

US012414912B2

(12) **United States Patent**
Anapolle

(10) **Patent No.: US 12,414,912 B2**
(45) **Date of Patent: Sep. 16, 2025**

(54) **TOPICAL PRODUCT INCLUDING APPLE**

(71) Applicant: **Ross Anapolle**, Newton, MA (US)

(72) Inventor: **Ross Anapolle**, Newton, MA (US)

(*) Notice: Subject to any disclaimer, the term of this patent is extended or adjusted under 35 U.S.C. 154(b) by 357 days.

(21) Appl. No.: **17/741,999**

(22) Filed: **May 11, 2022**

(65) **Prior Publication Data**

US 2023/0034385 A1 Feb. 2, 2023

(57) **ABSTRACT**

Provided is a topical apple product, comprising a base topical product configured for application to a human and an apple material substantially uniformly combined with the base topical material. Also provided is a method of treating a skin condition or ailment with topical apple product. The apple material can have a Polyphenols/Total Antioxidant Activity of $\geq 3.00\%$.

TOPICAL PRODUCT INCLUDING APPLE**CROSS REFERENCE TO RELATED APPLICATIONS**

The present application is a continuation of U.S. application Ser. No. 15/693,897 filed Sep. 1, 2017, entitled TOPICAL PRODUCT INCLUDING APPLE, which claimed priority under 35 USC 119(e) from provisional application Ser. No. 62/382,375, entitled TOPICAL PRODUCT INCLUDING DRIED APPLE PEEL POWDER, filed on Sep. 1, 2016, and provisional application Ser. No. 62/382,399, entitled TOPICAL PRODUCT INCLUDING APPLE PEEL EXTRACT, filed on Sep. 1, 2016, which are incorporated herein by reference in their entireties.

FIELD OF INTEREST

The present inventive concepts relate to the field of topical products, in particular, the present invention relates to topical products comprising apple, apple constituents, and/or apple byproducts, such as apple peel powder, apple extract, and the like.

SUMMARY

In accordance with aspects of the present disclosure, provided is a topical product comprising an apple material, sometimes referred to herein as a “topical apple product.” The apple material can take the form of an apple peel powder, liquid extract, or the like. The apple material can comprise apple peel, apple, flesh and/or combinations thereof. The topical apple product can comprise the apple material combined with a base topical product. The topical apple product can take the form of a liquid, lotion, gel, paste, salve, ointment, cream, rub, powder, extract, wax, or spray, as examples, that can be applied to skin, hair, teeth, and/or nails.

In accordance with aspects of the present disclosure, provided is a topical product, comprising a base topical product configured for application to a human and an apple material substantially uniformly combined with the base topical material.

In various embodiments, the apple material comprises dried apple peel powder.

In various embodiments, the apple material comprises liquid apple extract.

In various embodiments, the apple material comprises apple peel.

In various embodiments, the apple material comprises apple flesh.

In various embodiments, the apple material comprises antioxidants.

In various embodiments, the apple material comprises Polyphenols/Total Antioxidant Activity of $\geq 3.00\%$.

In various embodiments, the apple peel extract comprises Polyphenols/Total Antioxidant Activity in a range of about 20% to about 35%.

In various embodiments, the base topical product is a cosmetic product.

In various embodiments, the cosmetic product is chosen from a group consisting of: face and/or body lotion, such as moisturizers and cleansers, skin serums, body powder, sunscreen, bronzer, shampoo, conditioner, soap, hair color, hair detangler, mask, peel, lipstick, lip gloss, lip balm, foundation, blush, toner, mascara, eye shadow, eye and/or anti-aging solutions, shave cream, lotion, or gel, aftershave,

2

deodorant, antiperspirant, cologne, perfume, body splash, toothpaste, floss, and/or mouthwash and/or mouth rinse.

In various embodiments, the base topical material is chosen from a group consisting of: medical treatment product, such as a first aid cream or spray or other skin treatment cream or spray, such as for use to treat a wound, skin irritation, burn, rash, eczema, infection, and/or melanoma, or the like.

In various embodiments, the topical apple product is suitable for application to human skin.

