## Background/Summary

RELATED APPLICATIONS [0001] This application claims priority to U.S. Provisional Application No. 63/333,669, filed on Apr. 22, 2022. The entire contents of the foregoing application are expressly incorporated herein by reference.

### FIELD OF THE INVENTION

[0002] The present disclosure relates to activators of Transcription factor EB (TFEB), and pharmaceutically acceptable salts thereof, compositions of these compounds, processes for their preparation, their use in the treatment of diseases, their use in optional combination with a pharmaceutically acceptable carrier for the manufacture of pharmaceutical preparations, the use of the pharmaceutical preparations in the treatment of diseases, and methods of treating diseases comprising administering a TFEB activator to a warm-blooded animal, especially a human.

### BACKGROUND OF THE INVENTION

[0003] Autophagy is a process by which cells recycle intracellular material for energy, thus avoiding cell death due to stress, nutrient deprivation, or cell damage (Mizushima et al, 2008, *Nature*, 451 (7182), 1069-1075). In addition to nutrient provision, the autophagy pathway also acts as a “self-cleaning” pathway, breaking down misfolded or otherwise non-functioning proteins, cellular components, or any other materials either hazardous or no longer needed by the cell. During autophagy, the cellular components which have been tagged for degradation are encapsulated by a phagophore which forms an autophagosome, which next fuses with a lysosome, thus starting the degradation process. This catabolic process regenerates amino acid building blocks and other cellular materials which can be used in the synthesis of other proteins and also generates ATP which is used for energy in other cellular processes (Glick et al (2010) *The Journal of Pathology*, 221 (1), 3-12).

[0004] Transcription factor EB (TFEB) has been shown to be a master regulator of the autophagy process, activating genes involved in the expression of lysosomes as well as other related functions (Settembre et al, (2011), *Science*, 332 (6036), 1429-1433). When activated, TFEB translocates from the cytoplasm to the nucleus, where it activates the synthesis of the autophagy genes (Sardiello et al, (2009), *Science*, 325 (5939), 473-477). Because of its role in autophagy stimulation, activation of TFEB is a potential treatment option for a variety of diseases which have either a buildup of non-functioning or harmful proteins, such as Alzheimer's disease, or which have improper lysosomal activity, such as lysosomal storage diseases (Napolitano et al, 2016, *J. Cell. Sci.*, 129 (13), 2475-2481).

[0005] Thus, there is a need for TFEB activators as potential therapeutic agents for treating diseases or disorders that are responsive to TFEB activation.

### SUMMARY OF THE INVENTION

[0006] The present disclosure provides compounds, or pharmaceutical compositions thereof, that are TFEB activators. Compared to known compounds, it is unexpected to find that the compounds disclosed herein have better potency and/or lower in vitro clearance. In one aspect, the present disclosure relates to a pharmaceutical composition comprising a pharmaceutically acceptable carrier or diluent and a compound represented by Formula (I):

##STR00002##

or a pharmaceutically acceptable salt thereof. The definition of each variable is described herein.

[0007] In another aspect, the present disclosure provides a method of treating a disease or disorder that is responsive to activation of TFEB in a subject comprising administering to said subject an

effective amount of at least one compound described herein, or a pharmaceutically acceptable salt thereof, or a pharmaceutical composition comprising at least one compound described herein, or a pharmaceutically acceptable salt thereof, and a pharmaceutically acceptable carrier or diluent. [0008] Another aspect of the present disclosure relates to the use of at least one compound described herein, or a pharmaceutically acceptable salt thereof, for the manufacture of a medicament for the treatment of a disease or disorder responsive to activation of TFEB. Also provided is a compound described herein or a pharmaceutically acceptable salt thereof, or a pharmaceutical composition comprising at least one compound described herein, or a pharmaceutically acceptable salt thereof, and a pharmaceutically acceptable carrier or diluent, for use in treating a disease or disorder responsive to activation of TFEB.

