure. It will also be apparent that some of the desired benefits of the present disclosure can be obtained by selecting some of the features of the present disclosure without utilizing other features. Accordingly, those who work in the art will recognize that many modifications and adaptations to the present disclosure are possible and can even be desirable in certain circumstances and are a part of the present disclosure. Thus, the following description is provided as illustrative of the principles of the present disclosure and not

in limitation thereof.

(18) As used throughout, the singular forms “a,” “an” and “the” include plural referents unless the context clearly dictates otherwise. Thus, for example, reference to “an element” can include two or more such elements unless the context indicates otherwise.

(19) Ranges can be expressed herein as from “about” one particular value, and/or to “about” another particular value. When such a range is expressed, another aspect includes from the one particular value and/or to the other particular value. Similarly, when values are expressed as approximations, by use of the antecedent “about,” it will be understood that the particular value forms another aspect. It will be further understood that the endpoints of each of the ranges are significant both in relation to the other endpoint, and independently of the other endpoint.

(20) For purposes of the current disclosure, a material property or dimension measuring about X or substantially X on a particular measurement scale measures within a range between X plus an industry-standard upper tolerance for the specified measurement and X minus an industry-standard lower tolerance for the specified measurement. Because tolerances can vary between different materials, processes and between different models, the tolerance for a particular measurement of a particular component can fall within a range of tolerances.

(21) As used herein, the terms “optional” or “optionally” mean that the subsequently described event or circumstance can or cannot occur, and that the description includes instances where said event or circumstance occurs and instances where it does not.

(22) The word “or” as used herein means any one member of a particular list and also includes any combination of members of that list. Further, one should note that conditional language, such as, among others, “can,” “could,” “might,” or “may,” unless specifically stated otherwise, or otherwise understood within the context as used, is generally intended to convey that certain aspects include, while other aspects do not include, certain features, elements and/or steps. Thus, such conditional language is not generally intended to imply that features, elements and/or steps are in any way required for one or more particular aspects or that one or more particular aspects necessarily include logic for deciding, with or without user input or prompting, whether these features, elements and/or steps are included or are to be performed in any particular aspect.

(23) Disclosed are components that can be used to perform the disclosed methods and systems. These and other components are disclosed herein, and it is understood that when combinations, subsets, interactions, groups, etc. of these components are disclosed that while specific reference of each various individual and collective combinations and permutation of these may not be explicitly disclosed, each is specifically contemplated and described herein, for all methods and systems. This applies to all aspects of this application including, but not limited to, steps in disclosed methods. Thus, if there are a variety of additional steps that can be performed it is understood that each of these additional steps can be performed with any specific aspect or combination of aspects of the disclosed methods.

(24) Disclosed is a telescoping insulated box and associated methods, systems, devices, and various apparatus. It would be understood by one of skill in the art that the disclosed box is described in but a few exemplary embodiments among many. No particular terminology or description should be considered limiting on the disclosure or the scope of any claims issuing therefrom.

(25) For ease of understanding, the use of the directional terms herein, such as right, left, front, back, top, bottom, and the like can refer to the orientation shown and described in the corresponding figures, but these directional terms should not be considered limiting on the orientation or configuration required by the present disclosure. The use of ordinal terms herein, such as first, second, third, fourth, and the like can refer to elements associated with elements having matching ordinal numbers. For example, a first light bulb can be associated with a first light socket, a second light bulb can be associated with a second light socket, and so on. However, the use of matching ordinal numbers should not be considered limiting on the associations required by the present disclosure.

(26) FIG. 1A shows in one exemplary aspect a box **100** comprising walls **102** defining insulation cavities **104** within each of the walls **102**. The walls **102** can comprise a plurality of sides **106** and a bottom **108** of the box **100**. The box **100** can comprise four or any other number of sides **106**. The sides **106** and the bottom **108** can define an interior **110** of the box **100**. The sides **106** and the bottom **108** can comprise the insulation cavities **104** when the box **100** is assembled in accordance with the present disclosure. Line **110-110** defines a cross-section, a perspective view of which is shown in FIG. 1B.

(27) FIG. 1B is a cross-sectional view of the box **100** of FIG. 1A. The cross-sectional plane is defined by line **110-110**. The insulation cavities **104** can be defined within each of the walls **102**, the construction of the walls **102** being described more fully below. In the current aspect, the insulation cavities **104** are empty and filled with air. In other aspects, various insulators such as repulpable or recyclable insulator pads **226** (described below) can fill the cavities **104**.