In various embodiments, the topical apple product is suitable for application to human hair.

In various embodiments, the topical apple product is suitable for application to human teeth.

In various embodiments, a percentage of apple material in the topical apple product is greater than 0% and up to about 50%.

In various embodiments, the percentage of apple material in the topical apple product is greater than 0% and up to about 25%.

In various embodiments, the percentage of apple material in the topical apple product is greater than 0% and up to about 10%.

In accordance with another aspect of the inventive concept, provided is a topical applicant product, comprising a base topical product configured for application to a human and an apple material substantially uniformly combined with the base topical material. The apple material is a dried apple peel powder having Polyphenols/Total Antioxidant Activity of $\geq 3.00\%$, the apple peel extract topical is suitable for application to human skin, and the base topical product is chosen from a group consisting of: face and/or body lotion, such as moisturizers and cleansers, skin serums, body powder, sunscreen, bronzer, shampoo, conditioner, soap, hair color, hair detangler, mask, peel, lipstick, lip gloss, lip balm, foundation, blush, toner, mascara, eye shadow, eye and/or anti-aging solutions, shave cream, lotion, or gel, aftershave, deodorant, antiperspirant, cologne, perfume, body splash, toothpaste, floss, and/or mouthwash and/or mouth rinse.

In accordance with another aspect of the inventive concept, provided is a method of treating a skin condition and/or ailment, including applying a topical apple product to a portion of skin condition repair skin dryness, irritation, rash, and/or melanoma.

In various embodiment, the apple material has a Polyphenols/Total Antioxidant Activity of $\geq 3.00\%$.

In accordance with aspects of the present disclosure, provided is a method of making a topical apple product, comprising providing a base topical product configured for application to a human and combining an apple material with the topical product.

BRIEF DESCRIPTION OF THE DRAWINGS

The present invention will become more apparent in view of the attached drawings and accompanying detailed description. The embodiments depicted therein are provided by way of example, not by way of limitation, wherein like reference numerals refer to the same or similar elements. The drawings are not necessarily to scale, emphasis instead being placed upon illustrating aspects of the invention. In the drawings:

FIG. 1 is a front view of a container partially filled with a base topical product, in accordance with the prior art;

FIG. 2 is a front view of an embodiment of a container partially filled with an apple material, in accordance with aspects of the inventive concept;

3

FIG. 3 is a notional view of an embodiment of a process for making a topical apple product, in accordance with aspects of the inventive concept;

FIG. 4 is a flowchart showing an embodiment of a method of making a topical apple product, in accordance with aspects of the inventive concept; and

FIG. 5 is a flowchart showing an embodiment of another method of making a topical apple product, in accordance with aspects of the inventive concept.

DETAILED DESCRIPTION OF PREFERRED EMBODIMENTS

Various aspects of the inventive concepts will be described more fully hereinafter with reference to the accompanying drawings, in which some exemplary embodiments are shown. The present inventive concept may, however, be embodied in many different forms and should not be construed as limited to the exemplary embodiments set forth herein.

It will be understood that, although the terms first, second, etc. are used herein to describe various elements, these elements should not be limited by these terms. These terms are used to distinguish one element from another, but not to imply a required sequence of elements. For example, a first element can be termed a second element, and, similarly, a second element can be termed a first element, without departing from the scope of the present invention. As used herein, the term “and/or” includes any and all combinations of one or more of the associated listed items.

It will be understood that when an element is referred to as being “on” or “connected” or “coupled” to another element, it can be directly on or connected or coupled to the other element or intervening elements can be present. In contrast, when an element is referred to as being “directly on” or “directly connected” or “directly coupled” to another element, there are no intervening elements present. Other words used to describe the relationship between elements should be interpreted in a like fashion (e.g., “between” versus “directly between,” “adjacent” versus “directly adjacent,” etc.).

The terminology used herein is for the purpose of describing particular embodiments only and is not intended to be limiting of the invention. As used herein, the singular forms “a,” “an” and “the” are intended to include the plural forms as well, unless the context clearly indicates otherwise. It will be further understood that the terms “comprises,” “comprising,” “includes” and/or “including,” when used herein, specify the presence of stated features, steps, operations, elements, and/or components, but do not preclude the presence or addition of one or more other features, steps, operations, elements, components, and/or groups thereof.