[0231] The compounds and intermediates described herein may be isolated and used as the compound per se, i.e., the neutral form. Alternatively, when a moiety is present that is capable of forming a salt, the compound or intermediate may be isolated and used as its corresponding salt. As used herein, the terms "salt" or "salts" refers to an acid addition or base addition salt of a compound described herein. "Salts" include in particular "pharmaceutical acceptable salts". The term "pharmaceutically acceptable salts" refers to salts that retain the biological effectiveness and properties of the compounds described herein and which typically are not biologically or otherwise undesirable. In many cases, the compounds of the present disclosure are capable of forming acid and/or base salts by virtue of the presence of amino and/or carboxyl groups or groups similar thereto.

[0232] Pharmaceutically acceptable acid addition salts can be formed with inorganic acids or organic acids, e.g., acetate, aspartate, benzoate, besylate, bromide/hydrobromide, bicarbonate/carbonate, bisulfate/sulfate, camphorsulfonate, chloride/hydrochloride, chlorthephylionate, citrate, ethandisulfonate, fumarate, gluceptate, gluconate, glucuronate, hippurate, hydroiodide/iodide, isethionate, lactate, lactobionate, laurylsulfate, malate, maleate, malonate, mandelate, mesylate, methylsulphate, naphthoate, napsylate, nicotinate, nitrate, octadecanoate, oleate, oxalate, palmitate, pamoate, phosphate/hydrogen phosphate/dihydrogen phosphate, polygalacturonate, propionate, stearate, succinate, sulfate, sulfosalicylate, tartrate, tosylate and trifluoroacetate salts.

[0233] Inorganic acids from which salts can be derived include, for example, hydrochloric acid, hydrobromic acid, sulfuric acid, nitric acid, phosphoric acid, and the like.

[0235] The salts can be synthesized by conventional chemical methods from a compound containing a basic or acidic moiety. Generally, such salts can be prepared by reacting free acid forms of these compounds with a stoichiometric amount of the appropriate base (such as Na, Ca, Mg, or K hydroxide, carbonate, bicarbonate or the like), or by reacting free base forms of these compounds with a stoichiometric amount of the appropriate acid. Such reactions are typically carried out in water or in an organic solvent, or in a mixture of the two.

[0236] Generally, use of non-aqueous media like ether, ethyl acetate, ethanol, isopropanol, or acetonitrile is desirable, where practicable. Lists of additional suitable salts can be found, e.g., in "Remington's Pharmaceutical Sciences", 20th ed., Mack Publishing Company, Easton, Pa., (1985); and in "Handbook of Pharmaceutical Salts: Properties, Selection, and Use" by Stahl and Wermuth (Wiley-VCH, Weinheim, Germany, 2002).

These excipients are, for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example, corn starch, or alginic acid; binding agents, for example, starch, gelatin or acacia; and lubricating agents, for example magnesium stearate, stearic acid or talc. The tablets are uncoated or coated by known techniques to delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or glyceryl distearate can be employed.

Formulations for oral use can be presented as hard gelatin capsules wherein the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules wherein the active ingredient is mixed with water or an oil medium, for example, peanut oil, liquid paraffin or olive oil.

[0268] The parenteral compositions (e.g., intravenous (IV) formulation) are aqueous isotonic solutions or suspensions. The parenteral compositions may be sterilized and/or contain adjuvants, such as preserving, stabilizing, wetting or emulsifying agents, solution promoters, salts for regulating the osmotic pressure and/or buffers. In addition, they may also contain other therapeutically valuable substances. The compositions are generally prepared according to conventional mixing, granulating or coating methods, respectively, and contain about 0.1-75%, or contain about 1-50%, of the active ingredient.

[0269] The compound of the present disclosure or pharmaceutical composition thereof for use in a subject (e.g., human) is typically administered orally or parenterally at a therapeutic dose. When administered intravenously via infusion, the dosage may depend upon the infusion rate at which an IV formulation is administered. In general, the therapeutically effective dosage of a compound, the pharmaceutical composition, or the combinations thereof, is dependent on the species of the subject, the body weight, age and individual condition, the disorder or disease or the severity thereof being treated. A physician, pharmacist, clinician or veterinarian of ordinary skill can readily determine the effective amount of each of the active ingredients necessary to prevent, treat or inhibit the progress of the disorder or disease.