(28) FIG. 2 shows in one exemplary aspect a blank **200** configured to form the box **100** of FIG. 1. The blank **200** can comprise four outer side panels **202a,b,c,d**, each connected to another by a parallel fold line **204**. Each of four inner side panels **206a,b,c,d** can be connected to one of the four outer side panels **202a,b,c,d** by a connecting strip **208**. Each connecting strip **208** can be connected to the respective outer side panel **202a,b,c,d** by a fold line **210** along one edge **212** and be connected to respective the inner side panel **206a,b,c,d** by a fold line **214** on an opposite edge **216**. Each of a first and a third inner side panel **206a,c** can comprise two tabs **207**. Each of four inner bottom panels **218a,b,c,d** can

be connected to one of the four inner side panels **206a,b,c,d** by a fold line **220**. The blank can also comprise four outer bottom panels **222a,b,c,d**, each connected to one of the four outer side panels **202a,b,c,d** by a fold line **224**.

(29) Each of the four outer side panels **202a,b,c,d** can be covered by an insulator pad or batt **226**. The insulator pads **226** can comprise paper or other paper fiber materials; however, in other aspects, the insulation batts **226** can comprise cotton, foam, rubber, plastics, fiberglass, mineral wool, or any other flexible insulation material. In the present application, the insulation batts **226** can be repulpable. In the present aspect, the box can be 100% recyclable. In the present aspect, the box **100** can be single-stream recyclable wherein all materials comprised by the box can be recycled by a single processing train without requiring separation of any materials or components of the box **100**. In the present aspect, the box **100** can be compostable. In the present aspect, the box **100** can be repulpable. In the present aspect, the box **100** and the insulator pads **226** can be repulpable in accordance with the requirements of the Aug. 16, 2013, revision of the “Voluntary Standard For Repulping and Recycling Corrugated Fiberboard Treated to Improve Its Performance in the Presence of Water and Water Vapor” provided by the Fibre Box Association of Elk Grove Village, IL which is hereby incorporated in its entirety. In the present aspect, the box **100** and the insulator pads **226** can be recyclable in accordance with the requirements of the Aug. 16, 2013, revision of the “Voluntary Standard For Repulping and Recycling Corrugated Fiberboard Treated to Improve Its Performance in the Presence of Water and Water Vapor” provided by the Fibre Box Association of Elk Grove Village, IL.

(30) Recyclable and repulpable insulation materials are further described in U.S. patent application Ser. No. 15/677,738, filed Aug. 15, 2017, U.S. Provisional Patent Application No. 62/375,555, filed Aug. 16, 2016, U.S. Provisional Patent Application No. 62/419,894, filed Nov. 9, 2016, and U.S. Provisional Patent Application No. 62/437,365, filed Dec. 21, 2016, which are each incorporated by reference in their entirety herein.

(31) The insulator pads **226** can be configured or spaced to allow bending of the fold lines **204** between each of the outer side panels **202a,b,c,d** such that the insulator pads **226** face the interior **110** of the box **100**. A first and a third inner bottom panel **218a,c** can also be covered by insulator pads **226**. The insulator pads **226** can be affixed to the panels by glue, hot melt, double-sided tape, or any other method known in the art. In other aspects (not shown), insulator pads **226** can be omitted altogether. In such case, the insulation cavities **104** can use air as an insulating material.

(32) In other aspects (not shown), the number of outer side panels **202a,b,c,d** (and corresponding panels) can be greater or less than four. In yet other aspects, the tabs **207** need not be on the first and third inner side panels **206a,c**, and can be on any desired side panel **206**.

(33) The insulator pad **226** covering a fourth outer side panel **202d** can be cut short, and the insulator pad **226** covering a first outer side panel **202a** can extend past its edge, such that when the first and fourth outer side panels **202a,d** are joined together—assembling the box in a 3-D configuration—the insulator pad **226** extending from the first outer side panel **202a** can touch and can cover a portion of the fourth outer side panel **202d**. In some aspects, the first outer side panel **202a** can comprise a tab (not shown) that extends outward similar to the tab **207** of the first inner side panel **206a** and the insulator pad **226** can cover the tab of the first outer side panel **202a**. In these aspects, the tab beneath the insulator pad **226** covering the first outer side panel **202a** can contact and can cover a portion of the fourth outer side panel **202d** instead of the insulator pad **226**.