In accordance with aspects of the present invention, there are provided various topical apple products comprising apple material, such as apple peel powder, extract or the like. As will be discussed further below, the topical apple products can take any of a variety of forms, including, but not limited to, cosmetic, and non-cosmetic topically applied to the skin, hair, teeth, or other tissue. Various forms of apple material have antioxidant properties that can be particularly advantageous for treating and/or repairing various skin ailments and/or conditions. The topical apple product can take the form of a liquid, lotion, gel, paste, salve, ointment, cream, rub, powder, extract, wax, or spray, as examples, that can be applied to skin, hair, teeth, and/or nails.

As an example, various methods have been used to make apple peel powder from apple skins, such as those described

4

in U.S. Pat. No. 8,551,554 (the ‘554 Patent”), the contents of which are incorporated herein by reference. The ‘554 Patent primarily described manners of making such a powder in view of studies showing in vitro cancer fighting benefits. For therapeutic purposes, the ‘554 Patent described making the apple peel powder to have an unusually high phenolic content, i.e., 3.00%. To the limited extent that uses of such a powder were disclosed in the ‘554 Patent, they were limited to treating and inhibiting the proliferation of liver cancer cells. The apple peel powder is described as being made for oral consumption as a dietary supplement, in tablet or capsule form, or as a food additive or ingredient.

The Liu ‘554 Patent describes a method that “involves providing an apple peel, subjecting the apple peel to a phytochemical preservation treatment, drying the treated apple peel, and grinding the dried, treated apple peel to a powder” (‘554 Patent at col. 2, ll. 60-63). Additionally, the ‘554 Patent reports the results of testing different apple varieties and different ways of processing the apple peels. For example, the ‘554 Patent reports that: “The anthocyanin contents of the freeze-dried peels . . . was much higher than the anthocyanin content of the fresh peels . . . an apparent 14-fold increase in the anthocyanin content of the apple peels after blanching and freeze-drying” (‘554 Patent at col. 12, ll. 14-21). It also reports that: “The citric acid and ascorbic acid treatments were not effective in preventing oxidation of the phenolic compounds during oven-drying of the apple peels at 60°C. Heat inactivation by blanching the peels for 10 seconds was much more successful” (‘554 Patent at col. 12, ll. 6-64).

Other testing showed that: “The untreated freeze-dried peels had similar phytochemical contents and water activity to the blanched peels. However, the presence of potentially active enzymes in the untreated peels could lead to problems with the apple peel powder during storage and in food applications. Peels blanched for 10 seconds and freeze-dried before being ground to a powder would make the most stable product” (‘554 Patent at col. 13, ll. 46-53). “The decreased water activity could allow for greater chemical stability and increased shelf-life of the apple peel powder” (‘554 Patent at col. 13, ll. 40-41). Thus: “After reviewing the data, the peels were blanched for 10 seconds and freeze-dried to make the most stable food ingredient, with high phytochemical contents” (‘554 Patent at col. 11, ll. 51-53).

Leahy Orchards Inc. of Canada produces an organic dried apple peel powder under the tradename AppleActiv DAPPTM. Some of the significant characteristics of AppleActiv DAPPTM are: high phenolic and flavonoid content, rich in antioxidants, enzymes, vitamins and minerals; and provide clinically supported health benefits. As in the ‘554 Patent, this product is promoted as a dietary supplement or food ingredient to be consumed and digested by a living being (e.g., person). Other approaches to producing dried apple peel powder may also suffice, so the present invention need not be limited to the methods disclosed in the ‘554 Patent.

In contrast to uses where apple peel powder (APP) is consumed and digested into the body, the present invention includes novel products and uses of products that include apple material, such as apple peel powder or extract, for application as a topical agent or ingredient in a topical apple product. The apple material can be an apple peel powder made for a method described in the ‘554 Patent and/or can take the form of AppleActiv DAPP from Leahy Orchards Inc., or the like. In various embodiments, the apple powder and/or apple peel extract is made by extracting phytochemicals from apple peels using a phytochemical treatment

5

process, drying the treated apple peel, and grinding the dried, treated apple peel to a powder.