[0270] The above-cited dosage properties are demonstrable in vitro and in vivo using advantageously mammals, e.g., mice, rats, dogs, monkeys or isolated organs, tissues and preparations thereof. The compounds of the present invention can be applied in vitro in the form of solutions, e.g., aqueous solutions, and in vivo either enterally, parenterally, advantageously intravenously, e.g., as a suspension or in aqueous solution. The dosage in vitro may range between about  $10^{-3}$  molar and  $10^{-9}$  molar concentrations.

intensity inside the Nucleus region. [0501] 3). Selected population that the EGFP mean intensity

inside the Nucleus region>background as the EGFP-positive cells [0502] 4). Selected the

Surrounding region of the nucleus and calculated the EGFP mean intensity of the region [0503] 5).

Inside the EGFP-positive cell population, selected the cells with EGFP mean intensity inside the

Nucleus region/the EGFP mean intensity inside the surrounding region=1.2 (This ratio could be

slightly adjusted from time to time) as the Translocation positive cell. [0504] 6). Outputted the ratio

of Translocation positive cell/EGFP-positive cells as the Translocation Positive Ratio. [0505] 7).

Each time set the ratio of DMSO group (Control Group) as ~15% and then normalized the

compound group to the DMSO group.

[0506] The EC.sub.50 of reference compound Torin 1 was 28.34 nM.

[0509] 3. 40 μL of 10 mM NADPH solution was added to each well. The final concentrations of NADPH was 1 mM. The mixture was pre-warmed at 37° C. for 5 minutes. The negative control samples were prepared by replacing NADPH solutions with 40 μL of ultra-pure H.sub.2O. The negative control was used to exclude the misleading factor that resulted from instability of chemical itself. Samples with NADPH were prepared in duplicate. Negative controls were prepared in singlet.

[0510] 4. The reaction was started with the addition of 2 μL of 200 μM control compound or test compound solutions. Verapamil was used as positive control in this study. The final concentration of test compound or control compound was 1 μM.

[0511] 5. Aliquots of 50 μL were taken from the reaction solution at 0 and 30 minutes. The reaction was stopped by the addition of 4 volumes of cold acetonitrile with Internal Standard (100 nM alprazolam, 200 nM imipramine, 200 nM labetalol and 2 μM ketoprofen). Samples were centrifuged at 3, 220 g for 40 minutes. Aliquot of 90 μL of the supernatant was mixed with 90 μL of ultra-pure H.sub.2O and then used for LC-MS/MS analysis.

## 6. Data Analysis

[0512] All calculations were carried out using Microsoft Excel.

[0513] Peak areas were determined from extracted ion chromatograms. The slope value, k, was determined by linear regression of the natural logarithm of the remaining percentage of the parent drug vs. incubation time curve.

[0514] The in vitro half-life (in vitro t.sub.1/2) was determined from the slope value:

$$[00001] \text{invitro} t_{1/2} = -(0.693 / k)$$

[0515] Conversion of the in vitro t.sub.1/2 (min) into the in vitro intrinsic clearance (in vitro CL.sub.int, in μL/min/mg protein) was done using the following equation (mean of duplicate determinations):

$$[00002] \text{invitro} CL_{\text{int}} = \left( \frac{0.693}{t_{1/2}} \right) * \left( \frac{\text{volume of incubation (L)}}{\text{amount of proteins (mg)}} \right)$$

[0516] Conversion of the in vitro t.sub.1/2 (min) into the scale-up unbound intrinsic clearance (Scale-up CL.sub.int, in mL/min/kg) was done using the following equation (mean of duplicate determinations):

$$[00003] \text{Scale-up} CL_{\text{int}} = \left( \frac{0.693}{t_{1/2}} \right) * \left( \frac{\text{volume of incubation (L)}}{\text{amount of proteins (mg)}} \right) * \text{ScalingFactor}$$