(34) FIG. 3 shows a side view of the blank **200** of FIG. 2. The insulator pads **226** can be cut along each of their edges **302** at the fold lines **204** between the outer side panels **202a,b,c,d**. For example, each cut **304** can form an angle **306** with a plane of the blank **200**. The angle **306** can be 45-degrees, such that when the box **100** walls **102** each form a 90-degree angle relative to each other, the cuts **304** of the insulator pads **226** are in facing or almost facing contact but are not compressed against each other.

(35) FIG. 4 shows another aspect of the blank **200** for the box **100** in accordance with the current disclosure. In the current aspect, the insulator pads **226** are omitted. The insulator pads **226** can be inserted during assembly of the box **100** or omitted. The connecting strips **208** can each comprise sides **402** which are angled towards each other in the direction of the inner side panels **206** from the outer side panels **202**. For example and without limitation, the sides **402** of the connecting strips **208** can form approximately a 45-degree angle with the fold line **210** between the connecting strip **208** and the outer side panel **202**. In this way, the connecting strips **208** can form a top surface **602** (shown in FIG. 6) of the box **100**, each side **402** of the connecting strips **208** in facing or almost facing contact with, without overlapping, one of the sides **402** of the adjacent connecting strips **208**.

(36) FIG. 5A shows the box **100** corresponding to the blank of FIG. 4, in a partially assembled configuration. The first and the fourth outer side panels **202a,d** are joined to form a ring **502** comprising the four sides **106** of the box **100**.

(37) FIG. 5B is a detail view of the box **100**, in accordance with another aspect of the current disclosure. In the present aspect, the box **100** can be assembled from a blank in which the connecting strips **208** can alternate between a rectangular shape **504** (the sides **402** of the connecting strips **208** perpendicular to the fold line **210** between the connecting strip **208** and the outer side panel **202**) and a trapezoidal shape **506** (as shown in FIG. 4). The two opposing inner side panels **206a,c** connected to the rectangular connecting strips **504** can fold into the box **100** first, followed by the opposing inner side panels **206b,d** connected to the trapezoidal connecting strips **506**. In other aspects, different inner side panels **206a,b,c,d** can have or be attached to the rectangular **504** or trapezoidal connecting strips **506**. As such, the angled sides **402** of the trapezoidal connecting strips **506** can provide a symmetric look to the corners **508** of

the box, the box **402** of the rectangular connecting strips **504** can be tucked under the trapezoidal connecting strips **506**, such that no gap is defined therebetween to see inside the insulation cavities **104**. Additionally, in some aspects, the box **100** can be dimensioned such that some of the inner side panels **206a,b,c,d** cannot easily fold into the box **100** without bending. In such cases, an additional fold line **510** across the inner side panel **206a,b,c,d** can allow for easier assembly.

(38) FIG. **6** shows the box **100** having the insulator pads **226** (shaded), wherein one of the inner side panels **206** has been folded into the box **100**. The connecting strip **208** can cover a top edge **604** of the insulator pad **226**. Each inner side panel **206a,b,c,d** can face the corresponding outer side panel **202a,b,c,d** (not shown in FIG. **6**) and sandwich a respective one of the insulator pads **226** in each cavity **104** formed therebetween. The tabs **207** can fold to face the adjacent sides **106** of the box **100**. The inner bottom panel **218** can form the bottom **108** of the interior **110** of the box **100**. Another one of the insulating pads **226** (not shown) can be sandwiched between the inner bottom panel **218** and the outer bottom panels **222**.

(39) The blank **200** of FIG. **2** can be assembled to form the box **100** in its 3-D configuration by a following procedure. The first and the fourth outer side panels **202a,d** can be joined together such that the insulator pads **226** face the interior **110** of the box **100**. The outer bottom panels **222a,b,c,d** can be folded to form the bottom **108** of the box **100**. For example, the first and the third outer bottom panels **222a,c** can be folded in first, followed by the second and fourth outer bottom panels **222b,d**. The inner side panels **206a,b,c,d** can be folded in towards the interior **110** of the box **100**, such that the inner side panels **206a,b,c,d** contact the insulator pads **226**, and such that the inner bottom panels **218a,b,c,d** face and lay over the outer bottom panels **222a,b,c,d**. In the current aspect, for the blank **200** shown in FIG. **2**, the first and the third inner side panels **218a,c** can be folded in first, such that the tabs **207** of the first and third inner side panels **218a,c** are sandwiched between the second and fourth outer side panels **202b,d** and the corresponding second and fourth inner side panels **218b,d**. In another aspect, the second and fourth side inner panels **202b,d** can be folded into the box **100** first, and then the first and third inner side panels **218a,c** subsequently folded in, such that the tabs **207** are exposed to the interior **110** of the box **100** in the assembled configuration. This method can use the tabs **207** to hold down the second and fourth inner side panels **202b,d**, while the previous method can allow the tabs **207** to remain hidden.