In a preferred form, the apple material preferably includes Polyphenols/Total Antioxidant Activity of $\geq 3.00\%$. But in some embodiments, a topical apple product having apple material having Polyphenols/Total Antioxidant Activity of $0.00\% <$ and $< 3.00\%$ could also provide treatment, repair, and/or prevention improvements and advantages over the base topical product without the apple material, e.g., a topical apple product having Polyphenols/Total Antioxidant Activity of $0.00\% <$ and $\leq 0.50\%$, $0.50\% <$ and $\leq 1.00\%$, $1.00\% <$ and $\leq 1.50\%$, $1.50\% <$ and $\leq 2.00\%$, $2.00\% <$ and $\leq 2.50\%$, and/or $2.50\% <$ and $\leq 3.00\%$ could be advantageously provided. In some embodiments, the Polyphenols/Total Antioxidant Activity of can be between in a range of about 3% to about 10%, 10% to 20%, and/or 20% to about 35%, or more.

The topical apple product can be formed by adding the apple peel material to a "base product" or "base topical product." The base product can take the form of a liquid, lotion, gel, paste, salve, ointment, cream, rub, powder, extract, wax, or spray, as examples. The base product could be a product suitable for application to skin, hair, teeth, and/or nails.

FIG. 1 shows an embodiment of a container holding a base topical product and FIG. 2 shows an embodiment of a container holding an apple material. The precise amount of apple material, e.g., dried apple peel powder or liquid extract added to a base topical product will vary depending on the intended use of the product. For example, when used in a cosmetic product, such as makeup, the apple material can be generally undetectable from the look, feel, consistency, and application perspectives of the base topical product. That is, in various embodiments the topical apple product can appear to the consumer and user to be no different, or not substantially different, than the base topical product without the apple material. The apple material need not alter, or substantially alter, the look, feel, consistency, and/or application of the base topical product, while providing significant repair and/or treatment benefits to the area of application (e.g., damaged skin).

As examples, the topical apple product can take the form of any of the following (base product+apple material (e.g., Dried apple peel powder, liquid apple extract, or the like): face and/or body lotion, such as moisturizers and cleansers, skin serums, body powder, sunscreen, bronzer, shampoo, conditioner, soap, hair color, hair detangler, mask, peel, lipstick, lip gloss, lip balm, foundation, blush, toner, mascara, eye shadow, eye and anti-aging solutions, shave cream, lotion, or gel, aftershave, deodorant, antiperspirant, cologne, perfume, body splash, toothpaste, floss, and/or mouthwash or mouth rinse. As other examples, the topical apple product can be a medical treatment product, such as a first aid cream or spray or other skin treatment cream or spray, such as for use to treat a wound, skin irritation, burn, rash, eczema, infection, and/or melanoma, or the like.

FIG. 3 shows a notional example of a base product and apple material being combined to form a topical apple product.

Depending on the particular base product, different techniques can be used to combine in the apple material with the base product. Preferably, in most embodiments, the selected technique achieves equal, or substantially equal, suspension and a uniform consistency in the base products, e.g., liquids, gels, or solids (e.g., lipstick, deodorant, etc.). That is, preferably, the addition of the apple material does not adversely alter the consistency of the base product. For

6

example, the apple material, e.g., dried apple peel powder, liquid extract, or the like, can be combined (e.g., mixed) into a complete base product, such as a lotion, powder, gel, or the like, as shown in the representative method 400 of FIG. 4. Or, in other embodiments, the apple material, e.g., dried apple peel powder, liquid extract, or the like, can be combined (e.g., mixed) with base product constituents, during the process of making the base product to form a topical apple product.

In the method 400 of FIG. 4, a base topical product is provided in step 402. A percentage of applicant material within the final topical apple product is determined. The apple material is provided to achieve the determined percentage. And the base topical product and the apple material are combined to form the topical apple product having the predetermined amount of apple material.