(40) Furthermore, in the current aspect, the insulator pads **226** on the first and third inner bottom panels **218a,c** can touch the outer bottom panels **222a,b,c,d**. The second and fourth inner bottom panels **218b,d** can then form the bottom **108** facing the interior **110** of box **100**. In other aspects, the order of folding can be different, such that the bottom **108** and the sides **106** of the box still comprise insulation cavities **104**.

(41) In other aspects, such as when the number of outer side panels **202a,b,c,d** (and corresponding panels) vary from four, the procedure can be described more generally by the following steps: joining the outer side panels **202a,b,c,d** at opposite ends **202a,d** such that the outer side panels **202a,b,c,d** form a ring **502**; folding the outer bottom panels **222a,b,c,d** to form the bottom **108** of the box **100**, the bottom **108** and the ring **502** of outer side panels **202a,b,c,d** defining the interior **110** of the box **100**; folding the inner side panels **206a,b,c,d** in towards the interior **110** of the box **100**, such that the connecting strips **208** cover the top edges **604** of the insulator pads **226**, and such that each inner side panel **206a,b,c,d** faces the corresponding outer side panel **202a,b,c,d**; and folding the inner bottom panels **218a,b,c,d** to face the bottom **108** of the box **100**.

(42) FIG. **7** shows another aspect of the insulator pads **226**. In the present aspect, the insulator pads **226** can be individual pieces, unattached to a blank and inserted into the insulation cavities **104** during the assembly of the box **100**. Two bottom insulation pads **702** can insulate the insulation cavity **104** of the bottom **108** of the box **100**, which can also be called a bottom insulation cavity. The insulator pads **226** can comprise a covering or liner **704** that can be made of plastic, for example and without limitation, such that moisture is prevented from entering an interior of the insulator pads **226**.

(43) FIG. **8** shows another aspect of the insulator pads **226**. In the present aspect, a singular side insulator pad **802** can fill a plurality of insulation cavities **104** (side insulation cavities) by wrapping circumferentially in the walls **102** of the sides **106** (side walls). A separate bottom insulation pad **702** can insulate the bottom insulation cavity.

(44) FIG. **9** is a perspective view of a telescoping insulated box assembly **900**. The telescoping insulated box assembly **900** can comprise an inner box **902** and an outer box **904**. Each of the inner box **902** and the outer box **904** can be assembled according to the present disclosure as a box **100** comprising walls **102** that define insulation cavities **104** (shown in FIG. **2**). The telescoping box assembly **900** can be formed by the inner box **902**, which is smaller than the outer box **904**, upside down into the outer box **904**, such that the bottom **108** of the box **100** forming the inner box **902** is a part of a top side **906** of the telescoping box assembly **900** opposite to a bottom side **908** of the telescoping box assembly **900**, the bottom side **908** formed by the bottom **108** of the outer box **904**. In other aspects (not shown), the telescoping box assembly **900** can be in a reversed orientation while carry contents, such that the bottom **108** of the outer box **904** can form the top side **906** of the telescoping box assembly **900** and the bottom **108** of the inner box **902** can form part of the bottom side **908** of the telescoping box assembly **900**. The inner box **902** can be sized such that the inner box **902** slides snugly into the outer portion. Snugly can mean that the inner and outer portions **902,904** in an assembled telescoping box assembly **900** can press against each other with enough force such that frictional forces alone can keep the inner and outer portions **902,904** secured together, such that the portions **902,904** do not separate

through gravitational forces when the telescoping box assembly **900** is empty or filled with contents up to a given weight and external force needs to be applied to separate the boxes **902,904**. In other aspects, the fit can be designed to be looser or tighter as desired.

(45) When the inner box **902** forms part of the top side **906** of the telescoping box assembly **900**, a handle **910** can be attached to the inner box **902**. In some aspects, the handle **910** can be a strip of flexible plastic, the ends of which are adhesive, such that the handle also functions to secure the outer bottom panels **222a,b,c,d** of the inner box **902** together. The handle **910** can be of sufficient strength to support the weight of the telescoping box assembly **900** and its contents, as well as to support pulling the inner box **902** out of the outer box **904** in order, for example, to retrieve the contents.

(46) FIG. **10** is a perspective view of the inner box **902** of the telescoping box assembly **900** partially inserted in (or telescoping from) the outer box **904**.

(47) FIG. **11** is a perspective view of the inner box **902** placed side-by-side with the outer box **904**, both portions facing in the same orientation, their bottoms **108** facing down and a top edge **1102** facing up. An exterior height **1104** of the inner box **902** can match an interior height **1106** of the outer box **904**, such that when the inner box **902** is fully inserted into the outer box **904**, the bottom **108** of the inner box **902** is level, or coplanar, with the top edge **1102** of the outer portion **104**.

(48) FIG. **12** is a perspective view of the telescoping box assembly **900** comprising access tabs **1202**. Each access tab **1202** can comprise a telescope covering portion **1204** that can cover a corner (not shown) of the inner box **902**, such that the inner box **902** is secured inside the outer box **904**. The tabs **1202** can be attached to the outer box **904**, such as by adhesives such as glue. Each tab **1202** can define cuts **1206** and perforations **1208** such that tearing a portion of the tab **1202** along the perforation **1208** can allow the covering portion **1204** to fold up and expose the corner of the inner box **902**. As such, the inner box **902** can be removed from the outer box **904** after tearing the portion of the tab **1202** along the perforation **1208**, such as by holding the outer box **904** and pulling on the handle **910** of the inner box **902** in an opposite direction.

(49) One should note that conditional language, such as, among others, “can,” “could,” “might,” or “may,” unless specifically stated otherwise, or otherwise understood within the context as used, is generally intended to convey that certain aspects include, while other aspects do not include, certain features, elements and/or steps. Thus, such conditional language is not generally intended to imply that features, elements and/or steps are in any way required for one or more particular aspects or that one or more particular aspects necessarily include logic for deciding, with or without user input or prompting, whether these features, elements and/or steps are included or are to be performed in any particular aspect.

(50) It should be emphasized that the above-described aspects are merely possible examples of implementations, merely set forth for a clear understanding of the principles of the present disclosure. Any process descriptions or blocks in flow diagrams should be understood as representing modules, segments, or portions of code which include one or more executable instructions for implementing specific logical functions or steps in the process, and alternate implementations are included in which functions may not be included or executed at all, may be executed out of order from that shown or discussed, including substantially concurrently or in reverse order, depending on the functionality involved, as would be understood by those reasonably skilled in the art of the present disclosure. Many variations and modifications may be made to the above-described aspect(s) without departing substantially from the spirit and principles of the present disclosure. Further, the scope of the present disclosure is intended to cover any and all combinations and sub-combinations of all elements, features, and aspects discussed above. All such modifications and variations are intended to be included herein within the scope of the present disclosure, and all possible claims to individual aspects or combinations of elements or steps are intended to be supported by the present disclosure.

Claims

1. A telescoping box assembly, comprising: an outer box comprising a plurality of outer side walls and an outer bottom, the plurality of outer side walls defining an outer top edge positioned opposite from the outer bottom, the outer box defining an interior cavity extending from the outer top edge to the outer bottom; an inner box comprising a plurality of inner side walls and an inner bottom, the plurality of inner side walls defining an inner top edge positioned opposite from the inner bottom, the inner box positioned upside down within the interior cavity with the inner top edge touching the outer bottom; and an access tab overlapping adjacent outer sidewalls and comprising a telescope covering portion configured to cover a corner of the inner box and a perforation configured to be torn to allow removal of the corner of the inner box from the outer box, the access tab covering the corner of an inside bottom and a portion of the outer top edge, the access tab securing the inner box within the interior cavity.
2. The telescoping box assembly of claim 1, wherein the portion of the outer top edge is a corner portion of the outer top edge.
3. The telescoping box assembly of claim 1, wherein the corner is defined where the inside bottom meets a first inner side wall of the plurality of inner side walls and a second inner side wall of the plurality of inner side walls.