FIG. 5 shows another method 500 of making the topical apple product. In this method the apple material is added while making the base topical product, to collectively form the topical apple product. In step 502, a percentage of apple material is determined for a total amount of topical apple product or determined amount of base topical product. The base topical product constituents are provided and the apple material is provided as an additional constituents. The constituents are combined and processed to form a topical base product having the predetermined percentage of apple material, e.g., dried apple peel powder and/or liquid apple extract.

In various embodiments of methods used in making a topical apple product, an appropriate amount of apple material, e.g., as a percentage of the base product, can be predetermined, such as by a machine capable of volume and/or weight measures. This percentage can be variously determined based on several factors, such as not exceeding an amount (apple material threshold amount) that would adversely affect the look, feel, texture, consistency, odor, and/or performance of the base product, such as for cosmetics and other product that are not primarily palliative. For medical topical base products, some or all of these factors may be less of a consideration. For example, in various embodiments, a topical apple product may include a percentage of apple material that is greater than 0% and up to about 50%, while in other embodiments, the percentage may be greater than 0% and up to about 25%, while in still other embodiments, the percentage may be greater than 0% and up to about 10%, while still in other embodiments, the percentage may be greater than 0% and up to about 5%. Depending on the embodiment, the percentage of apple material in a topical apple product could be of still another percentage. In the methods of FIGS. 4 and 5, as examples, the amount of apple material to be added to the base product is predetermined. This can be done by an automated machine configured to determine the appropriate quantities of apple material and/or base topical material to form the topical apple product having the predetermined and desired amount of apple material.

While the foregoing has described what are considered to be the best mode and/or other preferred embodiments, it is understood that various modifications can be made therein and that the invention or inventions may be implemented in various forms and embodiments, and that they may be applied in numerous applications, only some of which have been described herein. It is intended by the following claims to claim that which is literally described and all equivalents thereto, including all modifications and variations that fall within the scope of each claim.

It is appreciated that certain features of the invention, which are, for clarity, described in the context of separate embodiments, may also be provided in combination in a single embodiment. Conversely, various features of the invention which are, for brevity, described in the context of a single embodiment may also be provided separately or in any suitable sub-combination.

For example, it will be appreciated that all of the features set out in any of the claims (whether independent or dependent) can be combined in any given way.

What is claimed is:

1. A method of making a topical apple product consisting essentially of a non-food base topical material and a processed apple material, the method comprising:

selecting the base topical material from the group consisting of a lotion, a paste, a gel, a cream, a non-aqueous liquid, and a powder having cosmetic and/or therapeutic applications when topically applied to human skin, hair, teeth and/or nails;

preparing the processed apple material by sequentially blanching and freeze-drying apple peels to preserve and stabilize phytochemicals in the apple peels to form dried processed apple peel powder and/or processed apple peel extract that has a shelf-stable Polyphenols/Total Antioxidant Activity of $\geq 3.00\%$; and

combining a predetermined amount of the processed apple material with an amount of the base topical material until the two are substantially uniformly combined to form the topical apple product containing greater than 0% up to about 50% of the processed apple material and having substantially equal and a uniform consistency.

2. The topical apple product method of claim 1, wherein the processed apple material comprises processed apple peel extract.

3. The method of claim 1, wherein the processed apple material comprises dried processed apple peel powder.

4. The method of claim 1, wherein the processed apple material further includes some apple flesh.

5. The method of claim 1, wherein the processed apple material comprises antioxidants.

6. The method of claim 1, wherein the dried processed apple peel powder and/or processed apple peel extract comprises Polyphenols/Total Antioxidant Activity in a range of about 20% to about 35%.

7. The method of claim 1, wherein the base topical material is a cosmetic product.

8. The method of claim 1, wherein the base topical material is selected from the group consisting of:

face lotion, facial moisturizers, facial cleansers, body lotion, body moisturizer, body cleanser, skin serums, body powder, sunscreen, bronzer, shampoo, conditioner, soap, hair color, hair detangler, mask, peel, lipstick, lip gloss, lip balm, foundation, blush, toner, mascara, eye shadow, anti-aging solutions, shave cream, lotion, gel, aftershave, deodorant, antiperspirant, cologne, perfume, body splash, toothpaste, mouthwash, and mouth rinse.