4. The telescoping box assembly of claim 1, wherein the access tab defines a cut configured to be torn to expose the corner.
 5. The telescoping box assembly of claim 1, wherein the access tab defines perforations configured to be torn to expose the corner.
 6. The telescoping box assembly of claim 1, wherein a first outer side wall of the plurality of outer side walls defines an outer surface extending from the outer top edge to the outer bottom, and wherein a side portion of the access tab covers a portion of the outer surface.
 7. The telescoping box assembly of claim 6, wherein the side portion defines cuts and perforations configured to tear to fold the access tab and expose the corner.
 8. The telescoping box assembly of claim 1, wherein the inner bottom defines an outer surface facing away from the interior cavity, and wherein a handle is coupled to the outer surface.
 9. The telescoping box assembly of claim 8, wherein the handle extends across the inner bottom from a first inner side wall of the plurality of inner side walls to a second inner side wall of the plurality of inner side walls.
 10. The telescoping box assembly of claim 1, wherein: the access tab is a first access tab; the corner is a first corner; the portion is a first portion; the inner bottom defines a second corner diagonally opposite from the first corner; and the box assembly further comprises a second access tab covering the second corner and a second portion of the outer top edge.
 11. The telescoping box assembly of claim 1, wherein the access tab is secured to the outer box by an adhesive.
 12. The telescoping box assembly of claim 1, wherein the outer box defines an outer insulation cavity and the inner box defines an inner insulation cavity, and wherein an outer portion of the inner box presses against an inner portion of the outer box such that the inner box and the outer box do not separate through gravitational forces when the telescoping box assembly is empty of contents.
 13. A method for opening a telescoping insulated box assembly, the method comprising: obtaining an inner box disposed within an interior cavity defined by a plurality of outer side walls of an outer box; grasping a portion of an access tab, the access tab overlapping adjacent outer sidewalls of the outer box and comprising a telescoping portion and a perforation, the access tab securing the inner box within the interior cavity of the outer box, an outer top edge of the outer box defining an opening to the interior cavity, the inner box positioned upside down within the interior cavity with an inner top edge of the inner box touching an outer bottom of the outer box, the telescoping portion of the access tab covering a portion of the outer top edge of the outer box and a corner of an inner bottom of the inner box; tearing the perforation and folding the telescoping portion of the access tab upwards to expose the corner; and removing the inner box from the interior cavity of the outer box to expose the interior cavity.
 14. The method of claim 13, wherein folding the portion of the access tab upwards to expose the corner comprises tearing the access tab along a cut defined by the access tab.
 15. The method of claim 13, wherein folding the portion of the access tab upwards to expose the corner comprises tearing the access tab along perforations defined by the access tab.
 16. The method of claim 13, wherein removing the inner box from the interior cavity of the outer box to expose the interior cavity comprises pulling on a handle coupled to the inner bottom.
 17. The method of claim 13, wherein the outer top edge of the outer box is defined by a plurality of outer side walls of the outer box, wherein a first outer side wall of the plurality of outer side walls defines an outer surface positioned opposite from the interior cavity; and wherein a side portion of the access tab at least partially covers the outer surface.
 18. The method of claim 17, wherein the side portion of the access tab defines perforations configured to tear.
 19. The method of claim 13, wherein the portion is a corner portion of the outer top edge.
 20. The method of claim 13, wherein the outer top edge is positioned flush with the inner bottom when the inner box is positioned within the interior cavity.
 21. The method of claim 13, wherein the access tab is attached to the outer box by an adhesive.
 22. An assembly, comprising: an outer box comprising a plurality of walls comprising an inner wall portion and an outer wall portion extending from a top edge to a bottom of the outer box and defining an insulation cavity between the inner wall portion and the outer wall portion; a telescoping box within the outer box and comprising a plurality of walls comprising an inner telescoping wall portion and an outer telescoping wall portion and defining a telescoping insulation cavity extending to a bottom of the telescoping box between the inner telescoping wall portion and the outer telescoping wall portion, wherein the telescoping insulation cavity extends to the bottom of the outer box; and an access tab overlapping adjacent walls of the outer box and comprising a telescope covering portion configured to cover a corner of the telescoping box and a perforation configured to be torn to allow removal of the corner of the telescoping box from the access tab.
 23. The assembly of claim 22, wherein the access tab covers the corner of the bottom of the telescoping box and a portion of an outer top edge, the access tab securing the telescoping box within the outer box.
-