9. The method of claim 1, wherein the base topical material is selected from the group consisting of:

a topical medical treatment product, a first aid cream and spray, a skin treatment cream and spray for use to treat a wound, skin irritation, burn, rash, eczema, infection, and/or melanoma.

10. The method of claim 1, wherein the percentage of dried processed apple peel powder and/or processed apple peel extract in the topical apple product is sufficient to

provide significant repair, prevention and/or treatment benefits to an area of application.

11. The method of claim 1, wherein the percentage of dried processed apple peel powder and/or processed apple peel extract in the topical apple product is greater than 0% and up to about 25% of the topical apple product.

12. The method of claim 1, wherein the percentage of dried processed apple peel powder and/or processed apple peel extract in the topical apple product is greater than 0% and up to about 10% of the topical apple product.

13. A method of making a topical apple product consisting essentially of a non-food base topical material and a processed apple material, the method comprising:

selecting the base topical material from the group consisting of a lotion, a paste, a gel, a cream, a non-aqueous liquid, and a powder having cosmetic and/or therapeutic applications when topically applied to human skin, hair, teeth and/or nails;

preparing the processed apple material by sequentially blanching and freeze-drying apple peels to preserve and stabilize phytochemicals in the apple peels to form dried processed apple peel powder and/or processed apple peel extract that has a shelf-stable Polyphenols/Total Antioxidant Activity of $\geq 3.00\%$; and

combining a predetermined amount of the processed apple material with an amount of the base topical material until the two are substantially uniformly combined to form the topical apple product containing greater than 0% up to about 50% of the processed apple material and having substantially equal and a uniform consistency,

wherein the base topical material is selected from the group consisting of:

face lotion, facial moisturizers, facial cleansers, body lotion, body moisturizer, body cleanser, skin serums, body powder, sunscreen, bronzer, shampoo, conditioner, soap, hair color, hair detangler, mask, peel, lipstick, lip gloss, lip balm, foundation, blush, toner, mascara, eye shadow, anti-aging solutions, shave cream, lotion, gel, aftershave, deodorant, antiperspirant, cologne, perfume, body splash, toothpaste, mouthwash, and mouth rinse.

14. The method of claim 13, wherein the processed apple material comprises antioxidants.

15. The method of claim 14, wherein the processed apple material comprises processed apple peel extract and/or dried processed apple peel powder.

16. The method of claim 13, wherein the processed apple material further includes some apple flesh.

17. A method of making a topical apple product consisting essentially of a non-food base topical material and a processed apple material, the method comprising:

selecting the base topical material from the group consisting of a lotion, a paste, a gel, a cream, a non-aqueous liquid, and a powder having cosmetic and/or therapeutic applications when topically applied to human skin, hair, teeth and/or nails;

preparing the processed apple material by sequentially blanching and freeze-drying apple peels to preserve and stabilize phytochemicals in the apple peels to form dried processed apple peel powder and/or processed apple peel extract that has a shelf-stable Polyphenols/Total Antioxidant Activity of $\geq 3.00\%$; and

combining a predetermined amount of the processed apple material with an amount of the base topical material until the two are substantially uniformly combined to form the topical apple product containing

greater than 0% up to about 50% of the processed apple material and having substantially equal and a uniform consistency,

wherein the base topical material is selected from the group consisting of:

a topical medical treatment product, a first aid cream and spray, a skin treatment cream or spray for use to treat a wound, skin irritation, burn, rash, eczema, infection, and/or melanoma.

18. The method of claim 17, wherein the processed apple material comprises antioxidants.

19. The method of claim 18, wherein the processed apple material comprises processed apple peel extract and/or dried processed apple peel powder.

20. The method of claim 19, wherein the dried processed apple peel powder and/or processed apple peel extract comprises Polyphenols/Total Antioxidant Activity in a range of about 20% to about 35%.

21. The method of claim 15, wherein the dried processed apple peel powder and/or processed apple peel extract comprises Polyphenols/Total Antioxidant Activity in a range of about 20% to about 35%.
